Storage.—These works, as well as those in Lower Egypt, are intended to raise the water surface above them and to control the distribution of supply, but in no way to store that supply. The necessity of storing up, for use at a future period of scarcity, of the superfluous flood discharge of the river, became apparent as a result of the development of Lower Egypt and the demand for perennial irrigation in Upper Egypt. The idea, however, was not a new one, and, if Herodotus is to be believed, it was a system actually pursued at a very early period of Egyptian history, when Lake Moeris, in the Fayoum, was filled at each Nile flood and drawn upon as the river ran down. When Sir Colin Scott Moncrieff first undertook the management of Egyptian irrigation many representations were made to him of the advantage of storing the Nile water; but he consistently maintained that before entering on that subject it was his duty to utilize every drop of the water at his disposal. This seemed all the more evident as at that time financial reasons made the construction of a costly Nile dam, to form a reservoir, out of the question. Every year, however, between 1890 and 1902 the supply of the Nile during May and June was actually exhausted, no water at all being allowed then to flow out into the sea. In these years, too, owing to the extension of drainage works, the irrigable area of Egypt was greatly enlarged, so that if perennial cultivation was to be further increased it would be necessary to augment the volume of the river, and this could only be done by storing up some of the unused flood supply. The

first difficulty that presented itself in carrying this out was that, during the months of high flood, the Nile is so charged with silt that to pond water up then would probably lead to the silt being deposited in the reservoir; this might in no great number of years render the reservoir useless. It was seen, however, that yearly, by the middle of November, the flood water was fairly free from deposit, while the volume of water was still so great that, without injuring irrigation, sufficient water might be stored to fill a great reservoir. Accordingly, when it was determined to construct a dam, it was decided that it should be supplied with sluices large enough to discharge, unchecked, the whole volume of the river until the middle of November, and then to begin storage.

Sir Benjamin Baker, K.C.M.G., was entrusted with carrying out the work. He was one of the three eminent engineers, Mons. Boule (French) and Sig. Torricilli (Italian), being the others, who formed the commission to decide on the preliminary scheme prepared for the Government, but which was abandoned on Sir Benjamin Baker's advice. Then a new site was chosen. The new site for this great Nile dam was at the head of the first cataract above Aswan. A dike of syenitic granite here crosses the valley; so hard is it that the river had nowhere scoured a really deep channel through it, and on this the dam was erected, at a cost of about £3,000,000. The greatest head of water which could be put on the building was about 103 ft. It is pierced by 140 under sluices of 150 sq.ft. each, and by 40 upper sluices, each of 75 sq.ft. The reservoir could contain 1,000 million tons of water. In the few years following 1902 the need for an immediate further increase in the volume of water available for summer irrigation became pressing. As a consequence, it was decided to heighten the dam about 23 ft., thus increasing the reservoir capacity to 2,400,000,000 tons of water. However, this was only done after the work of protecting the toe of the dam by aprons was completed. These aprons reduce the effective head of water against the dam so that, even when heightened 23 ft., the dam has not now so great an effective head against it as before, as may be seen from fig. 5.

The work of heightening was begun in 1907 and finished in 1912, at a cost of about £1,500,000. The need of existing areas for all the water available was accentuated by the phenomenally low flood of 1913, which was followed, as a natural consequence, by a poor spring and summer supply in 1914. The 1913 flood was estimated to be the lowest for 150 years, and except for the existence of the various barrages and the dam across the river, would have meant famine as well as financial disaster to the country.

The Sudan.—Previous to 1910, except for a few thousand acres served by pumps, all the crops grown in the Sudan along the main Nile from Wadi Halfa to Khartoum, and along the White Nile from Khartoum to the Sudd region, were sown on land naturally inundated on its low banks by the annual rise of the

FIG. 5.—ASWAN DAM. CROSS-SECTIONS OF THE ORIGINAL AND HEIGHTENED DAM

Nile. On the Blue Nile, however, rainfall alone was depended on to fertilize the crops grown. About 1909 one of the few uncultivated areas below Khartoum was turned into a perennial irrigation farm, and was among the first to produce cotton in the Sudan by means of water pumped from the Nile. Soon after that date the possibility of growing cotton in the Gezira, that huge tract which lies in the fork of the Blue and White Niles, was suggested by Lord Lovat. Here some 5,000,000 ac. form a gently sloping plain stretching along between both rivers for about 200 m. from Khartoum. From this point southwards the plain is interspersed with small, isolated granitic hills. Of the 5,000,000 ac.

in this plain, probably 3,000,000 ac. will form the maximum area cultivable. On the remaining 2,000,000 ac. near Khartoum the soil is said not to be so good; it is of a more sandy nature.

Two experimental farms of a few hundred acres each were set down in the cultivable area. The summer climate in the Gezira was found to be too trying, although below Khartoum and in Egypt cotton is entirely a summer crop. An experiment was, however, made of sowing cotton in mid-July which could be picked in the following spring; this gave a return, on an average, of 400 lb. per acre, a figure equal to the normal Egyptian production. This result was obtained at a season of the year when there is usually an abundance of water in the river, a most fortunate arrangement. In exceptional circumstances a final watering may be necessary as late as April 15, though normally the last watering is expected to be given by March 31. Before either of these dates Egypt, notwithstanding her great reservoir at Aswan, in years of low river requires all that the Blue Nile can supply. It became necessary, therefore, to devise a building which would act as a combined barrage and dam on the Blue Nile, to enable the ordinary river supply to flow on to the plain; and at the same time store a sufficient volume of it to meet the demands in the Gezira in those months when Egypt requires all that flows in the river. It was decided to build such a structure at a point 5 m. south of Sennar, where a narrow belt of gabbro rock, which scarcely rises above the level of the plain on either side, runs across the river.

Construction was proceeded with and completed in July 1925 at a cost of about £6,000,000, the canal system bringing the total to about £9,000,000. The dam can store about 600 million tons of water for use in the critical period, which extends from January to March inclusive, when Egypt requires all that passes down in a very low year. The main canal leading from the dam is some 36 m. long before reaching the point where branch canals spread out from it on to the land to be irrigated. The area judged sufficient to form a commercial proposition, in view of the cost of the works, and at the same time not to injure Egypt even in a phenomenally low year, was 300,000 ac.; it is now known that this area can be considerably increased without endangering Egypt's supply.

Tokar.—Besides the Gezira plain the Sudan has other irrigation areas where great improvements have taken place, as at Tokar and Kassala. The river Barakat rises in the rainy season in the Abyssinian hills, and rushes as a chocolate-coloured, thick stream on to the Tokar plain, where it eventually spreads out into a thin film which is sucked up by the thirsty soil. The plain, however, is much greater in extent than the water can cover, although some finds its way to the sea, as recorded in 1921. The flood is liable to break away into areas not hitherto cultivated or, even if cultivated, so far from Tokar as to be inconvenient for transport. In recent years work was carried out for the purpose of exercising some control over the direction of flow, and has so far been successful. The annual area served varies greatly. In 1921-22 about 55,000 ac. were flooded, though not all were cultivated.

Kassala.—The river Gash rises in the Abyssinian foothills, and becomes of considerable volume, in the flood season, by the time it reaches Kassala. Here it spreads itself over the plain in such a manner that none of its waters ever reach the Nile. Some control has been exercised over the flow to keep the water annually to definite areas. In a really good year, with the supply of water at a maximum, 50,000 ac. of cotton might be cultivated. Owing to a poor flood only 11,000 ac. were sown in 1925.

India.—Irrigation gives valuable aid in the fight against those periodic famines which always happen after monsoon rainfall failures in India, and it also causes an increase in production through its extension into new and suitable areas hitherto lying fallow. During 40 years, 1885-1925 in particular, developments have steadily progressed. Some 10,500,000 ac. were irrigated in 1878-79; 19,250,000 ac. at the beginning of the century and 28,000,000 ac. in 1923-24. Additional works now under construction will add 2,500,000 acres. New schemes are contemplated which will add a further 4,750,000 acres. When completed they will bring the irrigated area of British India up to about 36,000,000 acres. These

figures exclude the water supplied from the Punjab canals to 650,000 ac. in the native States. The Sutlej valley project, mainly for the benefit of native States, will increase the total by a further 3,250,000 ac., making in the proximate future a grand total of about 40,000,000 ac. of irrigated land in all India.

In 1900-01 39,142 m. of channels were in operation; by 1920-21 this had increased to 55,202 m. or an average addition of about 800 m. of channels per annum. The annual revenue return is between 7% and 8% on the capital invested in Government irrigation works. The following table shows the acreage of crops matured during 1923-24 by means of Government irrigation systems compared with the total area under cultivation in the several provinces of India:

Province	Net area cropped	Area irrigated by Government irrigation works	Percentage of area irrigated to total cropped area	Capital cost of Government irrigation and navigation works to end of 1923-24	Estimated value of crops raised on areas receiving State irrigation
	Acres	Acres	%	Lakhs of rupees	Lakhs of rupees
Madras.	36,424,000	6,891,000	18.9	1,207	3,556
Bombay					
Deccan	39,000,000	418,000	1.0	881	538
Sind	4,134,000	3,427,000	82.9	479	1,054
Bengal.	22,806,000	93,000	0.4	422	78
United Provinces.	35,011,000	1,979,000	5.6	1,577	1,348
Punjab.	26,731,000	10,207,000	38.2	2,543	5,505
Burma.	13,857,000	1,730,000	12.5	363	812
Bihar and Orissa	24,665,000	954,000	3.9	627	622
Central Provinces.	17,427,000	438,000	2.5	483	281
North-west Frontier Province	2,583,000	359,000	13.9	276	226

	223,205,000	26,538,000	11.9	8,925	14,030

Canada.—Irrigation in Canada has been, so far, very partially developed, and only in those provinces where extensive farming operations are in progress, such as Alberta, Saskatchewan and Manitoba. Developments are based upon the Federal Irrigation Act of 1894, under which the ownership of all surface water supply is vested in the Crown, which grants the necessary licences for its use. Occasional droughts occur all over the wheat-growing belts; provision, however, is steadily and systematically being made to supply irrigation water, to counteract as much as possible their effects. On the eastern section of the Canadian Pacific Railway company a census of the yields obtained and the water used by a group of ten farmers during 1924, shows that the average yield of wheat was 19½ bu. per ac. with an irrigation of 4 in. deep plus rainfall; with two 4 in. irrigations the yields were from 30 to 35 bu. and with three 4 in. irrigations were as high as 43 bu. per acre. In this district the rainfall was 11.24 in.; of which 9.68 in. fell during the growing season.

Australia.—Owing to the lack of an adequate rainfall the advantages of irrigation appealed many years ago to Australians. At first the object aimed at was to develop in unoccupied territory. While these efforts generally proved successful, in recent years the policy has been to extend irrigation to existing pastoral settlements; and some very large conservations of flood water schemes have been carried out, under which considerable areas of land are now in process of more intensive settlement.

The Murrumbidgee river (N.S.W.), is controlled by a dam 240 ft. high, at Burrinjuck, which can conserve about 960,000,000 tons of water. The scheme is to irrigate about 200,000 ac., of which 120,000 ac. were settled by June 1923. They are mainly devoted

DESERT LAND AREAS BEFORE AND AFTER RECLAMATION

1. Preparing a carrot field on a south-western American farm or ranch. Water is conveyed through the ditches between rows in which carrots are planted. A transverse canal, not shown in illustration, carries the water from main canal. Workman uses shovel to keep ditches open. Quantity of water varied according to needs of different crops
2. Expanse of desert in the State of Washington, before irrigation. Because of dry climate and lack of water for cultivation, only sagebrush bushes can grow in these regions under natural conditions
3. The Yakima Project, Washington. Land shown in fig. 2, after reclama-

tion and irrigation. Hayrakes are shown gathering hay into windrows. Water for irrigation purposes is obtained from the mountainous regions where rainfall is plentiful. There it is stored in reservoirs made by damming up valleys, and is conveyed thence by canals to the land where it is needed for the raising of crops

4. Unreclaimed desert land, Rio Grande Project, New Mexico and Texas. Large areas of this kind have been made useful by irrigation
5. Rio Grande Project after reclamation and irrigation, showing field of grain standing ready for harvest

to vegetable and fruit growing and dairying purposes.

In Victoria the principal irrigation works are on the Goulbourne, Murray, Loddon, Werribee and MacAllister rivers. While the works for some of these schemes were completed before 1910 the areas to be irrigated are still only in process of settlement, and extension of the works are from time to time taking place. In 1923, 350,727 ac. were irrigated.

The Dawson Valley scheme (Queensland), under construction in 1928, comprises a dam 140 ft. high, at Nathans Gorge, to impound about 3,100,000,000 tons of water. When completed it will be the second largest reservoir in the world. The area to be served is about 250,000 ac.; the Inkerman irrigation area of 4,500 ac. is served by 230 shallow well pumps. Provision is being made to increase it to 10,000 acres. There are a number of smaller pump schemes at Townsville, Rockhampton, Gingera and Fairymead, which collectively serve about 4,000 acres.

In South Australia the Rennearth scheme serves 7,850 ac., mainly fruit producing. The Murray river pumping plants serve 17,800 ac., and are being extended to serve a further 11,000 acres. The Cadett scheme serves about 1,200 ac., and is supplied with water pumped through 90 ft. of height. The Waikerie scheme serves about 9,800 ac. and has the water lifted through 150 ft. of head. The Kingston scheme serves 500 ac.; the Moorook scheme serves 1,000 ac.; the Coodoyle scheme is ready to serve about 3,600 ac.; which can be increased to 30,000 ac. of irrigable land. The Berni scheme serves 7,700 ac.; the Chaffey scheme will serve 14,000 ac.; the Murray swamp land scheme will eventually make available for irrigation 13,700 ac., of which 5,800 ac. are now cultivated. Smaller schemes serve about 10,000 ac. in all. In Western Australia the Harvey irrigation scheme serves 4,000 acres.

Union of South Africa.—Irrigation was at first confined to small schemes whose entire works usually lay within the boundary of one farm. Works of greater magnitude were made easier of accomplishment when the Cape Government, to encourage irrigation, passed Acts in 1876-77. Completed irrigation schemes, although numerous, are individually small in area, none exceeding 10,000 acres. Among those under construction or development are some of considerable magnitude. These latter include the Great Fish river scheme, where 75,000 ac. are to be irrigated; the Sundays river scheme of 36,000 ac., and the Kamanassie river scheme of 28,000 acres.

The total area of land in South Africa under irrigation or in process of being brought under irrigation under Board schemes is about 350,000 acres.

China.—China, with its huge population of about 300 millions, has, no doubt, a very large area of irrigated land, but no statistics are available as to its extent except in a few small special districts where Europeans reside or have commercial interests. Hitherto engineering has been largely devoted to preventing the rivers in more than average floods overflowing their banks and inundating the land, an effect which has been many times accompanied by great loss of life. Commissioners have studied river control and the conservancy boards in recent years have reported on and carried out important works with this end in view. Quite obviously there is a large field in China for this form of development, and no doubt it will in time be followed by the more usual irrigation works.

Iraq.—The construction of the Hindia barrage was one of the first steps undertaken in the modern regeneration of irrigation in this historical area. In 1925 the Diala Cotton company inaugurated a great scheme whereby 108,000 ac. will be fertilized by water from the Diala river, a tributary of the Tigris. The company, it is understood, intends to extend its operations as fast as possible under its concession; and a time can be envisaged when adequate control of the Euphrates and Tigris under conditions of peace and good government will allow of great areas of the arid plains of Iraq to be once again cultivated.

Italy.—The most highly developed irrigation in the world is probably that practised in the plains of Piedmont and Lombardy, where every variety of condition is to be found. The engineering works are of a high-class order, and from long generations of experience the farmer knows how best to use his water. The

principal river of northern Italy is the Po, which rises to the west of Piedmont and is fed, not from glaciers like the Swiss torrents, but by rain and snow, so that the water has a somewhat high temperature, a point of importance to the valuable meadow irrigation known as Marcite. This is only practised in winter, when there is abundance of water available, and much resembles the water meadow irrigation of England. The great Cavour canal is drawn from the left bank of the Po a few miles below Turin, and it is carried right across the drainage of the country. Its full flood discharge is 3,800 cu.ft. per second, which happens between October and May. For summer irrigation Italy depends on the glaciers of the Alps and the great torrents of the Dora Baltea, and Sesia can be counted on for a volume exceeding 6,000 cu.ft. per second. Lombardy is quite as well off as Piedmont for the means of irrigation. The Naviglio Grande of Lombardy is a very fine work drawn from the left bank of the Ticino, and useful for navigation as well as irrigation. It discharges between 3,000 and 4,000 cu.ft. per second, and probably nowhere is irrigation carried on with less expense. Another canal, the Villoresi, drawn from the same bank as the Ticino, further upstream, is capable of carrying 6,700 cu.ft. per second. Like the Cavour canal the Villoresi is taken across the drainage of the country, entailing a number of very bold and costly works.

Spain and Portugal.—Irrigation has developed in a number of places in the peninsula since the beginning of the century and schemes for further works are being considered. None of those so far completed are of any great magnitude, but among the proposals there is one for the irrigation of 120,000 ac. of the Guadalquivir. The possibilities of this river are being studied for other areas, and are great if, by regulations of its excess flow in flood time, its water can be conserved for use in the drier periods of the year. On the Tagus a scheme near Villa Franca is now being surveyed which, if carried out, will enable 30,000 ac. to be irrigated.

Greece.—Greece has recently entered into a contract to reclaim and develop a great area of land in the Vardar valley in the region of Salonika and is at the present moment considering tenders for similar works in the plain of Thessaly and the Struma and Drama valleys. These works will largely consist of draining the rivers which at present flow through the plains, so as to avoid the disastrous flooding which now constantly takes place, but it is also intended to utilize the waters running in the streams as much as possible for irrigation. With these works completed Greece will have somewhere in the region of 1,500,000 ac. added to her cultivated land, of which at least 500,000 ac. will be irrigated. It is said that in addition to the wonderful type of "Turkish" tobacco (the area where this is grown centres round Kavalla and is now Greek territory) cotton of the Egyptian type can also be grown on these plains.

Arabia.—An interesting irrigation development is the possibility of reviving agriculture by its aid in the Yemen. A syndicate has been studying a project to examine the many reservoirs which in ancient times controlled flood waters for the benefit of agriculture in that region. However, the prosecution of this scheme must await the settlement of political problems in that region.

Mexico.—In Mexico, and in particular in northern Mexico, where the rainfall is negligible in the lower or plain country, strips of land are cultivated near the rivers by irrigation. The total area is considerable, but there are no records of its extent. The works are individually limited in extent, but have been constructed entirely by private enterprise, and good results in crop are obtained from them.

South America.—An irrigation scheme on the Rio Negro was carried out in 1914 whereby 230,000 ac. are being developed. There are other minor irrigation works in the country. Many irrigation works have been carried out in the South and Central American republics but almost entirely by private enterprise.

UNITED STATES

Irrigation as an aid to crop production is confined mainly to the arable lands of the Western States which receive an annual precipitation of 5 to 20 in. and a summer rainfall between April 1 and Oct. 1, of 1 to 10 in., although nearly 1,000,000 ac. of rice is irrigated in Louisiana, Arkansas, Mississippi and Texas, where the annual rainfall is 40 to 50 inches. A relatively small quantity of water is used in drought periods in some of the Atlantic coast States in the production of truck and fruit crops. In 1919 the area irrigated in the United States, exclusive of the Atlantic coast States, was 19,191,716 ac., the States ranking first in the area

BY COURTESY OF THE U.S. BUREAU OF RECLAMATION

FIG. 6.—DESERT WASTE LANDS IN ARIZONA AWAITING RECLAMATION

irrigated being California, Colorado, Idaho, Montana, Utah and Wyoming, in the order named. The capital invested in irrigation enterprises was \$697,657,328, or \$36.35 an acre. The cost of preparing land for irrigation is estimated at \$345,450,000, or \$18 an acre, and the gross annual value of the principal irrigated crops was \$800,982,440 or \$41.74 an acre. Relatively small areas were irrigated by the inhabitants of the south-western portion of the United States in prehistoric times. The customs and methods used were improved by the Spanish conquerors and their descendants. Modern irrigation by the Anglo-Saxon race began in

1847 and its progress has been recorded by each decennial census since 1889. In that year the area irrigated was 3,564,416 ac.; in 1909 it was 14,433,285 ac.; and in 1919 it was as stated, 19,191,716 acres. The latter figure represents the present status of development approximately, no large extensions having taken place since 1920, because of the general depression in agriculture.

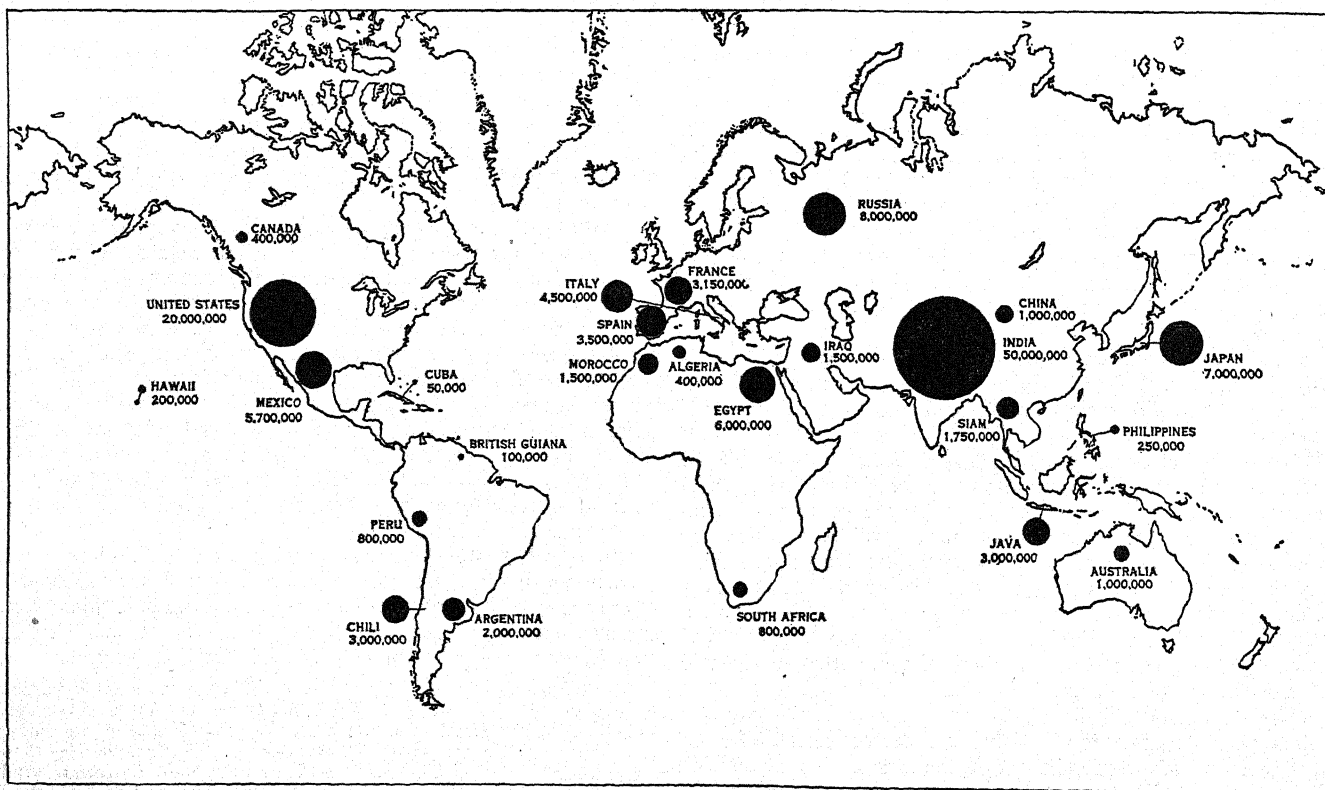

BY COURTESY OF THE U.S. BUREAU OF RECLAMATION

FIG. 7.—RECLAIMED LANDS UTILIZED FOR PASTURAGE

Seven agencies have been instrumental in accomplishing this development. The individual irrigator who either built a ditch himself or formed a partnership with one or more neighbours, and the co-operative companies, which are in reality larger groups of farmers acting together in building the necessary works, had to their credit 70% of the area reclaimed up to 1920. Public irrigation corporations, known as irrigation districts, and commercial enterprises, have each reclaimed 9½%; the United States bureau of reclamation 7%; private corporations operating under the Carey Act, 2½%; and the U.S. Indian service, 1¼%. Competent authorities have estimated that there is in the Western States an area aggregating 44,000,000 ac. in addition to that already irrigated, which it is feasible to irrigate when agricultural and economic conditions warrant. Thus the possibilities of irrigated agriculture in the Western States may be said to include a total area of 63,000,000 acres.

In outlining the salient features of irrigation in the United

BY COURTESY OF THE U.S. BUREAU OF RECLAMATION

FIG. 8.—IRRIGATED AREAS OF THE WORLD, REPRESENTED IN ACREAGE

States other than by the statistics given above, it may be remarked that the principles of hydraulics and hydrology which govern to so large an extent the design of irrigation structures, are identical for all countries, and where differences are created they are caused mainly by differences in building materials, in the standards of engineering design and construction, or in the demands and requirements of the water users. As has been indicated, the greater part of arid land reclamation has been brought about by farmers acting singly or in groups and organizations. These settlers were not financially able to build costly works and common practice involved the use of wood and temporary structures. In course of time, however, many land and water corporations were formed by the aid of foreign as well as domestic capital, for the purpose of exploiting the agricultural resources of the West. These were followed by legislative action by many of the States to enlarge the powers of farmers' organizations, principally by permitting them to bond their land holdings, so raising funds with which to build, purchase, and reconstruct irrigation systems. In 1902 Congress passed the Reclamation Act by which the Federal Government became an active participant in reclamation work. These three agencies, viz., the commercial enterprises, the irrigation districts and the nation, were financially able to employ experienced engineers to design and construct permanent irrigation works. The work of building new systems, and remodelling and reconstructing existing enterprises, has been going on for 25 years and is still in progress, with the result that the makeshifts of earlier periods are being replaced gradually by substantial structures of concrete, plain or reinforced; and a degree of efficiency and permanency is being attained in irrigation systems that will compare favourably with those of any other country. It is believed the United States ranks first in the number, dimensions and permanency of its concrete dams built to impound water for irrigation, in the efficiency of the mechanical equipment used to pump water for irrigation, and in the effectiveness of the appliances used to distribute water on farms.

The quantity of delivered water required for the irrigable lands of the Western States depends primarily upon such climatic influences as rainfall, temperature, sunshine, and evaporation, and to a less degree upon such factors as time and quantity of application, soils and crops. Based on sectional averages, the seasonal net requirements of delivered water range from 1.25 acre-feet per acre, where the effective rainfall is 12 in. during the crop-growing period, to as high as 3 acre-feet per acre where the annual precipitation is less than 10 in., the crop-growing period long, and the temperature high.

The most notable achievements in irrigation in the United States in recent years consist in (1) the large number of pumping plants installed in Arizona and California for the dual purpose of lowering the ground water level, thereby effecting cheap drainage and providing water for irrigation; (2) the development and extended use of the border method of applying water (see *Farmers' Bulletin* No. 1,243 U.S. Department of Agriculture); and (3) the results of intensive and extensive studies of soil moisture in relation to crop production and drainage. (S. Fo.)

IRULA, the darkest-skinned tribe of the Nilgiri Hills in South India (from Tamil *irul*, "darkness"), as the Badagas (*q.v.*) are the fairest. Speaking corrupt Tamil and practising a rude form of Vishnu-worship, the Irulas have as yet no marriage-rite beyond a feast. They bury their dead in a sitting posture with legs crossed or face downwards with head to the north. Though miserably poor, they are in much request as fortune-tellers.

IRUN, a frontier town of northern Spain, in the province of Guipúzcoa, on the left bank of the river Bidasoa. Pop. (1920) 14,161. Irun is the northern terminus of the Spanish Northern railway, and a thriving industrial town, with ironworks, tan-yards, potteries and paper mills. It derives its prosperity from the fact that it is the most important custom-house in Spain for the overland trade with the rest of Europe. Irun is also on the chief highway for travellers and mails. It is the terminus of some important narrow-gauge mining railways and steam tramways, which place it in communication with the mining districts of Guipúzcoa and Navarre, and with the valuable oak, pine and

beech forests of both provinces.

IRVINE, a royal burgh, parish and seaport of Ayrshire, Scotland. Pop. (1921) 11,826. It is situated on the north bank of the estuary of the Irvine, 29½ m. S.W. of Glasgow by the L.M.S. railway. It is connected with the suburb of Fullarton on the south side of the river by a fine bridge. Alexander II. granted it a charter, which was confirmed by Robert Bruce. Towards the end of the 17th century it was reckoned the third shipping port in Scotland, and though its importance in this respect declined owing to the partial silting-up of the harbour, its water-borne trade revived after 1875, the sandy bar having been removed and the wharfrage extended and improved. The Academy is a pre-Reformation foundation. The industries include engine-making, shipbuilding, iron founding, the manufacture of chemicals and hosiery, saw-mills and spelter works. Irvine unites with Ayr, Ardrossan, Prestwick, Saltcoats and Troon in sending one member to parliament. The exports consist principally of coal, iron, fireclay goods and chemical products, and the imports of grain, timber, limestone, ores and salt. At DREGHORN, 2 m. to the S.E. coal and fireclay are worked and bricks made.

IRVING, EDWARD (1792-1834), Scottish church divine, generally regarded as the founder of the "Catholic Apostolic Church" (*q.v.*), was born at Annan, Dumfriesshire, on Aug. 4, 1792. At the age of 13 he entered the University of Edinburgh. In 1809 he graduated M.A.; and in 1810, on the recommendation of Sir John Leslie, he was chosen master of an academy newly established at Haddington, where he became the tutor of Jane Welsh, afterwards Mrs. Carlyle. He became engaged in 1812 to Isabella Martin, whom in 1823 he married; but meanwhile he gradually fell in love with Jane Welsh, and she with him. He tried to get out of his engagement with Miss Martin, but was prevented by her family. Irving introduced Carlyle to Jane Welsh in 1821. Irving left Haddington for Kirkcaldy in 1812. Completing his divinity studies by a series of partial sessions, he was "licensed" to preach in June 1815, but continued to teach for three years. In the summer of 1818 he resigned his mastership and went to Edinburgh. He was meditating a missionary tour in Persia when, in 1819, he was appointed assistant to Dr. Chalmers in St. John's parish, Glasgow. Irving's preaching awakened little interest among the congregation of Chalmers, Chalmers himself, with no partiality for its bravuras and flourishes, comparing it to "Italian music, appreciated only by connoisseurs"; but as a missionary among the poorer classes he wielded an influence that was altogether unique. In 1822 he was ordained minister of the Caledonian church, Hatton Garden, London. There his sermons at once attracted a crowd of fashionable people.

For years the subject of prophecy had occupied much of his thoughts, and his belief in the near approach of the second advent had received corroboration in the work of a Jesuit priest, writing under the assumed Jewish name of Juan Josafat Ben-Ezra. In 1827 he published a translation of it, accompanied with an eloquent preface. Probably the religious opinions of Irving had gained breadth and comprehensiveness from his intercourse with Coleridge, but gradually his chief interest in Coleridge's philosophy centred round that which was mystical and obscure, and it probably accounts for his adoption of the doctrine of millenarianism. The first stage of his later development, which resulted in the establishment of the "Irvingite" or "Holy Catholic Apostolic Church," in 1832, was associated with conferences at his friend Henry Drummond's seat at Albury concerning unfulfilled prophecy, followed by study of the prophetic books and especially of the Apocalypse, and by several series of sermons on prophecy both in London and the provinces. Crowds filled the largest churches of Edinburgh in the early summer mornings to hear his apocalyptic lectures in 1828. In 1830 his hopes were aroused by the seeming actual revival in a remote corner of Scotland of those apostolic gifts of prophecy and healing which he believed to be kept in abeyance by the absence of faith.

Irving welcomed the new "power" with a conviction which was unshaken by the remonstrances or desertion of his dearest friends, the recantation of some of the principal agents of the "gifts," his own declension into a subordinate position, the meagre and

barren results of the manifestations and their general rejection both by the church and the world. His excommunication by the presbytery of London, in 1830, for publishing his doctrines regarding the humanity of Jesus Christ, and the condemnation of these opinions by the General Assembly of the Church of Scotland in the following year, were secondary episodes. The "irregularities" connected with the manifestation of the "gifts" gradually estranged his own congregation, and on the complaint of the trustees to the presbytery of London, whose authority they had formerly rejected, he was declared unfit to remain the minister of the National Scotch Church of Regent square. After he and those who adhered to him (describing themselves as of the Holy Catholic Apostolic Church) had in 1832 removed to a new building in Newman street, he was in March 1833 deposed from the ministry of the Church of Scotland by the presbytery of Annan on the original charge of heresy. With the sanction of the "power" he was now after some delay reordained "chief pastor of the church assembled in Newman street." He died on Dec. 7, 1834.

The writings of Edward Irving published during his lifetime were *For the Oracles of God, Four Orations* (1823); *For Judgment to come* (1823); *Babylon and Infidelity foredoomed* (1826); *Sermons*, etc. (3 vols., 1828); *Exposition of the Book of Revelation* (1831); an introduction to a translation of Ben-Ezra; and an introduction to Horne's *Commentary on the Psalms*. His collected works were published in 5 volumes, edited by Gavin Carlyle. See also the article CATHOLIC APOSTOLIC CHURCH.

The Life of Edward Irving, by Mrs. Oliphant, appeared in 1862 in 2 vols. Among a large number of biographies published previously, that by Washington Wilks (1854) has some merit. See also Hazlitt's *Spirit of the Age*; Coleridge's *Notes on English Divines*; Carlyle's *Miscellanies*, and Carlyle's *Reminiscences*, vol. i. (1881).

IRVING, SIR HENRY (1838-1905), English actor, whose original name was John Brodribb, was born at Keinton-Mandeville, Somerset, Feb. 6, 1838. After a brief experience as clerk in a city firm he started as an actor. He made his first appearance (Sept. 29, 1856) at Sunderland as Gaston, duke of Orleans, in Bulwer Lytton's *Richelieu*, billed as Henry Irving. This name he eventually assumed by royal licence. For ten years he played in various provincial stock companies, acting in more than 500 parts. In 1866 he obtained an engagement at the St. James's theatre, London, to play Doricourt in *The Belle's Stratagem*. A year later he joined the company of the newly-opened Queen's theatre, where he acted with Charles Wyndham, J. L. Toole, Lionel Brough, John Clayton, Mr. and Mrs. Alfred Wigan, Ellen Terry and Nelly Faren. This was followed by short engagements at the Haymarket, Drury Lane and Gaiety. He made his first conspicuous success as Digby Grant in James Albery's *The Two Roses* (Vaudeville, June 4, 1870), which ran for 300 nights. In 1871 he began his association with the Lyceum theatre by an engagement under Bateman's management. The fortunes of the house were saved by Irving's immediate success as Mathias in *The Bells*, a version of Erckmann-Chatrian's *Le Juif Polonais* by Leopold Lewis. The play ran for 150 nights. With Miss Bateman, Irving was seen in W. G. Wills's *Charles I.* and *Eugene Aram*, in *Richelieu*, and in 1874 in *Hamlet*. The unconventionality of this last performance, during a run of 200 nights, singled him out as the most interesting English actor of his day. In 1875, still with Miss Bateman, he was seen as Macbeth; in 1876 as Othello, and as Philip in Tennyson's *Queen Mary*; in 1877 in *Richard III.* and *The Lyons Mail*.

In 1878 Irving opened the Lyceum under his own management. With Ellen Terry as Ophelia and Portia, he revived *Hamlet* and produced *The Merchant of Venice* (1879). His Shylock was as much discussed as his Hamlet had been, the dignity with which he invested the Jew marking a departure from the traditional interpretation of the rôle, and pleasing some as much as it offended others. After the production of Tennyson's *The Cup*, a revival of *Othello* (in which Irving played Iago to the Othello of Edwin Booth) and of *Romeo and Juliet*, there began a period at the Lyceum which had a potent effect on the English stage. The Lyceum stage management, and the brilliancy of its productions in scenery, dressing and accessories, were revelations in the art of *mise-en-scène*. *Much Ado about Nothing* (1882) was followed

by *Twelfth Night* (1884); *Olivia*—an adaptation of Goldsmith's *Vicar of Wakefield* by W. G. Wills (1885); *Faust* (1886); *Macbeth* (1888); *The Dead Heart*, by Watts Phillips (1889); and *Ravenswood*—Herman Merivale's dramatic version of Scott's *Bride of Lammermoor* (1890). Irving's magnificent presentment in 1892 of Wolsey in *Henry VIII.* and of King Lear were followed in 1893 by a fine performance of Becket in Tennyson's play of that name. During these years Irving, with the whole Lyceum company, paid several visits to America. The chief remaining novelties at the Lyceum during Irving's sole managership (the theatre passed, at the beginning of 1899, into the hands of a limited liability company) were Comyns Carr's *King Arthur* in 1895; *Cymbeline*, in which Irving played Iachimo, in 1896; Sardou's *Madame Sans-Gêne* in 1897; *Peter the Great*, a play by Laurence Irving, the actor's second son, in 1898; and Conan Doyle's *Waterloo* (1894). The new régime at the Lyceum was signalized by the production of Sardou's *Robespierre* in 1899, in which Irving reappeared after a serious illness, and in 1901 by an elaborate revival of *Coriolanus*. Irving's only subsequent production in London was Sardou's *Dante* (1903), a vast spectacular drama, staged at Drury Lane. He died "on tour" at Bradford on Oct. 13, 1905, and was buried in Westminster Abbey.

Both on and off the stage Irving always maintained a high ideal of his profession, and in 1895 he received the honour of knighthood, the first ever accorded an actor. He was also the recipient of honorary degrees from the universities of Dublin, Cambridge and Glasgow. His acting, apart from his genius as a presenter of plays, divided criticism, opinions differing as to the extent to which his mannerisms of voice and deportment interfered with or assisted the expression of his ideas. So strongly marked a personality as his could not help giving its own colouring to whatever part he might assume, but the richness and originality of this colouring at its best cannot be denied, any more than the spirit and intellect which characterized his renderings. Extraordinary versatility must be conceded to an actor who could satisfy exacting audiences in rôles so widely different as Digby Grant and Louis XI., Richard III. and Becket, Benedick and Shylock, Mathias and Dr. Primrose.

Fitzgerald, *Sir Henry Irving: a biography* (1906); Bram Stoker, *Personal Reminiscences of Henry Irving*, 2 vols. (1906); W. H. Pollock, *Impressions of Henry Irving* (1908); A. Brereton, *The Life of Henry Irving*, 2 vols. (1908).

IRVING, HENRY BRODRIBB (1870-1919), English actor, elder son of Sir Henry Irving (q.v.), was born in London on Aug. 5, 1870. He was educated at Marlborough and New College, Oxford, and was called to the bar in 1894; but he abandoned this profession for that of the stage, for which his inherited aptitude had always been very marked. At Oxford he belonged to the O.U.D.S. and played the leading parts in Browning's *Straford* and Shakespeare's *King John*. His first professional appearance in London was made in Sept. 1891, with John Hare at the Garrick theatre in Robertson's *School*. In 1894 he joined Ben Greet's company, and met Miss Dorothea Baird, whom he married in 1896 at the time of her great popular success in Du Maurier's *Trilby*. His earliest notable success was in Barrie's *The Admirable Crichton* (1903). He repeated many of his father's famous parts, but did original work of a high order in Stevenson's *Dr. Jekyll and Mr. Hyde*, Stephen Phillips's *The Sin of David*, and many other productions. He was manager of the Savoy theatre from 1913 until his death. He was a keen student of criminology, and published a *Life of Judge Jeffreys* (1898); *French Criminals of the 19th Century* (1901); and *A Book of Remarkable Criminals* (1918). He died in London on Oct. 17, 1919. See A. Brereton, "H.B." and Laurence Irving (1922).

IRVING, LAURENCE SYDNEY BRODRIBB (1871-1914), English actor, younger son of Sir Henry Irving (q.v.), was born in London on Dec. 21, 1871. He was educated at Marlborough and abroad, being destined for the diplomatic service; but he joined Frank Benson's Shakespearean company in 1893, and made his first professional appearance in London in 1894 in Barrie's *Walker, London*. He married Mabel Hackney, the actress, and with his wife played in Brieux's *The Three Daughters of M.*

Dupont, and *The Incubus*, as well as in *The Unwritten Law*—his own adaptation of Dostoevsky's *Crime and Punishment*—and in Lengyell's *Typhoon*. He wrote *Peter the Great* (produced by his father in 1898), *Bonnie Dundee* and *Richard Lovelace*, as well as a number of translations and adaptations of plays. Both he and his wife lost their lives when the "Empress of Ireland" sank in the St. Lawrence river on May 29, 1914. See A. Brereton, "H.B." and Laurence Irving (1922).

IRVING, WASHINGTON (1783–1859), American man of letters, was born in New York city on April 3, 1783. Both his parents were immigrants from Great Britain, his father—originally an officer in the merchant service, but at the time of Irving's birth a considerable merchant—having come from the Orkneys and his mother from Falmouth. Irving was intended for the legal profession, but his studies were interrupted by an illness necessitating a voyage to Europe, in the course of which he proceeded as far as Rome and made the acquaintance of Washington Allston.

He was called to the bar upon his return, but made little effort to practise, preferring to amuse himself with literary ventures. The first of these of any importance, a satirical miscellany entitled *Salmagundi, or the Whim-Whams and Opinions of Launcelot Langstaff and Others*, written in conjunction with his brother William and J. K. Paulding, gave ample proof of his talents as a humorist. These were still more conspicuously displayed in his next attempt, *A History of New York from the Beginning of the World to the End of the Dutch Dynasty*, by "Diedrich Knickerbocker" (1809). The satire of *Salmagundi* had been principally local, and the original design of "Knickerbocker's" *History* was only to burlesque a pretentious disquisition on the history of the city in a guide-book by Dr. Samuel Mitchell. The idea expanded as Irving proceeded, and he ended by creating a distinct literary type out of the solid Dutch burgher whose phlegm had long been an object of ridicule to the mercurial Americans. Though far from the most finished of Irving's productions, "Knickerbocker" manifests the most original power, and is the most genuinely national in its quaintness and drollery. The very tardiness and prolixity of the story are skilfully made to heighten the humorous effect.

Upon the death of his father, Irving had become a sleeping partner in his brother's commercial house, a branch of which was established at Liverpool. This, combined with the restoration of peace, induced him to visit England in 1815, when he found the stability of the firm seriously compromised. After some years of ineffectual struggle it became bankrupt. This misfortune compelled Irving to resume his pen as a means of subsistence. His reputation had preceded him to England, and the curiosity naturally excited by the then unwonted apparition of a successful American author procured him admission into the highest literary circles, where his popularity was ensured by his amiable temper and polished manners. As an American, moreover, he stood aloof from the political and literary disputes which then divided England. Campbell, Jeffrey, Moore, Scott, were counted among his friends, and the last-named zealously recommended him to the publisher Murray, who consented (1820) to bring out *The Sketch Book of Geoffrey Crayon, Gent.* (1819–20). The most interesting part of this work is the description of an English Christmas, which displays a delicate humour, not unworthy of the writer's evident model, Addison. Some stories and sketches on American themes contribute to give it variety; of these "Rip van Winkle" is the most remarkable. It speedily obtained the greatest success on both sides of the Atlantic. *Bracebridge Hall, or the Humourists*, a work purely English in subject, followed in 1822, and showed to what account the American observer had turned his experience of English country life. The humour is, nevertheless, much more English than American.

Tales of a Traveller (4 pts.) appeared in 1824 at Philadelphia, and Irving, now in comfortable circumstances, determined to enlarge his sphere of observation by a journey on the Continent. After a long course of travel he settled down at Madrid in the house of the American consul, Rich. His intention at the time was to translate the *Coleccion de los Viajes y Descubrimientos* (Madrid, 1825–37) of Martin Fernandez de Navarrete; finding,

however, that this was rather a collection of valuable materials than a systematic biography, he determined to compose a biography of his own by its assistance, supplemented by independent researches in the Spanish archives. His *History of the Life and Voyages of Christopher Columbus* (London, 4 vols.) appeared in 1828, and obtained a merited success. *The Voyages and Discoveries of the Companions of Columbus* (Philadelphia, 1831) followed; and a prolonged residence in the south of Spain gave Irving materials for two highly picturesque books, *A Chronicle of the Conquest of Granada from the MSS. of [an imaginary] Fray Antonio Agapida* (1829), and *The Alhambra: a series of tales and sketches of the Moors and Spaniards* (1832). Previous to their appearance he had been appointed secretary to the embassy at London, an office as purely complimentary to his literary ability as the legal degree which he about the same time received from the University of Oxford.

Returning to the United States in 1832, after 17 years' absence, he found his name a household word, and himself universally honoured as the first American who had won for his country recognition on equal terms in the literary republic. After the rush of fêtes and public compliments had subsided, he undertook a tour in the western prairies, and returning to the neighbourhood of New York built for himself a delightful retreat on the Hudson, to which he gave the name of "Sunnyside."

BIOGRAPHICAL WORKS

His acquaintance with the New York millionaire, John Jacob Astor, prompted his next important work—*Astoria* (1836), a history of the fur-trading settlement founded by Astor in Oregon, deduced with singular literary ability from dry commercial records, and, without laboured attempts at word-painting, evincing a remarkable faculty for bringing scenes and incidents vividly before the eye. *The Adventures of Captain Bonneville* (1837), based upon the unpublished memoirs of a veteran explorer, was another work of the same class. In 1842 Irving was appointed ambassador to Spain. He spent four years in the country, without this time turning his residence to literary account; and it was not until two years after his return that Forster's life of Goldsmith, by reminding him of a slight essay of his own which he now thought too imperfect by comparison to be included among his collected writings, stimulated him to the production of his *Life of Oliver Goldsmith, with Selections from his Writings* (1849). Without pretensions to original research, the book displays an admirable talent for employing existing material to the best effect. The same may be said of *The Lives of Mahomet and his Successors* (1849–50). Here as elsewhere Irving correctly discriminated the biographer's province from the historian's, and, leaving the philosophical investigation of cause and effect to writers of Gibbon's calibre, applied himself to represent the picturesque features of the age as embodied in the actions and utterances of its most characteristic representatives.

His last days were devoted to his *Life of George Washington* (5 vols., 1855–59, New York and London), undertaken in an enthusiastic spirit, but which the author found exhausting and his readers tame. His genius required a more poetical theme, and indeed the biographer of Washington must be at least a potential soldier and statesman. Irving lived to complete this work, dying of heart disease at Sunnyside, on Nov. 28, 1859.

Although one of the chief ornaments of American literature, Irving was not characteristically American. But he was one of the few authors of his period who really manifested traces of a vein of national peculiarity which might under other circumstances have been productive. "Knickerbocker's" *History of New York*, although the air of mock solemnity which constitutes the staple of its humour is peculiar to no literature, manifests nevertheless a power of reproducing a distinct national type. Had circumstances taken Irving to the West, and placed him amid a society teeming with quaint and genial eccentricity, he might possibly have been the first Western humorist, and his humour might have gained in depth and richness.

In England, on the other hand, everything encouraged his natural fastidiousness; he became a refined writer, but by no means

a robust one. His biographies bear the stamp of genuine artistic intelligence, equally remote from compilation and disquisition. In execution they are almost faultless; the narrative is easy, the style pellucid, and the writer's judgment nearly always in accordance with the general verdict of history. Without ostentation or affectation, he was exquisite in all things, a mirror of loyalty, courtesy and good taste in all his literary connections, and exemplary in all the relations of domestic life. He never married, remaining true to the memory of an early attachment blighted by death.

BIBLIOGRAPHY.—The principal edition of Irving's works is the "Geoffrey Crayon," published at New York in 1880 in 26 volumes. His *Life and Letters* was published by his nephew Pierre M. Irving (1862-64; German abridgment by Adolf Laun, 1870). There is a good deal of miscellaneous information in a compilation entitled *Irvingiana* (1860); and W. C. Bryant's memorial oration, though somewhat too uniformly laudatory, may be consulted with advantage. It was republished in *Studies of Irving* (1880), along with C. Dudley Warner's introduction to the "Geoffrey Crayon" edition and Mr. G. P. Putnam's personal reminiscences of Irving, which originally appeared in the *Atlantic Monthly*. See also *Washington Irving* (1881), by C. D. Warner, in the "American Men of Letters" series; H. R. Haweis, *American Humourists* (1883); William Morton Payne, *Leading American Essayists* (1910); *Notes while Preparing The Sketch Book, 1817* (1927), and *A Tour in Scotland* (1817), edited by Farley Williams.

(R. G.)

IRVINGTON, a town of Essex county, New Jersey, U.S.A., just S.W. of Newark; served by the Lehigh Valley railroad and by electric trolley and motor-coach lines. The population was 25,480 in 1920, and was estimated locally at 47,000 in 1928. It is a residential suburb of Newark and New York; and has numerous and varied manufacturing industries (including chemical plants, metal refineries, foundries, lumber mills and sash factories), with an aggregate output in 1925 valued at \$26,979,051. Irvington was settled in 1692, and was called Camptown until 1852, when the present name was adopted in honour of Washington Irving. It was incorporated as a village in 1835, as a town in 1898; and has a commission form of government.

IRWIN, EDWARD FREDERICK LINDLEY WOOD, 1ST BARON (1881-), British politician, was born April 16, 1881. The only surviving son of the 2nd Viscount Halifax, he was educated at Eton and at Christ Church, Oxford, being elected fellow of All Souls college in 1903. In Jan. 1910 he was returned to parliament as Conservative member for the Ripon division of Yorkshire, and retained his seat until 1925. During the World War he served in France (1915-17) with the Yorkshire Dragoons, in which he held the rank of major, being mentioned in despatches, and was an assistant secretary to the minister of national service, 1916-18. In April 1921 he was appointed under-secretary of State for the colonies. In this capacity he made a tour of the West Indian colonies, and published his conclusions on the administrative and economic problems which he encountered in a report issued in June 1922. From Oct. 1922 to Jan. 1924 he was president of the Board of Education. In Nov. 1924 he became minister of agriculture and fisheries in Mr. Baldwin's second Government.

In Oct. 1925 he was appointed governor-general of India in succession to the marquess (then earl) of Reading, being raised to the peerage as Baron Irwin of Kirkby Underdale two months later. Arriving in India in April, 1926, he sought eagerly to stay the rapid development of old antagonisms between Hindus and Mohammedans, leading to embittered and widespread inter-communal disorder. His offer in Aug. 1927, to convene a conference of leaders with the object of frankly facing the causes of these miserable differences did not meet with an adequate response, but it encouraged efforts to bring about agreement by mutual compact. One cause of friction was the approach of the time prescribed in the Government of India Act, 1919, for examination of the Montagu-Chelmsford reforms. The date was accelerated by two years and a parliamentary commission under the chairmanship of Sir John Simon was appointed in Nov. 1927. Though hampered by the strength and obstructiveness of the Swarajist element in the Legislative Assembly, Lord Irwin showed remarkable patience and perseverance in his efforts to overcome the boycott which the Swarajist and Liberal politicians sought

to impose on the ground of the non-inclusion of Indians in the commission. Indian participation on equal terms was secured by means of committees of the central and provincial legislatures sitting with the commission. The great bulk of the Muslims, the depressed Hindu classes and other important minorities gave their co-operation. Lord Irwin came into exceptionally friendly contact with the Indian princes and a committee under Sir Harcourt Butler examined the relations between the Paramount Power and the States. His high character, linked with approachableness, made a great impression on the Indian mind.

Like his father, Lord Irwin, who had been sworn a member of the privy council in 1922, took a keen interest in ecclesiastical affairs, and published a study of John Keble in the "Leaders of the Church Series."

(F. H. Br.)

ISAAC, the only son of Abraham and Sarah and father of Jacob and Esau. He thus occupies a middle position between the two major figures in the ancestry of Israel. Apart from the incidents described in Gen. xxii. (the rescue of Isaac from the sacrificial altar), Gen. xxiv. (the wooing of Rebecca by proxy) and Gen. xxvii. (the rivalry between his sons), the only incidents of his life are those included in Gen. xxvi., which describes mainly his dealings with Abimelech, king of Gerar. It is to be noted that these events can be closely paralleled from the Abraham narratives. Isaac is, in fact, the least distinguished and most vague of the three great patriarchal characters, and the most significant points in the passages which deal with him are (i.) the mention of Beersheba as his home (e.g., Gen. xxvi. 23, 33) and (ii.) the fact of his sowing corn, thus passing from the stage of pure nomadism to that of semi-nomadism (Gen. xxvi. 12). (See GENESIS.)

ISAAC I. (COMNENUS), emperor of the East (1057-1059), was the son of an officer of Basil II. named Manuel Comnenus, who on his deathbed commended his two sons Isaac and John to the emperor's care. Basil had them carefully educated at the monastery of Studion, and advanced them to high official positions. During the disturbed reigns of Basil's seven immediate successors, Isaac by his prudent conduct won the confidence of the army; in 1057 he joined with the nobles of the capital in a conspiracy against Michael VI., and after the latter's deposition was invested with the crown, thus founding the new dynasty of the Comneni. The first care of the new emperor was to reward his noble partisans with appointments that removed them from Constantinople, and his next was to repair the beggared finances of the empire. He revoked numerous pensions and grants conferred by his predecessors upon idle courtiers, and, meeting the reproach of sacrilege made by the patriarch of Constantinople by a decree of exile, resumed a proportion of the revenues of the wealthy monasteries. Isaac's only military expedition was against the Hungarians and Petchenegs, who began to ravage the northern frontiers in 1059. Shortly after this successful campaign he was seized with an illness, and believing it mortal appointed as his successor Constantine Ducas, to the exclusion of his own brother John. Although he recovered Isaac did not resume the purple, but retired to the monastery of Studion and spent the remaining two years of his life as a monk, alternating menial offices with literary studies. His *Scholia* to the *Iliad* and other works on the Homeric poems are still extant in ms. He died in 1061. Isaac's great aim was to restore the former strict organization of the government, and his reforms, though unpopular with the aristocracy and the clergy, and not understood by the people, certainly contributed to stave off for a while the final ruin of the Byzantine empire.

See E. Gibbon, *The Decline and Fall of the Roman Empire* (ed. J. Bury, London, 1896, vol. v.); G. Finlay, *History of Greece* (ed. 1877, Oxford, vols. ii. and iii.); and J. Bury in *English Historical Review*, iv., 251 ff. (1889).

ISAAC II. (ANGELUS), emperor of the East 1185-1195, and again 1203-1204, was the successor of Andronicus I. He inaugurated his reign by a decisive victory over the Normans in Sicily, but elsewhere his policy was less successful. He failed in an attempt to recover Cyprus from a rebellious noble, and by the oppressiveness of his taxes drove the Bulgarians and Vlachs to revolt (1186). In 1187 Alexis Branas, the general sent against

the rebels, treacherously turned against his master, and attempted to seize Constantinople, but was defeated and slain. The emperor's attention was next demanded in the east, where several claimants to the throne successively rose and fell. In 1189 Frederick Barbarossa of Germany sought and obtained leave to lead his troops on the third crusade through the Byzantine territory; but he had no sooner crossed the border than Isaac, who had meanwhile sought an alliance with Saladin, threw every impediment in his way, and was only compelled by force of arms to fulfil his engagements. The next five years were disturbed by fresh rebellions of the Vlachs, against whom Isaac led several expeditions in person. During one of these, in 1195, Alexius, the emperor's brother, taking advantage of the latter's absence from camp on a hunting expedition, proclaimed himself emperor, and was readily recognised by the soldiers. Isaac was blinded and imprisoned in Constantinople. After eight years he was raised for six months from his dungeon to his throne once more. (See CRUSADES.) But both mind and body had been enfeebled by captivity, and his son Alexius IV. was the actual monarch. Isaac died in 1204, shortly after the usurpation of his general, Mourzouphles. He was one of the weakest and most vicious princes that occupied the Byzantine throne.

See Gibbon, *Decline and Fall* (ed. J. Bury, London, 1896, vol. vi.); G. Finlay, *History of Greece* (ed. 1877, Oxford, vols. iii. and iv.); V. N. Zlarski, *Geschichte der Bulgaren* (Leipzig, 1918).

ISAAC, HEINRICH (born c. 1450), Belgian composer. The exact date and place of his birth are unknown but Cambrai has been assigned as his place of origin by some writers. About 1477 he appears to have gone to Florence and for many years he was organist at the Medici chapel. After Lorenzo di Medici's death he found his way to Vienna and obtained an appointment as composer at Maximilian's court at Innsbruck. In 1515 he returned to Florence with a yearly pension of 150 florins. Few biographical facts have been established with certainty but the allusions found here and there in contemporary and later writings show him to have been recognized as one of the great musicians of his time. Until recently he was included in the group of German composers—Finck, Stölzer, Agricola and others—among whom he was the outstanding figure. The Italians called him "Arrhigo Tedesco," and his fame as a writer of German songs in the latter part of his life was an added reason for assuming him to be a German; but there seems now no doubt that he came from the Netherlands. His church music, of which much has been preserved, is masterly in form and shows great skill and ingenuity in the leading of the parts. But side by side with monumental masses he wrote, while in Florence, light secular compositions of a kind suited to the atmosphere of the Medici court. He also helped Lorenzo with his *canti carnascialeschi* for May Day celebrations. Later, at Innsbruck, he wrote the very simple and beautiful German songs on which his fame rests. Many of his melodies, some of them no doubt traditional, were treasured among the people and revived again and again to suit new words. Thus, *Innsbruck ich muss dich lassen*, written it is said to words by the emperor Maximilian, served for the hymn *O Welt, ich muss dich lassen*, for Paul Fleming's *In allen meinen Taten*, and for two chorales in Bach's *Matthew Passion* (Nos. 16, 44).

Of Isaac's ten published masses, five are included in *Misse Heinrichs* (Petrucchi 1906); two in the Wittenberg edition (1541); *Carminum* and *Une musique de Biscay*; one in the *Liber quindecim missarum* (Nuremberg 1539), the famous *O praeclara*, written on one four-note subject throughout; and two in Ott's collection: *Missae 13 vocum* (Nuremberg 1539). There are also thirteen ms. masses preserved in the libraries in Vienna, Munich and Brussels. Motets and Psalms are contained in upwards of forty collections published up to 1564. (See Eitner: *Bibl. der Musiksammlwerke*, Berlin 1877.)

ISAAC OF ANTIOCH, Syriac author, is said to have flourished under Theodosius II. (408–450), and was a native either of Amid (Diarbekr) or of Edessa. Several writers identify him with Isaac, the disciple of S. Ephraim, who is mentioned in the anonymous *Life* of that father; but according to the patriarch Bar Shūshan (d. 1073), who made a collection of his homilies, his master was Ephraim's disciple Zenobius. He is supposed to have migrated to Antioch, and to have become abbot

of one of the convents in its neighbourhood. According to Zacharias Rhetor he visited Rome and other cities, and the chronicle of Pseudo-Dionysius of Tell-Mahrē informs us that he composed poems on the secular games of 404, and wrote on the destruction of Rome by Alaric in 410. He also commemorated the destruction of Antioch by an earthquake in 459, so that he must have lived till about 460. Unfortunately these poems have perished.

It seems safe to conclude with his editor, Bedjan (p. ix.); that works by at least two authors have been included in the collection attributed to Isaac of Antioch. Still the majority of the poems are the work of one hand—the 5th-century Monophysite who wrote the poem on the parrot. A full list of the 191 poems existing in European mss. is given by Bickell, who copied out 181 with a view to publishing them all: the other 10 had been previously copied by Zingerle.

ISAAC OF KAIRAWAN: see ISRAELI.

ISAACS, JORGE (1837–1895), Colombian poet and novelist, was born at Cali, in the province of Cauca, Colombia, in April 1837, the son of a prosperous English Jew. He received an excellent education, first at Bogotá and later in England. During the War of the Cauca (1860–63), he was reduced to poverty by the destruction of his patrimony in the Cauca valley. Settling in Bogotá, in 1864 he published a slight volume of *Poesías* that attracted considerable attention, and in 1867, a novel, *María*, which won immediate recognition and remains his chief title to fame. Seizing the opportunity thus opened to him for a political career, he entered public life, and in 1871–72 was appointed consul-general in Chile. On his return he served in the provincial legislatures of Cauca, Cundinamarca and Antioquia, and filled numerous political, educational and editorial positions. He died in Abagüé on April 17, 1895. Although he continued to write until his death, and was a generous contributor to periodical literature, none of his later efforts fulfilled the promise of his first two volumes. *María*, his best work, is the most famous Spanish-American novel. An idyllic picture, very likely autobiographical, of life among the Cordilleras of his native Cauca valley, it has been called by one eminent critic "the poem of America," and has been translated into several foreign languages. Among his poems, notable are "Río Moro" (River Moro), "La Noche Callada" (The Silent Night), and "La Tumba del Soldado" (The Soldier's Tomb); *Saulo* is part of an uncompleted drama; *La revolución radical en Antioquia* is his most important prose work outside of fiction.

See Antonio Gómez Restrepo: "La literatura colombiana," *Revue Hispanique*, vol. xliii. (Paris, 1918).

ISABELLA (1451–1504), *la Católica*, queen of Castile, daughter of John II. of Castile, by his second wife Isabella, granddaughter of John I. of Portugal (thus being through both parents a descendant of John of Gaunt), was born at Madrigal on April 22, 1451. On the accession of her brother, Henry IV. (1454), she was withdrawn by her mother to Arevals, where her early education was conducted in the deepest seclusion. Removed by Henry to the court, her hand was sought in application by many suitors, among whom were Alphonso of Portugal, Pedro Giron, and Ferdinand of Aragon, whom she ultimately married at Valladolid on Oct. 19, 1469. An offer of the crown of Castile was made to her by the revolutionary leaders in the civil war; she declined it and in 1468 was recognized by her brother as lawful heir. On his death, she was proclaimed queen of Castile and Leon (Dec. 13, 1474).

Spain undoubtedly owed to Isabella's clear intellect, resolute energy and unselfish patriotism much of that greatness which it acquired under "the Catholic sovereigns." The moral influence of the queen's personal character over the Castilian court was incalculably great; from the debasement and degradation of the preceding reign she raised it to being "the nursery of virtue and of generous ambition." She did much for letters in Spain by founding the palace school and by her protection of Peter Martyr d'Anghiera. The very sincerity of her piety and strength of her religious convictions led her at times into great errors of State policy; her efforts for the introduction of the Inquisition into Castile and for the proscription of the Jews are cases in point. It was a happy intuition that led her to give credence to the

scheme of Columbus and to finance his undertaking, offering in a generous impulse to pawn her personal jewels if the Treasury funds proved inadequate. She died at Medina del Campo on Nov. 24, 1504.

See W. H. Prescott, *History of the Reign of Ferdinand and Isabella* . . . (1837); Baron de Nervo, *Isabelle la Catholique* . . . (Paris, 1874; Eng. trans. by Lieut.-col. Temple-West, 1897).

ISABELLA II. (1830–1904), queen of Spain, daughter of Ferdinand VII. and his fourth wife, Maria Christina, was born in Madrid on Oct. 10, 1830. In virtue of the Salic law, set aside by the Cortes at Ferdinand VII.'s persuasion in 1830, Don Carlos disputed Isabella's title on her proclamation (Sept. 29, 1833), and the seven years' Carlist War ensued. A constitutional and parliamentary Government was established, which dissolved the religious orders, confiscated the property of the Church and sought to restore order in finances. In 1840 the queen-regent, Maria Christina, resigned in favour of Espartero. A military and political *pronunciamiento* by O'Donnell and Narvaez turned out Espartero in 1843 and declared Isabella of age. She married her cousin, Prince Francisco de Assisi de Bourbon (1822–1902). Her reign (1843–68) was one long succession of palace intrigues and military *pronunciamientos* to further the ends of the political parties—Moderados (1846–54), Progressists (1854–56), Union Liberal (1856–63). In 1868 Serrano and Prim defeated Isabella's Moderado generals at Alcolea, and Isabella was exiled. She was induced to abdicate in Paris on June 25, 1870, in favour of her son, Alphonso XII. Isabella was the tool of profligate courtiers who gave her court a deservedly bad name, and her wayward, unscrupulous interference in politics made her unpopular. She continued to live in France after the Restoration (1874) and died on April 10, 1904.

ISABELLA, **ISABEAU**, or **ELIZABETH OF BAVARIA** (1370–1435), wife of Charles VI. of France, was the daughter of Stephen II., duke of Bavaria. She was born in 1370, was married to Charles VI. on July 17, 1385, and crowned at Paris on Aug. 22, 1389. She fell under the influence of the dissolute court in which she lived, and the king having become insane (August 1392) she consorted chiefly with Louis of Orleans. After the assassination of the duke of Orleans (Nov. 23, 1407) she attached herself sometimes to the Armagnacs, sometimes to the Burgundians, and led a scandalous life. Following the murder of John the Fearless she went over to the side of the English, into whose hands she surrendered France by the treaty of Troyes (May 21, 1420), at the same time giving her daughter Catherine in marriage to the king of England, Henry V. She died in Sept. 1435, and was interred without funeral honours in the abbey of St. Denis.

See Vallet de Viriville, *Isabeau de Bavière* (1859); Marcel Thibault, *Isabeau de Bavière, Reine de France, 1370–1405* (1903).

ISABELLA OF HAINAUT (1170–1190), queen of France, was the daughter of Baldwin V., count of Hainaut, and Margaret, sister of Philip of Alsace, and was born in 1170 at Lille. She was married to Philip Augustus, and brought to him as her dowry the province of Artois. She was crowned at St. Denis on May 29, 1180. As Baldwin V. claimed to be a descendant of Charlemagne, the chroniclers of the time saw in this marriage a union of the Carolingian and Capetian dynasties. In 1184, Philip, waging war against Flanders, was angered at seeing Baldwin support his enemies, and called a council at Sens for the purpose of repudiating his wife. Robert, the king's uncle, successfully interposed. She died in 1190. Her son became Louis VIII. of France.

See Cartellieri, "L'Avènement de Phil. Aug." in *Rev. hist.* liii. 262 et seq.

ISABEY, JEAN BAPTISTE (1767–1855), French painter, was born at Nancy on April 11, 1767. He went to Paris in 1785 and became a pupil of David. Employed at Versailles on portraits of the dukes of Angoulême and Berry, he was given a commission by the queen, which opens the long list of those which he received, up to the date of his death in 1855, from the successive rulers of France. Patronized by Josephine and Napoleon, he arranged the ceremonies of their coronation and prepared drawings for the publication intended as its official commemoration, a work for which he was paid by Louis XVIII., whose portrait

he executed in 1814. Although Isabey did homage to Napoleon on his return from Elba, he continued to enjoy the favour of the Restoration, and took part in arrangements for the coronation of Charles X. The monarchy of July conferred on him an important post in connexion with the royal collections, and Napoleon III. granted him a pension, and the cross of commander of the Legion of Honour. "Review of Troops by the First Consul" was one of his most important compositions, and "Isabey's Boat,"—a charming drawing of himself and family—produced at a time when he was much occupied with lithography—had an immense success at the Salon of 1820 (engraved, Landon, *Annales*, i. 125). His portrait of "Napoleon at Malmaison" is held to be the best ever executed.

See Madame de Basily-Callimaki, *J. B. Isabey, sa vie et son temps* (1909).

ISABNORMAL LINES, in meteorology, lines upon a map connecting places having equal departures from the normal. A better term is *isanomalous lines*. Each parallel of latitude can be considered as having a certain normal temperature based on a general mean of temperatures at stations along that parallel. Places which are relatively warm for their latitude have a positive anomaly, while abnormally cold places have a negative anomaly. As these anomalies are expressed in degrees it is easy to interpolate isanomalous lines, which can then be used to analyse the effects of ocean currents, continentality, etc. The method can also be applied to the mapping of abnormal weather compared with average climate for any selected small area.

ISAEUS (c. 420 B.C.–c. 350 B.C.), Attic orator, the chronological limits of whose extant work fall between the years 390 and 353 B.C., is described in the Plutarchic life as a Chalcidian; by Suidas, whom Dionysius follows, as an Athenian. The accounts have been reconciled by supposing that his family sprang from the settlement (κληρουχία) of Athenian citizens among whom the lands of the Chalcidian *hippobotai* (knights) had been divided about 509 B.C. A connection with Euboea would explain the non-Athenian name Diagoras which is borne by the father of Isaeus, while the latter is said to have been "an Athenian by descent" (*Ἀθηναῖος τὸ γένος*). So far as we know, Isaeus took no part in the public affairs of Athens. "I cannot tell," says Dionysius, "what were the politics of Isaeus—or whether he had any politics at all."

Isaeus (who was born probably about 420 B.C.) is believed to have been an early pupil of Isocrates, and he certainly was a student of Lysias. The profession of Isaeus was that of which Antiphon had been the first representative at Athens—that of a *λογόγραφος*, who composed speeches which his clients were to deliver in the law courts. But, while Antiphon had written such speeches chiefly (as Lysias frequently) for public causes, it was with private causes that Isaeus was almost exclusively concerned.

The most interesting recorded event in the career of Isaeus is his connection with Demosthenes, who attained his civic majority in 366. He had resolved to prosecute his fraudulent guardians, and sought the aid of Isaeus. Plutarch states that Demosthenes "employed Isaeus as his master in rhetoric, though Isocrates was then teaching, either (as some say) because he could not pay Isocrates the prescribed fee of ten minae, or because he preferred the style of Isaeus for his purpose, as being *vigorous and astute*" (*δραστήριον καὶ πανούργον*). The speeches of Demosthenes against Aphobus and Onetor (363–362 B.C.) afford the best possible gauge of the sense and the measure in which he was the disciple of Isaeus; the intercourse between them can scarcely have been either very close or very long. The date at which Isaeus died can only be conjectured from his work. It may be placed about 350 B.C.

Isaeus has a double claim on the student of Greek literature. He is the first Greek writer who comes before us as a consummate master of strict forensic controversy. He also holds a most important place in the general development of practical oratory, and therefore in the history of Attic prose. Antiphon marks the beginning of that development, Demosthenes its consummation. Between them stand Lysias and Isaeus. The open, even ostentatious, art of Antiphon had been austere and rigid. The con-

cealed art of Lysias had charmed and persuaded by a versatile semblance of natural grace and simplicity. Isaeus brings us to a final stage of transition, in which the gifts distinctive of Lysias were to be fused into a perfect harmony with that masterly art which receives its most powerful expression in Demosthenes. Here, then, are the two cardinal points by which the place of Isaeus must be determined. We must consider, first, his relation to Lysias; secondly, his relation to Demosthenes.

With less love of antithesis than Lysias, and with a diction almost equally pure and plain, Isaeus yet habitually conveys the impression of conscious and confident art. Hence he is least effective in adapting his style to those characters in which Lysias peculiarly excelled—the ingenuous youth, the homely and peace-loving citizen. On the other hand, his more open and vigorous art does not interfere with his moral persuasiveness where there is scope for reasoned remonstrance, for keen argument or for powerful denunciation. Passing from diction and composition to the treatment of subject-matter, we find the divergence wider still. Lysias usually adheres to a simple four-fold division—proem, narrative, proof, epilogue. Isaeus frequently interweaves the narrative with the proof. He shows the most dexterous ingenuity in adapting his manifold tactics to the case in hand, and often “out-generals” (*καταστρατηγεί*) his adversary by some novel and daring disposition of his forces. Lysias, again, usually contents himself with a merely rhetorical or sketchy proof; Isaeus aims at strict logical demonstration, worked out through all its steps. As Sir William Jones well remarks, Isaeus lays close siege to the understandings of the jury.

What, we must next ask, is the relation of Isaeus to Demosthenes? The Greek critic who had so carefully studied both authors states his own view in broad terms when he declares that “the power of Demosthenes took its seeds and its beginnings from Isaeus” (Dion. Halic. *Isaeus* 20). Attic prose expression had been continuously developed as an art; the true link between Isaeus and Demosthenes is technical, depending on their continuity. The *composition* of Demosthenes resembles that of Isaeus in blending terse and vigorous periods with passages of more lax and fluent ease, as well as in that dramatic vivacity which is given by rhetorical question and similar devices. In the versatile disposition of subject-matter, the divisions of “narrative” and “proof” being shifted and interwoven according to circumstances, Demosthenes has clearly been instructed by the example of Isaeus. Still more plainly and strikingly is this so in regard to the elaboration of systematic proof; here Demosthenes invites direct and close comparison with Isaeus by his method of drawing out a chain of arguments, or enforcing a proposition by strict legal argument. And, more generally, Demosthenes is the pupil of Isaeus, though here the pupil became even greater than the master, in that faculty of grappling with an adversary’s case point by point, in that aptitude for close and strenuous conflict which is expressed by the words *ἀγών*, *ἐναγώνιος*.

EXTANT SPEECHES

The pseudo-Plutarch, in his life of Isaeus, mentions an *Art of Rhetoric* and 64 speeches, of which 50 were accounted genuine. From a passage of Photius it appears that at least¹ the 50 speeches of recognized authenticity were extant as late as A.D. 850. Only eleven, with a large part of a twelfth, have come down to us; but the titles of forty-two² others are known.³

The titles of the lost speeches confirm the statement of Dio-

¹For the words of Photius (cod. 263), *τούτων δὲ οὐ τὸ γνήσιον μαρτυρήντες ὡς καταλείπονται μόνον*, might be so rendered as to imply that, besides these 50, others also were extant. See *Att. Orat.* ii. 311, note 2.

²Forty-four are given in Thalheim’s ed.

³The second of our speeches (the Meneclean) was discovered in the Laurentian Library in 1785, and was edited in that year by Tyrwhitt. In editions previous to that date, Oration i. is made to conclude with a few lines which really belong to the end of Orat. ii. (s. 47, *ἀλλ’ ἐπεὶ τὸ πρᾶγμα . . . ψηφίσασθε*), and this arrangement is followed in the translation of Isaeus by Sir William Jones, to whom our second oration was, of course, then (1779) unknown. In Oration i. all that follows the words *μη ποιήσαντες* in s. 22 was first published in 1815 by Mai, from a ms. in the Ambrosian Library at Milan.

nysius that the speeches of Isaeus were exclusively forensic; and only three titles indicate speeches made in public causes. The remainder, concerned with private causes, may be classed under six heads: (1) *κληρικοί*—cases of claim to an inheritance; (2) *ἐπικληρικοί*—cases of claim to the hand of an heiress; (3) *διαδικασίαι*—cases of claim of property; (4) *ἀποστασίον*—cases of claim to the ownership of a slave; (5) *ἐγγυήσις*—action brought against a surety whose principal had made default; (6) *ἀντωμοσία* (as=*παραγραφή*)—a special plea; (7) *ἔφεσις*—appeal from one jurisdiction to another.

Eleven of the 12 extant speeches belong to class (1), the *κληρικοί*, or claims to an inheritance. This was probably the branch of practice in which Isaeus had done his most important and most characteristic work. And, according to the ancient custom, this class of speeches would therefore stand first in the manuscript collections of his writings. The case of Antiphon is parallel: his speeches in cases of homicide (*φονικοί*) were those on which his reputation mainly depended, and stood first in the manuscripts. Their exclusive preservation, like that of the speeches made by Isaeus in will-cases, is thus primarily an accident of manuscript tradition, but partly also the result of the writer’s special prestige.

Six of the 12 extant speeches are directly concerned with claims to an estate; five others are connected with legal proceedings arising out of such a claim.

The speeches of Isaeus supply valuable illustrations to the early history of testamentary law. They show us the faculty of adoption, still, indeed, associated with the religious motive in which it originated, as a mode of securing that the sacred rites of the family shall continue to be discharged by one who can call himself the son of the deceased. But practically the civil aspect of adoption is, for the Athenian citizen, predominant over the religious; he adopts a son in order to bestow property on a person to whom he wishes to bequeath it. The Athenian system, as interpreted by Isaeus, is thus intermediate, at least in spirit, between the purely religious standpoint of the Hindu and the maturer form which Roman testamentary law had reached before the time of Cicero.¹ As to the form of the speeches, it is remarkable for its variety. There are three which, taken together, may be considered as best representing the diversity and range of their author’s power. The fifth, with its simple but lively diction, its graceful and persuasive narrative, recalls the qualities of Lysias. The 11th, with its sustained and impetuous power, has no slight resemblance to the manner of Demosthenes. The eighth is, of all, the most characteristic, alike in narrative and in argument. Isaeus is here seen at his best. No reader who is interested in the social life of ancient Greece need find Isaeus dull. If the glimpses of Greek society which he gives us are seldom so gay and picturesque as those which enliven the pages of Lysias, they are certainly not less suggestive. Here, where the innermost relations and central interests of the family are in question, we touch the springs of social life; we are not merely presented with scenic details of dress and furniture, but are enabled in no small degree to conceive the feelings of the actors.

The best manuscript of Isaeus is in the British Museum—Crippsianus A (=Burneianus 95, 13th century), which contains also Antiphon, Andocides, Lycurgus and Deinarchus. The next best is Bekker’s Laurentianus B (Florence), of the 15th century. Besides these, he used Marcianus L (Venice), saec. 14, Vratislaviensis Z saec. 14² and two very inferior mss., Ambrosianus A. 99 P (which he dismissed after Or. i.), and Ambrosianus D. 42, Q (which contains only Or. i., ii.). Schömann, in his edition of 1831, generally followed Bekker’s text; he had no fresh apparatus beyond a collation of a Paris ms. R in part of Or. i.; but he had sifted the Aldine more carefully. Baiterus and Sauppe (1850) had a new collation of A, and also used a collation of Burneianus 96, M, given by Dobson in vol. iv. of his edition (1828). C.

¹Cf. Sir H. J. F. Maine’s *Ancient Law* (1906); ch. vi., and the *Tagore Law Lectures* (1870) by Herbert Cowell, lect. ix., “On the Rite of Adoption,” pp. 208 f.

²The date of L and Z is given as the end of the 15th century in the introduction to Wyse’s edition.

Scheibe (Teubner, 1860) made it his especial aim to complete the work of his predecessors by restoring the correct Attic forms of words; thus (*e.g.*) he gives ἡγγύα for ἐνεγύα, δέδιμεν for δεδίαμεν, and the like,—following the consent of the mss., however, in such forms as the accusative of proper names in ἦν rather than ἦ, or (*e.g.*) the future φανήσομαι rather than φανοῦμαι, etc., and on such doubtful points as φράτερες instead of φράτορες, or Ἐλεθυίας instead of Εἰλεθυίας.

ISAIAH. It is important to realize that practically all we know of the life and career of the Prophet Isaiah of Jerusalem is contained in the book of Isaiah. But the book itself, as it lies before us in our Bibles contains much more material than that which is directly concerned with the life and work of the prophet. In its present form, as a book, it is a comparatively late production, compiled out of a series of prophetic collections made by a succession of redactors and editors. "These collections embody a nucleus of Isaianic material—the actual prophecies of Isaiah himself—which was added to and enlarged as time went on. But even in the earliest form of compilation which critical analysis can detect this Isaianic material has been combined with non-Isaianic matter." As we shall see, at least one, if not two other writers contributed largely to the book as we have it. As the late G. Buchanan Gray well remarks in his commentary on Isaiah (p. xii.), "No full justice can be done to a book which is a great monument to Jewish religion after the exile if all our attention is devoted to determining whether this or that passage is genuine and dismissing it as not 'genuine' if it is not the work of Isaiah. In reference to works such as the Book of Isaiah the term 'genuine' is indeed misleading. None of the nameless writers may have possessed the religious genius of Isaiah, but together they represent the play of the earlier prophetic teaching on the Jewish Church. In religion as elsewhere, great personalities count first, and it is the privilege of a student of the Book of Isaiah to come face to face with one, if not two, such personalities; but the religious community is the necessary outcome, or field of action, of the great religious personality and his teaching, and the student of the Book of Isaiah has but half entered into his inheritance if he communes with Isaiah and the great exilic prophet, but fails to feel the life of that post-exilic community, which not only preserved for themselves and for us the words of the earlier prophets, but preserved them in books which were also made to breathe the hopes and aspirations that sustained the Jews through centuries of isolation, oppression and temptation."

The book falls into two main divisions: (*a*) Chapters i.–xxxix.; (*b*) Chapters xl.–lxvi. The whole of the material contained in (*b*) is post-exilic in date; that contained in (*a*) is partly post-exilic and partly earlier. The material directly or indirectly connected with the prophet Isaiah of Jerusalem is all contained in (*a*).

Analysis of the Book.—One of the great triumphs of Old Testament Criticism is revealed by the critical analysis of the Book of Isaiah. It is no part of our present task to trace the history of the development of this criticism. Suffice it to say that it reached its high watermark in the works of Duhm (*Jesaja*) 2nd ed. 1902 and Marti (*Jesaja*) 1900. Invaluable work had been done in this country by T. K. Cheyne in a succession of works, the most important of which for our present purpose is the *Introduction to the Book of Isaiah*, 1898. Since the publication of these treatises a certain amount of reaction has taken place in Isaianic criticism. It will be convenient for our purpose to follow Duhm and Marti as guides and to notice as we proceed the more important modifications that have come to the front since.

Chapter i forms a general preface to the whole Isaianic collection. The chapter is itself composite and was probably put together in its present shape by editors. The themes it deals with

may be summarized as follows:—(1) An address on Israel's faithlessness *c.* 701 B.C. (vv. 2–17), (2) the sin of Judah and the choice given (vv. 18–20) *c.* 701 B.C., (3) a dirge over Jerusalem's declension, passing over into a threat (vv. 21–26) before 701 B.C.; (4) a post-exilic addition dealing with the deliverance of a remnant and the annihilation of Apostates (vv. 27–28); (5) a fragment against nature-worship (vv. 29–31) *c.* 722 B.C. All these passages may be regarded as Isaianic except vv. 27–28. Note the heading v.1 which was added by an editor to the whole book of collected prophecies. The rest of chapters i.–xxxix. can broadly be divided into four books, viz., Bk. 1 first collection of Isaiah's prophecies, Chapters ii.–xii.; Bk. 2 an intermediate collection of oracles mainly concerning foreign nations, Chapters xiii.–xxiii.; Bk. 3 a third collection of Isaianic prophecies dealing mainly with the deliverance of Jerusalem with an eschatological preface and appendix, chapters xxiv.–xxxv.; Bk. 4 a historical appendix to the collected form of Isaianic prophecies, chapters xxxvi.–xxxix.

1. The first collection of Isaiah's prophecies, Chapters ii.–xii. This is itself composed of minor collections (notice ii.1–iv.6 and vi.1–ix.7). We come to the earliest minor collection contained in chapter ii.1–iv.6. These chapters are carefully arranged being provided with an eschatological preface ii.2–4, and a Messianic appendix iv. 2–6. Both these apocalyptic passages may be regarded as dependent upon Old Tradition (so Gressmann) and are probably older than Isaiah himself. Thus in the striking section ii. 2–4, which recurs in Micah iv. 1–4 both prophets are probably citing from a common source containing early features, *e.g.*, that Mount Zion is made higher than all the mountains and here assumes the position of the Mountain of the Gods of old myth. Isaiah takes this old story as a sort of text with its idealistic description of the future and sets against it a picture in striking contrast with the evils of the present. The section that follows ii. 6–21 has for its main theme Israel's Sin and the Day of Doom, and gives the prophet's conception of the Day of Yahweh (note especially chapter ii. 11–17 and the passage against idolatry v.18 *sqq.*). A section follows on Judah's impending ruin, completed by *c.* 735 B.C., contained in iii. 1–15 and this again by a powerful passage directed against the ladies of Jerusalem, iii. 16–iv.1. The whole section is completed by iv. 2–6, apocalyptic in character. Here vv. 5–6 may form a later addition. The general theme of the passage is the felicity of the redeemed community after it has been purged by judgment.

Chapter v. forms a section by itself and may be dated *c.* 735 B.C. The theme of the chapter is the parable of the vineyard and its application. The parable is contained in vv. 1–7 (*cf.* Matt. xxi. 32 *sqq.*); vv. 8–24 contain a denunciation in the form of six woes directed against the upper classes (vv. 25–30 should follow chapter x. 4). The whole composition is a very powerful piece of writing.

The second minor collection (Chapters vi.1 to ix.8) contains important material. Chapter vi. gives an account of Isaiah's inaugural vision, date about 738, and may have been composed to form an introduction to the group that follows which consists of (*a*) chapter vii. (prophecies of the period of the Syro-Ephraimitish war); (for the sign of Emmanuel, vii. 14–16, see article EMMANUEL); (*b*) viii. 1–4, *c.* 734 B.C., and vv. 5–10 and 11–15 all of the same period. An epilogue of uncertain date follows in vv. 16–18. This is an important section which seems to have been written down when the failure of the prophetic addresses contained in vii. 1–8, 15, had become evident. The Prophet now solemnly consigns "the testimony" to an inner circle of disciples.

The final section culminates in the description of the Messianic King (viii. 18–ix. 6). The text of the opening verses seems to have been much edited, in fact rewritten to form an introduction to what follows. The grand picture of the Messianic King given in ix. 1–6 is probably from Isaiah's hands, though some critics have denied this. The date of the Messianic passage is uncertain; perhaps it may be assigned to the youthful period of Isaiah's life, when he despaired of the Davidic House as represented by Ahaz (contrast xi. 1–9). The section that follows ix. 7–x. 4, to which should be attached v. 26–30 may be dated about 735 B.C. It is an artistically constructed poem with a refrain and may be entitled

"Yahweh's Outstretched Hand." It is mainly directed against north Israel and is a splendid example of Isaiah's poetical genius. A collection of oracles against Assyria with a Messianic appendix follows in Chapter x. 5-xi. 16. The Messianic section forms an appropriate conclusion. The Isaianic material here is fragmentary in character and has been edited to a certain extent by later hands. The general date of the fragments appears to be between 711 and 701 B.C. The date of the Messianic appendices xl. 1-9 and 10-16 is uncertain, but vv. 1-9 may be Isaianic while 10-16 probably belong to a later age; xl. 1-9 form perhaps the grandest of all the Messianic passages of the O.T. Its wonderful picture of the Golden Age marked by universal peace and its serene outlook on a transformed world are worthy of Isaiah. These features reflect the serenity of old age. Isaiah probably composed the passage towards the end of his life: notice the prophet's revived hope in the Davidic dynasty. Chapter xii. (probably post-exilic) forms the lyrical epilogue to the first complete Isaianic collection embodied in chapters ii.-xii. Chapter xii. is largely composed of reminiscences of the Psalter.

Book 2 forms an intermediate collection of oracles mainly concerning foreign nations, chapters xiii.-xxiii. The bulk of this section consists of ten "oracles" (burdens); and interspersed among these are four passages without titles which undoubtedly come from Isaiah's hand, viz. (a) xiv. 24-27 (b) xvii. 12-14 (c) Chapter xviii. and (d) Chapter xx. Of the ten oracles Chapter xvii. 1-6, 9-11, and xxii. 1-8, 12-14, may be assigned with confidence to Isaiah, while chapter xv. to xvi. 12 may be an older prophecy adopted by Isaiah and re-affirmed in a special postscript (Chapter xvi. 13-14). The only "oracles" which bear no relation to Isaiah or his age are Chapter xiii. 2-xiv. 23 against Babylon, which was probably composed during the Exile; chapter xix. against Egypt, Chapter xxi. and Chapter xxiii. Not improbably this collection in its original form, consisting of ten oracles had an independent existence. The editor of the complete Isaianic collection took over this book which contained a genuine Isaianic element by inserting the four passages mentioned above and then incorporated the whole into the collected form of Isaiah's prophecies. It should be noted that it occupies in the complete book a similar position to corresponding groups of oracles in Ezekiel (Chapters xxv.-xxxii.) and Jeremiah (according to the LXX arrangement). Probably this editor is responsible for the heading, chapter xiii. 1, or at least for the words *which Isaiah Ben Amoz saw*. The poem on the Fall of Babylon consists of (a) a prophecy directed against Babylon xiii. 2-22 and (b) a triumphal ode on the downfall of the oppressive power, xiv. (4b)-21. This latter is certainly one of the finest compositions in the O.T. The date of composition probably belongs to the latter years of the Exile and therefore is more or less contemporary with Deutero-Isaiah. Note the contrast in tone between this oracle and that of Chapter xxi. Chapter xvii. 1-11, containing an oracle about Ephraim and Syria, may be dated about 735 B.C. and the second of the appended Isaianic fragments, Chapter xvii. 12-14, about 702 B.C. This is a very fine piece of writing. The third of the appended fragments, containing an address to the Ethiopian Ambassadors, may be dated about the same time (Chapter xviii.). Chapter xix., an oracle about the fall of Egypt, seems to be of composite origin, vv. 1-15 perhaps may be dated between 528 and 485 B.C., while the remarkable verses, 16-25, forming an appendix, seem to belong to a later date still. Note the broad universalistic spirit of the passage which can hardly belong to an earlier time than the Greek period. Sellin, however, takes a different view. He dates vv. 1-17 prior to 663 B.C., and even vv. 18-25 he thinks are pre-Exilic. Chapter xx. contains the fourth of the appended Isaianic pieces. It may perhaps be dated about 711 B.C. in the reign of Sargon. The words translated Egypt (Misraim) and Ethiopia (Cush) may however be referred to a different provenance, if Winckler can be followed in assuming the existence of a Musri and Cush in north Arabia: it is possible that these terms have been confused with Egypt and Ethiopia in this chapter and occasionally elsewhere in the O.T. Chapter xxi. 1-10 containing a vision of the fall of Babylon may be dated about the end of the Exile. It is followed by two fragmentary oracles

on Edom, and Kedar, and has appended to it an Isaianic fragment xxi. 16-17 which may be dated about 711 B.C. Chapter xxii. 1-14, an oracle on the Valley of Vision, may be dated about 701 B.C. Appended to this oracle is an interesting political invective directed against Shebna with a later appendix (Chapter xxii. 15 sqq.). The final chapter of this Section Chapter xxiii. deals in its present form with the Fall of Tyre and perhaps with the siege which the prophecy has in view is the one conducted by Nebuchadnezzar 586-573 B.C. (vv. 13 and 15-18 may be post Exilic additions). Duhm has proposed a brilliant solution by slightly altering the text in 8 and substituting Sidon for Tyre (Sidon is mentioned in vv. 2, 4 and 12). The reference will then be to the devastation of Sidon by Artaxerxes III. A later editor again altered it so as to make it refer to the siege of Tyre by Alexander the Great. Book iii. contains the third collection of Isaianic prophecies dealing mainly with the deliverance of Jerusalem, with an eschatological preface and appendix. The centre of this group of chapters is largely composed of material from Isaiah's hand dating apparently from the crisis of Sennacherib's invasion in 701 B.C. To the post-exilic editor who combined this collection with the two preceding books, the dominating interest was eschatological.

The invasion of Sennacherib was invested with an eschatological significance, and was "regarded as typical of the last great attempt to extinguish the people of Yahweh" at the end of the age. This editor will also have been responsible for prefixing the eschatological preface (chs. xxiv.-xxvii.) and affixing the eschatological appendix (chs. xxxiv.-xxxv.) to the central group.

The third collection thus falls into three main parts, viz., I. Eschatological Preface (Chs. xxiv.-xxvii.). II. Prophecies dealing mainly with the Deliverance of Jerusalem (Chs. xxviii.-xxxiii.). III. Eschatological Appendix (Chs. xxxiv.-xxxv.). Chapters xxiv.-xxvii. are characterized by certain remarkable features. When the lyrical passages or songs are taken away there emerges a uniform apocalypse. The songs in question are (a) xxv. 1-5 (commemorating the destruction of a strong city); (b) xxv. 9-11 (the taunt song on Moab); (c) xxvi. 1-19 (a poetical meditation); and (d) the song in xxvii. 2-5. The subject of the main apocalyptic section is a great catastrophe which convulses the entire world. A picture of world-wide desolation is drawn in vivid colours. This is followed by a description of the divine judgment on the evil powers (heavenly and earthly) and of Yahweh's enthronement on Mount Zion (Ch. xxiv.). Finally the "Coronation festival"—"a feast of fat things for all peoples"—is described (xxv. 6-8). The date of this section is hard to determine. The earliest assignable date is in the reign of Artaxerxes Ochus and probably the limits are 350-330 B.C. A number of distinguished scholars, however, date these compositions late in the Maccabean period, but on insecure grounds. The doctrinal importance of the chapters is considerable. Thus ch. xxvi. 19 contains perhaps the first clear allusion to the doctrine of the resurrection; cf. the oracles contained in chapters xxviii.-xxxiii. Doubts have been raised as to the Isaianic character of xxviii. 23-29, a little poem in the style of the Wisdom literature which may well be Isaiah's. Ch. xxix. 17-24 is almost certainly post-exilic (the *humble and needy* of v. 19 are the oppressed pious so often mentioned in the Psalms). Ch. xxx. 18-26 also post-exilic. Ch. xxx. 27-33 doubtfully Isaianic, perhaps post-exilic. Chapters xxxii.-xxxiii. contain a description of the renovated state in the Messianic age and form a contrast with preceding chapters especially as regards the upper classes. With the exception of vv. 6-8 Chapter xxxii. might have been written by Isaiah. If so, with chapter xxxiii., it must be a product of the prophet's old age. Though the subject of chapter xxxiii. is undoubtedly the deliverance of Jerusalem from Sennacherib it is highly improbable that the chapter is a composition by Isaiah. It seems rather to be a sort of liturgical meditation by a post-exilic poet on the deliverance of Jerusalem. It is in fact a composition parallel to xxvi. 1-19 (cf. xxxvii. 22-32, also post-exilic). Sellin, however, warmly defends the Isaianic character of the passage, as well as of the previous chapters xxxiv.-xxxv., probably written by the same hand to form the eschatological appendix to the preceding group. Edom figures prominently in xxxiv.; but the apocalyptic character of the pas-

sage is not modified by this fact—Edom in fact became a symbolical name for the oppressive world-power. The earliest possible date of composition would be about 400 B.C.

A further appendix to the Isaianic collection ending at Chapter xxxiii. is contained in Chapters xxxvi.—xxxix. These chapters which are mainly narrative in character have been excerpted from the Book of Kings. They correspond to 2 Kings xviii. 8–xx. 19. The only divergencies are (a) the omission in the Isaiah text of the section contained in 2 Kings xviii. 14–16 and (b) the insertion in the Isaiah text of Hezekiah's psalm of thanksgiving Is. xxxviii. 9–20, apparently a late post-exilic composition. See further HEZEKIAH.

The Deutero-Isaiah.—With Chapter xl. a new section of the book of Isaiah begins. Here the background is entirely different from that of the earlier chapters contained in part I. The oppressive world-power is no longer Assyria but Babylon. The Exile is not so much predicted as pre-supposed. The chapters are the work of a great lyrical poet who sees everything through a sort of golden haze. Chapters xl.–xlviii., apart from some small interpolations, are the work of this writer who apparently composed them c. 538 B.C., i.e., after Cyrus had appeared on the scene, but before his capture of Babylon. Theologically the chapters are of great importance, insisting as they do on the unique character of Yahweh who is the sole God—there is but one God Yahweh and Israel is his prophet. The chapters were apparently written in Babylonia. Chapters xlix.–lv., which by a majority of critics are ascribed to "Deutero-Isaiah" (style and phraseology are practically the same), are distinguished from the preceding chapters by the disappearance from them of the themes so prominent in the earlier chapters. Cyrus is no longer referred to. The Exodus from Babylon is no longer insisted upon. The future glory of Zion-Jerusalem is prominently dwelt upon, and the gathering in of the exiles scattered throughout the world is described. Possibly these chapters were composed, as Cornill suggests, "under the immediate impression produced by the issue of the edict in which Cyrus gave permission to the exiles to return home."

It is important to note Sellin's reminder that the whole work of Deutero-Isaiah is eschatological. "With the victory of Cyrus there dawns for him those last times which for centuries had been the object of a burning hope. By this everything is to be explained—the miraculous march through the wilderness, the picture of the New Jerusalem, the conversion of the heathen and the overthrow of the world-power" (cf. also xlix. 26: li. 6 sqq.). It has been commonly assumed that the prophecies of Deutero-Isaiah were circulated by this author in written form; but recently the view that the discourses were spoken orally at different times (perhaps in some place where the exiles met) has gained ground.

Trito-Isaiah.—With Ch. lvi. an entirely new section of the Book begins. Here everything breathes a different atmosphere. Zion's felicity—the day of longed-for salvation—has not yet dawned. But the obstacle is no longer Babylon, but godless members of the Jerusalem community and heretics. There is here no question of a Return—a new Exodus. The Jews are settled in the Holy Land; Jerusalem is no longer in ruins, but has a settled population; the Temple has been re-built. But matters are not well with the restored community. There are grave symptoms of internal weakness. Social conditions are unsatisfactory; the rich oppress the poor. The old Israelitish population of the land (in Judaea and Samaria) is unwilling to submit to the "yoke of the Law" and threatens to build a rival Temple. The chapters form a distinct group by themselves, though the various items are strung rather loosely together. They were evidently written at a critical time, when it was all-important to strengthen the faith of the strict, religious party by kindling hope among them in the coming salvation. The godless are to be brought into judgment, and redress is to come for the pious followed by the glorification of the Holy City.

Apart from some inconsiderable additions the chapters are regarded by many modern scholars, including Duham and Marti, as having emanated from one author, who is styled for the sake of convenience the "Trito-Isaiah." He wrote in the middle of the fifth century, apparently (c. 450 B.C.), a few years before the

arrival of Nehemiah in Jerusalem.

There are certain difficulties about the hypothesis of Trito-Isaiah which have been well summarized by Sellin, who points out that the themes which are prominent in the time of Malachi and Nehemiah are absent from these chapters. Moreover, there are two, if not three, passages which imply that the Temple was not in existence at the time when the author wrote (cf. lxiii. 18; lxiv. 8 sq.; and lxvi. 1–5). Possibly the first two of these passages are late interpolations, while the third does not necessarily imply the non-existence of the Jerusalem Temple. If these chapters are not a literary unity the best alternative view as to their origin is perhaps the following: a post-Exilic editor taking a section of writing which belonged to Deutero-Isaiah, viz., Chapters lx–lxii., combined this, "with the work of a Jerusalemite prophet of the period between 586 and 520" (Sellin) and enlarged it with additions of his own.

It is impossible here to do more than refer to the so-called "Servant Songs" about which a whole literature has grown up (xlii. 1–4; xlix. 1–6; l. 4–9; lii. 13–liii. 12). Is the servant here a collective term for the true Israel, or does it stand for an individual and if so for whom? The commonly accepted view has been some form or other of the first or collective interpretation (see J. Skinner, *The Cambridge Bible* ad loc.); but recently several scholars have adopted the individualistic interpretation; so especially Sellin who now identifies the servant with Moses, though he formerly thought of Jehoiachin. See further discussions by S. A. Cook, *Camb. Ancient History*, iii. 489 sqq., and H. Wheeler Robinson, *The Cross and the Servant*.

The Origin of the Book of Isaiah.—It may be inferred from Ecclus. xlviii. 20–25 that the book as we have it was then already in existence c. 200–180 B.C.; further it seems probable that about 400 B.C. a Book of Isaiah was in existence which contained chapters i.–xxxv. of our present book, to which chapters xxxvi.–xxxix. were added later. Between 400 and 200 B.C. the work of Deutero- and Trito-Isaiah which at first circulated independently, were added to the Isaianic collection. Not improbably the juxtaposition may have been due to Deutero-Isaiah himself, for there are linguistic points of contact between the later chapters and the work of Isaiah of Jerusalem. The earlier history of the Isaianic collection is wrapped in obscurity. It is clear that the prophet himself was primarily a preacher and delivered his discourses orally; they were written down only at a later stage. (Cf. the analogous case of Jeremiah, Jer. xxxvi.) Fragments of the prophet's discourses were no doubt carefully treasured by his disciples (cf. Is. viii. 16; xxx. 8). Then collections were formed and later still further collections, the whole being brought up to date by eschatological additions.

The Life and Activity of Isaiah.—The prophet Isaiah, the son of a certain Amoz, was the father of two sons who bore highly symbolical names, viz., Shear-Jashub ("a remnant shall return") and Maher-shalal-hash-baz ("swift spoil, speedy prey"). The prophet's family probably belonged to the aristocracy of Jerusalem and may have had connections with the royal house. At any rate the prophet seems to have been able to enter the presence of the king at will (cf. Chapter vii.). His active career extended from about 738 B.C. (cf. Is. vi. 1) to at least 701 B.C. and probably later 690 B.C. (?). He may have been martyred under Manasseh as Jewish legend attests. The prophet lived through a succession of political crises connected with the intervention of Assyria in Western Asia, viz.: the Syro-Ephraimitish War 734 B.C.; the fall of Samaria, 722 B.C.; the siege of Ashdod by Sargon, 711 B.C.; the death of Sargon, 705 B.C.; and the invasion of Sennacherib in 701 B.C. Isaiah has well been called "the prophet of Faith." He stands a sublime figure for faith in the supremacy of the spiritual over the earthly; for the potency of high ideas and ideals over brute force and power. To have combined such a lofty faith with practical statesmanship—for Isaiah was essentially a man of action—is an achievement worthy of the greatest men of any age.

ISAIAH, ASCENSION OF, an interesting apocryphal book of the Old Testament. Its various constituents—the *Martyrdom of Isaiah*, the *Testament of Hezekiah* and the *Vision of Isaiah*—circulated independently as early as the 1st century. The first of these was of Jewish origin, and is of less interest than the other two, which were the work of Christian writers. The *Vision of Isaiah* is important for the knowledge it affords us of 1st century beliefs in certain circles as to the doctrines of the Trinity, the Incarnation, the Resurrection, the Seven Heavens, etc. The long lost *Testament of Hezekiah*, which is, in the opinion of Charles, to be identified with iii. 13b–iv. 18 of our present work, is unquestionably of great value owing to the insight it gives us into the history of the Christian Church at the close of the 1st century. Its descriptions of the worldliness and lawlessness which prevailed among the elders and pastors, *i.e.*, the bishops and priests, of the widespread covetousness and vainglory as well as the growing heresies among Christians generally, agree with similar accounts in 2 Peter, 2 Timothy and Clement of Rome.

Of the three original sources, (i.) The *Martyrdom of Isaiah* consists of i. 1, 2^a, 6^b–13^a, ii. 1–8, 10–iii. 12, v, 1^b–14, and is but an imperfect survival of the original work. (ii.) The *Testament of Hezekiah* is to be found in iii. 13^b–iv. 18, in a mutilated form, without beginning or end. (iii.) The *Vision of Isaiah* is vi.–xi. 1–40. Its archetype existed independently in Greek, and differs in many respects from the form in which it was republished by the editor of the entire work. This editor had the three documents mentioned at his disposal; the first was of Jewish, the others of Christian origin; he reduced or enlarged them as it suited his purpose, and put them together as they stand in our text. As regards the dates of the different elements, the *Martyrdom* belongs to the 1st century A.D., the *Testament of Hezekiah* to the period 88–100 A.D., the *Vision of Isaiah* to the close of the 1st century A.D., but the work as we now have it is probably not earlier than the latter half of the 2nd century.

See R. H. Charles, *The Ascension of Isaiah* (1900), in *The Apoc. and Pseudepig. of the O.T.*, ii. 155–162 (1913), and in the S.P.C.K. "Translations of Early Documents" (1918). (W. O. E. O.)

ISANDHLWANA, an isolated hill in Zululand, 8m. S.E. of Rorke's Drift across the Tugela river, and 105m. N. by W. of Durban. On Jan. 22, 1879, a British force encamped at the foot of the hill was attacked by about 10,000 Zulus, the flower of Cetewayo's army, and destroyed. Of eight hundred Europeans engaged about forty escaped (*see* ZULULAND: *History*).

ISANOMALOUS LINES. Lines connecting places of similar temperature and pressure, etc., to equal departures from the average values of the respective zones of latitude. *See* also ISABNORMAL LINES.

ISAR (identical with *Isère*, in Celtic "the rapid"), a river of Bavaria. It rises in the Tirolese Alps, at an altitude of 5,840 feet. It winds in deep, narrow gorges through the Alps, and at Tölz (2,100 ft.), enters the Bavarian plain, which it traverses in a generally north and north-east direction, and enters the Danube immediately below Deggendorf. It is 219 m. long with a drainage area of 38,200 sq.m. Below Munich the stream is 140 to 350 yd. wide, and is studded with islands. It is not navigable, except for rafts. The Isar is essentially the national stream of the Bavarians; it traverses the finest corn land in the kingdom. On its banks lie the cities of Munich and Landshut, and the venerable episcopal see of Freising. (*See* DANUBE.)

ISATIN, in chemistry, an oxygenated derivative of indole (*q.v.*) prepared by oxidizing indigo with nitric or chromic acid. It crystallizes in orange-red prisms melting at 200–201° C. Isatin, which furnishes indirubin, the red pigment of indigo, on condensation with indoxyl, is of practical importance in the manufacture of vat colours (*see* DYES, SYNTHETIC). For example, it yields Ciba red G (thioindigo scarlet G) by condensation with α -hydroxythio-naphthene and subsequent bromination of the condensation product. Isatin is also of outstanding scientific interest because it affords a noteworthy example of tautomerism (*see* ISOMERISM). It is a chemical individual with two personalities. Certain of its reactions suggest the lactam constitution (I.) whereas others indicate the lactim configuration (II.).

Although itself existing in only one form, isatin has two methyl ethers: pseudomethylisatin (III.) made from dibromomethyl-oxindole, and methylisatin (IV.) prepared by

the interaction of methyl iodide and silver isatin. The absorption curves of isatin and the pseudomethyl ether are practically identical and differ considerably from that of the methyl ether. Accordingly, isatin is regarded as having the lactam structure, although its silver derivative corresponds with the lactim formulation.

Isatin and its homologues are produced by condensing aniline and its homologues with hydroxylamine sulphate and chloral hydrate; an intermediate isatinimide is formed which on hydrolysis furnishes the corresponding isatin.

ISAURIA, a district in the interior of Asia Minor. The nucleus of it was that section of the Taurus which lies directly south of Iconium and Lystra. Lycania had all the Iconian plain; but Isauria began as soon as the foothills were reached. When the Romans first encountered the Isaurians (early in the 1st century B.C.), they regarded Cilicia Trachea as part of Isauria, which thus extended to the sea; the whole basin of the Calycadnus was reckoned Isaurian, and the cities in the valley of its southern branch formed what was known as the Isaurian Decapolis. Towards the end of the 3rd century A.D., however, all Cilicia was detached for administrative purposes from the northern slope of Taurus; Pisidia was also detached, and made to include Iconium. In compensation Isauria received the eastern part of Pamphylia. Restricted again in the 4th century, Isauria ended as the wild district about Isaura Palaea and the heads of the Calycadnus. During the war of the pirates against Rome, the Isaurians took so active a part that the proconsul P. Servilius followed them into their fastnesses, and reduced the whole people to submission. The Isaurians were afterwards placed under the rule of Amyntas, king of Galatia; but it is evident that they continued to retain their predatory habits and virtual independence. In the 4th century they are described by Ammianus Marcellinus as the scourge of the neighbouring provinces of Asia Minor; but they are said to have been effectually subdued in the reign of Justinian. Isauria passed into the hands of Turcomans and Yuruks with the Seljuk conquest.

This comparatively obscure people had the honour of producing two Byzantine emperors, Zeno, whose native name was Trakalisseus Rousoumbladeotes, and Leo III., who ascended the throne of Constantinople in A.D. 718, reigned till 741, and became the founder of a dynasty of three generations. The ruins of Isaura Palaea are mainly remarkable for their fine situation and their fortifications and tombs. Those of Isaura Nea have disappeared, but numerous inscriptions and many sculptured *stelae*, built into the houses of *Dorla*, prove the site. It was the latter, and not the former town, that Servilius reduced by cutting off the water-supply. The site was identified by W. M. Ramsay in 1901.

ISCHAEMIC ANOXAEMIA: *see* SHOCK AND COLLAPSE.

ISCHIA (Gr. *Παθηκόσσα*, "the apes' island," Lat. *Aenaria*, in poetry *Inarime*), an island off the coast of Campania, Italy, province of Naples, 16 m. S.W. of Naples and 7 m. S.W. of the Capo Miseno, the nearest point of the mainland. Pop. (1921) 27,631. It is situated at the west extremity of the gulf of Naples, and is the largest island near Naples, measuring about 19 m. in circumference and 26 sq.m. in area. It belongs to the same volcanic system as the mainland near it, and the Monte Epomeo (anc. *Ἐπωμῆς*, viewpoint), the highest point of the island (2,588 ft.),

lies on the N. edge of the principal crater, which is surrounded by twelve smaller cones. The island was occupied by Greek settlers but its Eretrian and Chalcidian inhabitants abandoned it about 500 B.C. owing to an eruption, and it is said to have been deserted almost at once by the greater part of the garrison which Hieron I. of Syracuse had placed there about 470 B.C., owing to the same cause. Later on it came into the possession of Naples, but passed into Roman hands in 326, when Naples herself lost her independence.

Several eruptions are recorded in Roman times. The last of which we have any knowledge occurred in 1301, but the island was visited by earthquakes in 1881 and 1883, 1,700 lives being lost in the latter year, when the town of Casamicciola on the north side of the island was almost entirely destroyed. The hot springs (147°), are alkaline and saline, and are much visited by bathers, especially in summer. They were known in Roman times, and many votive altars dedicated to Apollo and the nymphs have been found. The island is mountainous, beautiful and fertile. Wine, corn, oil and fruit are produced, especially the former, while the mountain slopes are clothed with woods. Tiles and pottery are made. Straw-plaiting is a considerable industry at Lacco; and a certain amount of fishing is also done. The potter's clay of Ischia served for the ancient potteries of Cumae and Puteoli.

The chief towns are Ischia on the E. coast, capital and seat of a bishop (pop. in 1921, town, 2,825; commune, 7,815), with a 15th century castle, to which Vittoria Colonna retired after the death of her husband in 1525; Casamicciola (pop. in 1921, town, 2,690; commune, 3,375) on the north, and Forio on the west coast (pop. in 1921, town, 2,476; commune, 5,813). There is regular communication with Naples, both by steamer direct, and also by steamer to Torregaveta, 2 m. W.S.W. of Baiae and 12½ m. W.S.W. of Naples, and thence by rail. (T. A.)

ISCHL, spa and town in Upper Austria. Beautifully situated between the rivers Ischl and Traun on a peninsula at an altitude of 1,530 ft., it is one of the most fashionable watering-places in Europe, and is famous for its mild climate (mean annual temp. -49.4 F), its saline and sulphur drinking springs, mud, sulphur and brine baths. Much of its popularity has been due to the fact that it was from 1822 the summer residence of the Austrian imperial family. Ischl is a centre of the Austrian salt industry which has been carried on since the 12th century. Pop. (1923) 10,200.

ISEO, LAKE OF, a lake in Lombardy, north Italy (anc. *Lacus Sebimus*), at the southern foot of the Alps, between the provinces of Bergamo and Brescia. The Oglio enters the north end at Lovere and leaves the south end at Sarnico to join the Po. Area 24 sq.m., length 17½ m., greatest width 3 m., greatest depth 984 ft., height of surface above sea-level 607 ft. It contains the island of Síviano, culminating in Monte Isola (1,965 ft.) crowned by a chapel, while to the south is the islet of San Paolo, occupied by the buildings of a small disused Franciscan convent and to the north the equally tiny island of Loreto, with a ruined chapel containing frescoes. At the southern end of the lake are the small towns of Iseo (15 m. by rail from Brescia) and of Sarnico. From Paratico, opposite Sarnico, on the left bank of the Oglio, a railway runs in 6½ m. to Palazzolo, on the main Brescia-Bergamo line. Towards the head of the lake, the deep wide valley of the Oglio is seen, dominated by the glittering snows of the Adamello (11,661 ft.). Along the east shore a fine carriage road as well as the railway runs from Iseo to the town of Pisogne (13½ m.), on the north-east side of the lake.

ISÈRE, a department of France, formed in 1790 out of the northern part of the old province of Dauphiné. Pop. (1926) 558,079. It is bounded north by the department of the Ain, east by Savoie, south by the Hautes Alpes and the Drôme and west by the Loire and the Rhône department. Area 3,178 sq.m. The department consists of most of the upper course of the Isère river (*q.v.*) and of the Drac, among the French Alps, and of the lower land towards the great bend of the Rhône at Lyons (Bas Dauphiné). At Vienne the average annual temperature is 5.3° above that of Paris, but winters are cold amongst the mountains, and rainfall increases there to nearly 80 in. The department is divided into three separate arrondissements (Grenoble, la Tour du Pin

and Vienne), 45 cantons and 564 communes. It is in the region of the XIV. Army Corps (Lyons). Its capital is Grenoble which is the seat of a court of appeal, of an académie (educational division), and of a bishop now in the province of Lyons, but before the Revolution in that of Vienne: other important towns are Vienne, St. Marcellin and la Tour du Pin. It contains coal and iron mines, slate and stone quarries and several mineral springs. The forests cover much ground. Flourishing industries are those of cement, glove making, silk weaving and paper making, metal work of various kinds, etc. Wheat, oats, vines, mulberries, chestnuts, tobacco, etc. are grown. The pastures feed horses, mules and cattle, while sheep from Provence migrate into the department in summer. Crémieu is a hill town with ancient fortifications and market. La Grande Chartreuse is in the department.

ISÈRE (anc. *ISARA*), tributary of the Rhône, south-east France, 180 m. long, with a descent of 7,550 ft. and a drainage area of 4,275 square miles. It flows through the departments of Savoie, Isère and Drôme. It rises as a torrent in the Galise glaciers of the French Graian alps, and has successive sections of its course orientated south-east, north-west and north-east-south-west, crossing the geological outcrops for the most part obliquely, and receiving the Arly and Arc, among other streams. After traversing the northern part of the axis of the Belledonne chain, it enters the wider Graisivaudan valley, floored by Jurassic strata, which is parallel to the Belledonne and flows south-westward to its union with its southern feeder, the Drac, just below Grenoble; it becomes navigable at Montmélian.

ISERLOHN, a town in the Prussian province of Westphalia, on the Baar, 17 m. W. of Arnsberg, and 30 m. E.N.E. from Barmen by rail. Pop. (1925) 30,296. Iserlohn is a very old town, its gild of armourers being referred to as "ancient" in 1443. Both in the town and neighbourhood there are numerous foundries and works for iron, brass, steel and bronze goods, while other manufactures include wire, needles and pins, fish-hooks, machinery, umbrella-frames, thimbles, bits and furniture.

ISFAHAN (*ès-fah-hahn'*) (the *Aspadana* of Ptolemy and *Spahan* of the Pehlevi texts), a Persian province and city. The province is bounded by the districts of Kashan and Gulpaigan on the north, Khuzistan on the west, Yazd on the east and Fars on the south. Data are insufficient on which to base any very accurate estimate of the total population, but it is doubtless well under 600,000. The amount of grain cultivation in some districts is very large and much is exported to other parts of Persia; but the cultivation of the poppy, cotton and tobacco constitutes the chief wealth of Isfahan province. The general elevation lies between 5,000 ft. in the east and 9,000 ft. in the west. The total revenue amounted to 8,007,433 krams (£ St. = 45 krams) in 1926-27.

The City of Isfahan, formerly the capital of Persia, is now only the administrative headquarters of the province. Choosing Isfahan for his capital, Shah Abbas I. made it a large and imposing town, and it had a population of at least 600,000 in the 17th century, whence the Persian saying *Isfahān nūsf-i-jahān* (Isfahan is half the world). The city lies in 32° 39' N. and 51° 40' E., at an elevation of 5,330 ft. along the north bank of the Zayinda Rud, which is crossed by three fine masonry bridges, one in the centre of the city, the Pul-i-Julfa because it leads to the suburb of Julfa on the south bank of the river, and two others at the extremity of the city. The Pul-i-Julfa or Allah Verdi Khan bridge, consists of 33 arches, is 388 yards in length with a paved roadway of 12 yards in breadth, and has galleried arcades on each side for foot passengers. The water supply of the city is principally from open canals led off from the river and from several streams and canals which come down from the hills in the north-west. The population (according to an estimate made in 1913) is 80,000 including that of the suburb of Julfa, but Lorini (1910) put it at 100,000 and Julfa 4,000. There is a small settlement of Jews, numbering some five thousand.

Viewed from the air, the city presents an immense expanse of mingled buildings and gardens, 30 m. in circuit; but, with the exception of the bazaars and other scattered agglomerations of houses, there is really no continuous inhabited area, except in the

centre. The city lies in a level tract of country which extends around it for miles, and a peculiar feature of the landscape is the large number of towers which dot the plain providing shelter for pigeons whose fertilizing manure forms a lucrative source of revenue.

THE MODERN CITY

Present-day Isfahan is largely a city of vanished glory. Many of its remarkable buildings having suffered from long neglect, an official was sent from Tehran in 1902 to inspect the crown buildings and to report on their condition. Pursuant to his report it was decided to repair and renovate some, while others were demolished and their timber, bricks and stone sold to local builders. Many of the gardens for which in the early days it was famous, became wildernesses. Of the many fine buildings constructed by the Safavis and during the Kajar dynasty very few remain.

The heart of the city and central point of interest at the present time is the Maidan-i-Shah, an immense and still imposing rectangular space, 560 yards from north to south, by 174 yards, bordered by brick buildings of two storeys of recessed arches or arcades, in front of which still survive a few stunted planes and sycamores. On the south side of the *maidan* is an arched portal leading to the famous Masjid-i-Shah, or royal mosque, completely covered with enamelled bricks of great brilliancy, which was built by Shah Abbas I. at the end of the 15th century and is even now one of the most beautiful buildings in the world. It is still in good repair. On the eastern side stands the blue-domed Masjid-i-Lutf Allah, and opposite, on the west side, is the Aali Kapu (highest gate or sublime porte), a lofty building in the form of an archway crowned in the fore part by an immense open balcony (which formerly served as an audience hall) supported by wooden columns commanding the square. This gateway leads into the gardens of the former royal palace, which covers a considerable area with its courts and pavilions, one of which, the Chihil Situn (hall of forty pillars), was famous as the verandah and throne-room of Shah Abbas. On the north side of the *maidan* is the gateway, covered with brick of faience, leading to the main bazaar.

From the precincts of the palace mentioned above runs the grand avenue or Chahar Bagh (four gardens), an avenue laid out by Shah Abbas I., nearly $\frac{3}{4}$ m. in length and two hundred feet broad, leading to the Julfa bridge. It was originally laid out with watercourses and fountains, and poplar and sycamore trees; most of the latter have disappeared, but the avenue, which has been sadly neglected, is now being restored. Between this avenue and the *maidan* is the Madrassah-i-Shah Husain, built in 1710, designed as a college for the training of mullahs and dervishes, and described by Curzon in 1892 as "one of the stateliest ruins that he saw in Persia." The bazaars of Isfahan lie behind the northern and eastern sides of the *maidan*, and in them it is possible to walk for 3 miles or more under covered shade. They have all the characteristic features of other Asiatic marts and the trade carried on preserves for Isfahan some at least of the prestige which once belonged to the city. Brocaded cloths, felt goods, saddles, native weapons, lacquered ware, articles of silver filigree-work and of metal are among the characteristic merchandise. The confluence of people in the bazaars is very great and tends to give an exaggerated idea of the populousness of the city.

Julfa, across the Zayinda Rud, is the Armenian suburb of Isfahan. Here Shah Abbas, about 1603, transplanted several thousand families of Christian Armenians from Julfa on the Araxes and settled them on the outskirts of his capital. They are strictly orthodox and have a cathedral. The population of the suburb has tended to decline in recent years.

In Isfahan itself the Church Missionary Society has a church, medical mission, industrial home and schools and hostels both for boys and girls. Among these the Stuart Memorial college is the leading educational institution in this part of Persia. It has some 200 boys on its rolls, and maintains a staff of four or five Englishmen in addition to its Persian teachers.

From Isfahan there are several unconstructed roads, and one quite suitable for motor traffic to Tehran (240 m.). Roads to Shiraz (290 m.) and to Kirman (400 m.) via Yazd are also,

amongst others, at any rate, passable by motor-cars. Isfahan is notably a centre of the metal-work industry, such as chiselled brass ware in bowls, vases, trays, painted pen cases, etc.; earthenware, pottery and tiles, reproducing old patterns; also printed calicoes of native design. A telephone service was installed in the city in 1911, and there is telephonic communication with Gulpaigan (100 m.) and with Dehkhurd (76 m.). The climate of Isfahan is damp and subject to extremes. The temperature varies from a maximum of 97.8° F in July to 23.8° in Jan. The relative humidity is 63 as compared with 54 at Tehran and 67 at Bushire. The average rainfall over a period of 17 years was 4.74 inches.

HISTORY

The natural advantages of Isfahān—a genial climate, a fertile soil and abundance of water for irrigation—must have always made it a place of importance. In the most ancient cuneiform documents, referring to a period between 3000 and 2000 B.C., the province of *Anshan*, which certainly included Isfahān, was the limit of the geographical knowledge of the Babylonians, typifying the extreme east, as Syria (or *Martu-ki*) typified the west. The two provinces of *Anshan* and *Subarta*, by which we must understand the country from Isfahān to Shuster, were ruled in those remote ages by the same king, who undoubtedly belonged to the great Turanian family; and from this first notice of Anshan down to the 7th century B.C. the region seems to have remained more or less dependent on the paramount power of Susa. The Western Iranians, after separating from their eastern brethren on the Oxus as early perhaps as 3000 B.C., are believed to have bifurcated into two branches, westward into Media and southward towards Persia. The first substantial settlement of the southern branch would seem to have been at Isfahān, where *Jem*, the eponym of the Persian race, is said to have founded a famous castle, the remains of which were visible as late as the 10th century A.D. At the commencement of the 7th century B.C. Persia and Anshan are still found in the annals of Sennacherib amongst the tributaries of Elymais, confederated against Assyria; but shortly afterwards the great Susian monarchy, which had lasted for full 2,000 years, crumbled away under continued pressure from the west, and the Aryans of Anshan recovered their independence, founding for the first time a national dynasty, and establishing their seat of government at Gabae on the site of the modern city of Isfahān.

The royal city of Gabae was known as a foundation of the Achaemenidae as late as the time of Strabo, and the inscriptions show that Achaemenes and his successors did actually rule at Anshan until the great Cyrus set out on his career of western victory. The provincial name of Anshan or Assan seems after the age of Cyrus to have given place to Gabene or Gabiane, which alone appears in the Greek accounts of the wars of Alexander and his successors, and in the geographical descriptions of Strabo. Gabae or Gāvi became gradually corrupted to *Jaī* during the Sassanian period, and it was thus by the latter name that the old city of Isfahān was generally known at the time of the Arab invasion. Subsequently the title of *Jaī* became replaced by *Sheheristān* or *Medīneh*, "the city" *par excellence*, while a suburb which took the name of *Yahudieh*, or the "Jews' town," gradually rose into notice and superseded the old capital.

Sheheristān and *Yahudieh* in the early ages of Islam are described as independent cities, each surrounded by a separate wall; but about the middle of the 10th century the famous Buyid king, known as the *Rukn-addaula* (*al-Dowleh*), united the two and many of the adjoining villages in one general enclosure which

was about 10m. in circumference. The city, which had now resumed its old name of Isfahān, continued to flourish till the time of Timur (A.D. 1387), who is said to have erected a *Kelleh Minār* or "skull tower" of 70,000 heads at the gate of the city, as a warning to deter other communities from resisting his arms. Isfahān, however, recovered and when the Safavid dynasty, who succeeded to power in the 16th century, transferred their place of residence to it from Kazvin, it rose rapidly in population and wealth. It was under Shah Abbas the first, the most illustrious sovereign of this house, that Isfahān attained its greatest prosperity. This monarch adopted every possible expedient, by stimulating commerce, and encouraging arts and manufactures, to attract visitors to his favourite capital. He built several magnificent palaces in the richest style of Oriental decoration, planted gardens and avenues, and distributed amongst them the waters of the Zende-rūd in an endless series of reservoirs, fountains and cascades. The baths, mosques, colleges, bazaars and caravanserais of the city received an equal share of his attention, and European artificers and merchants were encouraged to settle in his capital. Ambassadors visited his court from many of the first states of Europe, and factories were permanently established for the merchants of England, France, Holland, the Hanseatic towns, Spain, Portugal and Moscow. The celebrated traveller Chardin, who passed a great portion of his life at Isfahān in the latter half of the 17th century, has left a detailed and most interesting account of the statistics of the city at that period. He himself estimated the population at 600,000, though in popular belief the number exceeded a million. There were 1,500 flourishing villages in the immediate neighbourhood; the enceinte of the city and suburbs was reckoned at 24m. while the mud walls surrounding the city itself, probably nearly following the lines of the Buyid enclosure, measured 20,000 paces. In the interior were counted 162 mosques, 48 public colleges, 1,802 caravanserais, 273 baths and 12 cemeteries. The adjoining suburb of Julfa was also a most flourishing place. The first blow to the prosperity of modern Isfahān was given by the Afghan invasion at the beginning of the 18th century, since which date, although continuing till the end of the century to be the nominal head of the empire, the city has gradually dwindled in importance, and now only ranks as a second or third rate provincial capital.

For modern Isfahān see E. G. Browne, *A Year Amongst the Persians* (1926).

ISHII, KIKUJIRO, VISCOUNT (1866–), Japanese diplomatist, was born at Chiba, Japan. Like other members of his family, he was destined to enter official life. His intention was to become a lawyer, but his studies in international law gave him a deep interest in foreign affairs. His early days were full of incident: the Meiji reconstructions took place before his eyes, and the constant stream of foreign influences soon aroused in him a desire to see and understand other countries. Leaving the law faculty of the Imperial university in Tokyo in 1890, he was made attaché to the Japanese Legation in Paris. During his stay in Paris he applied himself to the study of European languages and became proficient in French and English. He was made third secretary in 1893, and about this time he devoted much attention to the problems of economics and international trade. He was distressed to observe that Japan did not hold such a position in the world's mart as in the opinion of most Japanese she deserved, and he set himself to find out the causes of the trouble. He endeavoured to form a Franco-Japanese mutual trade association, and although his efforts did not at first meet with the full success he desired, a certain stimulus was at once felt. Some part of the fruits of Ishii's labours were seen in the commercial mission which was sent from France to Japan in 1925.

In 1896 he was appointed Consul to Chemulpho (Jinsen) in Korea. After this he was made second secretary and later first secretary at the Japanese Legation in Peking. He was, therefore, in Peking in an official capacity during the Boxer rising. In 1900 he was appointed Secretary of the Head Office and chief of the telegraph section of the Home Office Department, which post he held until he became director of the Commerce Bureau in 1904. In 1907 he was sent to San Francisco and Vancouver in connection

with the anti-Japanese riots there. His success in this matter was the direct cause of his appointment in the following year as Vice-Minister for Foreign Affairs. His love of France and understanding of French problems made him an easy favourite for the ambassadorship to Paris in 1912, and on his return he took over the portfolio for Foreign Affairs in the new Government. He was chief of the Foreign Office for the period 1915–16, and in the latter year he was created Viscount, having been made Baron in 1912. He played a great part in American-Japanese relations and was a special envoy to the United States in 1917. He was nominated a member of the House of Peers in 1916. In 1920 Viscount Ishii was for the third time officially delegated to Paris. In 1927 he became one of the Japanese delegates to the Naval Disarmament Conference at Geneva. He returned to Japan in the autumn of 1927, and retired from diplomatic service.

Perhaps Ishii's greatest claim on his country's gratitude was his work in connection with the so-called "Gentlemen's Agreement" made between Washington and Tokyo in 1907. Lansing was the United States representative in the negotiations, for which reason the arrangement is sometimes called the "Lansing-Ishii Pact." The western coast of the United States made representations to Congress deploring the increasing immigration of Asiatics, notably Chinese and Japanese. It was claimed that owing to the Asiatic standard of living being lower than that of Americans, there was a serious possibility of California becoming a Japanese colony, and the aid of legislation was invoked. The Lansing-Ishii pourparlers resulted in the postponement of suggested legislative measures, and a yearly maximum (tentatively fixed at 150) was proposed. Japan, through Ishii, agreed not to issue passports for more than this number annually to enter the United States as residents, and it was through Japan's alleged breach of faith in connection with this agreement that the Immigration Restriction Act was passed by Congress in 1924. In substance, this Act was one of the proposals originally shelved by the labours of Lansing and Ishii.

In Dec. 1920 Viscount Ishii became Japanese delegate to the 11th session of the Council of the League of Nations. In Aug. 1923 he became President of the Council of the League and in the following month was one of the Vice-Presidents of the Assembly. In Sept. 1925 he was again a Vice-President of the Assembly. In March 1926 he was President of the Council at its 39th session, and as such acted as President of the Assembly (March 1926) until the election of the new President. (A. N. J. W.)

ISHIM, a town in the Uralsk Area of the R.S.F.S.R. in 56° 10' N. and 69° 18' E., on the Ishim river, a left bank tributary of the Irtysh. Average January temperature -3.8° F, average July 66.0° F, rainfall 17.5 in. per annum, half of which falls between June and August. Pop. (1926) 14,099. A railway from Sverdlovsk (Ekaterinburg) to Omsk, passes through the town. It is an agricultural centre, with fairs in December and May to which tallow, butter, skins, hides, cattle, horses, bristles, groceries and the products of local *kustar* (peasant) industries are sent.

ISHMAEL was the son of Abraham and his Egyptian concubine, Hagar. Through the jealousy of Sarah, mother and son were driven from the tribe, and saved from death by thirst through the miraculous discovery of a well (Gen. xxi. 8–20). Ishmael grows up an archer (Gen. xxi. 20) and a "wild ass of a man" (Gen. xvi. 12), living to the south and east of Palestine. He is the ancestor of twelve tribes of desert rangers (Gen. xxv. 12–18), of whom the most important seem to be Nebaioth (Assyrian Nabaitu and Pliny's Nabataei) and Kedar (Assyrian Kidru and Pliny's Cedrei). A third tribe, Dumah, may be the Domata of Pliny, and Jetur seems to be the eponymous ancestor of the Itureans.

"Ishmael," therefore, is used in a wide sense of the wilder, roving peoples encircling Canaan from the north-east to the south, related to but on a lower rank than the "sons" of Isaac. It is practically identical with the term "Arabia" as used by the Assyrians. Nothing certain is known of the history of these mixed populations. They are represented as warlike nomads and with a certain reputation for wisdom (Baruch iii. 23). Not improbably they spoke a dialect (or dialects) akin to Arabic or Aramaic. According to the Mohammedans, Ishmael, who is recognized as their

ancestor, lies buried with his mother in the Kaaba in Mecca. See T. Nöldeke, *Ency. Bib.*, s.v., and the articles EDOM, MIDIAN.

ISHPEMING, city, Marquette county, Michigan, U.S.A., in the northern part of the Upper Peninsula, 15m. from Lake Superior, at an altitude of 1,400 feet. It is on Federal highway 41, and is served by the Chicago and Northwestern, the Duluth, South Shore and Atlantic and the Lake Superior and Ishpeming railways. The population was 10,500 in 1920 (30.5% foreign-born white). It is in the heart of the Marquette Range iron district, and there are large mines within the city limits. The county in 1926 produced 3,940,581 gross tons of ore; gold, silver and marble also are found in the vicinity. The city has various manufacturing industries, with an aggregate output in 1925 valued at \$1,844,629. Ishpeming was settled about 1854 and incorporated as a city in 1873. The name is an Ojibway word, meaning "high up."

ISHTAR or **ĪSTAR**, the name of the chief goddess of Babylonia and Assyria, the counterpart of the Phoenician Astarte (q.v.). The earliest written form of the name is *Ash-dar*, an Accadian rendering of the older Sumerian Innini, "Lady of Heaven." Ishtar was the Semitic deity identified with the Sumerian virgin mother-goddess, who was always associated with the planet Venus. For this reason Ashdar, Ishtar, is undoubtedly the same deity as the south Arabian Athtar, god of the planet Venus. At all events it is now generally recognized that the name is Semitic in its origin. Where the name originated is likewise uncertain, but the indications point to Erech, where we find the worship of a great Sumerian mother-goddess having no association with a male counterpart flourishing in the oldest period of Babylonian history. She appears under various names, among which are Nanā, Innanna, Ninā and Anunit. As early as the days of Khammurabi we find these various names which represented originally different goddesses, though all manifest as the chief trait the life-giving power united in Ishtar. Even when the older names are employed it is always the great mother-goddess who is meant. Ishtar is the one goddess in the pantheon who retains her independent position despite and throughout all changes that the Babylonian-Assyrian religion undergoes.

See S. Langdon, *Tammuz and Ishtar* (Oxford, 1914); Joseph Plessis, *Etude sur les textes concernant Ishtar-Astarte* (1921).

ISHTIB (Shtip), town, south Serbia, Yugoslavia. Pop. (1921) 11,191. There are several mosques, a bazaar and a number of fountains. Wheat and the poppy are cultivated and there is a vegetable oil factory in the town. During the World War Ishtib was an important military centre, and a railway was constructed to Veles. There is lignite in the district, also some hot mineral springs.

ISIDORE OF ALEXANDRIA¹ (fl. c. A.D. 500), Greek Neoplatonist, head of the school in Athens in succession to Marinus who followed Proclus. He is known principally as the preceptor of Damascius who wrote a favourable *Life of Isidorus*. He was more of an enthusiast than a thinker, and inclined to theosophical speculation.

Damascius' *Life* is preserved by Photius in the *Bibliotheca*, and the fragments are printed in the Didot edition of Diogenes Laërtius. See Agathias, *Hist.* ii. 30; Photius, *Bibliotheca*, 181.

ISIDORE OF SEVILLE (ISIDORUS HISPALENSIS) (c. 570-636), Spanish encyclopaedist and historian, was born of a noble family from Cartagena. Distinguishing himself in controversies with the Arians, in 609 he was chosen to succeed his brother Leander as archbishop of Seville. In the provincial and national councils he played an important part, notably at Toledo in 610, at Seville in 619 and in 633 at Toledo, which profoundly modified the organization of the Church in Spain. His great work, however, was the preservation of the remnants of Greek and Roman culture against the barbarians. His chief writing, the *Originum sive etymologiarum libri xx*, written between 622 and 633 (last ed. by W. M. Lindsay, Oxford, 1911) condenses the fruit of his

¹With Isidore of Alexandria has been confused an Isidore of Gaza, mentioned by Photius. The latter accompanied Damascius to the Persian court when Justinian closed the schools in Athens in 529. Suidas says that Hypatia was the wife of Isidore of Alexandria but this is chronologically impossible.

extensive reading in the seven liberal arts, the sciences, architecture, war, political theory, the nature of spiritual beings, etc. It was much cited by the Schoolmen, and though not original, is interesting for the history of thought.

Of the *Libri differentiarum sive de proprietate sermonum*, the first book is a collection of synonyms and the second of explanations of metaphysical and religious ideas. The *De scriptoribus ecclesiasticis* or *De viris illustribus*, was a continuation of the work of St. Jerome and of Gennadius. The *De natura rerum*, ed. G. Becker (Berlin, 1857), a treatise on astronomy and meteorology, contained the sum of physical philosophy during the early middle ages. His *Regula monachorum* was adopted by many of the monasteries in Spain during the seventh and eighth centuries. The *De Fide Catholica contra Iudeos* was edited by K. Weinhold (Paderborn 1874). The collection of canons known as the *Isidoriana* or *Hispalensis* is not by him, and the following are also of doubtful authenticity: *De ortu ac obitu patrum qui in Scriptura laudibus efferuntur*; *Allegoriae scripturae sacrae et liber numerorum*; *De ordine creaturarum*.

Isidore's works were edited by F. Orevale (Rome, 1797-1803, 7 vols.), and reproduced in Migne, *Patrol. Lat.* 81-84. Mommsen has edited the valuable historical works, *Chronica maiora* or *Chronicon de sex aetatibus* (from the creation to A.D. 615) and the "Historia Gothorum, Wandalorum, Sueborum" in the *Monum. Germ. hist., auctores antiquissimi*; *Chronica minora II*. See also C. Canal, *San Isidoro* (Seville, 1897); E. Brehaut, *An Encyclopaedist of the Dark Ages, Isidore of Seville* (New York, 1912); C. H. Beeson, *Isidor-Studien* (Munich, 1913); A. Schmekel, *I. von Sevilla* (Berlin, 1914) and Manitius, *Gesch. d. latein. Lit.* (1911).

ISIN (modern Ishan Bahriyat). The identification of the ancient Isin with this site, which lies 14 miles due south of Afaj, in 31° 51' N. and 45° 17' E., is due to Col. Stevenson. The city of Isin was of late foundation and does not appear in inscriptions until the last years of the Ur-Engur dynasty of Ur. After the final overthrow of the Sumerians of that city state the two dominant principalities in Babylonia were Larsa and Isin, which were of Semitic origin. From 2357 B.C. these two states had each a synchronous dynasty. In spite of various changes and the growth of the first dynasty of Babylon Isin managed to maintain itself, until in 2126 B.C. when it was conquered by the Elamites who had previously made themselves masters of Larsa. Finally both cities were united to the Babylonian empire under Hammurabi.

The site consists of a low mound of about 200 acres, extending from north-east to north-west. On the summit is a large building. Such scanty excavation as has been done by Langdon shows that the site was occupied in Neo-Babylonian times. There is a further mound which has not yet been explored.

ISINGLASS, a pure form of commercial gelatin obtained from the swimming bladder or sound of several species of fish. The sturgeon is the most valuable, various species of which, especially *Acipenser stellatus* (the seuruga), *A. ruthenus* (the sterlet) and *A. güldenstädtii* (the ossétr), flourish in the Volga and other Russian rivers, in the Caspian and Black seas, and in the Arctic ocean, and yield the "Russian isinglass"; a large fish, *Silurus parkerii*, and probably some other fish, yield the "Brazilian isinglass"; other less definitely characterized fish yield the "Penang" product; while the common cod, the hake and other *Gadidae* also yield a variety of isinglass. The sounds, having been removed from the fish and cleansed, undergo no other preparation than desiccation or drying, an operation needing much care; but in this process they are subjected to several different treatments. If the sound be unopened the product appears in commerce as "pipe," "purse" or "lump isinglass"; if opened and unfolded, as "leaf" or "honeycomb"; if folded and dried as "book," and if rolled out, as "ribbon isinglass." Russian isinglass generally appears in commerce as leaf, book, and long and short staple; Brazilian isinglass, from Para and Maranham, as pipe, lump and honeycomb; the latter product, and also the isinglass of Hudson bay, Penang, Manila, etc. is darker in colour and less soluble than the Russian product.

The finest isinglass, which comes from the Russian ports of Astrakhan and Taganrog, is prepared by steeping the sounds in

hot water in order to remove mucus, etc.; they are then cut open and the inner membrane exposed to the air; after drying, the outer membrane is removed by rubbing and beating. As imported, isinglass is usually too tough and hard to be directly used. To increase its availability, the raw material is sorted, soaked in water till it becomes flexible, and then trimmed; the trimmings are sold as a lower grade. The trimmed sheets are sometimes passed between steel rollers, which reduce them to the thickness of paper; it then appears as a transparent ribbon, "shot" like watered silk. This is dried, and, if necessary, cut into strips.

The principal use of isinglass is for clarifying wines, beers and other liquids. This property is the more remarkable since it is not possessed by ordinary gelatin; it has been ascribed to its fibrous structure, which forms a fine network in the liquid in which it is disseminated, and thereby mechanically carries down all the minute particles which occasion the turbidity. The cheaper varieties are generally used. Of secondary importance is its use for culinary and confectionery purposes, e.g., in making jellies, stiffening jams, etc. Here it is often replaced by the so-called "patent isinglass," which is a very pure gelatin, and differs from natural isinglass by being useless for clarifying liquids. Mixed with gum, it is employed to give a lustre to ribbons and silk; incorporated with water, Spanish liquorice and lamp-black, it forms an Indian ink; a solution, mixed with a little tincture of benzoin, brushed over sarsenet and allowed to dry, forms the well-known "court plaster." Another plaster is obtained by adding acetic acid and a little otto of roses to a solution of fine glue. It also has valuable agglutinating properties; on being dissolved in two parts of pure alcohol, it forms a diamond cement, cooling to a white, opaque, hard solid; it also dissolves in strong acetic acid to form a powerful cement, which is especially useful for repairing glass, pottery, and like substances.

ISIS, the most famous of the Egyptian goddesses. She was of human form, in early times distinguished only by the hieroglyph

of her name  upon her head. Later she commonly wore the

horns of a cow, and the cow was sacred to her; it is doubtful, however, whether she had any animal representation in early times, nor had she possession of any considerable locality until a late period, when Philae, Behbēt and other large temples were dedicated to her worship. Yet she was of great importance in mythology, religion and magic, appearing constantly in the very ancient Pyramid texts as the devoted sister-wife of Osiris and mother of Horus. In the divine genealogies she is daughter of Keb and Nut (earth and sky). She was supreme in magical power, cunning and knowledge.

Isis was identified with Demeter by Herodotus, and described as the goddess who was held to be the greatest by the Egyptians; he states that she and Osiris, unlike other deities, were worshipped throughout the land. The importance of Isis had increased greatly since the end of the New Kingdom. The great temple of Philae was begun under the XXXth Dynasty; that of Behbēt seems to have been built by Ptolemy II. The cult of Isis spread into Greece with that of Serapis (q.v.), early in the 3rd century B.C. In Egypt itself Isea, or shrines of Isis, swarmed. At Coptos Isis became a leading divinity on a par with the early god Min. About 80 B.C. Sulla founded an Isiac college in Rome, but their altars within the city were overthrown by the consuls no less than four times in the decade from 58 to 48 B.C., and the worship of Isis at Rome continued to be limited or suppressed by a succession of enactments which were enforced until the reign of Caligula. At Philae the temple of Isis was frequented until the middle of the 6th century when the last remaining shrine of Isis was finally closed.

See G. Lafaye, art. "Isis" in Daremberg et Saglio, *Dictionnaire des antiquités* (1900); id. *Hist. du culte des divinités d'Alexandrie hors de l'Égypte* (1883); Meyer and Drexler, art. "Isis" in Röscher's *Lexikon der griech. und röm. Mythologie* (1891-92) (very elaborate); E. A. W. Budge, *Gods of the Egyptians*, vol. ii. ch. xiii.; Ad. Rusch, *De Serapide et Iside in Graecia cultis* (dissertation) (Berlin, 1906). (The author especially collects the evidence from Greek inscriptions earlier than the Roman conquest; he contends that the mysteries of Isis were not equated with the Eleusinian mysteries.)

ISKELIB, a town in Asia Minor, altitude 2,460 ft., near the left bank of the Kizil Irmak (anc. *Halys*), 100 m. in a straight line north-east of Angora and 60 S.E. of Kastamuni. Population (1927) 53,722. It lies several miles off the road, between Changri and Amasia in a picturesque *cul de sac* amongst wooded hills, at the foot of a limestone rock crowned by the ruins of an ancient fortress. To the south of the town are saline springs, from which salt is extracted.

ISLA, JOSÉ FRANCISCO DE (1703-1781), Spanish satirist and Jesuit, first showed his gifts in the *Triunfo del amor y de la lealtad: Dia Grande de Navarra*, a satirical description of the ceremonies at Pamplona in honour of Ferdinand VI.'s accession; its sly humour so far escaped the victims that they thanked the writer for his appreciation of their local efforts, but the true significance of the work was discovered shortly afterwards, and the protests were so violent that Isla was transferred by his superiors to another district. He gained a great reputation as an effective preacher, and his posthumous *Sermones morales* (1792-93) justify his fame in this respect. His position in the history of Spanish literature is due to his *Historia del famoso predicador fray Gerundio de Campazas, alias Zotes* (1758), a novel which wittily caricatures the bombastic eloquence of pulpit orators in Spain.

See B. Gaudeau, *Les Prêcheurs burlesques en Espagne au XVIII^e siècle* (1891); V. Cian, *L'Immigrazione dei Gesuiti spagnuoli letterati in Italia* (Torino, 1895).

ISLAM (Arabic, "submission" to the will of God) is the name which all Muhammadans give to their religion; it claims to be a divine revelation communicated to the world through Muhammad, who was the last of a succession of inspired prophets, beginning with Adam. Its *doctrine* and *practice* are based upon (1) the Word of God, the Qur'an (see KORAN); (2) the traditions (Hadith), or rather the sayings and manner of life (*sunna*) of Muhammad, as contained in the traditions.

Creed.—The Muslim creed is "There is no god but God (Al-lāh): Muhammad is the apostle of God." The acceptance of this faith is held to imply belief in (i.) God, (ii.) the angels, (iii.) the inspired books, (iv.) the prophets, (v.) the day of judgment and (vi.) God's predestination of good and evil. In the Qur'an the unity of God is emphasized as against the mistaken conception of the Christian Trinity, and the divine nature is expounded through an enumeration of His various qualities under the three categories of power, unity and goodness. Around the throne of God are the angels, pure, sexless beings, some of whom bear the throne, while others praise Him continually; they are also His messengers and are sent to help the faithful in their fight with unbelievers. Some are the guardian angels of men, others are the watchmen of hell.

Creation.—God created the world in six days, and set Adam in the garden of paradise, but, tempted by Satan, Adam fell. Intermediate between men and angels are the Jinn, male and female, created from fire; some are believers, others are infidels. The devil is sometimes described as one of the angels, sometimes as one of the Jinn; he was expelled from heaven because he refused to prostrate himself before Adam at his Lord's command.

Prophets.—God has revealed Himself to man through prophets, to some of whom he has given a book, e.g., to Moses the Law (*taurāt*), to Jesus the Gospel (*injl*), to Muhammad the Qur'an. A prophet has been sent by God to each people, but Muhammad is "the seal of the prophets," i.e., the last of the series. His mission at first was to warn men of imminent judgment, and in the earlier chapters of the Qur'an descriptions of the resurrection, the last judgment, and paradise and hell frequently occur.

Practice.—The religious practices obligatory on the believer are (i.) the recital of the creed; (ii.) the performance of divine worship five times a day; (iii.) the fast in the month of Ramadan; (iv.) payment of the legal alms; (v.) the pilgrimage to Mecca.

Creed.—The creed must be recited at least once in a lifetime aloud, correctly, with full understanding of its meaning and with heartfelt belief in its truth.

Worship.—Every man who professes Islam is required in

ordinary life to worship God five times in each day. In the Qur'ān only four times are mentioned. "Wherefore glorify God, when the evening overtaketh you, and when ye rise in the morning, and unto Him be praise in Heaven and earth; and in the evening and when ye rest at noon" (xxx. 16-17), but commentators say the "evening" includes the sunset and after sunset. The five times therefore are: (1) Dawn or just before sunrise, (2) just after noon, (3) before sunset, (4) just after sunset and (5) just after the day has closed. Tradition decides within what limits the recitals may be delayed without impairing their validity. The service (*Ṣalāt*—incorrectly translated "prayer"—for which the word *du'ā* is used) is preceded by the lesser ablution (*wuḍū*) consisting in the washing of face, hands (to the elbows) and feet in prescribed manner. Complete washing of the body (*ghusl*) is required only after legal pollution. The worshipper faces the *qibla* (direction of prayer), which was at first Jerusalem, but was changed by the prophet to Mecca. In a mosque the *qibla* is indicated by a niche (*mihrāb*) in one of the walls. The service consists of prescribed ejaculations, and the recital of parts of the Qur'ān, always including the first *sūra*, accompanied by prostrations of the body. (See Muḥammad Ali, *The Holy Qur'ān*, preface xviii-xxv.) Detailed physical positions are prescribed for each part of the worship; these vary slightly in the four *sunni* schools. On a journey, in time of war or in other special circumstances, the set form of worship may be modified in accordance with appointed rules. In place of (2) there is the prayer of the assembly, which is observed on a Friday (*yaum al-jam'a*, "the day of assembly") in a mosque, and is usually accompanied by a bidding-prayer or declamation (*khutba*) delivered from a step of the pulpit (*minbar*). Special services are also prescribed for certain occasions, as on the eclipse of the sun or the moon, etc. Among the Sūfis special attention is given to informal prayer, consisting chiefly in the continual repetition of the name of God (*dhikr*). (See SUFFRISM.) This is still a characteristic of some of the Dervish (*q.v.*) communities.

Fasting.—The command to fast begins with the words, "O ye who believe! There is prescribed for you the fast, as it was prescribed for those before you." The expression "those before you" has been taken to refer to the Jews, who fasted on the day of atonement, but more probably refers to the long fast of 36 days observed by the eastern Christians. In the passage of the Qur'ān referred to (ii. 179-181) Muslims are required to fast during the month of Ramaḍān, "wherein the Qur'ān was revealed," but if one is on a journey or sick he may fast "another number of days," and if he is able to fast and does not, "he may redeem it by feeding a poor man," but "if ye fast, it is better for you." This fast was probably instituted in the second year at Medina. At that time the corrected lunar year was in use, and Ramaḍān, the ninth month, was always in the winter. A few years later Muḥammad decreed the use of the uncorrected lunar year, which remains the standard of time for the Muslim world, so that the month of fasting now occurs at all seasons of the year in turn. The fast is severe, and means entire abstinence from food and drink from sunrise to sunset each day of the month. The fast is associated with the statement that in this month God sent down the Qur'ān from the seventh heaven to Gabriel in the lowest that it might be revealed to the Prophet.

Alms.—Alms are of two kinds: (1) the legal and determined (*zakāt*), and (2) voluntary (*sadaqāt*). The former were given in cattle, grain, fruit, merchandise and money once a year after a year's possession. For cattle a somewhat elaborate scale is adopted. Of grain and fruit a tenth is given if watered by rain, a twentieth if the result of irrigation. Of the value of merchandise and of money a fortieth is prescribed. In the early days of Islam the alms were collected by officials and used for the building of mosques and similar religious purposes. At the present time the carrying of these prescriptions is left to the conscience of the believers, who pay the alms to any needy fellow-Muslim.

Pilgrimage.—The fifth religious duty of the Muslim is the pilgrimage (*hajj*) to Mecca, which should be performed once by every Muslim "if he is able," that is, if he can provide or obtain the means to support himself on pilgrimage and his family during

his absence, and if he is physically capable. The pilgrimage is made at one time of the Muslim year, namely, from the 7th to the 10th of the month Dhu'l-Hijja. For the arrangements for the journey from various countries to Mecca, see CARAVAN. When the pilgrim arrives within five or six miles of the holy city he puts off his ordinary dress after ablution and prayer, and puts on the two seamless wrappers which form the dress of the pilgrim (the *ihrām*), who goes without head-covering or boots or shoes. He must not shave at all, or trim the nails or anoint the head during the ceremonial period. The chief parts of the ceremonial are the visit to the sacred mosque (*masjid al-harām*), the kissing of the black stone, the compassing of the Ka'ba (the *Tawāf*) seven times, three times running, four times slowly, the visit to the Maqām Ibrahim, the ascent of Mount Safā and running from it to Mount Marwa seven times, the visit to Mount Arafāt, hearing a sermon, and going to Muzdalifa, where he stays the night, the throwing of stones at the three pillars in Minā on the great feast day, and the offering of sacrifice there. (For the localities see MECCA.) After the accomplishment of these ceremonies the ordinary dress is resumed, the pilgrimage is finished, but the pilgrim usually remains another three days in Mecca, then visits Medina to pay his respects to the tomb of Muḥammad. Beside the *hajj* (great pilgrimage) Islam also recognizes the merit of the *'umra* (or lesser pilgrimage), *i.e.*, a religious visit to Mecca at any time accompanied by most of the ceremonies of the *hajj*.

The ceremonies of the *hajj* have been described by several European travellers who have witnessed them, such as J. L. Burckhardt in 1814, Sir Richard Burton in 1853. (See bibliography to MECCA.) A concise account of them is given in T. P. Hughes *Notes on Muhammadanism*, 3rd ed. (1894). Details in vol. i. of Bukhārī's traditions (Houdas and Marçais's French translation, i. 493-567).

The Development of Islam.—The battle of Siffin (657) between 'Alī and Mu'awiya was the occasion of the first breach in the unity of Islam, and the results remain to this day. The occasion was in the first case political in connection with the disputed succession to the Caliphate (*q.v.*). After the battle 'Alī was compelled to submit his claims to arbitration, whereupon a number of his supporters (the Kharijites or Khawārij) broke away from him, saying that there should have been no appeal save to the Book of God.

The most important sectarian division in Islam—Sunnī, Shiah and Khawārij—have their origin in divergent theories on the office of the Caliph (Khalifa), the head of the Muslim community as successor of the Prophet.

Sunnīs.—The Sunnī (Sunnite) form by far the larger number—at the present day about 150 millions out of a total of nearly 235 millions. They hold that the Caliphate is an elective office and must be occupied by a member of the tribe of the Quraysh. They derive their name from the *sunna*, or "path," *i.e.*, the traditional practice of Muḥammad, as set forth in the Hadīth (or Traditions); of these traditions six collections are regarded as authoritative by the Sunnīs, viz., (1.) the *Kitāb al-jāmi' as-Ṣaḥīh* of Bukhārī (*q.v.*) (810-870). This is the most respected throughout the Muslim world and most carefully compiled (ed. L. Krehl and T. W. Juynboll, Leyden,—and frequently in the East; also with many commentaries. French translation by O. Houdas and W. Marçais, Paris, 1903 *sqq.*). (ii.) The *Ṣaḥīh* of Muslim (817-875) with an introduction on the science of tradition (ed. Calcutta, 1849, etc.). (iii.) The *Kitāb as-Sunan* of Abū Dā'ūd (817-888) (ed. Cairo, 1863, Lucknow, 1888, Delhi, 1890). (iv.) The *Jāmi' as-Ṣaḥīh* of Tirmidhī (*q.v.*). (v.) The *Kitāb as-Sunan* of Nasā'ī (830-915) (ed. Cairo, 1894). (vi.) The *Kitāb as-Sunan* of Ibn Māja (824-866) (ed. Delhi, 1865-1889). (See A. Guillaume, *The Traditions of Islam*, 1924.) To the Qur'ān and the Hadīth, as authoritative sources of religious doctrine and practice, the Sunnīs add *Ijmā'*, the universal consent which is held to justify practices or beliefs, although they are not warranted by the Qur'ān or tradition, and may be inconsistent with the apparent teaching of one or both of these. These beliefs and practices, which had often come from the pre-Islamic customs of those who had become believers, seemed to have escaped notice

until the Abbasid period. They were too deeply rooted in the lives of men to be abolished. It became necessary either to find a tradition to abrogate the earlier forbidding one, or to acknowledge that *ijmā'* is higher than the tradition. The former expedient was resorted to by some later theologians (e.g., Nawāwī) by a fiction that such a tradition existed though it was not found now in writing. But in earlier times some (as Ibn Qutayba) had adopted the latter alternative, saying that the truth can be derived much earlier from the *ijmā'* than from the tradition, because it is not open to the same chances of corruption in its transmission as the latter. Tradition itself was found to confirm this view, for the Prophet is related to have said, "My people does not agree to an error."

But *ijmā'* itself has been used in different senses: (i.) the *ijmā'* of Medina was used to indicate the authority coming from the practices of the people of Medina (*see below*). (ii.) The *ijmā'* of the whole community of Muslims is that most commonly recognized. It was used to support fealty to the Abbasid dynasty. By it the six books of tradition mentioned above are recognized as authoritative, and it is the justification of the conception of Muhammad as superhuman. (iii.) Some of the more thoughtful theologians recognize only the *ijmā'* of the doctors or the teachers of Islam (the *mujtahidūn*), these being restricted by the orthodox to the first few generations after Muhammad, while the Shi'ites allow the existence of such up to the present time.

The fourth basis of Islam, according to the Sunnis, is *qiyās*, i.e., analogy. It is that process by which a belief or practice is justified on the ground of something similar but not identical in the Qur'ān, the tradition, or *ijmā'*. Originally it seems to have been instituted as a check upon the use of private opinion (*ra'y*) in the teaching of doctrine. The extent to which it may be used is a subject of much discussion among theologians. Some would apply it only to a "material similarity," others to similarity of motive or cause as well.

By the ninth century there were established in the Sunnī world the four schools of law, which exist to the present day—Hanafī, Mālikī, Shāfi'ī and Hanbalī—(for these and the wide extension of the concept of law in Islam, *see ISLAMIC LAW*). They assiduously cultivated the various branches of Muslim theology and law, and the students they trained became the *'ulamā* (or, learned), who have filled such an important place in the history of Sunnī countries. In former times the colleges of Damascus, Baghdad, Nishapur, Bukhara, Cairo, Qayrawan, Seville, Cordova, were thronged by thousands of students; and the Azhar university in Cairo still preserves some of the characteristics of these earlier seats of learning. From their ranks were chosen the *qādis* (judges), the *muftis* (the authoritative exponents of the sacred law), and in countries like Turkey, in which they enjoyed the confidence of the government, they occupied numerous other official positions, and acquired wealth and power. The *'ulamā* have constituted the only equivalent in the Muslim world to the priesthood in Christendom, and have been active in the defence of orthodoxy and in resisting foreign influences. The Turkish republic has deprived them of most of their power, and in countries under European control their influence has greatly declined. Among the Sunnis the various orders of Dervishes (*q.v.*) have achieved a vast expansion.

The foundations of Sunnī theology for succeeding generations were laid in the 10th century by Abu'l-Ḥasan al-Ash'arī (*see ASH'ARĪ*); he was for 40 years a Mu'tazilite, then became orthodox, and at once applied rational methods for the support and interpretation of the orthodox faith. Before him, reason had not been allowed any scope in orthodox theology. He was not the first to use it; some teachers (as al-Junayd) had employed it in teaching, but only in secret and for the few. The methods of scholastic philosophy were now introduced into Muslim theology. The chief characteristic of his religious teaching was the adoption of the *via media* between materialistic grossness and the ideas of pure speculative philosophy. Thus he taught, as to the attributes of God, that they exist, but are not to be compared with human attributes; as to His visibility, that He can be seen but without the limitations of human sight. As to the great question of free

will, he denied man's power but asserted his responsibility. So he passed in review the doctrines of God, faith, the Qur'ān, sin, intercession, etc., and for the first time in the history of Islam produced a systematic theology. The teaching of Ash'arī was taken up and propagated by the Buwayhids soon after his death, and was developed and perfected by Abū Bakr al-Bāqilānī, the Cadi, (*d.* 1012), but up to the middle of the 5th century of Islam (*c.* A.D. 1058) was suspected elsewhere and confounded with Mu'tazilism. The Ash'arite al-Juwayni (known as Imām al-Ḥaramayn) was persecuted under Toghrul Beg (*c.* 1053) and exiled, but was restored under Alp Arslan by the vizier Nizām al-Mulk, who founded an Ash'arite college (the Nizāmiyya). In the West, Ibn Hazm (*q.v.*) fiercely opposed the system, but Ghazālī established its orthodoxy in the East, and it spread from Persia to Syria and Egypt under the Ayyūbids and Mamluks and thence to the Almohades in Africa under Ibn Tūmart (1130). It remains the predominating influence to the present day, its only serious rival being the theological system of al-Māturidī, a Hanafite (*d.* 945), whose creed as represented in that of an-Nasafī is still used largely by the Turks. Since the 12th century no great theological movement has been made in Islam. The quiet of religious life has thrice been broken by Wahhābism (*q.v.*) in Arabia, by Bābism (*q.v.*) in Persia, and by the Ahmadiyyah (*see below*) in India.

Shi'ites.—Historically the next most important group, but at the present time shrunk in numbers to about 12 millions only, is that of the Shi'ites (Shi'ah, i.e., "the party of 'Alī"). They regard 'Alī and his descendants as the only rightful Caliphs. For them the Caliphate was a God-given office, and not one to be given by human appointment. Belief in this was an ordinance of God, an article of the faith. He who did not accept it as such was an unbeliever. Moreover, the party consisted largely of Persians who on their conversion to Islam brought with them many of the doctrines of their old faith, religious and political. Among these was the belief in the divinity of the sovereign and the duty of worshipping him. Gnostic elements, which may have come from the old religion of Babylonia, were also introduced. The idea of an absolute personal and hereditary monarchy was thus developed among the subjects of 'Alī. But in Islam there is no separation between politics and theology. The theological position of the Shi'ites was that the superhuman power of Muhammad descended to the members of his house ('Alī and his children), so that they could interpret the will of God and tell future events.

The Shi'ites quite early broke up into a number of sects, several of which no longer exist. The most important at the present day is that of the Twelvers (the Ithnā'ashariyya) so called because they accept as Imāms twelve of the descendants of 'Alī. The 12th Imām, Muhammad, is said to have disappeared about 874, but to be still living, and he will return in the last days to establish the Shiah faith in the world. This has been the official creed of Persia since the beginning of the 16th century, and that of most of the Shi'ites of India. The Ismā'ilīs or Severners are the followers of Ismā'il, whom they regard as the 7th Imām, rather than his younger brother, Mūsā (797), who is accepted by the Twelvers. To the Ismā'ilīs belong the Carmathians (*q.v.*), the Fatimites (*q.v.*), the Assassins (*q.v.*) and the Druses (*q.v.*). The Zaydites are the followers of Zayd, a grandson of Husayn, and are the most moderate of the Shi'ites, for though holding that the imamate belongs only to the descendants of 'Alī by Fātima, and that any of these might be Imām (even though two or three should be in existence at the same time), they allow that circumstances might justify the appointment of another caliph for the time. Thus they acknowledge the imamate of Abū Bakr, and 'Umar, though 'Alī was more entitled to the office. One branch of the Zaydites, arising in the Yemen about 893, has remained there until the present day.

The Shi'ites differ from the Sunnites not only in their political theory of the caliphate, but in matters of law and ceremonial. They reject all the Sunnite books of Hadith or tradition, but have collections of traditions of their own, and claim to follow the Sunna, or way, of the Prophet, even as the Sunnis do. An allegorical and mystical interpretation reconciles the words of the Qur'ān with the inordinate respect paid to 'Alī; the Sunnite doctrine of

the uncreated Qur'ān is denied. To the creed "There is no god but God; Muḥammad is the apostle of God" they add "and 'Alī is the vice-regent of God" (*walī*, properly "confidant"). There are some modifications in detail as to the four main religious duties of Islam—the prescriptions of ritual purity, in particular, being made the main duty of the faithful. The prayers are almost exactly the same, but to take part in public worship is not obligatory, as there is at present no legitimate imām whose authority can direct the prayer of the congregation. Pilgrimage to Mecca may be performed by a hired substitute, or its place can be taken by a visit to the tombs of Shi'ite saints, e.g., that of 'Alī at Najaf, of Ḥusayn at Karbata, of Rizā at Mashhad, or of the "unstained Fātima" at Qum (daughter of Mūsā, the 7th Imām). The Shi'ites are much the most zealous of Muslims in the worship of saints (real or supposed descendants of 'Alī) and in pilgrimages to their graves, and they have a characteristic eagerness to be buried in those holy places. They celebrate many religious feasts. Of these the great sacrificial feast (*'id-i-Qurbān*; Turkish *Qurbān Bairām*) is also Sunnite; the first ten days of the month Muḥarram are dedicated to the mourning for the death of Ḥusayn at Karbalā which is celebrated by passion-plays (*ta'ziya*), while the universal joy of the Nawrūz, or the new year of the old Persian calendar, receives a Muslim sanction by the tradition that on this day the prophet conferred the caliphate on 'Alī. Shi'ite law permits temporary marriages (*mut'a*), provided that a dower is specified, and that a period—a year, a month or a day—is fixed. Another special doctrine is that it is lawful for a man in case of danger or persecution to deny his faith (*taqiyya*, "caution"), and pass himself off as a Sunnī. The best accounts of Shi'ism are in E. G. Browne, *History of Persian Literature in Modern Times*, index s.v. Shi'a (1924), and I. Goldziher, *Vorlesungen über den Islam*, 196 sqq. (1925).

The **Khawarij**, the third sect (originating like the other two in disputes over the caliphate), added to their political doctrine that this office was open to any believer whom the faithful might consider fitted for it, even though he be a black slave; certain theological doctrines on the subject of sin, e.g., they regarded any one who had committed one of the greater sins as no longer a believer, and they rejected the doctrine of justification by faith without works. Under the Umayyads they were a source of trouble to the government through their constant risings, but under the Abbasids they became restricted to Eastern Arabia, and only a few of them now survive there and in North Africa.

Apart from these three important groups which had their origin in primitive times and exist to the present day, there has been in Islam an immense activity in theological speculation, resulting in the formation of many sects, the majority of which have now ceased to exist. The first impulse to these speculations appears to have come from contact with Christian theologians in Damascus during the Umayyad Caliphate. Two sects arose under these influences—that of the Murjiites and that of the Qadarites. The Murjiites ("postponers") were so called because they postponed the judgment of human actions until the Day of Judgment. In politics they accepted the Umayyads as *de facto* rulers, since they were Muslims, and left the judgment of their actions to God. As theologians they taught that religion consists in belief (*īmān*) in the unity of God and in His apostle, and in that alone, consequently no one who held this faith would perish eternally, though he had been a sinner. This was opposed to the Khārijite doctrine that the unrepentant sinner would perish eternally, even though he had professed Islam.

The Qadarites were concerned with the doctrine of predestination and free-will. So long as Muslims were fighting the battles of Islam they naturally paid most attention to those revelations which laid stress on the absolute determination of a man's destiny by God. They fought with great bravery because they believed that God had fore-ordained their death or life and they could not escape His will. In the quieter realm of town and court life and in their disputations with Christians they were called upon to reconcile this belief with the appeals made in the Qur'ān to man's own self-determination to good, to courage, etc. The Qadarites declared that man had power over his own actions. But the teaching of

predestination had gained too great a hold on Muslims to be thus displaced. The teaching of the Qadarites was held to be heresy, and one of its first professors, Ma'bad al-Juhānī, was put to death in 699.

Many of the Qadarites were also Mu'tazilites, whose founder was Wāsil ibn 'Atā, who separated himself (whence his followers were called Mu'tazilites, "Separatists") from his teacher Ḥasan al-Baṣrī, and founded a school which became numerous and influential. The Mu'tazilites objected to the attributes of God being considered in any way as entities beside God; they explained away the anthropomorphisms used in speaking of the Deity; they regarded the Qur'ān as created and as a product of Muḥammad writing under the divine influence. Briefly, they asserted the supremacy of reason (*'aql*) as distinct from faith received by tradition (*naql*). They also called themselves "the people of justice and unity" (*Ahl al-'adl wat-tauhid*). Such a faith as this naturally found favour rather with the thinking classes than with the uneducated multitude, and so went through many vicissitudes. At the time of its appearance and until the reign of Ma'mūn its adherents were persecuted as heretics. After discussions among the theologians Ma'mūn took the decided step of proclaiming that the Qur'ān was created, and that a belief in this dogma was necessary. Mu'tazilites were appointed to official posts, and an inquisition (*mihna*) was appointed to enforce belief in their doctrine. This movement was strongly opposed by the orthodox and especially by Ahmad ibn Ḥanbal (*q.v.*). By him the founding of theology on reason was rejected, and he suffered persecution for his faith. See W. N. Patton, *Ahmed ibn Hanbal and the Mihna*, (Leyden, 1897). Mu'tazilism retained its sway until 849, when the caliph Mutawakkil again declared the Qur'ān uncreate and restored orthodoxy.

According to an early tradition Muḥammad said that Islam would be divided into 73 sects, of which 72 would perish and one would be saved. The Arabic writers on the heretical sects of Islam feel compelled therefore to restrict their number to 72, but as they adopt diverse classifications the number of sects they describe amounts to some hundreds. The fullest accounts available in translation are given by Shāhristānī, *Religionpartheien und Philosophenschulen*, übersetzt von Th. Haarbrucker (1851), and by 'Abd al-Qāhir al-Baghādādī, *Moslem Schisms and Sects*, trans. by K. C. Seelye (1920).

RECENT DEVELOPMENTS

In modern times the most important sectarian developments have been those of the Wahhābis (*q.v.*), the Bābis (*q.v.*), and the Ahmadiyya. The last of these movements was started by Mirzā Ghulām Ahmad, who, in 1879, began to preach in the village of Qadian in the province of the Punjab, India. He claimed to be not only the promised Mahdi but also the promised Messiah—personages generally held to be distinct in ordinary Muslim theology. Another modification he introduced into Islamic doctrine had reference to the death of Jesus; the commonly-accepted belief maintains that Jesus was taken by God alive into heaven, while a phantom was crucified in his place; in opposition to this he declared that Jesus was actually crucified, but was taken down from the cross while still alive by his disciples, was healed of his wounds and afterwards made his way into Kashmir, where he finally died, his tomb being still in existence in the city of Srinagar. Having thus removed the ground for any expectation of the second coming of Jesus from heaven to earth, he explained that he himself was the Messiah, not as being an incarnation of Jesus (for he rejected the doctrine of transmigration), but as having come in the likeness of Jesus—being Jesus for this generation just as John the Baptist was Elijah, because he came in the spirit and power of Elijah.

In proof that he had come in the spirit and power of Jesus, Mirzā Ghulām Ahmad adduced the likeness of his own character and personality to that of Jesus, his gentleness of spirit, the peaceful character of his teaching, his miracles and the appropriateness of his teaching to the need of the age. In harmony with this pacific claim, he expounded the doctrine of Jihād (usually interpreted as meaning war against unbelievers) as a striving after

righteousness. Mirzā Ghulām Aḥmad died in 1908, and a few years after his death his followers split into two parties, one having its headquarters in Qadian and the other in Lahore. Both these sections of the community succeeded in enlisting the services of devoted, self-sacrificing men, who are unceasingly active as propagandists, controversialists and pamphleteers. They control an extensive missionary activity, not only in India, West Africa, Mauritius and Java (where their efforts are mainly directed towards persuading their co-religionists to join the Aḥmadiyya sect), but also in Berlin, Chicago and London. Their missionaries have devoted special efforts to winning European converts and have achieved a considerable measure of success. In their literature they give such a presentation of Islam as they consider calculated to attract persons who have received an education on modern lines, and thus not only attract non-Muslims, and rebut the attacks made on Islam by Christian controversialists, but win back to the faith Muslims who have come under agnostic or rationalist influences.

Apart from these organized movements, there has been considerable theological activity in the Muslim world in recent years. This has especially expressed itself in apologetic literature, which endeavours to present Islam in a form acceptable to the present generation and to discard those special features which have exposed it to hostile criticism; thus polygamy, slavery and intolerance are declared to receive no sanction from the Qurʾān, as rightly interpreted; in Islam the reconciliation of religion and science is effected, and the demands of the modern spirit of enlightenment are satisfied. Of such modernist literature there has been a considerable output, especially in Egypt and India; it naturally appeals most to those readers who have come under European influences, and excites considerable opposition among more conservative orthodox circles, who remain loyal to the traditional schools of thought (as enumerated above) and resent the rejection of traditional, mediaeval theology by the modern thinkers. The older sects continue to flourish, and the new thought has not yet attempted to organize itself on sectarian lines and has thus remained largely a matter of individual opinion.

This lack of sectarian development is possibly in great measure due to the absorbing attraction that political problems during recent years have exercised upon the Muhammadan world. Anxiety as to the fate of Turkey after the Armistice, the withdrawal of the Holy Cities from the control of the Caliph and the occupation of Jerusalem by unbelievers, the separation of the Sultanate from the Caliphate (in 1922), and the abolition of the Caliphate altogether (in 1924) were circumstances that profoundly stirred the minds of pious Muslims all the world over and did not create an atmosphere favourable to the calm consideration of purely dogmatic problems. Moreover, in many Muhammadan countries some form of nationalism obscured the larger vision of a united Islamic world; in Turkey it took the extreme form of Pan-Turanianism, or Pan-Turkism, which aimed at the union of all sections of the Turkish race in one vast confederacy and sought to purge the national life from all foreign admixture, in language, literature and political institutions; in India nationalist feeling prompted the Hindu-Muslim entente and gave birth to the oft-repeated sentiment, "I am an Indian first, and a Muslim afterwards"; among the Muhammadan populations of Russia the formation of Soviet Socialist republics has evoked nationalistic movements which have temporarily thrust purely religious interests into the background; Bolshevik propaganda has also met with a response among the Muslims of Java.

But Islam is so closely bound up with every aspect of the life of a Muslim people that even a purely nationalist political movement may react strongly on the religious life. This has been notably the case in Turkey, where the Government, besides abolishing the Caliphate, has confiscated the religious endowments and suppressed the religious orders; polygamy has practically been made illegal; the date of Ramaḍān has been fixed in accordance with astronomical science instead of being made dependent on reports that the moon has been seen (as has been the immemorial custom in the Islamic world); and the discontinuance of the wearing of the veil by women and the adoption of hats by men, are

typical of a changed attitude towards the established usages of Muhammadan society. The breach with the past has been nowhere so violent as in Turkey, but throughout the whole Islamic world there are indications of a changed attitude towards religious questions. The old orthodoxy still holds the allegiance of the masses, as well as many of the educated, but others, especially those whose education has brought them under European influences, are seeking a re-statement of their religion, more in harmony with their general outlook upon life. To those that seek a solution in the realization of some nationalist ideal, there remains little save a sentimental attachment to Islam, while they deprive it of any control over law and social organization; the reformers, on the other hand, claim for the precepts of Islam control over all the relations of human life, but seek to restore it to its primitive simplicity, believing that thus it can be brought into harmony with modern thought and modern conditions.

Mott, *The Moslem World of To-day* (1925). (T. W. A.)

ISLAMABAD, a town of India in the state of Kashmir, on the north bank of the Jhelum. Pop. (1921) 9,464. It is the second town in the Kashmir valley, and was originally the capital of the valley, but is now decaying. It contains an old summer palace, overshadowed by plane trees, with numerous springs, and a fine mosque and shrine. Below the town is a reservoir containing a spring of clear water called the *Anant Nag*, slightly sulphurous, from which volumes of gas continually arise; the water swarms with sacred fish.

ISLAMIC INSTITUTIONS. Of all the institutions of Islam the caliphate is the oldest, the most fundamental, and in essence the most enduring. For its history see **CALIPHATE**; the present subject is its origin and nature. Muhammad ruled over his people as a divinely inspired and guided prophet. He led the public prayers; he acted as judge; he controlled the army. On his death a leader was put in his place of similar authority, though without the divine prophetic guidance. He was called the "successor" (*khalīfah*, caliph) of the Prophet, later also the *amīr-al-mu'minīn*, commander of the faithful, and was elected by the Muslims, just as the Arab tribes had always elected their chiefs. He was thus an absolute ruler, but was democratically elected. For the Sunnites it has been a matter of agreement (see **ISLAMIC LAW**) from the earliest times that the Muslim community must appoint such a leader (see **IMĀM**). The Shi'ites, on the other hand, hold that the appointment lies with God, and that God always has appointed, though his appointment may not always have been known and accepted. Their position may be called a legitimist one. Some few heretical sects have held that the necessity of a leader was based on reason, not on the agreement of the community. But, for all, the rule of the leader thus appointed is absolute, and all authority is delegated from him and, in theory, can be resumed by him at any time.

But Abū Bakr, the first caliph, nominated his successor, 'Umar, and that nomination was accepted and confirmed by the people. So a second precedent was fixed, which was again carried a step farther, when Mu'āwiyah I., the first Umayyad caliph, nominated his son, Yazīd I., as his successor, and caused an oath of allegiance

to be taken to him. The hereditary principle was thus introduced, though some relics of the form of election persisted. The Ottoman claim was based on an asserted nomination by the last 'Abbāsīd, who died in exile in Egypt in 1538, of the Ottoman sultan, Salīm I., as his successor. Such a nomination in itself was a perfectly legal act, but in this case had a fatal flaw. It was an absolute condition, laid down in tradition, that the caliph must be of the tribe of Quraish, that of the Prophet.

The duties of the caliph were to enforce legal decisions and maintain the divinely revealed ordinances; guard the frontiers and equip armies; receive the alms; put down highwaymen; maintain the Friday services and the festivals; decide disputes and receive evidence bearing on legal claims; marry minors, male and female, who have no guardians; divide booty. He had to be a free, male, adult Muslim; have administrative ability; be an effective governor and do justice to the wronged. So long as he fulfilled these conditions he was to be absolutely obeyed. The caliph, therefore, was the highest executive officer of a system assumed to be definite and fixed. To depose him a *fatwā* (see MUFTI) would be required—in Turkey from the Shaykh-ul-Islām—that he had violated some essential of the Muslim faith, and no longer fulfilled the conditions of a caliph.

The Diwans.—But it was impossible for the caliph personally to administer the affairs of the empire, and by degrees government bureaux (*diwāns*; see DIVAN) were created to regulate and administer the system of taxation and the revenues of the state. The sources of revenue were (i.) the poor-rate (*zakāt*), a tithe paid by every Muslim; (ii.) the fifth of all booty; (iii.) the poll-tax (*jizya*) on non-Muslims; and (iv.) the land-tax (*kharāj*) also on non-Muslims. The non-Muslims must retain their lands, cultivate them and pay the land-tax and the poll-tax and give contributions in kind to support the local Muslim garrisons which were massed in great camp-cities at strategic points. The first patriarchal period of conquest, unearned wealth and the simple life passed rapidly into the genuinely Arab empire of the Umayyads, with whom came an immediate development of organization in the state. The seclusion of the caliph in Umayyad times increased still further when the administration of the state passed by delegation into other hands, and the caliph himself became a sacrosanct figurehead, as in the case of the later 'Abbāsīds; when theories of semi-divine nature and of theocratic rule appeared, as in the case of the Fatimites; and finally when all the elaborate court ritual of Byzantium was inherited by the Ottoman sultans.

Under the 'Abbāsīds the semi-independent provinces became fully independent, or at most acknowledged the caliph as a spiritual head and paid a nominal tribute. His name might stand on the coinage and prayers be offered for him in the Friday service, the two signs of sovereignty to this day in Islam. With this crumbling of the empire went a more elaborate organization; bureaux took the place of principles and of the energy of individual rulers.

The Vizierate.—Abu 'l-Abbās, the first 'Abbāsīd caliph, was the first to appoint a vizier (*wazīr*, "helper," so Aaron is *wazīr* to Moses in the Qur'ān), a confidential minister to advise him and come between him and the people. The vizier sometimes became as important as the caliph, for with a weak ruler his vizier became absolute, with a strong ruler his vizier remained subordinate. Until the time of Rāḍī (934-940) the vizierate thus fluctuated in importance. In that caliphate the vizier lost all authority, and in his place came the *amīr al-umarā*—equivalent to the *major domus* of the Franks—the head of the Turkish bodyguard, in terror of whom the caliph now stood. When in 945 the Būyids captured Baghdad and the caliph became a purely spiritual sovereign, they took the title "vizier" for their own chief minister, and the caliphs retained only a secretary. Under the Seljuks, however, they regained their viziers and some real authority.

Under the early 'Abbāsīds the four most important ministers were the chief *cadi*, the chief of police or head of the life guards, the minister of finance and the postmaster, who was the head of the system of information and espionage which covered the empire. But at different times the different bureaux varied greatly. Under Mutawakkil we find the bureau of taxes and finance; bureau of the crown estates; bureau of state book-keeping; bureau of war,

i.e. of hired troops; bureau which kept reckoning and control of the pensions of the clients and slaves of the ruling family; bureau of the post system; bureau of expenditures.

As the chief of police, mentioned above, was rather the head of the caliph's bodyguard, there was also a police system after our ideas, but more thoroughgoing. The *muhtasib* had charge in the broadest sense of public order and morals in the streets, and had oversight as to weights, measures and adulterations; but had no right to interfere privately or enter houses save in the clearest and most necessary cases. He had a summary jurisdiction in all minor cases where no trial was necessary; but where witnesses and oaths entered the case must go to the *cadi*. Slaves and beasts of burden were under his guardianship; he prevented public scandals, such as the sale of wine; he regulated the public conduct of Jews and Christians. In the interest of public morals he had to find suitable husbands for widows and see that they did not marry before the legal time; questions of paternity also he had to investigate.

It is impossible in Islam to separate logically from the mass of institutions those which we should call religious, as Islam on all sides is for the Muslim equally religious. But perhaps the following may practically be separated under that rubric. Islam, runs a tradition, is built on five things: testimony that there is no god save Allāh, and that Muḥammad is the apostle of Allāh; prayer; the poor-rate; pilgrimage; fasting. For these see ISLAM.

The law and usage of religious foundations in perpetuity (*waqf*, mortmain) became as important in Islam as monastic endowments in mediaeval Europe, and such foundations tended similarly to absorb the greater part of the national wealth. A pious foundation could be erected in such a way that either so much from its funds would be paid yearly in perpetuity to the descendants of the erector, or those descendants would be employed as officials of the foundation.

The Imam.—When it became impossible for the caliph to lead the people personally in prayer in the mosque, he delegated that part of his duties to another, hence called *imām* (*q.v.*). Naturally, then, the appointment of the *imām* would lie with the supreme ruler. This holds of the daily prayers in the principal mosque (*al-masjid al-jāmī*) supported by the ruler where the Friday service is held, but in the separate smaller mosques built by each community the community chooses its own *imām*. The *imām* appoints the *muadhdhin*, the announcer of the hour of prayer from the minaret, and both have a claim on the state treasury.

Another office exercised when possible by the caliph, but very frequently delegated to some high dignitary, such as the heir to the caliphate or a prince, was the leadership of the pilgrimage caravan to Mecca and back. Sometimes this official, called *amīr-al-hajj*, was appointed *imām* as well. He then led all the pilgrimage ceremonies at Mecca.

The Cadi.—Islamic law (*q.v.*) is treated separately. Here, again, as judging is a duty of the caliph, a *cadi* is the delegate, or, when appointed by a vizier or governor, a delegate of his delegate. He examines into disputes brought before him and enforces his judgments, he names administrators of the estates of minors, the insane, etc.; he supervises the *waqf* property of mosques and schools in his district and inspects highways and public buildings; he watches over the execution of wills; he inflicts the due legal penalties for apostasy, neglect of religious duties, refusal to pay taxes, theft, adultery, outrages, murder; he can inflict the penalties of imprisonment, fine, corporal punishment, death; if there is no *imām*, he can perform his duty, as in fact can anyone who has the requisite knowledge.

The Army.—For the existence of an army in Islam, there are two grounds, the holy war (*jihād*, *q.v.*) against unbelievers without the state and the suppression of rebellion within. Under Umar, every able-bodied male Muslim was theoretically a fighting man, part of the national militia. This army was divided into corps situated in the conquered lands, as armies of occupation, where they eventually came to form military colonies in great camp-cities. The occupied countries had to support them, and they were bound to render military service at any time. But as the ideal of Umar broke down before facts the use of mercenary

and slave troops finally increased; although there has always continued in Muslim armies acting against unbelievers a proportion of volunteers not paid a fixed wage but subsidized by the state from the poor-rate and alms funds. The generals were appointed by the caliph, and had either unlimited authority to act as his representatives, concluding peace, acting as *cadi* and *imām*, distributing booty; or were restricted within limits, e.g. to simple leading of the troops and carrying on military operations. As war by a Muslim power is essentially sacred war, the regulations of *jihād* must be considered here. Unbelievers must first be invited to embrace Islam and, if they follow a sacred book and are not idol-worshippers, are given a choice between (a) becoming Muslims; or (b) submitting to the Muslims and entering on a treaty with them of protection and tribute; or (c) fighting. If they accept Islam, their lives, families and property are secure, and they form henceforth part of the Muslim community. If they submit and enter on treaty relations, they pay a poll-tax, for which their personal safety is assured, and assume a definitely inferior status, having no technical citizenship in the state, only the condition of protected clients (*dhimmīs*). If they elect to fight, the door of repentance is open, even when the armies are face to face. But after defeat their lives are forfeit, their families are liable to slavery, and all their goods to seizure. Apostates must be put to death. Four-fifths of the booty after a battle goes to the conquering army.

Education.—The glory of Muslim education was its university system, which fed the higher learning and did not serve every-day needs. Its primary system was very poor, almost non-existent; and technical education has never been recognized in Islam. Primary teachers were despised as ignorant and foolish. Their pupils were the young only; they taught the rudiments of reading, Qur'an, catechism, prayer, writing and arithmetic, but very little of the latter. Technical education was given by the guilds through their apprentice system, teaching mechanical arts and crafts. All Muslim university education, like all Muslim science, revolved round theology. There were, apparently, only two outstanding exceptions to this rule, the academy of Ma'mūn (813–833) at Baghdad, and the hall of wisdom of the Fatimites at Cairo (1004–1171); both of these are explained by their environment. From the earliest times, independent scholars instructed classes in mosques—the common places of meeting for the community—and gave their pupils personal certificates. Their subjects were the reading and interpretation of the Qur'an; the body of traditions from the Prophet; the thence deduced system of theology; the canon law. But the interpretation of the Qur'an involved grammatical and lexicographical studies of early Arabic, and hence of the early Arabic literature. Theology came to involve metaphysical and logical studies. Canon law required arithmetic and mensuration, practical astronomy, etc. But these last were strictly ancillary; the object of the instruction was primarily to give knowledge of value for the life of the next world, and, secondarily, to turn out theologians and lawyers. Medicine was in Jewish and Christian hands; engineering, architecture, etc., with their mathematical bases, were crafts. Gradually, educational institutions came to be equipped with scholarships of money or in kind for the students. The first instance of this is generally ascribed to Nishapur (Naisābūr) in 1066; but it soon became general in the system and afforded a means of control and centralization. A final, and most important, characteristic was the wide journeying of the students "in search of knowledge." Scholars thus kept in touch with one another all over the Muslim world, and intellectual unity was maintained.

The Sayyids.—To the democratic equality of Islam, in which the slave of to-day may be the prime minister of to-morrow, there is one outstanding exception. The descendants of the Prophet and of his relatives (the family of Hāshim) formed and form a special class, held in social reverence, and guarded from contamination and injury. These are the *sayyids* (lords), and genealogical registers of them are carefully preserved. They are of all degrees of wealth and poverty, but are guarded legally from *mésalliances* with persons of ignoble origin or equivocal occupation. Their influence is very great, and in some parts of the Muslim world

they enjoy the standing and reverence of saints.

ISLAMIC LAW. Law (*Sharī'ah*) in Islam has a wider application than any western secular law, since it claims to regulate all the aspects of life—duty to God, to one's neighbour, to one's self. It is really a system of duties, ethical, legal, religious, and governs not only the private life of the pious Muslim, but also fixes the laws of marriage, divorce and inheritance, as well as the criminal law. Its historical development began with Muḥammad sitting as judge in Medina; his decisions followed, at one time, the usages of the Arab and Jewish tribes of Medina; at another, his own personal judgment. At his death he left behind the legislative enactments embodied in the Qur'an, and the memory of his legal decisions. These were collected among the traditions (*ḥadīth*), which recorded his sayings and doings, manners and customs, and his answers to questions on religious life and faith, and his decisions in legal disputes.

The first collecting of traditions was for private purposes, and the first publication dealing with them was legal, viz. the *Muwatta'* of Malik ibn Anas (d. 795), a *corpus juris* based partly on traditions. Thereafter came collections of two different types, the earlier, arranged according to the companions of Muḥammad, on whose authority the traditions were transmitted, e.g., the *Musnad* of Ahmad ibn Hanbal; the other, called *Muṣannaf* (classified), containing traditions arranged in chapters according to their subject matter. That of Bukhārī is the most famous, and is arranged to give a traditional basis for a complete system of canon law; another is that of Muslim ibn al-Ḥajjāj, who paid less attention to legal aspects and more to minute accuracy.

Another element which came into the development was Roman law, which the Muslim jurist found at work in the conquered Roman provinces and in law courts. Many principles of Muslim law can be traced to the Roman codes, and it was plainly influenced by the liberty involved in the *Responsa prudentium* of Roman lawyers, and by the broad conception of the law of nature in the Edict of the Praetor.

During the Umayyad dynasty, the public life of the state was no longer so religious as it had been while Medina was still the capital, and though law was still needed, it had to be opportunist. Its development went on, but became speculative. The study of tradition was now private, and its students were more and more the personally pious, no longer living in contact with reality; they regarded any system of government which did not simply reproduce the patriarchal form of Medina, as a thing with which no religious man could have aught to do.

The rise of the 'Abbāsids brought a change, in that they had promised a return to the old religious attitudes. But in substance they were much as the Umayyads, and though the state was outwardly on a pious footing, and the religious sentiment of the people was respected, the old, absolute religious law was not restored. It was made possible for more theologians and lawyers to work with the state, but an irreconcilable party still remained, and the situation was fixed as it is to this day.

Yet the 'Abbāsids did, in their way, encourage legal studies, and under them processes and results, long pursued in private, became public. Almost within the first century of their dynasty the four legal schools, or rites, were formed and the principles established which survive to this day.

ISLAMIC LAW SCHOOLS

The first school to take definite form was the Hanīfite, founded by Abū Ḥanīfa (d. 767), who left behind him a definite system. He used few traditions, and preferred to go back to the Qur'an, and extract from it by reasoning the rulings which fitted his ideas. The 'Abbāsids adopted his school, and the Ottoman Turks also later, and it may be said to hold now a leadership among the four legal rites.

Mālik ibn Anas, the founder of the Mālikite school, used traditions much more generally than did Abū Ḥanīfa, but two of his principles marked a distinct advance and showed that he was no mere traditionalist. For one, he laid down the conception of public advantage (*istiṣlāḥ*); when a rule founded on even a valid analogy would work a general injury, it was to be set aside; justice must not be overcome by logic. And, for the other, he laid stress on the conception of the agreement (*ijmā'*), an idea which was to have indefinite importance in the future. When the surviving companions of the Prophet, after his death, agreed upon any point as belonging to their store of tradition and experience, their agreement was accepted as final.

The third school was founded by ash-Shāfi'ī (d. 820), who laid great stress on tradition, but gave to the principle of agreement (*ijmā'*) its full rights. The agreement of the Muslim peoples was to be the voice of God. "My people," said a tradition from Muḥammad, "will never agree in an error." So, over traditions and over the Qur'ān itself, the agreement tacitly or explicitly ruled and rules. It stamps as authoritative that which the other principles lay down. He also emphasized the principle of analogy (*qiyās*).

The four bases thus laid down by ash-Shāfi'ī—Qur'ān; traditions; analogy; agreement—have come to be accepted by all existing schools. This applies to all spheres of life, ethical, social, theological, legal, and it should never be forgotten that the Qur'ān is only one of the sources for Muslim faith and conduct.

The fourth, the Ḥanbalite school, was founded by the scholars of Ahmad ibn Ḥanbal after his death in 885. It minimizes agreement and analogy, is literal in its interpretations, and is now by far the smallest of the four surviving schools.

All these schools of law administer a scheme of duties, law which for centuries has had only a partial connection with the real legal systems of the Muslim peoples. Among the Wahhābīs and Ibādītes alone is it the whole of law. Elsewhere, since the Umayyad period, its courts have been in great part pushed aside by others, and its scheme has come to be regarded as an expression of impossible theory, to be realized, at best, with the coming of the millennium.

For as Islam spread, it came to regions, climates, customs, where the Arabian usages no longer held. Not only were the prescriptions of Medina ill adapted to the new conditions; the new people had legal usages of their own to which they clung and which nothing could make them abandon. So, as in religion the faiths of the conquered peoples were thinly veneered with Muslim phrases, in law there grew up a customary code (*'ādāt*) for each country, differing from every other, which often completely obscured and annulled the prescriptions of the *sharī'ah*. The one was an ideal system, studied and praised by the pious learned; the other was the actual working of law in the courts.

There also arose a new and specific statute law, emanating from the sovereign, and sometimes codified as in the Turkish statute law (*qawānīn*) derived from various European codes. Thus there has grown up in almost every Muslim country at least two systems of courts, the one administering the *sharī'ah*, and taking cognisance of private and family affairs, such as marriage, divorce, inheritance, its officials also giving rulings on purely personal religious questions, such as details of the ritual law, the law of oaths and vows, etc.; the other, the true law courts of the land, administering codes based on local custom and the decrees of the local rulers.

A rift almost as important entered the legal life of the Muslim lands on another side. Non-Muslim communities, settled in Muslim territory, have been uniformly permitted to administer and judge themselves according to their own customs and laws. Accordingly, to various ecclesiastical organizations, Christian and Jewish, was given over the administration of these non-Muslim sections of the community, their bishops and rabbis becoming their responsible heads and the links of contact with the Muslim rulers.

In accordance with the same principle, the European merchant, living and trading in the East, was put first by usage and finally by treaty under the jurisdiction and control of his own consul. Thus there grew up the extra-territorial law of the capitulations

and conventions, by which the sanctity of the person and household of an ambassador is extended to every European.

There may be said, then, in short, to be three elements in the legal life of a Muslim state: the *sharī'ah*, the sacred and fixed law of Islam; the civil law, based on the usages of the different peoples, Muslim and non-Muslim, and on statutes going back to the will of rulers; the international law of the capitulations, with a contractual sanction of its own.

In modern times, frequent demands have been made by liberal Muslim thinkers that the principle of agreement (*ijmā'*) should be so extended as to render possible changes in the *sharī'ah*, so as to bring it into harmony with modern conditions; but the orthodox legists have steadily resisted any such change. In 1926, the Turkish Republic solved the problem by adopting the Swiss Civil Code and the Italian Penal Code, thereby abolishing the sacred law of Islam altogether.

ISLAMISM: see PAN-ISLAMISM.

ISLAND, a piece of land surrounded by water (O.E. *ieg*=isle +land). The words "island," "isle" are sometimes used for a piece of land isolated during high tide or surrounded by marsh; e.g., Hayling Island, Isle of Ely; the spelling "island," accepted before 1700, is due to a false connection with "isle" (Fr. *île*, Lat. *insula*). Islands are usually classified as continental or oceanic. The former may result from the submergence of coastal highlands of which the summits remain above water or by the sea cutting through the isthmus (*q.v.*) of a peninsula, or through some zone of weakness between a coastal headland and the mainland. In all cases their structure is essentially that of the mainland and they occur on the continental shelf (*q.v.*). Examples are provided by the smaller islands off the coasts of Britain and Ireland (while the larger islands are in their turn continental islands of Europe. Oceanic islands have various origins. The majority of the islands of the Malay Archipelago may be regarded either as continental or oceanic, but such a group as the Caroline islands in their vicinity are truly oceanic. The ocean floor has marked irregularities, and where any individual peak, structurally belonging to the ocean bed, rises above the surface, an oceanic island is produced. Its projection above sea-level may be consequent on submarine volcanic activity, or on the buckling of the ocean bed by earth movements. Coral islands (see **ATOLL**) are usually oceanic islands and are frequently clustered upon submarine plateaux in shallow water, but occasionally represent the crowns of isolated peaks rising from deep water.

Island life exhibits features of special interest. The sea is a barrier to some forms of life, but acts as a carrier to others which, once established in their new home, frequently develop new features in their isolated surroundings. A long-established sea-barrier results in a marked difference between the fauna and flora even of adjacent islands; and this difference can be made to indicate the origin of an island. Wallace noticed that to the west of a line running between Bali and Lombok, and between Borneo and Celebes, the islands were biologically Asiatic, but to the east of the line (Wallace's line), notwithstanding the narrow Bali strait, the flora and fauna were Australian. Any detailed map of the biological regions of the globe will illustrate the importance of islands in the determination of the boundaries of faunal and floral types. Oceanic islands are usually colonized by but few animal forms, chiefly sea-birds and insects, but they are often clothed with abundant vegetation, the seeds of which have been carried by air and water currents, birds, etc., but the variety of plants is by no means so great as on the mainland.

ISLAY, the southernmost island of the Inner Hebrides, Argyllshire, Scotland, 16 m. W. of Kintyre and $\frac{3}{4}$ m. S.W. of Jura, from which it is separated by the Sound of Islay. Pop. (1921) 6,496; maximum breadth 15 m. and maximum length 25 m. The sea-lochs Gruinart and Indaal cut into it so deeply as almost to convert the western portion into a separate island. It is rich and productive, and has been called the "Queen of the Hebrides."

The surface generally is regular, the highest summit being Ben Bheigeir (1,609 ft.), but the shore is rugged. There are several freshwater lakes and streams, which provide good fishing. Islay was the ancient seat of the "lord of the Isles," the first to adopt that title being John Macdonald of Isle of Islay, who died about 1386; but the Macdonalds were ultimately ousted by their rivals, the Campbells, about 1616. Islay house, the ancient seat of the Campbells of Islay, stands at the head of Loch Indaal. Considerable business is done in stock-raising, and oats, barley and various green crops are raised. The chief difficulty in the way of reclamation is the great area of peat (60 sq.m.). The island contains several distilleries, producing large quantities of whisky, slate and marble are quarried, and iron and lead are found. At Bowmore, the chief town, some shipping is carried on. Port Ellen, the principal village, is a golfing resort, with a quay and a fishery. Port Askaig is the ferry station for Feolin on Jura. Regular communication with Glasgow and W. Tarbert is maintained by steamers which call at Bowmore, Port Ellen, Askaig and Bruichladdich. There are 3 lighthouses on the island.

ISLES OF THE BLEST or **FORTUNATE ISLANDS** (Gr. αἱ τῶν μακάρων νῆσοι; Lat., *Fortunatae insulae*), placed in Greek mythology in the Western ocean, and peopled, not by the dead, but by mortals upon whom the gods had conferred immortality. Like the Phaeacian land in Homer (*Od.* viii.) or the Celtic Avalon and St. Brendan's island, the Isles of the Blest have perpetual summer and abundance. No reference is made to them by Homer, who speaks instead of the Elysian Plain (*Od.* iv. and ix.), but they are mentioned by Hesiod (*Works and Days*, 168) and Pindar (*Ol.* ii.). By mediaeval map-makers, Madeira and the Canaries are sometimes named *Fortunatae insulae*. (See ATLANTIS.)

ISLINGTON (in Domesday and later documents *Iseldon*, *Isendon* and in the 16th century *Hisselton*), a northern metropolitan borough of London, England, bounded east by Stoke Newington and Hackney, south by Shoreditch and Finsbury, and west by St. Pancras, and extending north to the boundary of the county of London. Pop. (1925) 330,737. The southern part includes Holloway, Highbury, part of Kingsland and Barnsbury and Canonbury. The districts included preserve the names of ancient manors, and in Canonbury, which belonged in the 13th century to the priory of St. Bartholomew, Smithfield, traces of the old manor house remain. The fields and places of entertainment in Islington were favourite places of resort for London citizens in the 17th century and later; sports were practised here and the popularity of the place was increased by the discovery of chalybeate wells. At Copenhagen Fields, now covered by the Caledonian cattle market, a great meeting of labourers was held in 1834. They were suspected of intending to impose their views on parliament by violence and a display of military force was made. The Agricultural Hall, used for cattle and horse shows and other exhibitions, Pentonville Prison and Holloway Prison are in the borough. Islington is a suffragan bishopric in the London diocese. Its population includes metal, textile and transport workers and printers.

ISLIP, a township of Suffolk county, New York, U.S.A., in the central part of the south side of Long Island. The township is 16m. long from E. to W., and 8m. wide in its widest part. It is bounded on the S. by the Atlantic ocean; between the ocean and the Great South bay, here 5-7m. wide, is a long narrow strip of beach, called Fire Island, at the west end of which is Fire Island Inlet. The "Island" beach and the Inlet, both very dangerous for shipping, are protected by the Fire Island Lighthouse, the Fire Island Lightship, and a life saving station near the Lighthouse and another at Point o' Woods. A short distance E. of the Lighthouse there is a State park. Along the "Island" beach there is excellent surf-bathing. The township is served by two parallel branches of the Long Island railroad about 4m. apart. On the main (northern) division are the villages of Brentwood (first settled as Modern Times, a quasi free-love community), which now has the Convent and School of St. Joseph; Central Islip, the seat of the Central Islip State Hospital for the Insane; and Ronkonkoma, on the edge of a lake of the same name. On the

south division of the Long Island railroad are the villages of Bay Shore (to the west of which is West Islip); Oakdale; West Sayville, originally a Dutch settlement; Sayville and Bayport. These villages are famous for oyster and clam fisheries. About one-half of the present township was patented in 1684, 1686, 1688 and 1697 by William Nicolls (1657-1723), the son of Matthias Nicolls, who came from Islip in Oxfordshire, England; this large estate (on either side of the Connetquot or Great river) was kept intact until 1786; the west part of Islip was mostly included in the Moubray patent of 1708; and the township was incorporated in 1710.

See C. J. Werner, *Historical Miscellanies Pertaining to Long Island* (1917); B. F. Thompson, *History of Long Island* (1918); R. H. Gabriel, *The Evolution of Long Island* (New Haven, Conn., 1921); and H. J. Hazelton, *The Boroughs of Brooklyn and Queens, Counties of Nassau and Suffolk, Long Island, 1609-1924* (Chicago, 1925).

ISLY, the name of a small river on the Moroccan-Algerian frontier, a sub-tributary of the Tafna, famous as the scene of the greatest victory of the French army in the Algerian wars. The intervention of Morocco on the side of Abd-el-Kader led at once to the bombardment of Tangier by the French fleet under the prince de Joinville, and the advance of the French army of Gen. Bugeaud (1844). The enemy, 45,000 strong, was found to be encamped on the Isly river near Kudiat-el-Khodra. Bugeaud had a force of 6,500 infantry and 1,500 cavalry, with a few pieces of artillery. In his own words, the formation adopted was "a boar's head." On Aug. 14 the "boar's head" crossed the river about 9m. to the northwest of Kudiat and advanced upon the Moorish camp; it was immediately attacked on all sides by great masses of cavalry, but the volleys of the steady French infantry broke the force of every charge, and at an apt moment the French cavalry in two bodies, each of the strength of a brigade, broke out and charged. One brigade stormed the Moorish camp (near Kudiat) in the face of artillery fire, the other sustained a desperate conflict on the right wing with a large body of Moorish horse which had not charged, and only the arrival of infantry put an end to the resistance in this quarter. A general rally of the Moorish forces was followed by another action in which they endeavoured to retake the camp. Bugeaud's forces, which had originally faced south when crossing the river, had now changed direction until they faced almost west. Near Kudiat-el-Khodra the Moors had rallied in considerable force, and prepared to retake their camp. The French, however, continued to attack in perfect combination, and after a stubborn resistance the Moors once more gave way. For this great victory, which was quickly followed by proposals of peace, Bugeaud was made duc d'Isly.

ISMAIL (1830-1895), khedive of Egypt, was born at Cairo on Dec. 31, 1830, being the second of the three sons of Ibrahim and grandson of Mehemet Ali. After receiving a European education at Paris, where he attended the staff college, he returned home, and on the death of his elder brother became heir to his uncle, Said Mohammed, the Vali of Egypt. Said employed him on missions abroad, notably to the pope, the emperor Napoleon III. and the sultan of Turkey. In 1861 he was despatched at the head of an army of 14,000 to quell an insurrection in the Sudan. On the death of Said, on Jan. 18, 1863, Ismail was proclaimed viceroy without opposition. He found the Egyptian revenue vastly increased by the rise in the value of cotton which resulted from the American Civil War, the Egyptian crop being worth about £25,000,000 instead of £5,000,000. Ismail had discovered that the civilized nations of Europe made a free use of their credit for raising loans. He now proceeded to transfer his private debts to the state and to embark on a grand scale of expenditure.

During the sixties and seventies Egypt became the happy hunting-ground of financiers, to whose schemes Ismail fell an easy and a willing prey. In 1866-1867 he obtained from the sultan of Turkey, in exchange for an increase in the tribute, firmans giving him the title of khedive, and changing the law of succession to direct descent from father to son; and in 1873 he obtained a new firman making him to a large extent independent. He projected vast schemes of internal reform, remodelling the customs system and the post office, stimulating commercial

progress, creating a sugar industry, introducing European improvements into Cairo and Alexandria, building palaces, entertaining lavishly and maintaining an opera and a theatre. Of the total amount of debt incurred by Ismail for his projects, about 10% may have been sunk in works of permanent utility—always excluding the Suez canal. On his accession he refused to ratify the concessions to the canal company made by Said, and the question was referred in 1864 to the arbitration of Napoleon III., who awarded £3,800,000 to the company as compensation for the losses they would incur by the changes which Ismail insisted upon in the original grant.

In 1867 Ismail visited Paris and London, and in 1869 he again paid a visit to England. The opening of the canal in Nov. 1869 enabled him to claim to rank among European sovereigns, and to give and receive royal honours; this excited the jealousy of the sultan, but Ismail was clever enough to pacify his overlord. In 1876 the old system of consular jurisdiction for foreigners was modified, and the system of mixed courts introduced, by which European and native judges sat together to try all civil cases without respect of nationality.

In 1874 Ismail annexed Darfur, and was only prevented from extending his dominion into Abyssinia by the superior fighting power of the Abyssinians. But at length the inevitable financial crisis came. A national debt of over one hundred millions sterling (as opposed to three millions when he became viceroy) had been incurred by the khedive, whose fundamental idea of liquidating his borrowings was to borrow at increased interest. The bondholders became restive. Judgments were given against the khedive in the international tribunals. When he could raise no more loans he sold his Suez canal shares (in 1875) to Great Britain for £3,976,582. Foreign intervention followed. In Dec. 1875 Stephen Cave was sent out by the British Government to inquire into the finances of Egypt, and in April 1876 his report was published, advising that it was necessary for foreign Powers to interfere in order to restore credit. The result was the establishment of the Caisse de la Dette. In October Goschen and Joubert made a further investigation, which resulted in the establishment of Anglo-French control. A further commission of inquiry by Evelyn Baring (afterwards Lord Cromer) and others in 1878 made it necessary for Ismail to hand over his estates to the nation and accept the position of a constitutional sovereign, with Nubar as premier, Rivers Wilson as finance minister, and de Blignières as minister of public works.

The new régime lasted six months, and then Ismail dismissed his ministers, an occasion being deliberately prepared by his getting Arabi (*q.v.*) to foment a military *pronunciamento*. England and France insisted (May 1879) on the reinstatement of the British and French ministers. The tribunals were still giving judgments for debt against the government, and when Germany and Austria showed signs of intending to enforce execution, the governments of Great Britain and France determined to get rid of Ismail altogether. He was first advised to abdicate, and a few days afterwards (June 26), he received a telegram from the sultan, addressed to him as ex-khedive, and informing him that his son Tewfik was his successor. He left Egypt for Naples, but eventually retired to his palace of Emirghian on the Bosphorus. There he died on March 21, 1895. *NDN*. 438

Beneath a veneer of French manners and education Ismail remained throughout a thorough Oriental. It was his early encouragement of Arabi, and his introduction of swarms of foreign concession-hunters, which precipitated the "national movement" that led to British occupation.

See Earl Cromer, *Modern Egypt* (1908); and Lord Milner, *England in Egypt* (1892, 12th edit. 1915).

ISMAIL HADJI MAULVI-MOHAMMED (1781-1831), a Muslim reformer, was born at Pholah near Delhi. In co-operation with Syed Ahmed he attempted to free Indian Mohammedanism from the influence of the native early Indian faiths. The two men travelled extensively for many years and visited Mecca. In the Wahhabite movement they found much that was akin to their own views, and on returning to India preached the new doctrine of a pure Islam. The official Moham-

medan leaders objected, and the dispute led to the reformers being interdicted by the British government in 1827. The party then moved to Punjab where they made Peshawar the capital of the theocratic community which they wished to establish (1829). Ismail Hadji fell in battle against the Sikhs amid the Pakhli mountains (1831). Some of his adherents are still found in the mountains of the north-west frontier.

Ismail's book *Taqouāyat el Imān* was published in Hindustani and translated in the *Journal of the Royal Asiatic Society*, xiii. 1852.

ISMAIL, a town of Bessarabia, Rumania, capital of the Department of Ismail, situated on the left bank of the Chilia branch of the Danube. Pop. (1928) 37,400, including, besides Rumanians, Russians, Ukrainians, Bulgars, Turks, Jews and Gypsies. There are flour mills and a trade in cereals, woods, tallow and hides. As a Turkish fort and capital of a Samjak, Ismail long enjoyed peace and prosperity. It was occupied by Russia in 1770, 1790 and 1812; transferred to Rumania in 1856, to Russia in 1878, and to Rumania in 1918.

ISMAILIA, a town of Lower Egypt, on the north-west shore of Lake Timsah, a salt lagoon, about 50 m. from the Mediterranean and the Red Sea, and 93 m. N.E. of Cairo by rail. Population about 10,000. It was laid out in 1863, in connection with the construction of the canal, and is named after the khedive Ismail. Ismailia was the scene of the first scientific attack upon malaria, by the extinction of the *anopheles* mosquito. The town is well laid out. At the end of the quay are works supplying Port Said with water. On the other side of the lake are the so-called Quarries of the Hyenas, from which the building material for the town was obtained. It was an important headquarters for the Allied forces during 1916.

ISMAY, THOMAS HENRY (1837-1899), British ship-owner, was born at Maryport, Cumberland, on Jan. 7, 1837. In 1867 he took over the White Star Line of Australian clippers, and in 1868, established, in conjunction with William Imrie, the Oceanic Steam Navigation company, which has since become famous as the White Star Line. While continuing the Australian service, the firm determined to engage in the American trade, and for this purpose ordered from Messrs. Harland & Wolff, of Belfast, the first "Oceanic" (3,807 tons). The launching of this vessel marks a turning-point in north Atlantic travel. To Ismay is mainly due the credit of the arrangement by which some of the fastest ships of the British mercantile marine are held at the disposal of the government in case of war. The origin of this plan dates from the Russo-Turkish War, when there seemed a likelihood of England being involved in hostilities with Russia, and when, therefore, Ismay offered the Admiralty the use of the White Star fleet. In 1892 he retired from partnership in the firm of Ismay, Imrie and Co., though he retained the chairmanship of the White Star company. He died at Birkenhead on Nov. 23, 1899.

ISMET PASHA (1884-), Turkish statesman, was born in Smyrna of a Turkish family of Malatia. He received his education in the military schools of Turkey, and in 1903 graduated as an artillery lieutenant. Three years later he became a captain on the General Staff. After the Young Turk revolution of 1908, he was sent several times on military expeditions to Yemen. During the World War he served on the Syrian front, and was in command of an army corps when peace was declared. At the time of the occupation of Constantinople by the Allies he escaped to Angora disguised as a common soldier and was appointed by the Great National Assembly to be chief-of-staff during the military operations of the Nationalists against the Caliphate army and Armenia. Later he became commander-in-chief of the Turkish western front, and in this capacity insisted on the formation of a regular army in place of the irregular Nationalist forces. In the meantime, the irregular forces were unwilling to submit, and the Greek Army had taken the offensive. At Ineunu, Ismet defeated the Greeks, checked their offensive, subdued the irregular forces, and succeeded in completing the organization of a regular army. He remained in command of the western front until after the battle of the Sakharra and the fall of Smyrna, in which events he was the right-hand man of Mustafa Kemal. In 1922 he signed the Armistice concluded at Mudania with the Allies, and secured

the evacuation of Eastern Thrace. In 1922-3, as minister of foreign affairs and senior Turkish delegate to the Lausanne Conference, he ably defended the interests of his country, and signed the Treaty of Lausanne.

During the autumn of 1923, at the time of the declaration of the republic, he became prime minister. After a short rest, due to failing health, he became prime minister a second time, towards the end of 1924, and shared in the suppression of the Sheikh Said revolt in Kurdistan. The abolition of the Caliphate, the closing of the medreses (religious schools) and of the tekkes (monasteries), the abolition of the tithe, the adoption of the Swiss civil code, and the wearing of the hat are some of the momentous changes which were realized during Ismet's tenure of office. He again resigned office, according to constitutional procedure, in Nov. 1927, on the meeting of the third Great National Assembly, but was again invited to form a cabinet.

ISMID (IZMID, ISNIKMID) (anc. *Nicomedia*), a town of Asia Minor situated on rising ground near the head of the gulf of Ismid, Sea of Marmora. Pop. (1927) 55,790. It is an agricultural district, producing cocoons and tobacco, and there are large forests of oak, beech and fir. Near Yalova there are hot mineral springs, much frequented in summer. The town is connected by railway with Haidar Pasha, the western terminus, and with Angora, Konia and Smyrna. It contains a fine 16th-century mosque, built by the celebrated architect Sinan. As the seat of a Greek metropolitan and an Armenian archbishop, Ismid retains somewhat of its ancient dignity. The head of the gulf of Ismid is silting up and the port Darinje is almost 4 miles distant from Ismid. The vilayet of Ismid (Nodja-Eli) had a population of 286,670 in 1927.

ISNARD, MAXIMIN (1758-1825), French revolutionist, dealer in perfumery at Draguignan, was elected deputy (for the Var) to the Legislative Assembly, where he joined the Girondists. Attacking the court, and the "Austrian committee" in the Tuileries, he reproached Louis XVI. for infidelity to the constitution. But on June 20, 1792, when the crowd invaded the palace, he was one of the deputies who tried to protect the king. After Aug. 10, 1792 he was sent to the army of the North to justify the insurrection. Re-elected to the Convention, he voted the death of Louis XVI. and was a member of the Committee of General Defence organized on Jan. 4, 1793. On April 4, Isnard presented the report recommending a smaller committee of nine, which two days later was established as the Committee of Public Safety. On May 25, he was presiding at the Convention when a deputation of the commune of Paris came to demand the release of Hébert; Isnard made the famous reply: "If by these insurrections, continually renewed, it should happen that the principle of national representation should suffer, I declare to you in the name of France that soon people will search the banks of the Seine to see if Paris has ever existed." On June 2, 1793 he offered his resignation as representative of the people, but his arrest was not decreed until Oct. 3. He escaped, and on March 8, 1795 was recalled to the Convention, where he supported all the measures of reaction. He was elected deputy for the Var to the Council of Five Hundred. In 1797 he retired to Draguignan. In 1800 he published a pamphlet *De l'immortalité de l'âme*, in which he praised Catholicism; in 1804 *réflexions relatives au sénatus-consulte du 28 floréal an XII.*, an enthusiastic apology for the Empire. Upon the restoration he professed royalist sentiments, and was not disturbed, in spite of the law of 1816 proscribing regicide ex-members of the Convention.

See F. A. Aulard, *Les Orateurs de la Législative et de la Convention* (2nd ed., 1906).

ISOBAR, a line upon a map or pressure chart connecting places having the same atmospheric pressure. The pressures can either be "reduced to sea-level" by means of a calculated factor, or can be in the form of unaltered barometer (*q.v.*) readings. A general pressure map is intended to indicate by isobars the "reduced" average pressure, for any selected period over large areas, while the daily weather charts for smaller regions show the presence of cyclonic, anti-cyclonic, or other such temporary systems. Isobars should be interpreted as the intersections of inclined isobaric surfaces with the surface of the earth.

ISOCHORE, in physics, a line on a thermodynamic diagram

showing certain relations of pressure and temperature in a gas. If a gas is kept at a constant volume (*e.g.*, in a closed vessel) while the temperature to which it is subject is varied, the pressure exerted on the walls of the vessel by the gas alters in a definite manner. If, further, the way in which the temperature and pressure are thus related is indicated by a line on a graph, this line is known as an isochore (*ισο*, equal; *χωρος*, space).

The term is often applied also to van't Hoff's "reaction isochore," which may be briefly described. If a reversible chemical reaction takes place at a constant volume, the equilibrium constant, which determines the extent to which the reaction proceeds (*see* CHEMICAL ACTION), varies with the temperature in a way which depends upon the heat evolved by the reaction, thus:

$$\frac{d \log K}{dT} = \frac{-Q}{2T^2}$$

Here K is the equilibrium constant, T the absolute temperature, and Q the heat (in calories) which would be evolved if 1 gram-equivalent of the initial substance was completely converted to the final product at the temperature T .

ISOCLINIC LINES, lines drawn on maps, connecting those parts of the earth's surface where the magnetic inclination is the same in amount. (*See* TERRESTRIAL MAGNETISM.)

ISOCRATES (436-338 B.C.), Attic orator, was the son of Theodorus of the deme of Erchia. He received the best education Athens provided, and Plato (*Phaedrus*, 278 E) makes Socrates prophesy a brilliant future for him, saying that he will leave the whole of his generation behind in oratory, and that even greater things may be hoped from him, as "a certain philosophy is inborn in him." The dramatic date of the dialogue is about 410. He took no part in public life, for which he was unfitted in physique as well as by temperament, and under the Thirty he withdrew to Chios. He had already started teaching rhetoric, having lost his inherited fortune in the tumult of the end of the Peloponnesian War. He returned about the time of the restoration of the Democracy in 403. For the next ten years he continued to write occasional speeches for the law courts, of which six are extant. He himself despised this branch of his work.

His real vocation was teaching; about 392 he founded his famous school near the Lyceum, where for the rest of his life he may be said to have had the Greek-speaking world from the Black sea to Sicily for his pupils. They include Ephorus, Theopompus and Androtion among historians, Isaeus, Lycurgus and Hyperides among orators. Forty-one names are still known. (*See* P. Sanneg, *De schola Isocratea*, Halle, 1867.) There is a tradition that at the panegyric contest on the death of Mausolus of Caria in 351 there was not a competitor who had not been trained by Isocrates. The instruction given, though based on rhetorical composition, was not confined to it. It seems to have been as much a system of general culture as Quintilian's *Institutio Oratoria*.

Meanwhile he was also active as a publicist. The dominant idea of his public writings was the policy of uniting Greece in a concerted attack on Asia. In Greece there was peace neither between the cities nor inside them; a panhellenic invasion of the Persian empire would obliterate political enmities; its success would contribute to the solution of the economic problem. The difficulty was to find a leader to direct the enterprise; in the *Panegyricus* (380) he looks to a coalition between Athens and Sparta, whose leadership Greece would be proud to follow now as before. When this failed him, he looked in turn to Dionysius I. of Syracuse, Agesilaus III., and finally to Philip of Macedon. His faith in Philip lasted down to Chaeronea (*Philippus*, 346 B.C.; *Epist.* ii., ? 342 B.C.); the question whether it survived that depends on the view taken of the authenticity of *Epist.* iii. There is nothing against it except the tradition that on hearing of Chaeronea Isocrates killed himself by voluntary starvation. On the whole it seems better to discard the tradition than the letter; it is easy to see how the legend could have grown supposing, as seems probable, that he died soon after the battle. He was then 98.

Isocrates amassed considerable wealth at his profession, and fulfilled the usual public services of the rich man at Athens. He

married Plathane, widow of the sophist Hippias of Elis, and adopted her son Aphareus. He had one lawsuit in 355, being challenged to undertake a trierarchy or exchange properties. (See the *Antidosis*.)

We have to estimate his position from the political and the literary points of view. In the first place, his political views were in tune with the prevailing tendency of Greek political thought at the time. Xenophon, Plato, Aristotle (in the *Politics*) all lean at times to the idea of a monarchy to rule a united Greece. The special bent given to this tendency by Isocrates is the prominence of the attack on Asia in his scheme. And here he was not far wrong; Alexander did not lead a panhellenic army into Asia; but the extended field brought under the influence of Greek civilization produced indirectly the results Isocrates desired. He deals in two speeches, *On the Peace* and the *Areopagiticus* (both 355 B.C.), with Athenian politics; in the first he advocates a policy of equality and alliance between Athens and the subject cities of the empire, in the second he appears as a Cato mourning the moral degeneracy of the republic. Whatever may be thought of his political tenets, there is no doubt of his place in the history of literature. He was regarded by the Greeks as representing the smooth or florid school of prose style (*γλαφυρά, ἀνθηρά ἀρμονία*), which phrase was designed to describe his periodic, antithetical style, in contrast to the "austerity" of Antiphon. His real eminence consists in the fact that by giving an artistic finish to the literary branch of rhetoric he set a standard in form and rhythm for prose style. This prose style of his creation, based on the periodic sentence, and subject to rules of rhythm comparable to those of verse, though of course less strict, is his legacy to Cicero, and through him to the literature of modern Europe.

Works.—The extant works of Isocrates consist of 21 speeches or discourses and nine letters. Among these the six forensic speeches represent the first period of his literary life—belonging to the years 403–393 B.C. These are Or. xvi.–xxi. Among the forensic speeches, we must, on the whole, give the palm to the *Aegineticus* (or xix.)—a graphic picture of ordinary Greek life in the islands of the Aegean. Here—especially in the narrative—Isocrates makes a near approach to the best manner of Lysias. The remaining 15 orations form two clearly separated groups—the scholastic and the political.

Under the head of scholastic writings we have, first, three letters or essays of a hortatory character. (1) The letter to the young Demonicus—once a favourite subject in the schools—contains a series of precepts neither below nor much above the average practical morality of Greece. (2) The letter to Nicocles—the young king of the Cyprian Salamis—sets forth the duty of a monarch to his subjects. (3) In the third piece, it is Nicocles who speaks, and impresses on the Salaminians their duty to their king—a piece remarkable as containing a popular plea for monarchy, composed by a citizen of Athens. These three letters may be referred to the years 374–372 B.C.

Next may be placed four pieces which are "displays" (*ἐπιδείξεις*) in the proper Greek sense. They are the *Busiris* (Or. xi., 391–390 B.C.), *Encomium on Helen* (Or. x., 370 B.C.), containing the celebrated passage on the power of beauty, *Evagoras* (Or. ix., 365 B.C.) and *Panathenaicus* (Or. xii., 339 B.C.), his last work.

The third subdivision of the scholastic writings is formed by two most interesting essays on education—that entitled *Against the Sophists* (Or. xiii., 390–391 B.C.), and the *Antidosis* (Or. xv., 353 B.C.). The first of these is a manifesto put forth by Isocrates at the outset of his professional career of teaching, in which he seeks to distinguish his aims from those of other "sophists." As this piece is the prelude to his career, its epilogue is the speech on the *Antidosis*—so called because it has the form of speech made in court in answer to a challenge to undertake the burden of the trierarchy, or else exchange properties with the challenger. The discourse *Against the Sophists* had stated what his art was *not*; this speech defines what it *is*. His own account of his φιλοσοφία "the discipline of discourse" (*ἡ τῶν λόγων παιδεία*)—has been embodied in the sketch of it given above.

His political writings, again, fall into two classes—those which concern (1) the relations of Greece with Persia, (2) the internal affairs of Greece. The first class consists of the *Panegyricus* (Or. iv., 380 B.C.) and the *Philippus* (Or. v., 346 B.C.). The *Panegyricus* urges that Athens and Sparta should unite in leading the Greeks against Persia. The *Philippus* is an appeal to the king of Macedon to assume that initiative in the war on Persia which Isocrates had ceased to expect from any Greek city. In the view of Demosthenes, Philip was the representative barbarian; in that of Isocrates, he is the first of Hellenes, and the natural champion of their cause.

Of those discourses which concern the internal affairs of Greece, two have already been noticed—that *On the Peace* (Or. viii.), and the *Areopagiticus* (Or. vii.)—both of 355 B.C.—as dealing respectively with the foreign and the home affairs of Athens. The *Plataicus* (Or. xiv.) is an appeal to Athens to restore Plataea, destroyed by Thebes. The *Archidamus* (Or. vi.) is a speech purporting to be delivered by Archidamus III., son of Agesilaus, in a debate at Sparta on conditions of peace offered by Thebes in 366 B.C. It was demanded that Sparta should recognize the independence of Messene, which had lately been restored by Epameinondas (370 B.C.). The oration gives brilliant expression to the feeling which such a demand was calculated to excite in Spartans who knew the history of their own city. Xenophon witnesses that the attitude of Sparta on this occasion was actually such as the *Archidamus* assumed (*Hellen*, vii. 4. 8–11).

Of his letters the first—to Dionysius I.—is fragmentary; but a passage in the *Philippus* leaves no doubt as to its object. Isocrates was anxious that the ruler of Syracuse should undertake the command of Greece against Persia. The date is probably 368 B.C. Next in chronological order stands the letter "to the Children of Jason" (vi.). Isocrates urges Thebe, the daughter of Jason, and her half-brothers to set up a popular government. The date is 359 B.C. (See R. C. Jebb in *Journal of Philology*, v. 266, 1874.) The letter to Archidamus III. urges him to execute the writer's favourite idea—"to deliver the Greeks from their feuds, and to crush barbarian insolence." It is remarkable for a vivid picture of the state of Greece; the date is about 356 B.C. The letter to Timotheus (vii., 345 B.C.), ruler of Heraclea on the Euxine, introduces an Athenian friend who is going thither, and at the same time offers some good counsels to the benevolent despot. The letter "to the Government of Mytilene" (viii., 350 B.C.) is a petition to a newly established oligarchy, begging them to permit the return of a democratic exile, a distinguished musician named Agenor. The first of the two letters to Philip of Macedon (ii.) remonstrates with him on the personal danger to which he has recklessly exposed himself, and alludes to his beneficent intervention in the affairs of Thessaly; the date is probably the end of 342 B.C. The letter to Alexander (v.), then a boy of 14, is a brief greeting sent along with the last. The letter to Antipater (iv.) introduces a friend who wished to enter the military service of Philip. The later of the two letters to Philip (iii.) appears to be written shortly after the battle of Chaeronea in 338 B.C.

BIBLIOGRAPHY.—With the exception of defects at the end of Or. xiii., at the beginning of Or. xvi., and probably at the end of Letters i., vi., ix., the existing text is free from serious mutilations. It is also unusually pure. The smooth and clear style of Isocrates gave few opportunities for the mistakes of copyists. On the other hand, he was a favourite author of the schools. Numerous glosses crept into his text through the comments or conjectures of rhetoricians. This was already the case before the 6th century, as is attested by the citations of Priscian and Stobaeus. Jerome Wolf and Koraes successfully accomplished much for the text. But a more decided advance was made by Immanuel Bekker. He used five mss., viz., (1) Codex Urbinus III., Γ (this, the best, was his principal guide); (2) Vaticanus 936, Δ; (3) Laurentianus 87, 14, Θ; (13th century); (4) Vaticanus 65, Α; and (5) Marcianus 475, Ζ. The first three, of the same family, have Or. xv. entire; the last two are from the same original, and have Or. xv. incomplete.

J. G. Baiter and H. Sauppe in their edition (1850) follow Γ "even more constantly than Bekker." Their apparatus is enriched, however, by a ms. to which he had not access—Ambrosianus O. 144, E., which in some cases, as they recognize, has alone preserved the true reading. The readings of this ms. were given in full by G. E. Benseler in his second edition (1854–55). The distinctive characteristic of Benseler's textual criticism was a tendency to correct the text against even the

best ms., where the ms. conflicted with the usage of Isocrates as inferred from his recorded precepts or from the statements of ancient writers. Thus, on the strength of the rule ascribed to Isocrates—*φωρηντα μη συμπίπτειν*—Benseler would remove from the text every example of hiatus (on the mss. of Isocrates, see H. Bürmann, *Die handschriftliche Überlieferung des Isocrates*, 1885–86, and E. Drerup, in *Leipziger Studien*, xvii., 1895).

Editions: in *Oratores Attici*, ed. Imm. Bekker (1823–28); W. S. Dobson (1828); J. G. Baiter and Hermann Sauppe (1850). Separately *Ausgewählte Reden, Panegyrikos und Areopagitikos*, by Rudolph Rauchenstein, 6th ed., Karl Münscher (1908); in Teubner's series, by G. E. Benseler (new ed., by F. Blass, 1886–95) and by E. Drerup (1906, etc.); *Ad Demonicum et Panegyricus*, ed. J. E. Sandys (1868); *Evagoras*, ed. H. Clarke (1885). Extracts from *Orations* iii., iv., vi., vii., viii., ix., xiii., xiv., xv., xix., and *Letters* iii., v., edited with revised text and commentary, in *Selections from the Attic Orators*, by R. C. Jebb (1880); vol. i. of an English prose translation, with introduction and notes by J. H. Freese, has been published in Bohn's *Classical Library* (1894). See generally Jebb's *Attic Orators* (where a list of authorities is given) and F. Blass, *Die attische Beredsamkeit* (2nd ed., 1887–98), and the latter's *Die Rhythmen der attischen Kunstprosa* (1901). There is a special lexicon by S. Preuss (1904). On the philosophy of Isocrates and his relation to the Socratic schools, see Thompson's ed. of Plato's *Phaedrus*, Appendix 2. (R. C. J.; X.)

ISODYNAMIC LINES, lines drawn on maps, connecting those parts of the earth's surface where the magnetic force has the same intensity (see TERRESTRIAL MAGNETISM).

ISO GAMY, term applied in biology to conditions in which the sexual cells (gametes, *q.v.*) are alike, in contradistinction to heterogamy or anisogamy, where the gametes are differentiated into male elements (spermatozoa or spermatozooids) and female elements (ova). Isogamy occurs in some of the lower Algae and certain Protozoa, but it would seem that in most cases, if not in all, the gametes do not behave alike, so that they are functionally anisogamous. (See FERTILIZATION, PROTOZOA, ALGAE, REPRODUCTION.)

ISO GONIC LINES, lines drawn on maps, connecting those parts of the earth's surface where the magnetic declination is the same in amount (see TERRESTRIAL MAGNETISM).

ISOLA DEL LIRI, a town of Lazio, province of Frosinone, Italy, 15 m. by rail N.N.W. of Roccasecca, which is on the main line from Rome to Naples, 10 m. N.W. of Cassino. Pop. (1921), town 3,139; commune, 8,931. The town, as its name implies, is situated between two arms of the Liri. The many waterfalls of this river and of the Fibreno afford motive power for several important paper-mills; felt and blankets are also made. About 1 m. to the north is the church of San Domenico, erected in the 12th century, which probably marks the site of the villa of Cicero (see ARPINO).

ISOMERISM. In the period when chemical analysis was first introduced, the belief was generally held that the properties of every substance depended solely upon its chemical composition. Two substances which had the same properties were therefore supposed to be identical in composition; and, conversely, if a difference could be detected in the properties of two samples of a substance under the same conditions, it was held to be due to some difference in chemical composition.

The fundamental postulate that the properties of a substance are determined uniquely by its chemical composition is subject to certain well-defined types of exception. The general term "isomerism" which is sometimes assigned to these can be classified more accurately under three headings as, (i.) *polymorphism*, where a difference of properties is caused by a different arrangement of identical molecules in a crystal; (ii.) *polymerism*, where the molecules are of identical composition, but of different size; and (iii.) *isomerism*, where the molecules are of identical composition and size, but of different structure.

Polymorphism.—The fundamental postulate set out above was expressed in a precise form in 1801 by the Abbé Haüy, who made it the basis of his classification of minerals. "His guiding principle was this: that every difference in the fundamental form of a crystal implied a difference in its chemical composition" (Armitage, *A History of Chemistry*, 1906, p. 104). Thus, although the two minerals calcite, or Iceland spar, and aragonite appear to be merely two crystalline modifications of ordinary chalk (calcium carbonate) (see fig. 1), it is often possible to detect the presence of iron (as ferrous carbonate) in calcite, and of strontia

(as strontium carbonate) in aragonite. The two different methods of crystallization of calcium carbonate in calcite and in aragonite could therefore be attributed to the determining action of these impurities, since ferrous carbonate does in fact form crystals of the same general type as calcite, while crystals of strontium carbonate have the same general form as aragonite. Since, however, these impurities are not essential to the production of either

FIG. 1.—A. CALCITE. B. ARAGONITE

These two minerals have the same chemical composition, but differ widely in the form of the crystals

mineral, Haüy's postulate has long since been abandoned. It is, for instance, obviously untenable in the case of sulphur, where the type of crystallization depends on the temperature, and not on the composition of the sample, since the same sample of sulphur can be made to change from one crystalline form to the other without any change of composition merely by heating and cooling above and below 96° C. This is the phenomenon described as polymorphism, and affords a simple example of those variations of properties which lie outside the scope of chemical analysis, and which form the main subject of this article. Further examples of this phenomenon are described in the article ALLOTROPY.

Structural Isomerism.—The type of isomerism which depends on a dissimilar arrangement of equal numbers of atoms in the molecules of an element or compound is known as structural isomerism. It is therefore a mere truism to assert that it can only exist in polyatomic molecules. Thus among elements, since the majority of them contain only one atom in the molecule, polymerism (which depends on the formation of polyatomic molecules of two different sizes) is rare, although polymorphism is relatively common and isomerism (which depends on the formation of polyatomic molecules of equal size but different structure) is so scarce that soluble and insoluble sulphur (*q.v.*) still stand alone as the only case in which the existence of two forms of equal molecular weight has been clearly established. Since, however, carbon is unique in the readiness with which complex structures can be built up from the elementary atoms, it is not surprising that differences of properties depending on differences of molecular structure, in compounds of identical composition, should have been discovered amongst organic compounds at a very early period—antedating by nearly a century the discovery of the same phenomenon in elementary sulphur.

The first example of a pair of organic compounds of identical percentage composition, but having totally different properties, was recorded in 1820 by Dalton, who, by the distillation of fatty oils, prepared a gas which resembled olefiant gas (see ETHYLENE) in combining with chlorine, but appeared to contain twice as much carbon and hydrogen in a given volume. When, therefore, W. Henry in 1821 discovered a similar constituent in coal gas,

FIG. 2.—ISOMERISM

Molecular structure of (a) dextro-tartaric acid, (b) laevo-tartaric acid, (c) meso-tartaric acid. Note the change in position of the hydrogen (H), hydroxyl (OH) and carboxyl (COOH) groups, accounting on different behaviour towards polarized light

Dalton was able to suggest that "almost probably the atoms [molecules] of the new gas consist of two of olefiant gas." This conclusion was subsequently confirmed by Faraday, who separated the same compound by condensation from oil-gas at 0° F, and showed that it contained carbon and hydrogen in the same proportion as olefiant gas, but had twice the density. Faraday cited this case as evidence of "the existence of bodies composed of the same elements and in the same proportion but differing in their qualities," and ventured to predict that "now we are taught to look for them they will probably multiply on us." This pre-

diction was abundantly fulfilled; but in the case cited by Faraday the two bodies (now known as ethylene, C_2H_4 , and butylene, C_4H_8) differ in the number of atoms in the molecule; they are therefore polymeric and not isomeric in the strict usage of the word. These two phenomena give rise, however, to such similar changes of properties that it is often difficult to distinguish between them, unless the molecular weights of the two forms can be determined with ease and certainty, as in the case of ethylene and butylene, where they can be deduced at once from the densities of the two gases (see STOICHIOMETRY).

In the second case cited by Faraday, the fulminates prepared and analyzed by Liebig (1823) and Gay Lussac (1824) have the same composition as the cyanates prepared and analyzed by Wöhler (1824), although these compounds have nothing in common but their composition. Whilst, however, the percentage composition of both silver salts can be represented by the formula $AgCNO$, it is not easy to prove whether these salts are isomeric or polymeric, since the ordinary methods of determining molecular weights are not applicable to salts such as these. An undoubted example of true isomerism was disclosed, however, when Wöhler in 1828 converted ammonium cyanate into urea, since these two compounds are identical in molecular weight as well as in their percentage composition. Both compounds can, in fact, be represented by the formula CON_2H_4 , but whereas ammonium cyanate is regarded as an aggregate of ammonium and cyanate ions, NH_4 and CNO , urea is formulated as a compound in which two amino-groups, NH_2 , are united by a carbonyl group, CO , thus:

Ammonium cyanate, $(NH_4)CNO$; Urea (or carbamide), $CO(NH_2)_2$. The structural isomerism of these two substances can therefore be summarized by saying that in one compound (ammonium cyanate) all four atoms of hydrogen are attached to one atom of nitrogen to form an ammonium radical, NH_4 , whereas in the other compound (carbamide) each atom of nitrogen carries two atoms of hydrogen. This contrast is shown more clearly in the following structural formulae, where the links or "bonds" between the atoms are represented by straight lines, and the plus and minus signs represent opposite electric charges:

The double barbs pointing in opposite directions are used to indicate the fact (discovered at a much later date) that the conversion of one isomeride into the other can take place in either direction, *i.e.*, that the process is *reversible* (Walker and Hambly, 1895). Wöhler's discovery not only provided one of the first authentic cases of isomerism, but was hailed as the first example of the synthesis of an organic compound from inorganic materials by ordinary laboratory processes and without the intervention of any vital force. Since the urea which he had prepared from ammonium cyanate proved to be identical in every respect with that which is found in urine, Wöhler announced his discovery to Berzelius in the following terms: "I must tell you that I can prepare urea without requiring a kidney or an animal, either man or dog."

Metameric Substances.—Wöhler's synthesis, as affording the first recorded example of *isomeric change*, *i.e.*, of the conversion of one isomer into another, is second in importance only to the fact of isomerism itself, and Berzelius therefore introduced a special term to describe it. Thus in 1831 he introduced the term *isomeric* (*ισομερής*, composed of equal parts) to describe bodies composed of an equal number of atoms of the same elements but arranged in an unlike manner, and therefore possessing different chemical properties and crystalline forms, and the term *polymeric* (*πολύς*, several) to describe those cases in which, although the relative number of the atoms is the same, the absolute is not. In the following year he introduced the further term *metameric* (Gr. *μετα*, change) to describe those isomeric substances which

change easily into one another. Kekulé, however, confused this simple nomenclature by using the term *isomeric* to describe all compounds which have the same percentage composition but different properties; these compounds were then classed, on the one hand as polymeric when they had the same composition but differed in molecular weight, and on the other hand as metameric when the molecular weight was the same but the structure of the molecules was different; Kekulé therefore applied the term "metameric" to ordinary cases of structural isomerism. The terms *isomeric* and *polymeric* have fortunately survived in the sense of Berzelius' original definitions; but the term *metameric*, which was rendered ambiguous by Kekulé's attempt to make it mean something quite different, has been generally abandoned.

Examples of Structural Isomerism.—When structural chemistry came into existence about 1858, large numbers of isomeric compounds were prepared by deliberate synthesis. For instance, the following series of alcohols and acids can be regarded as fundamental units for the preparation of more complex carbon-compounds:

Methyl alcohol,	$CH_3\cdot OH$	Formic acid,	$H\cdot CO\cdot OH$
Ethyl alcohol,	$C_2H_5\cdot OH$	Acetic acid,	$CH_3\cdot CO\cdot OH$
Propyl alcohol,	$C_3H_7\cdot OH$	Propionic acid,	$C_2H_5\cdot CO\cdot OH$
Butyl alcohol,	$C_4H_9\cdot OH$	Butyric acid,	$C_3H_7\cdot CO\cdot OH$
Amyl alcohol,	$C_5H_{11}\cdot OH$	Valeric acid,	$C_4H_9\cdot CO\cdot OH$

In these abbreviated structural formulae, it will be seen that the alcohols contain an alkyl group or alkyl "radical," consisting of carbon and hydrogen in the ratio C_nH_{2n+1} , linked to the characteristic *hydroxyl* group, OH , of the alcohols; while the acids contain the same alkyl groups linked to the characteristic *carboxyl* group, $CO\cdot OH$, of the acids. By eliminating a molecule of water from an alcohol and an acid, it is possible to produce a member of the series of esters (*q.v.*), which afford innumerable examples of structural isomerism. Thus the three compounds:

Ethyl formate, $H\cdot CO\cdot O\cdot C_2H_5$, Methyl acetate, $CH_3\cdot CO\cdot O\cdot CH_3$,
Propionic acid, $C_2H_5\cdot CO\cdot OH$,

are obviously isomeric, since they all have the formula $C_3H_6O_2$; but, as they cannot be converted into one another by any simple process, they are not metameric in the sense of Berzelius' definition (although Kekulé cited the fatty acids and their esters as examples of his proposed use of this term).

Closer inspection shows, however, that isomerism can also occur in the alcohols and acids themselves, except in the simplest members of the two homologous series set out above. Thus we find that two different models of the propyl group, C_3H_7 , can be constructed as follows:

the spare bond by which the group is attached to hydroxyl or to carboxyl being at the end or at the centre of the chain of carbon atoms. We can therefore write the formulae of propyl alcohol, $C_3H_7\cdot OH$, and of butyric acid, $C_3H_7\cdot CO\cdot OH$, each in two ways:

Similarly, the higher members of this series of alcohols and acids give rise to increasing numbers of isomers. Thus the butyl radical, C_4H_9 , can exist in four forms,

and there are, therefore, four isomeric butyl alcohols and four isomeric valeric acids. Only a few further steps in the series are necessary in order to reach compounds of which hundreds of isomers are theoretically possible. There is therefore no limit to the extent to which structural isomers could be multiplied in organic chemistry if necessary.

Optical Isomerism.—If the two-dimensional formulae which have been used in the preceding paragraphs were correct, it would be possible to construct two alternative models to represent the molecule of ethyl alcohol, thus

In one model, which we may call the *trans*-form, the two hydrogen atoms are at opposite corners of the cross, whilst in the other, the *cis*-form, the two hydrogen atoms are adjacent. Since ethyl alcohol is known only in one form, we conclude that these planar formulae are incorrect. We therefore follow Pasteur in supposing that the atoms are arranged in three dimensions in space, and conclude that the conventional formulae in two dimensions are misleading. Isomerism in compounds of this type then becomes possible for the first time when an *asymmetric carbon atom*, i.e., a carbon atom linked to four different radicals, is present in the molecule. Two isomers are then possible, as in the formulae:

Each of these models is supposed to stand like a tripod on a triangular base, with H at the back and the CH₃ and C₂H₅ groups in front. Since these models differ in the same way as a right hand differs from a left hand they are often described as right-handed and left-handed. It will also be seen that, whichever of the four radicals occupies the vertical position the remaining three radicals are arranged in an opposite sequence, and that the two models are never superposable. If, however, one of the models is looked at in a mirror, the image of one will correspond with the object of the other. These two models are therefore also described as *mirror-images* of one another, or in more technical language they are said to be *enantiomorphous*, i.e., one is the opposite form of the other.

Two isomers which only differ in this subtle way must obviously resemble one another very closely. They can, however, be detected by the fact that the crystals like the molecules are *disymmetric*, i.e., yield an opposite figure when reflected in a mirror, and also by the power (which is generally possessed by solutions of the two isomers, as well as by the crystals) of twisting the plane of vibration of polarized light (*q.v.*) to the right or to the left. For this reason, this type of isomerism is often described as optical isomerism, and the optical isomers are distinguished as *dextro-rotatory* and *laevo-rotatory* according as the twist is to the right or to the left.

Even before Wöhler's discovery of the conversion of ammonium cyanate into urea, a genuine example of isomerism had been found in a pair of compounds of this type. Thus tartaric acid and racemic acid were shown to be identical in composition. This anomalous result was confirmed by Berzelius, who therefore cited

the two acids in 1831 as illustrations of the phenomenon which he proposed to describe as isomerism. In 1849 Pasteur made a crystallographic study of the salts of the two acids, the results of which are described in the article **STEREOCHEMISTRY**, since the phenomena are instances of stereoisomerism. As a result of these researches, and of the later theories of von 't Hoff and Le Bel (1874), it became possible to attribute the optical activity to the presence of an asymmetric carbon atom whose four different groups were situated at the corners of a tetrahedron, the carbon atom being at the centre. Since tartaric acid has two such asymmetric carbon atoms—those in heavy type in the formula

it was possible to assign to the dextro and laevo varieties the space formulae (a) and (b) (fig. 2), in which (b) is the mirror-image of (a), since the two are identical in properties except for their equal and opposite effects on polarized light and for their mirror-image crystalline forms. It followed therefore that racemic acid was a crystal mixture of equal amounts of the *d*- and *l*-acids, but that the *meso*-acid, which was optically inactive like racemic acid, owed its inactivity to "internal compensation" (fig. 2 c).

Static and Dynamic Isomerism.—Although structural isomers cannot usually be converted directly into one another, a large number of examples are now known in which conditions are present which enable isomeric change to take place. Thus the conversion of ammonium cyanate into urea probably depends on the fact that ammonia and cyanic acid can combine in two ways. In the one process, the cyanic acid is broken up by the familiar process of neutralization:

in the other process the ammonia is broken up and attached to two different points in the molecule of cyanic acid

If both processes are reversible, it is easy to see how one isomer can be converted into the other.

Another type of isomeric change is very common amongst the derivatives of benzene, where the displacement of an atom of hydrogen by some other atom or radical often leads to a relatively unstable product, which then changes to a more stable isomer by a process of exchange. A good example is afforded by acetanilide, which can be derived from aniline and acetic acid by eliminating a molecule of water:

This compound contains hydrogen, (i.) in the acetyl radical, $-\text{CO}\cdot\text{CH}_3$, (ii.) in the "imino-group," $-\text{NH}-$, (iii.) in the phenyl radical, C_6H_5- . When attacked by bleaching powder the central atom of hydrogen is replaced by chlorine; but by the further action of hydrochloric acid an isomeric change is induced in which the chlorine changes places with an atom of hydrogen in the phenyl group, thus:

This particular isomeric change has been shown to be due to a reversible chlorination, i.e., the hydrochloric acid interacts with the first product, setting free a molecule of chlorine, which then attacks a phenyl group and replaces an atom of hydrogen there,

Another interesting change of the same character is made use of in the manufacture of benzidine, with a view to preparing an important series of dye-stuffs:

In this isomeric change two molecules of aniline, which are joined together by the reactive "heads" of the molecule, undergo an isomeric change which leaves them united "tail to tail," so that the two heads are again available for further reactions. Under the conditions usually employed these isomeric changes appear to be completely non-reversible, since it has not been found possible to make a substituent in the phenyl group change places with a hydrogen atom in a radical attached to it.

Reversible Isomeric Change.—Although ethyl ether cannot be converted directly into any of the four butyl alcohols, it is quite easy to convert iso- and tertiary-butyl alcohol into one another; and this change can be carried out under conditions in which the isomeric change is shown to be reversible. Thus, if we remove a molecule of water from either of these alcohols, the product in each case is the hydrocarbon isobutylene,¹ thus:

If, therefore, this process of dehydration could be reversed, we should expect isobutylene to give rise simultaneously to iso- and tertiary butyl alcohol. This hydration of the hydrocarbon can be effected by dissolving gaseous isobutylene in sulphuric acid of moderate strength. A reversible process of hydration and dehydration then takes place, of which the main product is tertiary butyl alcohol, which can be separated and identified easily, since it is a solid, whereas isobutyl alcohol is liquid at ordinary temperatures. When, however, pure crystalline tertiary butyl alcohol is dissolved in sulphuric acid and oxidized by means of chromic acid, the main product of oxidation is isobutyric acid, which must have been formed by the oxidation of isobutyl alcohol:

A solution in sulphuric acid must therefore contain isobutyl alcohol as well as tertiary butyl alcohol. Whilst, therefore, iso- and tertiary butyl alcohols are perfectly stable in the free state, it is clear that in presence of sulphuric acid they are readily converted into one another, so that the isomerism is no longer fixed or *static*, but mobile or *dynamic*. Moreover, the mechanism by which the static isomerism of the alcohols has been rendered mobile or dynamic is also clear, since this phenomenon is seen to depend on a reversible process of hydration and dehydration.

The preceding experiments on the interconversion of butylene and the butyl alcohols were carried out by Büttlerow from 1867 to 1873. They were followed by the publication in 1877 of a paper of far-reaching importance under the prosaic title "On Isodibutylene." The hydrocarbon isodibutylene, C_8H_{16} , is a polymer of isobutylene, C_4H_8 , and is formed as a by-product when isobutylene is prepared from tertiary butyl alcohol by the action of 50% sulphuric acid. When, however, this polymer was oxidized by a mixture of chromic and sulphuric acids, oxidation products were obtained which showed the presence in the solution of two isomeric hydrocarbons and two isomeric alcohols. The equilibrium established by means of sulphuric acid therefore includes four compounds, as indicated by the scheme:

¹This is an isomer of the hydrocarbon butylene, C_4H_8 , which has been cited above as a polymer of ethylene, C_2H_4 .

At low temperatures the proportion of hydrocarbon is small; the principal equilibrium is then a dynamic isomerism of two alcohols, proceeding through the formation of a small quantity of an intermediate hydrocarbon, as indicated by the last three formulae of the above scheme. At high temperatures on the other hand the proportion of hydrocarbon is large; the main equilibrium is then a dynamic isomerism of two hydrocarbons, proceeding through the formation of a small quantity of an intermediate alcohol, as indicated in the first three formulae of the above scheme.

Büttlerow did not propose any new name for the condition of dynamic equilibrium between isomers which he had discovered in isodibutylene, but the term *dynamic isomerism* was introduced in 1899 by Lowry as a convenient abbreviation. Under this heading all cases of isomeric change should be included, in view of the possibility that they are all reversible to a larger or smaller extent; and the important question of the chemical and physical conditions under which a particular isomeric change takes place must also be regarded as subsidiary to the fact that an isomerism, which under other conditions may be merely static, has actually become dynamic.

Tautomerism.—The static isomerism of iso- and tertiary butyl alcohol, or of the two isodibutylenes, becomes dynamic only in presence of sulphuric acid of moderate strength, *i.e.*, when a reversible process of hydration and dehydration is set up. The isomerism of these compounds could therefore be rendered static at any moment by diluting the acid with water, when the isomers could be separated from one another in the ordinary way by fractional distillation, crystallization, etc. Büttlerow, however, also considered the possibility of reversible isomeric change proceeding without the addition of sulphuric acid, or of any similar "catalyst" to initiate the change: "In such cases, all attempts to establish a definite chemical structure for the substance would be useless, since molecules of the two or more isomeric varieties would always be present. It is clear that the chemical metamorphoses of such a substance must proceed sometimes in the sense of one chemical grouping, and sometimes in the sense of the other, according to the nature of the reagent and the conditions of the experiment."

He therefore put forward his discovery of dynamic equilibrium between isomers as a solution of the problem of the *dual reactivity* of hydrocyanic acid, HCN, and of cyanic acid, HCNO. Each of these acids is known only in a single form (although cyanic acid, HOCN, yields a polymer, cyanuric acid, to which the formula $\text{H}_3\text{O}_3\text{C}_3\text{N}_3$ is assigned); but each acid yields two series of methyl derivatives. Thus hydrocyanic acid gives, (i.) methyl cyanide, in which the methyl group CH_3 is attached to the carbon of the acid, and (ii.) methyl isocyanide, in which the methyl group is attached to nitrogen

In order to explain the dual reactivity of hydrocyanic acid, Büttlerow suggested that liquid prussic acid (as it is commonly called) is an equilibrium-mixture of two isomers,

just as gaseous nitrogen peroxide is an equilibrium-mixture of two polymers

This analogy suggests of course that, since the brown vapours of nitrogen dioxide are converted wholly into colourless crystals of the tetroxide by freezing (*see* NITROGEN), the crystals of solid prussic acid would consist of one pure isomer; but this deduction was beyond the scope of Büttlerow's discussion.

The dual reactivity of a chemical compound, such as prussic acid, which behaves towards some reagents as if it had one structural formula, and towards other reagents as if it had another structural formula, is now generally called "tautomerism." Thus the Oxford Dictionary defines tautomerism as follows: "This

term is applied to the property exhibited by certain compounds of behaving in different reactions as if they possessed two or more different constitutions, that is, as if the atoms of the same compound or group were arranged in two or more different ways, expressible by different structural formulae." This definition may now be regarded as an agreed definition of a term to which several different meanings had been assigned previously.

In many cases, tautomerism is due to the existence of two isomers in dynamic equilibrium with one another; but there is no reason to suppose that this is always the case. Thus, if we attribute to silver cyanide the formula AgNC , we should expect it to yield methyl isocyanide, CH_3NC , by the direct replacement of silver by methyl,

but it could also yield methyl cyanide, CH_3CN , through the intermediate formation of an addition-compound, thus:

It is therefore important to distinguish clearly between the purely chemical phenomenon of tautomerism, which implies the existence of *isomeric derivatives* of the parent-compound, and the physico-chemical phenomenon of dynamic isomerism which postulates the real existence of *isomeric forms of the parent-compound itself*.

The term tautomerism was introduced in 1885 by Laar in a paper "On the possibility of several structural formulae for the same chemical compound." This possibility was used to explain an observation of Zincke (1884), who had obtained identical, instead of isomeric, products by the action of phenylhydrazine on naphthaquinone and of diazobenzene on α -naphthol, and was unable to determine whether the product should be formulated as a hydrazone or as an azo-compound:

since one method of preparation pointed to the first of these structural formulae, and the other method to the second. In order to explain this and a number of similar cases, in which a single compound seemed to stand for more than one structural formulae, Laar put forward his hypothesis of tautomerism, of which a definition has virtually been given in the title of his paper. A more precise definition was put forward, however, in a paper published in the following year in which Laar stated that the various structural formulae that can be assigned to a tautomeric compound represent "*not isomeric but identical substances*."

This more precise definition was introduced in order to show that his hypothesis of tautomerism was quite distinct from the explanation of the dual reactivity of prussic acid which Büttlerow had given 8 years previously, but under a title that was so obscure that Laar was probably ignorant of the contents of the paper when his own first paper was written. The fundamental difference between the two explanations arises from the fact that, according to Laar, structural isomerides can never be isolated from a tautomeric substance, because they have no real existence, whereas in order to separate a mixture of dynamic isomerides it is usually only necessary to secure the proper experimental conditions, purity, dryness, low temperature, etc. In this way Laar's theory of tautomerism was soon shown to be incorrect in the main group of cases to which he applied it. The name which he introduced has, however, remained in use, but with a wide variety of meanings as alternatives to his original definition of the term, of which the one cited above is perhaps the most authoritative expression of the current and future usage of the word.

Laar's hypothesis, that several formulae may be required to represent the successive phases in the life history of a single substance, had already been used by Kekulé in 1872 in order to account for the non-existence of certain isomeric derivatives of benzene which would otherwise have appeared to be theoretically

possible. Thus, theory would predict the existence of the two isomers represented by the formulae

where the carbon atoms which carry the two atoms of bromine are united in the former case by a single bond, and in the latter case by a double bond. Since no such isomerism could be detected in practice, Kekulé suggested that the alternation of single and double bonds was mobile, in the sense that the first formula was a correct record of one phase in the life history of the molecule, but that this was followed by a phase of which the second formula was the record. This hypothesis is by no means improbable, but it was only rendered necessary by Kekulé's strict adherence to the view that every atom of carbon must carry four bonds. It is therefore noteworthy that, in their less formal writings, organic chemists habitually "cut the Gordian knot" by ignoring the double bonds of Kekulé's formula for benzene, and represent the hydrocarbon by a simple hexagon, in which the atoms of carbon are shown with an effective valency of 3 instead of 4. The many formulae that have been assigned to benzene, in order to account for the various chemical properties of the hydrocarbon, afford, however, an ideal example of Laar's hypothesis of tautomerism, since all these formulae are intended to represent the same hydrocarbon, *i.e.*, they represent identical and not isomeric substances.

Pseudomerism.—An alternative explanation of Zincke's observation (which he rejected) was described by Laar as pseudomerism in order to describe a discovery which von Baeyer had made in 1883, that a compound to which a definite structural formula can be assigned may nevertheless yield (or be prepared from) derivatives having a totally different structure. Thus Baeyer's observations showed that, although isatin yields an *O*-ethylisatin (a) by direct ethylation, an isomeric *N*-ethylisatin (b) can be prepared indirectly from ethylindole by oxidation, although the pseudoisatin (ψ -isatin) from which it is derived is altogether unknown:

A similar possibility has already been discussed in connection with silver cyanide, but many other illustrations might be cited. Thus, ordinary camphor, when boiled with benzoyl chloride, $\text{C}_6\text{H}_5\text{CO}\cdot\text{Cl}$, yields the benzoate of an isomeric alcohol (or enol), perhaps as a result of forming an intermediate addition-compound

This hypothesis was contrasted by Laar with his own hypothesis of tautomerism; but it should be noticed that the Oxford definition of tautomerism would include, instead of excluding, every case in which the occurrence of pseudomerism could be established, since it lays stress only on the fact of dual reactivity, and wisely ignores the various explanations that can be given of that fact.

Desmotropy and Prototropy.—The two structural isomerides which Zincke attempted, but failed, to prepare, differ from one another (apart from a rearrangement of the single and double bonds between the atoms) only in the position occupied by a single atom of hydrogen, which is attached to nitrogen in the hydrazone and to oxygen in the isomeric azo-compound. Most of the other cases cited by Laar were of the same type. When therefore his

theory of tautomerism became untenable, it was natural that this feature of his work should have tended to survive. Many writers have, in fact, adopted a definition which limits the phenomenon of tautomerism to cases of this type. Thus Kurt Meyer (1913) suggests that: "Substances are tautomeric if they form two series of derivatives which are deduced from two isomeric formulae; these formulae differ from one another in the position of a hydrogen atom, and of one or more double bonds." In the same way Schmidt, *Text-book of Organic Chemistry* (English trans., 1926), says: "A substance is tautomeric when it forms two series of derivatives. These are derived from two parent structures which differ only in the position of a hydrogen atom and of one or more double bonds."

This limitation is out of harmony with the definition of tautomerism cited above, and has the disadvantage of excluding the most characteristic of all cases of tautomerism, namely, that of the hydrocarbon benzene; it is therefore out of place in a modern definition of the term. On the other hand, this particular group of isomeric changes is so important that some special term is needed to describe it. The term *desmotropy*, or bond-shifting, was therefore put forward for this purpose by Jacobsen in 1887, to describe "a rearrangement of bonds consequent upon the displacement of a hydrogen atom," in the following note: "The word 'tautomerism' is based on Laar's view, which (I believe) is not shared by most chemists, that the molecules of compounds whose chemical behaviour is represented by two structural formulae differing in the point of attachment of a hydrogen atom never assume a definite constitution, but exist in a constant state of oscillatory change. The majority of chemists would explain the observations in question in this way, that the known form of such compounds are to be represented by a definite grouping of atoms which in certain reactions passes over into an isomeric grouping by a rearrangement of bonds consequent upon the displacement of a hydrogen atom" (*Ber.*, 1887, 20, p. 1,732, footnote).

A serious blunder was made, however, when Hantzsch and Hermann (1887) attempted to make this term mean something different by limiting it to those cases of supposed tautomerism to which Laar's term could no longer be applied, because pairs of isomers had actually been isolated from the substance in question. In this way a word which might have been a valuable addition in chemical nomenclature was rendered ambiguous and therefore useless. Until recently, therefore, there was no term available to describe specifically the important group of isomeric changes which Jacobsen sought to differentiate. This gap has now been filled by the introduction of the word *prototropy* (Lowry, *Trans. Chem. Soc.*, 1923, 123, p. 828) to describe those isomeric changes which depend only on the displacement of a hydrogen atom, or proton, accompanied by a rearrangement of bonds, as postulated in Jacobsen's definition. By way of contrast isomeric changes which involve only a displacement of bonds or valency electrons without any accompanying displacement of atoms has been described as *electrotropy* (cf. H. S. Fry, *Electronic Conception of Valence*, p. 11), whilst those isomeric changes which involve the displacement of radicals or ions other than hydrogen have been described by the term *ionotropy* (Lowry, "Le Mécanisme de la Transformation Chimique," Second Report of the *Institut International de Chimie Solvay*, 1925, p. 150).

Examples of Prototropic Change.—(a) Ethyl acetoacetate. The classical example of prototropy is found in ethyl acetoacetate, which was cited in Laar's first paper as an example of tautomerism, since it gives with almost equal readiness derivatives of the two structural isomers formulated below:

The first structure is described as the *ketonic* form, since it contains the characteristic group $\text{>C}\cdot\text{CO}\cdot\text{C}<$ of the ketones; the second structure contains a double bond ("en") and an alcohol-radical ("ol") and is therefore described as *enolic*. By working at low temperatures Knorr (1911) was able to separate the two isomers, to determine the proportions in which they are present in the liquid ester at atmospheric temperatures, and to

prove that they behave differently towards ferric chloride. Later on Kurt Meyer, who had devised a method for estimating the enolic form by its easy bromination, showed that the two isomers could be separated by "aseptic distillation," i.e., by fractional distillation in vessels of silica glass, in order to avoid the catalytic action of the alkali in ordinary glass. The isomerism of both the *ketonic* and the *enolic* forms of the ester has thus been studied with marked success.

(b) Nitrocamphor and the sugars. The migration of a hydrogen atom in nitrocamphor, giving rise to a salt-forming isomeride, is accompanied by changes of optical rotatory power or *mutarotation* (Lowry, *Trans. Chem. Soc.*, 1899, 75, p. 211), and can therefore be studied very easily with the help of a polarimeter to measure their rotary power.

As long ago as 1899 therefore the study of this compound led to the discovery that even this very facile type of isomeric change does not take place spontaneously, since solutions of nitrocamphor in chloroform could sometimes be kept for many days before they began to change, apparently as the result of the introduction of some catalytically active impurity.

Changes of mutarotation, resulting from analogous changes of structure, were discovered as long ago as 1846 by Dubrunfaut in freshly-prepared solutions of glucose, and subsequently by other workers in solutions of many other sugars, from several of which the two isomeric forms have been separated, just as in the case of ethyl acetoacetate. By making use of methylated sugars, which are soluble in inert organic solvents as well as in water, it has been possible to arrest the mutarotation of these compounds in just the same way as in the case of nitrocamphor (Lowry and Richards, 1925) and therefore to determine what conditions are needed in order to initiate the isomeric change. Experiments in non-aqueous solvents then showed that this can only be effected by *amphoteric solvents*, i.e., solvents such as water or a mixture of pyridine and cresol which possess both acid and basic properties (Lowry and Faulkner, 1925). These solvents are able to bring about the migration of a hydrogen atom, since on the one hand the basic components can take away a proton (or hydrogen atom) from the sugar, whilst on the other hand the acid components can supply a proton to the sugar at the new point of attachment. The isomeric change can therefore be attributed to an electrolysis (*q.v.*) of the sugar, as represented by schemes such as

where the two forms of the sugar are represented by the formula HG and GH, with the base or proton-acceptor on the left and the acid or proton-donor on the right.

Polymorphism and Isomerism of Prototropic Compounds.—The ease with which prototropic compounds can change into one another leads one to suspect that many of the cases which have been described as polymorphism really depend on differences of molecular structure, since, if the changes of structure are rapid, it may be quite impracticable to detect them. Thus in the case of π -bromonitrocamphor, two types of crystals had been submitted to crystallographic measurement and drawings published (Lapworth and Kipping, 1896) before they were shown to be isomerides of widely-different rotatory power. It therefore appears certain that when compounds of this type are reported to exist in polymorphic forms which differ in colour but yield identical solutions, the two series of crystals must be built up from molecules which differ in structure but are readily interconvertible in solution. It is, in fact, impossible to draw a sharp boundary between the two phenomena, and whilst the existence of isomerism can often be established, it is impossible to assert with confidence in any but the simplest cases that polymorphic crystals are built up from identical and not from isomeric molecules. (T. M. L.)

ISOMORPHISM, in crystallography and mineralogy (*q.v.*), the similarity of crystalline form in substances which are chemically related. Isomorphism is also used in mathematics as applied to groups to denote the correspondence between their operations (see GROUPS, THEORY OF).

ISONZO, a river in Italy which played a very important part in the World War on the Italian front, no less than twelve battles being named after it. It rises in the Val Trenta, north-west of Monte Tricorno, flows through the Plezzo basin in a southerly direction, past Caporetto and Tolmino, through the Canale gorge, between the hills E. of Gorizia and the Podgora-Sabotino group opposite, debouches in the plain of Eastern Friuli, until not far from its mouth it divides into two branches, the Sdobba and the Isonzato, both of which flow into the sea in the gulf of Trieste. Before the war the whole of its course was in Austrian territory, but on the outbreak of hostilities the Italian troops crossed it both in the gorge of Plava north of Gorizia, where they established a small bridgehead, and on its lower reaches south of Gradisca. There was very heavy fighting along its banks before the capture of Gorizia and during the operations leading to that capture (August 1916). Between Plava and Salcano and north of Plava the Italians remained on the right bank of the river, until the 10th battle of the Isonzo in May 1917, when an attack from Plava resulted in the Italian capture of Hill 383, Monte Kuk and Monte Vodice on the left bank. In the 11th battle (August 17–Sept. 12, 1917) the river was crossed by the Italians north of Plava between Dobar and Anhovo, and Auzza and the Jelenik were conquered, and immediately after the whole of the Bainsizza plateau, some 500 m. above sea level north-east of Gorizia. Higher up the left bank was again in Italian hands, except in the Tolmino sector which it proved impossible to capture in spite of repeated offensives. In October 1917 General Cadorna decided to withdraw all his artillery on the right bank, in view of the coming enemy offensive, but his orders to that effect were not completely carried out. The Austro-Germans delivered their attack on October 24, 1917 and broke through the Italian lines first in the Plezzo basin between Sleme and the Mrzli, and crossed the river at Idersko and Caporetto. This breach determined the fall of the positions further south and consequently of the whole Isonzo front, forcing the Italians to fall back on the Piave. The battle positions were reoccupied after the Italian victory of Vittorio in October–November 1918.

ISOPERIMETRY, a word originally used in geometry to refer to figures of equal perimeter; *e.g.*, a circle and an ellipse may have equal perimeters (circumferences) although not equal areas. One of the simplest of the problems arising in the study is to determine, from all plane figures having the same perimeter, the one that shall have the greatest area. This figure is the circle. Considered more generally, given any number of geometric figures, all defined in the same way, determine the form of the one possessing a maximum (or minimum) amount of a certain property; *e.g.*, of all the triangles having a given area (figures defined as plane, three-sided, and of a given area), the one having the least perimeter is equilateral. For the general definition and treatment consult works on the calculus of variations (*q.v.*), where the theory is extended to include solid as well as plane figures.

ISOPRENE, a mobile volatile liquid, C_5H_8 (sp. gr. 0.69; b.p. $34^\circ C$) which is of interest chiefly because it polymerizes readily to form rubber-like substances (see TERPENES and POLYMERIZATION).

ISOPTERA, an order of insects (*q.v.*), comprising the termites (*q.v.*) or so-called "white ants" of the tropics. (See also SOCIAL INSECTS.)

ISOSTASY: see GEODESY.

ISOTHERM, a line upon a map connecting places having the same temperature at any particular instant or for any selected period of time. Alexander von Humboldt (1769–1859) first employed them in a discussion of the temperatures occurring in the Northern Hemisphere. (See MATHEMATICAL MODELS.)

ISOTOPES is the term first applied by F. Soddy in 1913 to substances which, though they had different atomic weights, yet had identical chemical properties and occupied the same

place in the periodic table of the elements. Over a century earlier Dalton had postulated that atoms of the same element are similar to one another and equal in weight. A little later Prout suggested that the atoms of all elements were composed of atoms of a primordial substance which he endeavoured to identify with hydrogen.

If both these theories were right, the atomic weights of all elements would be comparable with each other as whole numbers. This the chemists soon showed was quite incompatible with experimental evidence. It is true that many were very nearly whole numbers, far too many for the effect to be pure chance, but others, like chlorine, were hopelessly fractional. Of the two alternatives Dalton's is much the simpler from the chemical point of view and was therefore quite rightly chosen as a working hypothesis. From this in course of time it developed into an article of scientific faith, and, despite the complete absence of positive evidence in its support, no serious questions as to its validity were raised until late in the 19th century. Of such speculations those of Crookes were founded on unsound evidence and were soon discredited. The question could not be settled by ordinary chemical methods, which employ countless myriads of atoms and could therefore only give a mean result, and it was only by the discovery of radioactivity and the development of accurate methods of weighing individual atoms that the existence of isotopes was disclosed. The two advances were nearly contemporaneous but the first definite convincing proof of isotopy was found among the radioactive elements and their products.

The Radioactive Isotopes.—In 1906 Boltwood discovered ionium and found that it had similar chemical properties to thorium. Further research using the most delicate radioactive methods failed to indicate the slightest chemical separation of these two elements once they had been mixed, and even more surprising their spectra appeared to be identical. Other pairs of elements in the radioactive group showed corresponding identities and later investigations on the chemistry of the products of radioactive disintegrations enabled the chemical law of radioactive change to be formulated (see RADIOACTIVITY). This stated that a radioactive element when it loses an alpha particle goes back two places in the periodic table; when it loses a beta particle it goes forward one place. An alpha particle is a helium nucleus of weight 4, whereas a beta particle is an electron of negligible weight. It follows that if a body loses one alpha and two beta particles it will be back again in the same place in the periodic

FROM F. W. ASTON, "ISOTOPES" (EDWARD ARNOLD)

Fig. 1, represents an atom with a nucleus made up of 6 protons and 3 electrons, surrounded by 3 planetary electrons, whose energy levels are represented by the small circles. Fig. 2. One proton and one electron have been added to the nucleus. The atomic number remains 3; therefore, Figs. 1 and 2 are isotopes. Fig. 3. The proton has been added to the nucleus and the electron to the planetary system, so that the atomic number becomes 4. Figs. 2 and 3 are therefore isobars

table although it will have lost a mass equal to four units of atomic weight.

Isotopic Bodies Predicted.—Supported by this law, which he was the first to state in its most general form, Soddy boldly claimed that these "isotopic" bodies would be both chemically and spectroscopically indistinguishable. He also predicted that the lead produced by the disintegration of uranium would have an atomic weight 206, while that of the lead produced from thorium would be 208, and that consequently the atomic weight of the lead found in uranium minerals should be less than that of ordinary lead (207.2) while that of lead from thorium minerals should be greater. These predictions were amply vindicated by

the work of experts on atomic weights (Richards, Hönigschmid and others), and it was shown beyond all dispute that the isotopic leads, though they differed by the predicted amount in properties such as atomic weight, density, and solubility which depend directly on the weight of their atoms, in all others, which do not—atomic volume, boiling-point, melting-point, refractive index and spectrum—were quite indistinguishable.

Practical Utilization of Indicators.—The impossibility of separating isotopes has been utilized in ingenious manner by Hevesy and Paneth. By the addition of a small quantity of a radioactive isotope to an ordinary inactive element, the latter is, so to speak, indelibly labelled and can be followed by the methods of radioactivity, which are incomparably more delicate than those of chemistry. In this way the solubility of very insoluble salts can be readily determined. By the addition of a little thorium B, an isotope of lead, valuable information has been obtained on the assimilation of the salts of the latter element by living plants. The use of such radioactive indicators affords a direct proof of the ionic dissociation theory; it has led to the discovery of certain metallic hydrides and to the determination of the velocity of diffusion of molecules among themselves, an otherwise insoluble problem.

The reasoning which led to the discovery of isotopes among the products of radioactive disintegration could not, however, be applied to the vast majority of elements which are not radioactive. For these there is only one direct method of testing Dalton's postulate, namely, that of weighing their individual atoms. This can be done by the analysis of positive rays (*see POSITIVE RAYS*). The fact that when subjected to Sir J. J. Thomson's method of positive ray analysis certain elements gave definite sharp parabolas, and not mere blurs, constituted the first direct proof that atoms of the same element were, even approximately, of equal mass. For some time the results of the application of this method of analysis appeared to support the hypothesis of Dalton, as the elements introduced into the discharge tube gave single, or apparently single, parabolas in the positions expected from their chemical atomic weights (*see CONDUCTION OF ELECTRICITY: Gases*).

Examination of Neon.—But when, in 1912, neon was examined, the trace obtained was definitely double. The brighter curve corresponded roughly to an atomic weight of 20, the fainter companion to one of 22, the atomic weight of neon being 20.20. The line 22 could only be explained as due to a hitherto unknown elementary constituent of neon. This agreed well with the new idea of isotopic elements which was just then emerging from the investigations on radioactivity, so that it was of importance to investigate the point as fully as possible. The first line of attack was an attempt at separation by fractional distillation, but the result was entirely negative. The second method employed was that of fractional diffusion through pipe-clay which gave a small, but definite, positive indication of separation. It therefore seemed probable that neon was a mixture of isotopes.

The Mass-Spectrograph.—By the time that research on the subject was resumed at the Cavendish laboratory in 1919, the existence of isotopes among the products of radioactivity had been proved beyond all reasonable doubt by the work on the atomic weight of lead. This fact automatically increased the value of the evidence of the complex nature of neon and the urgency of its definite confirmation. It was realized that separation could only be very partial at the best, and that the most satisfactory proof would be afforded by measurements of atomic weight by the methods of positive ray analysis. These would have to be so accurate as to prove beyond dispute that the accepted atomic weight lay between the real atomic weights of the two constituents, but corresponded with neither of them. The parabola method was not equal to this, but the required accuracy was achieved by means of the mass-spectrograph, an instrument capable of analysing positive rays (*q.v.*) into a spectrum of focussed lines, a mass spectrum. The first mass-spectrograph built in 1919 compared masses with an accuracy of about 1 in 1,000.

When neon was introduced into this apparatus, four new lines made their appearance at 10, 11, 20 and 22. The first pair are

second order lines. All four are well placed for direct comparison with standard lines, and a series of consistent measurements showed that to within about one part in a thousand, the atomic weights of the isotopes composing neon are 20 and 22 respectively. Ten per cent of the latter would bring the mean atomic weight to the accepted value 20.20, and the relative intensity of the lines agrees well with this proportion. The isotopic nature of neon was therefore settled beyond doubt. *See Plate in POSITIVE RAYS* for the first order lines of neon and some of the reference lines with which they were compared.

Analysis of Chlorine.—The element chlorine was naturally the next to be analysed, and the explanation of its fractional atomic weight (35.46) was obvious at once. Its mass-spectrum is characterized by four strong lines 35, 36, 37, 38. The simplest explanation of the group is to suppose that the lines 35 and 37 are due to the isotopic chlorines, and the lines 36 and 38 to their corresponding hydrochloric acids. The elementary nature of 35 and 37 is indicated by their second order lines at 17.5 and 18.5, and also when phosgene was used, by the occurrence of lines at 63 and 65 due to COCl^{35} and COCl^{37} .

Later it was found possible to obtain the spectrum of the negatively charged atoms of chlorine. This showed only two lines 35 and 37, so that the lines 36 and 38 cannot be due to isotopes of the element. These results show that chlorine is a complex element, and that its isotopes are of atomic weight 35 and 37. Spectra II., III. and IV. show the results with chlorine taken with different field strengths.

Other Elements.—As the work progressed with other elements further interesting results were obtained. Some elements, such as carbon and oxygen, were found to be "simple"; that is, not mixtures of isotopes. This was to be expected from their whole-number atomic weights. The large majority proved "complex," the number of isotopes tending to be greater in elements of high atomic weight. Tin has no less than 11 isotopes.

Mass rays of the metallic elements, which are in the majority, cannot in general be produced in the ordinary vacuum discharge but they can be investigated by means of anode rays. Thus the constitution of the alkali metals was first discovered by the use of an anode consisting of a platinum strip coated with salts of the metals and heated electrically. Dempster, at Chicago, produced mass rays of metals by heating the element in a furnace and

ionizing the vapour produced by electron impact. By this means he made the first analyses of magnesium calcium and zinc, and also confirmed the results already obtained for the lighter alkali metals.

More recently a large number of elements, including some of the rare earths, have been successfully attacked by means of the special method of "accelerated anode rays" (*see POSITIVE RAYS*) and in all 57 out of the 80 known non-radioactive elements have been analysed into their constituent isotopes or shown to be simple.

Table of Elements and Isotopes.

Element.	Atomic number.	Atomic weight.	Minimum number of isotopes.	Mass numbers of isotopes in order of intensity.
H . . .	1	1.008	1	1

The Whole-Number Rule.—By far the most important general result of these investigations is that, with the exception of hydrogen, the weights of the atoms of all the elements measured, and therefore almost certainly of all elements, are whole numbers to about one part in a thousand. Of course, the error expressed in fractions of a unit increases with the mass measured, but with the lighter elements the divergence from the whole-number rule is extremely small. This enables sweeping simplifications to be made in our ideas of mass.

The original hypothesis of Prout can now be restated with the modification that the primordial atoms are of two kinds: protons and electrons, the atoms of positive and negative electricity. According to the modern theory of the nucleus atom (*see* ATOM; MATTER) all the protons and about half of the elec-

trons are packed very close together to form a central, positively charged nucleus, round which the remaining electrons circulate, somewhat like the planets round the sun. All the spectroscopic and chemical properties of the atom depend on the net positive charge on the nucleus, which is the excess of protons over nuclear electrons. This is also clearly the number of planetary electrons in the neutral atom; it is called the "atomic number" and is actually the number of the element in the periodic classification: 1 for H, 2 for He, 3 for Li, and so on.

The whole-number weight of the atom, on the other hand, will be the total number of neutral pairs of protons and electrons it contains. This is also the number of protons in its nucleus, and is called the "mass-number" of the atom: 1 for H, 4 for He, 6 and 7 for the isotopes of Li, and so on. For the purpose of distinguishing isotopes it is customary at present to use the chemical symbol of the complex element with an index corresponding to the mass-number of the particular isotope, *e.g.*, Ne²², Rb⁸⁷.

Isotopes and Isobares.—Fig. 1 represents an atom with a nucleus made up of 6 protons and 3 electrons, surrounded by 3 planetary electrons. It must be borne in mind that the circles represent the energy levels of the latter, not their actual orbits. If we add 1 proton and 1 electron to the nucleus we shall get the atom represented in fig. 2. Here the atomic number remains 3 as before, the planetary electrons are unaffected and the chemical and spectroscopic properties unaltered but the weight of the atom will be increased by one unit. Figs. 1 and 2 are therefore atoms of different weight but identical chemical properties, *i.e.*, isotopes. They are in fact the isotopes of lithium Li⁶ and Li⁷.

If on the other hand the proton is added to the nucleus and the electron introduced into the planetary system we obtain fig. 3. Here the weight is increased by 1 as before but the atomic number is now 4, the planetary system altered and the chemical properties changed. Figs. 2 and 3 therefore represent atoms having the same weight but different properties; such substances are called isobares. Many pairs of isobares are known, the most striking being the most abundant constituents of argon and calcium having the same mass number 40. It is difficult to imagine bodies more completely different in all outward properties yet no difference whatever has yet been detected between the weights of their atoms.

Packing Fraction.—If the additive law of mass were as true when an atomic nucleus is built of protons plus electrons as when a neutral atom is built of nucleus plus electrons, or a molecule of atoms plus atoms, the divergences from the whole-number rule would be too small to be significant, and, since a neutral hydrogen atom is 1 proton plus 1 electron, the masses of all atoms would be whole numbers on the scale H=1. The measurements made with the first mass-spectrograph were sufficiently accurate to show that this was not true. The theoretical reason adduced for this failure of the additive law is that, inside the nucleus, the protons and electrons are packed so closely together that their electro-magnetic fields interfere and a certain fraction of the combined mass is destroyed, whereas outside the nucleus the distances between the charges are too great for this to happen. The mass destroyed corresponds to energy released, analogous to the heat of formation of a chemical compound, the greater this is the more tightly are the component charges bound together and the more stable is the nucleus formed. It is for this reason that measurements of this loss of mass are of such fundamental importance, for by them we may learn something of the actual structure of the nucleus, the atomic number and the mass number being only concerned with the numbers of protons and electrons employed in its formation.

The most convenient and informative expression for the divergences of an atom from the whole-number rule is the actual divergence divided by its mass number. This is the mean gain or loss of mass per proton when the nuclear packing is changed from that of oxygen to that of the atom in question. It is called the "packing fraction" of the atom and expressed in parts per 10,000. Put in another way, if we suppose the whole numbers and the masses of the atoms to be plotted on a uniform logarithmic scale such that every decimetre equals a change of 1%,

then the packing fractions are the distances, expressed in millimetres, between the masses and the whole numbers.

The original mass-spectrograph was not sufficiently accurate to detect the divergences from the whole-number rule except in the case of hydrogen. The atom of hydrogen weighs about 1.008 on the oxygen scale and its abnormal weight is clearly attributable to the fact that its nucleus consists of a single proton the mass of which will not be reduced by the packing effect described. In order to measure the packing fractions of other elements it has been necessary to build a special mass-spectrograph (*see* POSITIVE RAYS) with an accuracy of 1 in 10,000. The results obtained with this instrument are tabulated below. The table includes results for the lithium isotopes calculated from measurements made by Costa with an accuracy of 1 in 3,000.

Atom.	Packing fraction $\times 10^4$.	Mass $\alpha = 16$.	Atom.	Packing fraction $\times 10^4$.	Mass $\alpha = 16$.
H	77.8 ± 1.5	1.00778	Cl ³⁵	-4.8 ± 1.5	34.983
He	5.4 ± 1	4.00216	A ³⁶	-6.6 ± 1.5	35.976
Li ⁶	20.0 ± 3	6.012	Cl ³⁷	-5.0 ± 1.5	36.980
Li ⁷	17.0 ± 3	7.012	A ⁴⁰	-7.2 ± 1	39.971
B ¹⁰	13.5 ± 1.5	10.0135	As	-8.8 ± 1.5	74.934
B ¹¹	10.0 ± 1.5	11.0110	Kr ⁷⁸	-9.4 ± 2	77.926
C	3.0 ± 1	12.0036	Br ⁷⁹	-9.0 ± 1.5	78.929
N	5.7 ± 2	14.008	Kr ⁸⁰	-9.1 ± 2	79.926
O	0.0	16.0000	Br ⁸¹	-8.6 ± 1.5	80.926

Xenon (nine isotopes)			Xe ¹³⁴	-5.3 ± 2	133.929
Mercury (six isotopes)			Hg ²⁰⁰	$+0.8 \pm 2$	200.016
Lead (three isotopes)			Pb ²⁰⁶	$+0.8 \pm 2$	206.016

It will be seen that in addition to the first two fundamental constants of an atom, atomic number and mass number which settle the numbers of protons and electrons contained in its nucleus, we now have a third, the packing fraction, which gives entirely new information on the nucleus, for it is a measure of the forces binding those protons and electrons together. The discriminating value of this information is clear at once, *e.g.*, had the packing fraction of the helium atom not been greater than that of the oxygen atom it would have ruled out the possibility that the nucleus of the latter was simply built of four unchanged helium nuclei or alpha particles, for there would have been no loss of energy, that is mass defect, in the latter to represent the binding forces holding the four particles together. High packing fractions indicate looseness of packing, and therefore low nuclear stability; low packing fractions the reverse. When the packing fractions of the atoms are plotted against their mass-numbers, it is found that for all atoms above mass-number 20 these lie roughly on a single curve. (Fig. 4.)

From mercury, whose packing fraction is hardly distinguishable from that of oxygen, the curve descends and reaches a minimum of about -10 in the iron nickel region. It then ascends and in the case of atoms of odd atomic number continues to do so, in a roughly hyperbolic manner, right up to hydrogen $+77.8$. The light atoms of even atomic number have packing fractions well below this curve and approximate to a branch rising much less steeply to helium $+5.4$. This suggests that the light elements of odd atomic number have a common loosely packed, and therefore heavy, outside structure, which is not present in the closer packed and more stable nuclei of helium, carbon and oxygen.

Isotopes and Atomic Weights.—The theoretical importance of chemical atomic weight has been somewhat reduced by the discovery that for so large a number of elements it merely represents a statistical mean. Its position as a natural numerical constant associated with an element has now been taken by the atomic number, which indeed defines the element, though from the point of view of chemical analysis, the mean atomic weight is

as important as ever. The anomalies shown by those elements which, by their atomic weights, appear out of their right order in the periodic table, are now open to the simplest explanation. Thus argon, in which the heavier of two isotopes predominates, has a greater mean weight than potassium, in which the reverse is the case. The same explanation applies to cobalt, nickel, tellurium and iodine.

Since the atomic number only depends on the *net* positive charge on the nucleus, arithmetically any element can possess an indefinite number of isotopes. The table herewith shows that those present in detectable quantity are restricted both in number and range of weight, though the causes of these restrictions are at present unknown. No element of odd atomic number has more than two isotopes and, above atomic number 9, the mass-numbers of the isotopes always differ by 2, and the lighter is the more abundant constituent. The number of nuclear electrons tends to be even. That is, in the great majority of cases even atomic number is associated with even mass-number, and odd with odd. Beryllium and nitrogen are the only elements consisting entirely of atoms whose nuclei contain an odd number of electrons.

If the mass-numbers of the various species of atoms are plotted against their relative abundance in the earth's crust, a strong preponderance of those of type $8n$ may be seen. There is an extreme difference of range between the abundance of isotopes in an element and elements in nature. In the case of elements of an odd atomic number this cannot be ascribed merely to lack of delicacy in the means of detection of their isotopes. Thus while there are only about three Cl³⁵ atoms to one Cl³⁷ and about two Ga⁶⁹ atoms to one Ga⁷¹, yet there are a thousand million more atoms of chlorine than of gallium. This suggests that isotopes have some relation in common more fundamental than that of identity of nuclear charge, an idea which is supported by other independent lines of reasoning.

Spectra of Isotopes.—As regards their series spectra, in which, on Bohr's theory, the two bodies concerned are an electron and an enormously more massive atomic nucleus, the prediction that isotopes should be indistinguishable is satisfied to a high degree of precision. So far the only effect detected is a minute difference of wave-length between the lines of Carnotite lead (206) and ordinary lead (207.2). The most accurate measurements by Merton indicate that this has a maximum value of 0.011 \AA for the line $\lambda = 4058$. Smaller shifts are detectable in a few other lines, the wave-length for the lighter atom being the greater in all cases. In band spectra, where two nuclei are concerned, the isotope effects are much larger and in excellent agreement with theory. In the case of HCl bands in the infrared region the duplicate peaks are as much as 14 \AA apart, and in position and relative intensity, correspond exactly with the results expected from the presence of HCl³⁵ and HCl³⁷.

More recently by investigation of band spectra produced in the visible region by boron oxide and silicon nitride, Mulliken has shown that separate band heads appear corresponding to the 2 isotopes of boron, in the one case, and to 3 isotopes of silicon in the other. These results constitute valuable independent confirmation of the results of the mass-spectrograph.

Separation of Isotopes.—It is perhaps a fortunate thing for the simplicity of chemical arithmetic that the artificial separation of isotopes is excessively difficult, while at the same time no process tending to that end in nature appears to exist at all. Of the artificial methods the only one giving complete separation is the actual analysis of the mass-rays, during which the isotopic atoms strike the plate at different points and therefore, if collected, would yield pure specimens. The quantities so produced would, with the means at present available, be far too minute to be of any practical value.

A large number of methods for partial separation have been suggested and tried. The first successfully used, which is only applicable to gases, is that of free diffusion through pipe-clay or other suitable porous material. The diffusion rates are inversely proportional to the square roots of the masses concerned. It follows that if a large volume V of a mixture of isotopes is

allowed to diffuse, leaving a small residue *v*, the latter will be richer in the heavier constituent than was the original gas. The actual numerical value of this enrichment, under ideal conditions, with isotopes, such as those of neon, which differ by 10%, is only $(V/v)^{1/20}$, so that only by the use of very large volumes, or laborious repetitions, can any measurable change be achieved. The original experiments with neon gave a shift of atomic weight of rather more than 0.1 of a unit. Harkins, at Chicago, by the use of 19,000 litres of HCl, was able to obtain considerable samples in which the atomic weight of chlorine differed by 0.055 unit.

Another method, following much the same numerical laws, is that of Bronsted and Hevesey, which consists of free evaporation from a liquid surface at very low pressure. They obtained two samples of above 0.2 cc. of mercury differing in density by 5 parts in 10,000, or 0.1 of a unit. The atomic weights showed a corresponding difference, but the electrical conductivity of the two samples was indistinguishable to one part in a million.

Other methods of separation such as chemical action, centrifuging, ionic migration and thermal diffusion have only yielded meagre or entirely negative results. A very large number of attempts have been made in recent years to discover any variation in the chemical atomic weight of elements known to be complex, which would indicate a change in the proportions of the isotopes present. Boron, silicon, chlorine, iron and nickel have all received attention, but in no case with any certain positive result. From their experiments on silicon from no less than 12 different terrestrial and meteoric sources, Jaeger and Dijkstra concluded that their products differed in density not more than 0.00004%.

The accumulation of negative evidence of this kind is very impressive, and supports the idea that the evolution of the elements, apart from those produced by radioactive disintegration, must have been such as to lead to a proportionality of isotopes which was constant from the start, and, since we know of no natural process of separation, has remained constant ever since.

See F. W. Aston, *Isotopes* (2nd ed., 1924); K. Fajans, *Radioactivity* (trans. from the 4th German ed. by T. S. Wheeler and W. G. King, 1923); E. N. da C. Andrade, *The Structure of the Atom* (1927). (F. W. A.)

ISOXAZOLES, in chemistry, cyclic compounds containing a five-membered ring of three carbon atoms, one nitrogen atom, and one oxygen atom, the last two being adjacent to each other (see CHEMISTRY: *Organic: Heterocyclic Division*). They are prepared by eliminating water from the monoximes of β -diketones, β -ketone aldehydes, or hydroxymethylene ketones (L. Claisen, 1891). Dimethylisoxazole (see I.), thus obtained from acetylacetone and hydroxylamine, is a colourless pungent liquid boiling at 144–145° C at 760 mm.

This isoxazole can be nitrated by replacement of the hydrogen in position 4, and this nitro-compound reduced with amalgamated aluminium and moist ether yields 4-amino-3:5-dimethylisoxazole (II.), a base which resembles the aromatic primary amines in that its hydrochloride and other salts are diazotizable (G. T. Morgan and H. Burgess, 1921). Its diazonium chloride is represented by (III.). These results indicate that the isoxazole ring has certain properties in common with the aromatic nuclei of benzene and its homologues.

ISRAEL, the national designation of the Jews. The Hebrew name means "God strives" or "rules" (see Gen. xxxii. 28; and the allusion in Hosea xii. 4). It was borne by their ancestor, Jacob, the father of the 12 tribes. For some centuries the term was applied to the northern kingdom, as distinct from Judah, although the feeling of national unity extended it so as to include both.

See JACOB, HEBREW LANGUAGE, HEBREW RELIGION; JEWS: *History*; and PALESTINE.

ISRAELI, ISAAC BEN SALOMON (c. 845–c. 940), Jewish physician and philosopher, was born in Egypt, and became

court physician at Kairawan. Constantine the African translated into Latin his medical works, including the popular treatise on *Fevers*, while Gerard of Cremona translated his *Elements*, an exposition of Aristotle's *Physics*, and his *Book of Definitions* explaining philosophical terms. In philosophy, Israeli had a preference for the Neoplatonism of Proclus and the *Liber de Causis* rather than for Aristotle, and a conspicuous absence of any avowed attitude to Jewish dogma and the Scriptures. Through the labours of Gundissalinus he became very popular with the 13th century Scholastics who took from his *Definitions* the famous definition, *veritas est adaequatio rei et intellectus*. His *Opera Omnia* were published at Lyons in 1515.

See J. Guttmann, *Die phil. Lehren des Isaak ben Salomon Israeli* (Munster, 1911) and I. Husik, *Hist. of Mediaeval Jewish Philosophy* (New York, 1916).

ISRAËLS, JOSEF (1824–1911), Dutch painter, was born at Groningen, of Hebrew parents, on Jan. 27, 1824. His father intended him to be a rabbi and the study of the Talmud in his youth influenced his outlook in later life. However, the attempts he made under the guidance of two painters in his native town—Buys and van Wicheren—led to his being sent to Amsterdam, where he became a pupil of Jan Kruseman, of Jan Willem Pienemaun at the academy and of the sculptor Royer. He then spent two years in Paris, working in Picot's studio and at the Acad. des B. Arts under Pradier, H. Vernet and Delaroche; and returned to Amsterdam in 1847. There he remained till 1870, when he moved to The Hague for good. Israëls was one of the greatest Dutch painters of the 19th century. He has often been compared to J. F. Millet. They both saw in the life of the poor and humble a motive for expressing with peculiar intensity their wide human sympathy; but Millet was the peasant poet of rural life, while Israëls is a painter of the soul.

He began with historical and dramatic subjects in the romantic style of the day. In 1855, after an illness, he went to recruit his strength to the fishing-town of Zandvoort near Haarlem, and there he was struck by the daily tragedy of life. Thenceforth he was possessed by a new vein of artistic expression, sincerely realistic, full of emotion. Among his more important subsequent works are "The Zandvoort Fisherman" (Amsterdam gallery), "The Silent House" (gold medal at the Brussels Salon, 1858) and "Village Poor" (a prize at Manchester). In 1862 he achieved great success in London with his "Shipwrecked," and "The Cradle." We may mention among his maturer works "The Widower" (Mesdag collection), "When we grow Old" and "Alone in the World" (Amsterdam gallery), "An Interior" (Dordrecht gallery), "A Frugal Meal" (Glasgow museum), "Toilers of the Sea," "A Speechless Dialogue," "Between the Fields and the Seashore," "The Bric-à-brac Seller" (medals of honour at the great Paris Exhibition of 1900). In "David Singing before Saul" (Stedelijk museum, Amsterdam) and other pictures painted in his old age he attained a powerful style of expression by which he approached the later works of Rembrandt. As a water-colour painter and etcher he produced a vast number of works, full of deep feeling, generally treated in broad masses of light and shade, which give prominence to the principal subject. He died at The Hague on Aug. 12, 1911. His art created but few followers. Vincent van Gogh speaks of it with great admiration in his famous letters; and in so far as the expression of feeling was the subject matter of his pictures Israëls may be regarded as a precursor of the expressionists. His works are very numerous. The Rijksmuseum, Amsterdam, has 30 paintings and water-colours. He is represented in many public collections in Europe and America, and many works are in private ownership.

Israëls* (1912); A. Plaschaert, *J. Israëls* (1924); M. Eisler, *J. Israëls* (Studio Special Spring Number 1924). Pr. Zilcken, *J. Israëls in Peintres holland. modernes* contains a catalogue of his etchings (1899 2nd ed.). See also *J. Israëls. Spain; the Story of a Journey* (1900) with illustrations by the author.

ISSACHAR, Jacob's ninth son, his fifth by Leah, is the eponymous ancestor of one of the northern tribes of Israel,

occupying territory which included the Plain of Esdraelon, having affinities with the northern group of tribes rather than with the Joseph clans on their southern border. Issachar played but an insignificant part in Israelite history. The name hardly occurs in later times, and the references to the premonarchic period suggest an attitude of submissiveness to their Canaanite neighbours (*cf.* Gen. xlix. 14 *seq.*, and the fact that the Canaanite cities of the plain of Esdraelon retained their independence comparatively late), though Issachar is mentioned in Jud. v. 15 as taking a part in the war against Sisera.

ISSEDONES, name of an ancient people of Central Asia at the end of the trade-route leading north-east from Scythia (*q.v.*), described by Herodotus (iv. 26). The position of their country is fixed as the Tarim basin by the more precise indications of Ptolemy, who tells how a Syrian merchant penetrated as far as Issedon. They had their wives in common and were accustomed to slay the old people, eat their flesh and make cups of their skulls. Such usages survived among Tibetan tribes and make it likely that the Issedones were of Tibetan race.

ISSERLEIN, ISRAEL (d. 1460), German Talmudist. His fame attracted many students to Neustadt, and his profound learning did much to revive the study of the original Rabbinic authorities. After the publication of the Code of Joseph Caro (*q.v.*) the decisions of Isserlein in legal matters were added in notes to that code by Moses Isserles. His chief works were *Terumat ha-Deshên* (354 decisions) and *Peasqim u-kethahim* (267 decisions) largely on points of the marriage law.

ISSERLES, MOSES BEN ISRAEL (c. 1520–1572), known as REMA, was born at Cracow and died there in 1572. He wrote commentaries on the *Zohar*, the “Bible of the Kabbalists,” but is best known as the critic and expander of the *Shulhan Aruch* of Joseph Caro (*Caro*) (*q.v.*). His chief halakhic (legal) works were *Darke Moshê* and *Mappâh*. Caro, a Sephardic (Spanish) Jew, in his Code neglected Ashkenazic (German) customs. These deficiencies Isserles supplied, and the notes of Rema are now included in all editions of Caro's Code.

ISSOIRE, a town of central France, capital of an arrondissement in the department of Puy-de-Dôme, on the Couze, near its junction with the Allier, in the fertile plain of Limagne, 22 m. S.S.E. of Clermont-Ferrand on the P.L.M. railway to Nîmes. Pop. (1926) 5,205. Issoire (*Iciodurum*), probably founded by the Arverni, was in Roman times famed for its schools. The Christian community established by Stremonius in the 3rd century was overthrown by the Vandals in the 5th. During the religious wars of the Reformation, Issoire suffered severely from the Protestants in 1574, from the Roman Catholics in 1577 and in the contest between the Leaguers and Henry IV. The old part of the town is distinct from the new part, which has fine promenades. The church of St. Paul or St. Austremonie on the site of an older chapel over the tomb of St. Austremonie (Stremonius) is an excellent example of the Auvergne Romanesque. Issoire is the seat of a sub-prefect, and of tribunals of first instance and of commerce. Straw hats, linen goods and *galoches* are made. Trade is in corn, fruit and wine.

ISSOUDUN, a town of central France, capital of an arrondissement in the department of Indre, on the right bank of the Théols, 17 m. N.E. of Châteauroux by rail. Pop. (1926) 10,415. Issoudun, in Latin *Exoldunum* or *Uxellodunum*, existed in and before Roman times. Louis XIV. rewarded its fidelity during the Fronde by the grant of several privileges. The church of St. Cyr has a fine east window, and the chapel of the Hôtel Dieu is 16th century. Of the fortifications a town-gate (16th century) and the White Tower (12th century) survive. Issoudun is the seat of a sub-prefecture, and has tribunals of first instance and of commerce and a chamber of arts and manufactures. The industries, of which the most important is leather-dressing, also include malting and brewing and the manufacture of bristles for brushes and parchment. Trade is in wood, grain, live-stock and wine.

ISSUE PRICE, the price at which an investment banking house or a syndicate offers an issue of securities for sale to the public. This is to be distinguished from the “underwriting price” at which the issuing corporation disposes of the issue to the

underwriter, and also from the “syndicate price” at which participants in the selling syndicate can purchase the securities from the syndicate manager.

ISSUS, BATTLE OF (October, 333 B.C.). Topographically, the region in which the battle of Issus was fought is an interesting one. The field itself lies a few miles north of Myriandrus, at, or near Alexandria (Alexandretta). It is surrounded by mountainous country, and is approached by three passes: north-west of Issus the Cilician Gates over the Taurus range; north-east, the Amanic Gates leading to the Euphrates, and south the Syrian Gates leading into Syria and towards Sochi where Darius had assembled his army. Towards this last-mentioned pass Alexander marched, and either the Amanic Gates were unknown to him, or what is more probable he never expected that Darius, whose main strength lay in cavalry, would desert the plains. The unexpected, however, happened, and Darius, rejecting the advice of his generals, marched on the Amanic Gates which lay to the rear of Alexander. If tactically this was a bad move, strategically it was a sound one, for by advancing through this pass Darius compelled Alexander to relinquish the initiative and fight a battle to regain command of his communications. On hearing what Darius had done, Alexander at once assembled his generals pointing out to them the danger they were in, and then counter-marched to meet the Persians.

As the Greeks debouched on to the coastal plain Alexander deployed his army, the right wing resting on the foot-hills, and the left on the sea shore; the front of the army was about one mile and a half from flank to flank. The Persians, who considerably outnumbered Alexander, were drawn up on both banks of the river Pinarus (Deli), their main force of cavalry being on their right. Alexander, noticing this, reinforced his left wing with the Thessalian cavalry and secured his right by a *crochet* of light infantry. In front of his left wing he placed the Cretan archers and the Thracians; the Greek mercenaries he held in reserve.

The Battle.—The battle opened by a skirmish on the right flank, the Persians on the foot-hills being driven back. This done,

THE BATTLE OF ISSUS, 333 B.C., WHEN, BY OUTFLANKING ITS LEFT CENTRE, ALEXANDER BROKE THE FRONT OF THE PERSIAN ARMY

Alexander first rested his men, then led them forward at a slow pace, and on nearing the Pinarus advanced his right wing at a run in order to close, and so lessen the time taken in crossing the arrow-zone. Darius had established his headquarters in the centre of his line of battle, and towards him Alexander charged throwing the Persians back in confusion. Then the unexpected happened. The phalanx, disordered whilst crossing the Pinarus, fell back, whereupon Alexander wheeled his right wing round to the left, and

charged in flank the Greek mercenaries who were driving back the phalanx. Once he had extricated his centre the pursuit of the defeated Persians was taken up. The traditional losses given by Diodorus and Plutarch are 110,000 Persians killed and 450 Macedonians.

Tactics.—The main tactical interest in this battle is that though Alexander developed his attack from his normal order of battle he was in no way tied down by it, but adapted it to the ground and the probable actions of the enemy. He did not advance to the attack until he had secured both his flanks, neither did he direct his decisive attack against the Persian cavalry, the most formidable troops confronting him, but against the enemy's command, that is against Darius himself. Thus, he first decided on his objective, secondly he secured his advance, and thirdly, only then did he launch his attack which was carried out at top speed, and so simultaneously developed security and offensive power. The blow was an overwhelming one, yet in the elation of success Alexander did not lose his head, for directly he saw that his phalanx was in danger he wheeled his cavalry round to assist his infantry. By so doing he abandoned his goal in order to secure his base of action which was vital to him.

Lessons.—The main lessons of this battle are: correct distribution of troops to ground; concentration against the decisive point, and the maintenance of tactical direction. If the phalanx had been destroyed whilst Alexander was pursuing Darius, the whole of the Macedonian army would in all probability have been overwhelmed by the Persian right wing.

BIBLIOGRAPHY.—Same as for GRANICUS, BATTLE OF THE.

(J. F. C. F.)

ISSYK-KUL, also called Tuz-kul or salt lake, owing to its brackish waters, and by the Kalmucks Temurtu-nor (iron lake), a lake in the Kirghiz A.S.S.R. (*q.v.*) lying in a deep basin, apparently of tectonic origin, 5,400 ft. above sea-level. It extends from 76° 10' E. to 78° 2' E., and has a length of 115 m. from W.S.W. to E.N.E., and a breadth of 38 m.; its area is estimated at 2,230 sq.m. The name is Kirghiz for "warm lake" in reference to the fact that though ice may form occasionally, the surface of the lake is never completely frozen over. Issyk-kul lies between two westward running spurs of the Tian Shan mountains, the Kunghei Ala-tau range to the north, which rises on an average 8,000 ft. above the level of the lake, with peaks reaching 13,000 ft., and the snow clad Terskei Ala-tau range which skirts the south of the lake at a distance of 5 to 13 m. and rises 6,000 to 9,000 ft. above its level, with peaks reaching 15 to 18,000 ft. The passes over the Terskei lie at great altitudes, the Barskoun (12,000 ft.), the Suka or Sauka (11,650 ft.) and the Jauku (14,000 ft.). The Sauka, linking northwards with Karakol, the eastern stage for steamer communication with the west of the lake, from which a comparatively easy route leads to the railhead at Tokmak, is most used, since it links south with the Ak-su oasis by the Akbel pass (12,000 ft.) and the Bedel pass (12,400 ft.). Another route, involving a steep climb of 12,000 ft. over the Muzart Pass on the east of Khan-tengri, leads to the Tekes river.

The narrow plain which fringes the lake extends inland for 46 m. to the east and then rises to the Santash range, 5,970 ft. above the level of the lake, which forms a link between the Terskei Ala-tau and the Kunghei Ala-tau. A route from the east of the lake crosses this ridge, goes along the valley of the Tegen river, and crosses the Temur-lik-tau range to Kulja in Chinese Turkestan. There is an abundance of blossom, especially at the eastern end of the lake where bee-keeping is profitable, over 800 tons of honey being exported per annum. There are few trees, except in the valleys of the streams entering the lakes. Numerous small streams reach the lake from the mountain slopes, the two chief being the Tyub and Dzargalan from the east. The Chu river rises in several streams to the west of the lake and approaches the western extremity very closely in a curve which it takes before flowing north-west to lose itself in the desert; it is incorrectly shown on some maps as draining from Lake Issyk-kul. A marsh extends between the bend of the Chu and the lake, and a tiny stream drains from this marsh into Issyk-kul. Issyk-kul probably at one time drained through the Baum gorge at the north-west

extremity of the lake, through which the route now goes to Tokmak and the Russian settlements on the fertile loess strip extending to Frunze. The present level of the lake is lower than in former times, and sandy marshes overgrown with reeds, the haunts of the wild boar and the tiger, have spread on the sites formerly occupied by the lake. Fish, especially carp, abound in the lake; its waters are too salt to provide drinking water. The soils on the shore of the lake are sandy, but in a few places there are fertile clayey patches. The nomad herdsmen pasture their flocks in the Issyk-kul valley in winter and on the high alpine meadows in summer.

Along the narrow route by the southern shores of the lake, passed the tribes driven westward by the Huns, notably the Indo-Scythian Yue-chi (*q.v.*), and the blue-eyed and fair-haired Uzuns or Ussuns from Central Asia at the end of the 2nd century B.C. The former passed further west, but the latter settled in the valley and built the town of Chi-gu near the Tyub river, which still existed in the 5th century. The rude stone images of the Uzuns are sometimes washed up from the lake and are of a type distinct from those of the Kalmucks or Kirghiz; a huge copper cauldron of the Uzuns was washed ashore in 1842. The Uzuns disappear from history after the 5th century, but the fair-haired, blue-eyed, straight-nosed element sometimes met with among the Kirghiz of the Issyk-kul region indicates that they were probably absorbed by these tribes. The valley is at present occupied by the On, (right or east) section of the Kara-Kirghiz, with Russian settlements at the eastern end of the lake. Hsuan-tsang (*q.v.*) the Chinese Buddhist pilgrim passed south of Issyk-kul in the seventh century and has left a description of the region. In the early 14th century Nestorian Christians founded a monastery on the northern shores of the lake, indicated on the Catalan map of 1374. The famous Russian explorer Nikolai Przhevalsky (*q.v.*) died at Karakol in 1889, and for a time the town bore his name. The region was annexed to Russia in 1864.

ISTANBUL (STAMBUL): See CONSTANTINOPLE.

ISTHMUS, a narrow land connection between two larger portions otherwise separated by the sea. (Gr. *isthmós*, neck.)

ISTRIA, formerly a margravate and crownland of Austria, now the Italian province of Pola, in the region of Venezia Giulia; area 1,908 sq.m. It comprises the peninsula of the same name (area 1,545 sq.m.), which stretches into the Adriatic Sea between the Gulf of Trieste and the Gulf of Quarnero, and the islands of Cherso, Lussino and others. The coast line extends for 267 m., and is indented on the west by the bays of Muggia, Capodistria, Pirano, Porto Quieto and Pola, and on the east by those of Medolino, Arsa, Fianona and Volosca. A great portion belongs to the Carsic region, and is occupied by the so-called Istrian plateau, flanked north and east by mountains (Monte Maggiore 4,573 ft.). It slopes down south and west in undulating terraces towards the Adriatic. The Quieto in the west and the Arsa in the east, neither navigable, are the principal streams. The climate is on the whole warm and dry. The coasts are exposed to the *Sirocco* from the south-south-east, and the *Bora* from the north-east. Wheat, maize, rye, oats, olives, figs and melons are grown. Viticulture is well developed, and the best sorts of wine are produced near Capodistria, Muggia, Isola, Parenzo and Dignano, while well-known red wines are made near Refosco and Terrano. The oil of Istria was already famous in Roman times. Cattle are bred and lumbering gives beech and oak timber (good for shipbuilding), gall-nuts, oak-bark and cork. The bauxite mines produced 195,000 tons in 1925, and further mining has been prohibited for fear of exhausting the supply. Fishing, recovery of salt from the sea-water, and shipbuilding are other occupations. Istria had in 1921 a population of 299,295.

Istria was the ancient Istria or Histria, known to Rome as the abode of fierce Illyrian pirates. It owed its name to an old belief that the Danube (Ister, in Greek) discharged some of its water by an arm entering the Adriatic in that region. The Istrians, protected by the difficult navigation of their rocky coasts, were only subdued by Rome in 177 B.C. after two wars. Under Augustus the greater part of the peninsula was added to Italy, and the later removal of the capital to Ravenna advantaged Istria. After

the fall of the Western empire it was pillaged by Longobardi and Goths; it was annexed to the Frankish kingdom by Pepin in 789; and about the middle of the 10th century it fell to the dukes of Carinthia, then successively to the dukes of Meran, the duke of Bavaria and the patriarch of Aquileia, and the republic of Venice. Under this rule it remained until 1797, when Austria added it to the north-eastern part which had fallen to her share so early as 1374. By the peace of Pressburg, Austria was in 1805 compelled to cede Istria to France, and the department of Istria was formed, but in 1813 Austria again seized it, and retained it until 1918.

See T. G. Jackson, *Dalmatia, the Quarnero and Istria* (Oxford, 1887); A. A. Bernardy, *L'Istria e la Dolmazia* (Bergamo, Arti Grafiche u. d.) well illustrated.

ISYLLUS, a Greek poet, whose name was discovered on an inscription in the temple of Asclepius in Epidaurus. The inscription consists of a dedication in prose, giving the author's name, and 72 lines of Doric verse in various metres, recording a procession in honour of Asclepius and Apollo, and containing a paean and a poem of thanks to Asclepius for aid against Philip. The date assigned to the poem depends on whether this Philip is Philip II., who invaded Sparta after Chaeronea in 338, or Philip III., who did the same in 218.

Wilamowitz-Möllendorff, who characterizes Isyllus as a "poetaster without talent and a farcical politician," has written a treatise on him (Kiessling and Möllendorff, *Philosophische Untersuchungen*, Heft 9, 1886), containing the text with notes, and essays. The inscription was first edited by P. Kavvadias (1885), and by J. F. Baunack in *Studien auf dem Gebiete der griechischen und der arischen Sprachen* (1886).

ITACOLUMITE, a variety of porous yellow sandstone or quartzose schist occurring at Itacolumi, in the southern portion of Minas Geraes, Brazil. The rock is of interest for two reasons; it is believed to be the source of the abundant diamonds of the district, and it is the best known example of a flexible sandstone. If a piece 1 ft. in length and about $\frac{1}{2}$ in. thick be supported at its ends it will gradually bend under its own weight; if it then be turned over it will bend in the opposite direction. The cause of the flexibility is ascribed to the porous character of the rock and the interlocking of the sand-grains. (P. G. H. B.)

ITAGAKI, TAISUKE, COUNT (1837-1919), Japanese statesman, was born in Tosa in 1837. He distinguished himself originally as one of the soldier politicians who contributed so much to the overthrow of feudalism and the restoration of the administrative power to the throne. After taking a prominent part in subduing the resistance offered by a section of the *shogun's* feudatories to those changes, he received cabinet rank in the newly organized system. But in 1873 he resigned his portfolio as a protest against the ministry's resolve to refrain from warlike action against Korea. Itagaki feared that the country was about to pass under the yoke of a bureaucratic government. He became thenceforth a warm advocate of constitutional systems, though at the outset he does not seem to have contemplated anything like a popular assembly in the English sense of the term, his ideas being limited to the enfranchisement of the *samurai* class. Failing to obtain currency for his radical propaganda, he retired to his native province, and there established a school (the *Risshi-sha*) for teaching the principles of government by the people, thus earning for himself the epithet of "the Rousseau of Japan." His example found imitators. Not only did pupils flock to Tosa from many quarters, attracted alike by the novelty of Itagaki's doctrines, by his eloquence and by his transparent sincerity, but similar schools sprang up among the former vassals of other fiefs, who saw themselves excluded from the government. In 1875 no less than seven of these schools sent deputies to hold a convention in Osaka, and for a moment an appeal to force seemed possible.

But the statesmen in power were not less favourable to constitutional institutions than the members of the *Aikoku Kō-tō* (public party of patriots), as Itagaki and his followers called themselves. A conference attended by Kido, Okubo, Inouye, Ito, Itagaki and others entered into an agreement by which they pledged themselves to the principle of a constitutional monarchy and a legislative assembly. Itagaki now accepted office once

more. Finding, however, that his colleagues in the administration favoured a much more leisurely rate of progress than he himself advocated, he once more retired into private life (1876) and renewed his liberal propagandism. It is in the nature of such movements to develop violent phases, and the leaders of the *Aikoku-sha* (patriotic association), as the agitators now called themselves, not infrequently showed disregard for the preservation of peace and order. Itagaki made the mistake of memorializing the government at the moment when its very existence was imperilled by the Satsuma rebellion (1877), and this evident disposition to take advantage of a great public peril went far to alienate the sympathies of the cabinet. Recourse was had to legislation in restraint of free speech and public meeting. But repression served only to provoke opposition.

Throughout 1879 and 1880 Itagaki's followers evinced no little skill in employing the weapons of local association, public meetings and platform tours, and in Nov. 1881 the first genuine political party was formed in Japan under the name of *Jiyū-tō*, with Itagaki for declared leader. A year later the emperor announced that a parliamentary system should be inaugurated in 1891, and Itagaki's task might be said to have been accomplished. Thenceforth he devoted himself to consolidating his party. In the spring of 1882, he was stabbed by a fanatic during the reception given in the public park at Gifu. The words he addressed to his would-be assassin were: "Itagaki may perish, but liberty will survive." Once afterwards (1898) he held office as minister of home affairs, and in 1900 he stepped down from the leadership of the *Jiyū-tō* in order that the latter might form the nucleus of the *Seiyū-kai* organized by Count Ito. Itagaki was raised to the nobility with the title of "count" in 1887. From the year 1900 he retired into private life, devoting himself to the solution of socialistic problems. His countrymen justly ascribe to him the fame of having been the first to organize and lead a political party in Japan. He died in 1919. True to his liberal principles, he forbade his son to apply for the succession of his title and it lapsed.

ITALIAN CLOTH. "Italians" and "Italian linings" are two optional trade terms denoting an important class of fabric comprising various qualities and employed in the dress goods trade chiefly for coat and dress linings, aprons and ladies' overalls. These fabrics are characterized by a smooth and glossy surface resulting chiefly from their construction on the simple five-end weft satin weave structure (with the weft only displayed on the surface) as well as from the finishing and calendering which imparts to the fabric a very lustrous and glossy surface.

A typical example of the true Italian cloth of good quality is produced from a warp with 100 threads per inch of $\frac{2}{66}$'s fast black cotton, and 160 picks per inch of botany worsted weft, piece-dyed black and highly calendered; while a good quality of all-cotton Italian lining contains 72 ends per inch of 36's cotton yarn, and 120 picks per inch of 40's super quality weft.

ITALIAN CODES. The principal are the civil and the penal codes. The Italian civil code was promulgated on June 25, 1865, and came into force on Jan. 1, 1866. It was promulgated on Nov. 27, 1870, in the province of Rome and on June 25, 1871, in the provinces of Mantua and Venice. The States into which Italy was divided before unification, except the Papal State and Tuscany, had their own codes of civil laws. The first idea was to extend the "Codice Albertino," duly revised, throughout the kingdom. But the need soon became apparent for a new code more in accordance with the basic principles of the new constitution. Pisanelli understood this need and it rested with him to carry out his scheme. Several weighty voices were raised against the codification, wishing to return to the common law or *ius receptum*. The historian Cantù and D'Ondes Reggio maintained in the Italian chamber that codes were not necessary. Ninchi boldly stated: "You do not perceive that under the new code the State binds and shackles you from the hour of your birth to that of your death; that the code leads, hinders and encircles you in all the activities of your life; under this code you will not be free." But Pisanelli who, in point of codification was a follower of Savigny and not of Thibaut, successfully contended that it was undesirable to destroy all existent Italian codes, thus

"submerging the whole of Italy in the uncertainty of customs, judgments and common law, and to restore that *jus vagum*—the miserable condition in which people exist at the beginning of their civilization."

The Civil Code.—The Italian civil code was moulded on the Code Napoléon. One of the principal criticisms, especially in Italy, is that the Italian code has a foreign origin. Indeed, when one sees that its framework is almost entirely that of the Code Napoléon, which in its turn followed the division of the *Institutes* of Gaius, and that there are several articles in the Italian code which are simply a literal translation of the Code Napoléon, one cannot help thinking this criticism is well founded. Yet the Italian civil code is essentially national. The fact that before the unification of the kingdom all the Italian codes (with the exception of the Austrian which was in force in Lombardy and Venetia) had taken the Code Napoléon as a model does not mean that such a code was accepted in Italy as "a system of laws which was imposed," but that the Code Napoléon was a system of laws in harmony with Italian sentiments, customs and needs, of which the principal contents were, to quote Pisanelli again, "our legacy, fruit of the ancient Italian *sapientia*." So it was that doctrines in the Code Napoléon which were not in accordance with Italian traditions, such as, for instance, divorce, the system of community of property as between husband and wife, the distinction between "inheritance" and "universal legacy," were not accepted by the Italian code, whereas Roman doctrines, suitable to Italian customs and traditions, which were lacking in the Code Napoléon were restored in the Italian code; e.g., the equality as between the universal successor under testacy and the universal successor under intestacy, who is in both cases "heir." The Italian code has, as it were, Romanized the German "saisine héréditaire."

Foundations of Civil Code.—The Italian civil code is founded upon: (a) Roman law such as was commonly accepted at the time in Italy (hence the name of "common law"); (b) the Code Napoléon, especially for the laws relating to the registration of births, deaths and marriages, to the doctrine of absence and to the civil form of marriage; (c) the civil codes which from 1816 to 1865 were in force in the different Italian States (e.g., the laws regarding the easements created by the law were derived from the *Parmensis* code); (d) canon law, from which some rules relating to marriage and legitimation were drawn; (e) text writers and the decisions of the courts. The rules relating to private international law were derived from this source. The Italian code was the first which contained rules with reference to the conflict of laws.

Two general principles of private international law different from those recognized by English courts were adopted by the Italian code. The first is, that a person's civil status and family relations depend not on his domicile but on his nationality. The second is, that in the main, the law of the country to which the deceased belonged by nationality governs the beneficial succession to his immovables and movables, and this without regard to the situation of the property at the time of his death. The Italian code has not accepted the old maxim: *quot sunt bona diversis territoriis obnoxia, totidem patrimonium (tot legibus obnoxia) intelliguntur*.

From the Italian rules of private international law it is apparent that the term "national law" or "law of the nation" means the *local* or *territorial* law, and does not extend to the whole law of a foreign country including the rules of private international law. The Italian code refers to a foreign law for the solution of the substance of a question and not for the determination of the rules of private international law to be applied to a given case. How could the Italian legislature, which was the first to enact rules relating to the conflict of laws, accept the doctrine of the *renvoi*, which at the time was quite unknown?

The Italian code was the first to lay down the liberal principle that an alien is admitted to enjoy the same civil rights as those of nationals even if not resident in the kingdom, and this without any regard to reciprocity.

Revisions of Civil Code.—The Italian civil code has always

been considered as an intangible body of laws, not easily admitting of additions lest the structure should lose its harmony. For its omissions, especially as regards social and economic problems which either did not exist or were still latent at the time of its compilation, it was thought preferable to enact special laws. As regards the amendments which had to be made to satisfy the wants of a rapidly developing community, up to the present day there have been very few alterations of a fundamental kind. Suffice it to remember (a) the law of Dec. 6, 1877, which abolished the penalty of imprisonment for civil and commercial debtors; (b) the law of Dec. 9, 1877, which removed the incompetence of women to act as witnesses to private and public documents; (c) the Italian Nationality law, 1912, which repealed articles 4 to 15; (d) the law of Nov. 9, 1916, which made the so-called "transcription" of immovables obligatory; (e) the Decree law, Nov. 16, 1916, whereby if a person dies intestate leaving no surviving next of kin within the sixth degree, the estate goes to the Crown; (f) the Married Women's Status law, 1919, which introduced the greatest change in the law relating to married women. The code used to subject a married woman to a variety of disabilities; e.g., a married woman was incompetent, without her husband's consent, to make a donation, to alienate or mortgage her real property, to make a contract of loan, to assign or collect moneys, to be a guarantor, to compromise or to sue or be sued in respect of these matters, to act as an agent. But now by the Married Women's Status law, 1919, all these and other disabilities have disappeared.

After the World War, the provisions of the civil code were gradually extended to the annexed provinces. The Fascist Government soon awakened to the necessity for the revision of the civil code, and by the law of Dec. 30, 1923, the Government was empowered to alter the code where it deals with absence, illegitimate children, nullity of marriage, adoption, paternal authority, guardianship, transcription and prescription, and to amend those articles which give rise to traditional disputes or which are recognized as imperfect in form. By the law of Dec. 24, 1925, the Government was also empowered to introduce other alterations and additions to the code, keeping intact fundamental principles. A preliminary project of the new rules relating to obligations and contracts is now ready and it has been submitted to the courts, universities, etc., for their advice and suggestions.

The Penal Code.—The Italian penal code in force in 1928 was the Zanardelli code. Zanardelli availed himself of the several projects prepared by his predecessors, beginning with that of 1862 by Miglietti who intended to extend the Sardinian penal code of 1859 with alterations and additions to the whole kingdom. The Zanardelli code was promulgated on June 30, 1889, and came into force on Jan. 1, 1890. Following the Tuscan code of 1853, it divides offences into crimes (*delitti*) and contraventions (*contravvenzioni*). A contravention is an act which, although it may be innocuous *per se*, yet is a danger to the public tranquillity and other people's rights; such as exceeding the speed limit without injuring anyone.

The Zanardelli code will soon be superseded by a new one which will bring penal law more in accordance with the fundamental rights and interests of the new society which has sprung out of the Fascist revolution. The new code, which has been well received in Italy, has been prepared by Rocco, and will be the first of the Mussolini codes.

Scope of New Code.—The preliminary project comprises 751 articles. It is divided into three books. The first book deals with offences generally, the second with crimes, the third with contraventions. The code embodies some of the special laws which have been promulgated since the Fascist revolution, such as the Defence of the State law, the law relating to the press, and the Public Safety law. The new code keeps faith with the fundamental principles of the traditional Italian school; nevertheless it accepts many practical reforms advocated by the Italian "Positive school," showing an unmistakable breadth of view. It is imbued with much greater severity against the individual and rigidly safeguards the whole "majesty of the law" in accordance with the Fascist principle of the supremacy of the authority of

the State.

Extending the doctrine of the so-called "juridical territoriality," the new code deals with offences of an international nature. Thus whosoever shall offend the Italian State is punished according to Italian law, whether he be a citizen or a foreigner, and whether he be in the kingdom or abroad. In the case of extradition the code provides for the surrender of nationals and of political offenders.

Dealing with the defence of the State, the new code introduces capital punishment for any person who endeavours:—to submit the State or a part thereof to a foreign Sovereign; to weaken its independence or dissolve its unity; to detach a colony from the mother country; to make an attempt on the life, integrity or personal liberty of the king, the queen, the crown prince or the head of the Government; to reveal political or military secrets; to incite to insurrection or civil war. The death penalty is inflicted also on the citizen in a high military command who takes arms against the State or serves a foreign country at war with Italy. Apart from war time, the citizen who shall spread abroad false or injurious news concerning the internal condition of the State is punishable by five years' imprisonment. Whoever in the State organizes associations calculated to establish by violence the dictatorship of a social class or to suppress by violence either the economical and social order of the State or its political and juridical order is also liable to imprisonment. The refusal to obey an official is now treated as a crime punishable with imprisonment.

The code contains further and more stringent provisions for the protection of family life. Besides increasing punishment for adultery and concubinage, punishing bigamy even if the first marriage be void, and considering incest as a crime even if it does not give rise to public scandal, the code provides that whoever makes propaganda in favour of birth control is punishable with imprisonment, and that a married man who seduces a girl is liable to imprisonment from six months to three years.

The new code contains rules aimed at strengthening the protection of cults and religious sentiments and especially the Catholic religion. Economic and political strikes, boycotts and lockouts are considered as crimes. The crime of usury is created. Whoever fails to pay a debt incurred with the intention of not paying is punishable with imprisonment. The crime of exceeding the speed limit is established and is punishable with imprisonment.

(G. M. P.)

ITALIAN FRONT, IN THE WORLD WAR, 1914-1918. On the outbreak of the World War the Austro-Italian frontier, as delimited after the war of 1866, was about 600 km. in length, four-fifths of it in the mountain zone and a considerable part in the high Alps. To some extent it corresponded with the crest of the mountains, but in several areas it was well to the S. or W. of it, and almost everywhere the summits and the most favourable positions were held by Austria. Commencing at the top of the Stelvio pass, it followed the Alpine ridge to the Tonale, deflected S. to the Adamello group and the lake of Idro, turned E. across the Lago di Garda, S. of Riva, ascended the M. Altissimo of the Baldo group, crossed the Adige S. of Borghetto, turned N.E. along the outer edge of the Asiago plateau, E. along the Cime Portule, Dodici, Undici, crossed the Brenta below Grigno, kept along the ridge of the Cadore mountains, crossed the Cordevole S. of Livinallongo, passed S. of Cortina d'Ampezzo, reaching the Carnia Alps at M. Popera, keeping due E. along the crest to the source of the Pontebba stream, turned S. along Morlasio, M. Canin, M. Maggiore and M. Kolovrat, W. of the Isonzo, followed the Judrio, crossed the Torre below its confluence with the Natisone, passed E. of Palmanova, and reached the sea between the lagoons of Murano and Grado. It formed two salients—that of the Trentino, driven like a wedge into the heart of the Venetian plain, with a dozen military roads spreading fan-like from it in all directions, and that of the Friuli extending towards the Isonzo; the former was much more favourable to Austria than the latter was to Italy.

On the Italian side there was a main line of railway from Milan to the Austrian frontier at S. Giorgio di Nogaro, with a line push-

ing N. from Verona to the Austrian frontier at Borghetto, and another from Mestre N.E. to the frontier at Pontebba, a line parallel to the E. frontier from Udine to Palmanova, and a number of branch lines. On the Austrian side there were the main lines from the Brenner to the frontier, from Leoben to Pontebba and from Graz to Trieste and San Giorgio di Nogaro, an intermediate line along the Pusterthal, another from Kalgenfurt to Gorizia and Monfalcone and various branch lines.

As soon as Italy intervened in the war the Italian troops effected a forward push and succeeded in some sectors in securing more favourable positions—the Tonale, M. Baldo, Col Santo, Pasubio, Vallarsa and Valsugana sectors of the Alpine front (*see* TRENTINO), and crossed the upper Isonzo at Caporetto, occupying the Monte Nero and Plezzo areas. On the middle and lower Isonzo the advance was held up by the defences of Gorizia (*see* ISONZO and GORIZIA) and the Carso (*q.v.*), although the river was eventually crossed at Pieris and other points and Monfalcone occupied. Subsequently, after heavy fighting, the enemy having been able to strengthen the naturally strong Carso positions, the Isonzo line was pushed forward until in Aug. 1916 Gorizia was captured, with a wide area on the Carso to the S. of the town. Further progress on the Carso and at various points E. of the Isonzo was effected in the autumn of 1916 and the first months of 1917, the Bainsizza plateau N.E. of Gorizia being occupied after hard fighting in August.

On the Trentino front the Austrian offensive of May 1916 resulted in the loss by the Italians of several sectors on the Asiago (*q.v.*) plateau; but the last mountainous diaphragm was held as well as the Pasubio, and an Italian counter-offensive recaptured most of the lost ground. On the other sectors there were few changes. When the Austrians broke through at Caporetto (*q.v.*) in October 1917 the II. and III. armies fell back on the Piave, the Carnia and Cadore sectors were evacuated and some important positions on the Asiago plateau were also lost. The new front was 200 km. shorter than the old. From the Stelvio to Asiago it was unchanged; in the latter sector it was well to the S. of the old line, and further E. it ran along M. Asolon, M. Grappa (*q.v.*), Col dell'Orso to the Piave S. of Valdobbiadene, and then followed the Piave (*q.v.*) to its mouth. Only slight changes were effected, except in the Grappa and Asiago areas where, after desperate fighting in November and December, the Italians fell back still further, until by the end of the year the new line was definitely stabilized. At the battle of the Piave some positions in the Asiago area were lost and the Austrians crossed the Piave at two points, but the Italians counter-attacked and regained all the lost ground. There were no further changes until the Italian victory of Vittorio Veneto (*q.v.*), which ended the war on this front (Oct. 23–Nov. 3, 1918).

The strategic outline of the campaign on the Italian front is given *s.v.* WORLD WAR; *see* also the references to separate articles above.

(L. V.)

ITALIAN LANGUAGE, MODERN. Spoken Latin must necessarily have varied in the successive centuries and according to the speech of the peoples which adopted it. When the centripetal force of Rome was relaxed, these differences were emphasized and by degrees the Romance languages (*q.v.*) developed. To speak however of the language of Italy, Spain or France is an abstraction, if we understand by language the vernacular actually used by the inhabitants of a whole country; for each hamlet and even each family and social group possessed, as it now possesses, certain peculiarities of vocabulary and pronunciation. So that there existed throughout the Roman Empire, and in particular throughout the Italian peninsula, a variety of vernaculars, each almost undistinguishable from its immediate neighbours, and each gradually better differentiated from others that are and were spoken at increasingly greater distances whether actual or virtual. When we speak therefore of the Italian language and of its dialects we are using inaccurate expressions. There existed, from the days of Republican Rome and before (*cf.* Latin language), local vernaculars which became gradually modified by usage, scholastic influence, accession of peoples of different ethnical stocks, contact with other peoples, etc.; and these vernaculars

became more strongly differentiated during the earlier middle ages when, owing to the breaking up of the political organization, public education was impaired and communications were rendered difficult and slow. It is possible to group the local vernaculars on the basis of certain common features of pronunciation and morphology mostly, but by no means necessarily coinciding with geographical subdivisions of the land; and these groups we call dialects. What is generally understood by the words "Italian Language" will be considered after the dialects have been surveyed.

Dialects.—In the upper valleys of the Adige and the Piave and in some neighbouring districts, in the land east of the Tagliamento (Friuli) and in some neighbouring parts dialects are spoken belonging to the Ladin (Raetian) group (Trentino, Cadorino, Friulano, Goriziano, etc.), which is not to be considered as belonging to the Italian family, but as a Romance vernacular kindred to the language of south-eastern Switzerland. Along the Italian coast from Istria (and also from Dalmatia) as far as the mouth of the Po and in the islands of the upper Adriatic, varieties of the Venetian dialect are spoken. Venetian is to be considered the whole region from the Tagliamento to the left bank of the Mincio, with considerably diversified vernaculars (of Venice, proper, of Chioggia, Treviso, Padua, Vicenza, Verona). Part of this territory was originally inhabited by Ladin people as is shown by the persistence of final *-s* in the 2nd pers. sing. of the Present indicative of interrogatives: *vas-tu?* (cf. Ascoli, "Arch. glott." I, 411 ss.) Common features of the dialects of Venetia are the simplification of Latin *-ct-* to *-t-*, Latin *cl-* to palatal *c-* and the diphthongation of short stressed *e* and *o*. West of the Adige we meet with the Lombard dialects (in Brescia, Bergamo, Milan, Pavia, Lodi, Como, Valtellina and Canton Ticino) having in common like the dialects of Piedmont, the sounds of *ü* and *ö* (French *u* and *eu*), the lack of double consonants, the loss of final vowels and the frequent nasalisation of *n* and *m*. Connected with Lombard are the dialects of Liguria, Emilia and Romagna, all possessing the *ö* sound (*ü* only in Liguria), and all tending to the palatalization of Latin *-ct-*. Piedmontese dialects (Vercelli, Turin, Alessandria, Saluzzo, Monferrato, Asti, Aosta, etc.) are spoken west of the Ticino and the Trebbia as far as the Apennines and the Alps and are closer to French; while Ligurian vernaculars spoken all along the Riviera, at San Remo, Savona, Genoa, Spezia, Sarzana, have some points of contact with Provençal. On the other hand the dialects of Emilia (south of the Po; east of the Trebbia, north of the Apennines and the Reno, spoken at Piacenza, Parma, Reggio, Modena, Ferrara and Bologna), and those of Romagna (east of the Apennines, between the Reno, and the Marecchia) spoken at Ravenna, Imola and Forlì, respond to central Italian tendencies. In central Italy we find the dialects of the Marches between the Marecchia and the Tronto on the Adriatic coast (Pesaro, Ancona, Urbino, Macerata, Ascoli), of Umbria (upper valley of the Tevere and neighbouring districts (Perugia, Foligno, Spoleto, Terni), of Tuscany (upper valley of the Arno to the sea as far as Grosseto (Pistoia, Pisa, Lucca, Livorno, Firenze, Arezzo, Siena), of Latium (west of the Apennines from Grosseto to Terracina approximately) and of Corsica. The Tuscan dialects are closest to Latin, but in some parts of the region we meet with cases of rhotacism (*obbligo* for *obbligo*, *tumuro* for *tumulo*), with voiced for voiceless gutturals, (*siguro* for *sicuro*) and with *s* for *z* (*speransa* for *speranza*). Characteristic of the dialects of the Marches are the cases ofumlaut whereby changes in the internal vowels are caused by certain terminal vowels due to the accident (*castiello* next to *castella*, *muorto* next to *morta*, etc.). Corsican dialects are kindred to Tuscan, but southern Corsican is closely connected with Sardinian. In southern Italy we meet with dialectal groups which do not correspond to territorial divisions, in the northern section we find the dialects of Abruzzi (on the Adriatic side, south of the Tronto and the upper valley of the Pescara (Teramo, Aquila, Chieti, Sulmona), of Apulia (Puglia) and Basilicata spoken at Campobasso, Foggia, Barletta, Bari, Brindisi, Potenza; of Campania comprising Gaeta, Caserta, Avellino, Naples and Salerno. The southern section contains the dialects of the territories of Lecce, Otranto, Taranto, southern Calabria

and Sicily. Peculiar features of the Southern dialects in general are the preservation of intervocalic voiceless consonants which in other regions are substituted by voiced consonants (Ital. *cittadino* is at Naples *cetatino*), the assimilation of *-nd-* to *-nn-* (*scendere* is *scennere* at Naples); peculiar to the southern section and particularly to Sicily is the change of stressed and final *-e* to *-i* (*aviri* for *avere*) and *e, o* to *i, u* respectively in stressed syllables (*amuri* for *amore*). The vernaculars of Sardinia are no longer considered Italian dialects but rather as Romance vernaculars. There are of course others besides the phonetic differences between the various dialects. Thus all the northern dialects have lost the perfect and use instead the compound past or preterit (*ho cantato* for *cantai*); the southern dialects have kept the perfect. The archaic conditional *fora* < *fuera* occurs in older dialectal texts; in the south there occurs a present conditional *cantaria* from *cantare habebam* that by way of ancient Tuscan poems has found a place in the poetical language for the usual *canterei*. In Trieste and a few other places there occurs an exchange between the conditional and the subjunctive (*mì cantassi se podria* for *canterei se potessi*) (cf. G. Bertoni, *Italia dialettale*, Hoepli; Meyer-Luebecke, *Ital. Grammatik*, 1890; Guarnerio, *Fonologia romanza*, Hoepli).

The vocabulary of the several dialects varies owing to the different ethnical substrata and the peculiar conditions of the population. Words of Celtic origin being more frequent, if ever rare, where the pre-Roman population was Celtic; Germanic words having survived where the Teutonic occupation was longest (in the North) and Greek words occurring more frequently where the ethnic substratum was Greek or the Byzantine rule persisted through the earlier middle ages. Thus at Genoa "bran" is called *brènu* and at Como *bren* (Celtic); apart from a certain number of Germanic words that have been accepted by the literary language (*guerra, elmo, rocca, guancia, onta*, etc.) we find ven. *barba* for uncle, and *biet, biot* from old high-Germ. *blaut*, naked, in Lombardy. Of Greek origin are the Sicilian *melana*, ink, *centra*, nail, etc. On the contrary French words are quite as frequent in the literary language as in the dialects for, particularly during the 13th century, French and Provençal works were often read in Italy, and since then the literary relations between the two countries have been continuous and at times intimate, so that from *cavaliere*, for *cavallaro* to *vegliare* for *vegliare* and to *saggio* for *savio* instances of French influence are very frequently discernible (cf. Bertoni, *L'elemento germanico nella lingua ital.*, 1914; G. Rohlfs, *Griechen u. Romanen in Unteritalien*, 1924; R. R. Bezzola, *Abbozzo di una storia dei gallicismi italiani*, 1925).

The Literary Language.—During the middle ages only Latin was taught in the schools; consequently all who ventured to write in their local vernacular would tend to regularize or to latinize the more definitely dialectal features of their daily speech and thus roughly to approximate it to Tuscan and particularly to Florentine which, of all the Italian vernaculars, was closest to Latin. The country lacked political unity and thus had no political centre which might become linguistically pre-eminent. The earliest literary work in Italian as distinct from isolated sentences is the "cantilena" of a Tuscan jongleur (forty lines of eight syllables) which must be ascribed to the neighbourhood of Pisa and dated about 1150. (Since Mazzoni's article in "Studi medievali," II. (1928) pp. 247 ss., the date of the poem is certain and its meaning no longer so obscure as it was previously held.) During the 13th century there were written poems and prose works in practically every dialect of Italy. Such an output was in many departments more plentiful in Tuscany than elsewhere (except perhaps for lyrical poetry at the court of Frederick II.), and as it was more plentiful it soon excelled also for intrinsic merit. Despite this Dante when he had already composed most of his lyrics and the *Vita Nuova* did not yet realize that the literary language of Italy must be based on the vernacular of Florence, and suggested an artificial selection of the best elements from each dialect. In practice, however, he departed from his own theory, for his language is nothing but Florentine. Dante's influence was as great as his success, and

unintentional writings in other dialects disappeared after the beginning of the 14th century. Petrarch who was born in Tuscany if he seldom lived there, had no hesitation as to which dialect to prefer. Boccaccio grew up in Florence. Collectively their example contributed to the inevitable triumph of Florentine. The Renaissance brought about a recrudescence in the use of Latin; for a time every man making any claim to literary distinction either exclusively or in preference wrote Latin; and it was no longer mediaeval Latin, but a language as pure in vocabulary and style as the increasing familiarity with classical masterpieces could well bring about. Works in Italian were thus either popular in character, affecting and exaggerating popular traits, or were written in an unpleasant jargon constituted by the admixture of purely Latin words to, and the superimposition of Latin constructions on, an Italian basis (e.g., *Hyperotomachia Poliphili*, by F. Colonna). During the earliest period when the writers were struggling to build up an Italian tradition, they had naturally turned either to Latin or to French for their models. Ultimately Latin prevailed, but the general result was that an Italian literary language was developed which differed to a certain extent in vocabulary and to a greater extent in phrasing from the cultured speech of Florence; authors who did not hail from Tuscany were apt to allow dialectal features and local idioms to creep into their works, and when the Latin fashion somewhat abated at the beginning of the 16th cent. and the literary output in Italian was proportionately increased, despite the existence by then of a κοινή διάλεκτος, it was ardently debated whether the Florentine usage, the language of the princely courts or the works of Dante, Petrarch and Boccaccio should be taken as standards. Machiavelli championed the first, Castiglione the second and Cardinal Bembo the third solution. In theory, if not always in practice, Bembo triumphed, and his triumph implied the rigid conformance to models of the past precisely as was done in writing Latin or Greek. And thus during the later 16th, the 17th and the early 18th centuries the remoteness of prose style from everyday speech became accentuated in all except scientific works. At the same time there was an orgy of concepts and a considerable, if short-lived, influx of Spanish words and idioms. The so-called polite form of address in the third person is one of the few Spanish mannerisms that became established. In order to free themselves from the tyranny of the past, some 18th century authors (Verri, Beccaria) urged and practised a supine imitation of French, thus provoking a reaction and a return to the classics. Both these movements fostered the development of a more modern language; but it was only during the 19th century that the question was finally settled. A. Manzoni, a Milanese, steadily maintained that the vernacular of Florence must be the source and the touchstone of literary Italian. By then the Italian Kingdom was formed and Italy had acquired a political centre; the capital being established at Florence in 1864 and transferred to Rome in 1871 (cf. L. Morandi, *Origini della lingua italiana*, 7th ed., 1897; P. Rajna in D'Ancona e Bacci, *Manuale*, I., 1903; V. Crescini, *Origine della lingua ital.*, 1909; C. H. Grandgent, *From Latin to Italian*, 1927; T. Labande-Jeanroy, *La question de la langue en Italie*, 1925).

Contemporary Language.—Even cultured Italians, however, when in their native districts still spoke the local dialects; when writing therefore they made use of a medium that was to a certain extent foreign, being unable to employ their normal idioms unless they happened to be Tuscans. As a consequence throughout the 19th century prose style was often over elaborated, stiff, clumsy or excessively dialectal. And it was only during the present century that the Italian language ceased to labour under the severe handicap that had thwarted so long its natural development. The results of this soon became apparent for, except among the Tuscan writers of the earliest period, the literary language has never been so closely connected as it now is, with the spoken language. This change is perhaps greater than contemporaries are able to evaluate, though it implies no alteration in phonetic and morphology. Apart from a few orthographical changes and the obsolescence of words indicating things that are no longer in use, present day Italian is still Dante's Italian; such

sound changes as are noticeable in English, German and French are completely unknown to Italian. Of course the dialects, lacking the restraining influence of an acknowledged literary usage and of the schools, alter more rapidly and profoundly. Despite this a comparison of the sentences in the documents of Capua (A.D. 960) with some modern variety of the Neapolitan dialect would show that no fundamental change has occurred. And a similar result would be reached if 13th century Northern or Southern texts were compared to modern parallels, provided it was borne in mind that ancient writers endeavoured to normalise the dialectal forms and did not propose faithfully to reproduce the forms and pronunciation of local usage. Owing to the strong traditions of regional life, dialects survive in conversation, are constantly employed in popular songs and occasionally in drama. Dialectal drama has, during the last thirty years, met with much favour even when acted far from its original centres; and of late there has been an extraordinary revival in the folk songs and music. Dialects, however, increasingly feel the effect of the pre-eminence of Italian, the language of the schools, of the courts, of the newspapers and books, but there is no sign of the disappearance of the dialects themselves with their very attractive element of local colour.

The local vernacular of Florence is itself a dialect, and educated Florentines, and Italians in general, do not turn the guttural stops into aspirates (It. *casa*—Flor. *hasa*), do not exaggerate the softening of palatal *c* and *g* (It. *cacio*—Flor. *hasho*), and the Florentine habit of avoiding the diphthongation of short *e* and *o* under stress is not accepted by standard Italian (*buono* and not *bono*, *tiene* and not *tene*). On the other hand, standard Italian is necessarily streaked with dialectal pronunciations and mannerisms whether Tuscan or of other regions. Northern Italians e.g., find it difficult to discriminate between open and closed *e* and *o* in stressed syllables (the first *e* of *bene* is open, not closed as the Milanese pronounce it); the stressed *e* of *caramente* is close not open as it sounds at Turin. On the contrary in the South the tendency is to pronounce all these vowels close. Northern Italians tend to voiced and Southerners to voiceless *s*; Tuscans distinguish between them, though they are not consistent for there are instances of voiced *s* that have become voiceless in the course of years and vice versa. As a quite recent development accents have been exceptionally marked on all stressed vowels, unless they are in penultimate syllables, but this example was not followed. It has become customary to differentiate between acute and grave accents when they are marked, the former indicating a closed and the latter an open sound. Such a tendency, which is a consequence of the union of Italy and of a desire towards a greater uniformity of pronunciation, is welcome in itself, and may point to such developments in the use of accents as have become established in France and in Spain. (G. Malagoli, *Ortografia e ortografia italiana moderna*, Hoepli manual.)

(C. F.)

ITALIAN LITERATURE. One characteristic fact distinguishes the Italy of the middle ages with regard to its intellectual conditions—the tenacity with which the Latin tradition clung to life (see LATIN). At the end of the 5th century the northern conquerors invaded Italy. The political structure of Rome crumbled to pieces; Goths, Greeks, Lombards and Franks were in turn pre-eminent in Italy. Theoderic the Great, however, who considered himself a lieutenant of the Byzantine emperor, was not averse to learning, and even the Lombard kings, who belonged to a truly barbaric stock, seem to have been compelled by the force of local habits to countenance the existence of lay and ecclesiastical schools. The persistence of lay schools throughout the middle ages is an Italian characteristic. Ecclesiastical schools were founded as a matter of routine; when the Benedictine institutions underwent a period of decadence, Irish monks settled in Italy and helped in reviving religious zeal and interest in learning. If the original output of Italian scholars during the earlier middle ages was comparatively small, there were nevertheless men of outstanding merit practically in every century. Peter of Pisa was at Charlemagne's court together with Paul the Deacon who hailed from Montecassino; Gunzo of Novara migrated to

the court of the Saxon emperors; later Lanfranc of Pavia and Anselm of Aosta rose to important positions in France and in England. No doubt the persistence of the classical tradition in the native population was rendered possible by the relatively small number of barbaric settlers and helped by the sight of countless monuments of Roman greatness; this same persistence greatly hindered that peculiar re-elaboration of classical tradition and barbaric legends which gave rise in France to a new literature. Italians were late in the field and they preferred to import French works dealing with the Romans (*Faits des Romains*), Alexander the Great (*Roman d'Alixandre*) and Trojan legends (*Roman de Troie*). Likewise the Italians, whose vernacular dialects must have taken shape very early (there are records of dialectal sentences as early as the 9th century at Verona and in the south), were slow to realize that Latin, the language they were taught at school (*grammatica*), was no longer their real language; they were shy to break away from tradition: Gunzo of Novara (10th century) justified a grammatical slip he had made in a Latin speech by his habit of speaking the Italian vernacular which was similar to Latin, and yet until the 13th century no Italian dialect seems to have been used in writing, with the exception of some verses in a poem by the Provençal R. de Vaqueiras, an inscription at Ferrara and the song of a Tuscan jongleur (*Salva lo vescovo senato*).

The Fashion of French and Provençal.—By the end of the 12th and the beginning of the 13th centuries Latin had become unsuitable to the expression of everyday feelings, and the courtly society of feudal castles, as well as the people loitering in the squares, wished for some kind of literary entertainment. In many a castle of northern and central Italy Provençal troubadours were welcome guests; their poems were transcribed in manuscripts which are still extant, and there were many Italians who wrote Provençal poems, such as the Marchese Alberto Malaspina (12th century), Maestro Ferrari of Ferrara, Cigala of Genoa, Zorzi of Venice, Sordello of Mantua, Buvarello of Bologna, Nicoletto of Turin and others. The same courtly circles that appreciated Provençal lyrics greedily read Arthurian romances, at first in French and later in Italian translations. Carolingian poems found favour instead with the less educated people for whose benefit they were recited in the thoroughfares at first by French jongleurs, who must have endeavoured to make themselves more easily understood by italianizing their pronunciation, and later by Italian imitators. As a result there came into being numbers of works written by Italians in imperfect French during the 13th century. Such were the "Chansons de Geste," *Maçaire*, the *Entrée en Espagne* written by Nicola of Verona, the *Prise de Pampelune* and some others. Many such works have been lost, among them those which were later rendered into Tuscan *cantari* dealing with epic subjects, but a good number are still extant in prose as well as in verse, such as *Le régime du corps* by Aldobrandino of Florence or Siena, a chronicle of Venice written in 1267 by Martino da Canale, a treatise on Falconry translated by Daniele of Cremona (1251), the travels of Marco Polo written down, possibly from dictation, by Rustichello of Pisa (1298), who had previously lived at the court of Edward I. and composed many Arthurian romances; the encyclopaedic work *Lis livres dou tresor* of Brunetto Latini (just after 1260). Several authors—Canale, Ennachet, Latini (who wrote in France)—were at pains to state that they were using the French language because it was more pleasant than others and more widely understood. But so artificial an attempt must soon have proved a failure, for while it was in progress, there had begun an active effort at translating from Latin and French into the Italian vernaculars and also at writing original works in Tuscan and other Italian dialects.

It was in the course of the 13th century, and especially from 1250 onwards, that the new literature largely unfolded and developed itself. This development was simultaneous in the whole peninsula, only there was a difference in the subject-matter of the art. In the north, the poems of Giacomino of Verona and Bonvecino of Riva were specially didactic and religious, and were intended to be recited to the people. Uguccone of Lodi, Bonvecino, Giacomino, Girardo Patecchio and the others no doubt

wrote in their local dialects, occasionally adopting words and forms from other dialects with the intention of thus attaining a higher literary standard; and their genuine forms may at times have been further modified by enterprising copyists who spoke different if neighbouring vernaculars. Some of these religious works may possibly have been connected with the heretical movements in Lombardy at the period.

The Sicilian School.—In the south of Italy French lyrics of the *langue d'oïl* and particularly of the *langue d'oc* enjoyed favour in courtly circles. One of the most ancient poems of the Sicilian School, a name by which the poets of the court of Frederick II. are indicated whether they hail from Sicily or not, is ascribed to King John of Brienne, and the emperor Frederick, perhaps himself a poet, certainly encouraged his friends to cultivate the vernacular muse. Modern critics have pointed out French influences in many of these lyrics, and it may be that the famous and much discussed *contrasto* of Cielo Dalcamo, a poet who had probably studied at Salerno, was an attempt at imitating local and French popular or pseudo-popular poems. Despite some vigour, zest and coarseness it cannot rank with real popular poetry. The Provençals, however, had provided models which, being the product of social refinement in a feudal environment, must have proved more congenial to Frederick and his courtiers; and the lyrics of the Troubadours were often sheepishly imitated by Pier della Vigna, Enzo, Frederick's son, Jacopo Mostacci, Giacomo da Lentino and the others; among them Giacomino Pugliese and Rinaldo of Aquino occasionally gave signs of genuine feeling, and may have drawn inspiration from popular poetry. As has been noted, several of the poets of the Sicilian School were not Sicilians, but hailed from southern Italy, as Pier della Vigna and Rinaldo, from Tuscany, as Arrigo Testa, or from Genoa, as Percivalle Doria. Moreover Frederick and his courtiers were ever moving up and down Italy as the political situation required; and all of them endeavoured, when writing, to ennoble the language they used by discarding purely local forms and thus unconsciously worked towards a standard literary language. Later scribes may have emphasized such a tendency by altering Sicilian to Tuscan forms. Followers of the Provençals have been traced in Naples and Rome; and farther north, in central Italy, there were other forces at work besides the influence of the Troubadours.

Religious Poetry of the 13th Century.—The religious revival of the 13th century is connected in central Italy with St. Francis of Assisi (1182–1226). Around him a legend has grown up and from some points in it we seem to be able to infer that its hero had a strong feeling for nature, and a heart open to the most lively impressions. There is clear evidence of such gifts in his famous *Cantico del Sole*, which despite rhythmical irregularities is considered the finest religious hymn of early Italian literature. The Franciscan movement inspired the composition of many religious lyrics; and when after the saint's death the Order was split by dissensions, one of the upholders of strict adherence to the original rule, Jacopo dei Benedetti of Todi (d. 1306), wrote poems of outstanding merit. He was a lawyer and had probably tried his hand at poetry before his conversion. A vehement passion must have stirred his heart and maintained a despotic hold over him, the passion of divine love. Under its influence he went on subjecting himself to the severest sufferings, and giving vent to his religious intoxication in his poems. There is little art in him, and there is no indication of deliberate effort; there is only feeling, a feeling that absorbed him, fascinated him, penetrated him through and through. He was put in prison and laden with chains, but his spirit lifted itself up to God, and that was enough for him. The same feeling that prompted him to pour out in song ecstasies of divine love and to despise and trample on himself, moved him to reprove those who forsook the heavenly road, whether they were popes, prelates or monks.

To the religious movement in Umbria is also traceable the origin of the religious drama. In 1258 an old hermit, Raniero Fasani, leaving the cavern in which he had lived for many years, suddenly appeared at Perugia. These were difficult times in Italy. The breaking up of the feudal system, the incidence of economic forces connected with the rise of capitalism, the struggles between

popes and emperors kept the people in constant agitation, and spread abroad paralysing fears. Fasani represented himself as sent by God to disclose mysterious visions, and to announce terrible visitations to the world. Under the influence of fear there were formed "Compagnie di Disciplinanti," who, for a penance, scourged themselves till they drew blood, and sang "Laudi" in dialogue in their confraternities. These "Laudi," closely connected with the liturgy, were among the first examples of the drama in the vulgar tongue of Italy. Their development, however, was rapid. As early as the end of the same (13th) century we have the *Devozioni del Giovedì e Venerdì Santo*, which have some dramatic elements in them, though they are still connected with the liturgical office. Then we have the representation *di un Monaco che andò al servizio di Dio* ("of a monk who entered the service of God"), in which there is already an approach to the definite form which this kind of literary work assumed in the following centuries.

THE TUSCAN DIALECT

Tuscan Poetry.—In the 13th century Tuscany was peculiarly circumstanced both as regards its literary condition and its political life. The Tuscans spoke a dialect which most closely resembled the mother-tongue, Latin—one which afterwards became almost exclusively the language of literature, and which was already regarded at the end of the 13th century as surpassing the others; "Lingua Tusca magis apta est ad literam sive literaturam": thus writes Antonio da Tempo of Padua, born about 1275. Among the other cities Florence owing to geographical and economic causes acquired a pre-eminent position. From 1266, when the Hohenstaufens were defeated at Benevento, she was in a position to begin that movement of political reform which in 1282 resulted in the appointment of the Priori delle Arti. This was afterwards copied by Siena, by Lucca, by Pistoia, and by other Guelph cities in Tuscany with similar popular institutions. Economic prosperity found expression in the erection of churches and town halls and in their artistic decoration. It was no wonder that literature also rose to unlooked-for perfection. In Tuscany, too, there was some popular love poetry; there were imitators of the Troubadours and the Sicilians, such as Guittone del Viva of Arezzo and Dante of Majano; but literary originality took another line—that of humorous and satirical poetry. Folgore of San Gimignano laughs when in his sonnets he tells a party of Sienese youths what are the occupations of every month in the year, or when he teaches a party of Florentine lads the pleasures of every day in the week. Cene della Chitarra laughs when he parodies Folgore's sonnets. The sonnets of Rustico di Filippo are half fun and half satire; laughing and crying, joking and satire, are all to be found in Cecco Angiolieri of Siena. But another kind of poetry also began in Tuscany. Guittone d'Arezzo, besides imitating the love songs of the Provençals, attempted political poetry, and thus struck an original note. A more fruitful development occurred at Bologna, the seat of an already famous university. The poets of Provence had paid the same kind of homage to their ladies that the noblemen owed to their feudal overlords; at Bologna, where the new tendencies of the Schoolmen's philosophy were much discussed, a poet was born, Guido Guinicelli di Magnano (1230–75?), who followed at first the lead of Guittone but soon struck out on an original path, ascribing to his lady the power of calling into activity all the good qualities which were dormant in him, and as he was gifted with an extraordinary power of dramatic imagination and real feeling, he succeeded despite some philosophical subtleties in composing lyrics of striking beauty which brought about a revolution in Italian poetry and strongly influenced Cavalcanti and Dante.

But before we come to Dante, certain other facts, not, however, unconnected with his history, must be noticed. Didactic poetry, which was direct in northern Italy, adopted the allegorical device in Tuscany. Thus Brunetto Latini, whom Dante looked upon with filial affection, wrote the *Tesoretto*, in which the author professes to be lost in a wilderness and to meet with a lady, who is Nature, from whom he receives much instruction. Francesco da Barberino, a learned lawyer, wrote two little allegorical poems—the *Documenti d'amore* and *Del reggimento e dei costumi delle*

donne. A fourth allegorical work was the *Intelligenza*, attributed to Dino Compagni.

Prose in the 13th Century.—While the production of Italian poetry in the 13th century was abundant and varied, that of prose was scanty. The oldest specimen dates from 1211, and consists of short notices of entries and expenses by Florentine bankers from Siena. In 1253 and 1260 there are some commercial letters. Next in order to the original compositions in the *langue d'oïl* come the translations or adaptations from the same. There are translations and adaptations from French originals:—some moral narratives taken from religious legends; a romance of Julius Caesar; some short histories of ancient knights; the *Tavola rotonda*, translations of the *Milione* of Marco Polo and of the *Tesoro* of Latini. At the same time there appeared translations from Latin of moral and ascetic works, of histories and of treatises on rhetoric and oratory, several of which were due to Bono Giamboni. Among the oldest prose writing is a scientific book—the *Composizione del mondo* by Ristoro d'Arezzo, who lived about the middle of the 13th century. This work is a copious treatise on astronomy and geography. Ristoro seems to have been a careful observer of natural phenomena, and consequently many of the things he relates were the result of his personal investigations. There is also another short treatise, *De regimine rectoris*, by Fra Paolino, a Minorite friar of Venice, who was probably bishop of Pozzuoli, and who also wrote a Latin chronicle.

The 13th century was very rich in tales. There is a collection called the *Cento novelle antiche*, which contains stories drawn from Oriental, Greek and Trojan traditions, from ancient and mediaeval history, from the legends of Brittany, Provence and Italy, and from the Bible, from the local tradition of Italy as well as from bestiaries and ancient mythology. There were other prose tales inserted by Francesco da Barberino in his work *Del reggimento e dei costumi delle donne*, but they are of much less importance than the others. Some attention should be paid to the *Lettere* of Fra Guittone d'Arezzo, who wrote many poems and also some letters in prose, the subjects of which are moral, religious and political. During the later middle ages it had become the fashion to ornament Latin orations and letters with all sorts of rhetorical devices, among them rhythmic *clausulae* (*cursus*), and such a practice, which was enforced by a number of rhetorical treatises (*artes dictandi*), Guittone followed when writing Italian, with results that are often extravagant.

New Tuscan School of Lyric Poetry.—At the end of the 13th century in Tuscany, lyric poetry, almost of a sudden, reached a high standard of perfection. It depended to some extent on Guittone's and much more on Guinicelli's models, but its achievements were principally due to Cavalcanti. Guido Orlandi, Lapo Gianni, Dino Frescobaldi, Dante, Cino da Pistoia and a few others must all be grouped around him. The secret of their success was a fresh and sincere inspiration; as Dante expresses it—

Quando
Amore spira, noto, ed a quel modo
Ch'ei ditta dentro, vo significando—

that is to say, the expression of the feelings in the way in which love inspires them, in an appropriate and graceful manner, fitting form to matter, and by art fusing one with the other. In Lapo Gianni the new style is not free from some admixture of the old associations of the Siculo-Provençal school. Sometimes, however, he draws freely from his own heart, and then the subtleties and obscurities disappear, and his verse becomes clear, flowing and elegant.

Guido Cavalcanti was a learned man with a high conception of his art. He felt the value of it, and adapted his learning to it. His poems may be divided into two classes—those which portray the philosopher, "il sottilissimo dialettico," as Lorenzo the Magnificent called him, and those which are more directly the product of his poetic nature imbued with mysticism and metaphysics. To the first set belongs the famous poem—*Donna mi prega*, which in fact is a treatise on the nature of love, and was annotated later in a learned way by Marsilio Ficino and others. But there are many of his poems, the *ballate* particularly, in which the truth of the images and the elegance and simplicity of style are admirable,

and make us feel that we are in quite a new period of art.

Among the followers of the new school was also Cino da Pistoia, of the family of the Sigisbuldi. His love poems are so sweet, so mellow and so musical that they are only surpassed by Dante's. The pains of love are described by him with vigorous touches. It is easy to see that they are not feigned but real. The psychology of love and of sorrow nearly reaches perfection.

DANTE, PETRARCH AND BOCCACCIO

Dante (1265-1321).—As the author of the *Vita nuova*, the greatest of all Italian poets, Dante, also belongs to the same lyric school and partly shares Guinicelli's and Cavalcanti's conception of love. In the lyrics of the *Vita nuova* there is a high idealization of love. It seems as if there were in it nothing earthly or human, and that the poet had his eyes constantly fixed on heaven while singing of his lady. Several of the lyrics (*Rime*) not included in the *Vita nuova* or the *Convivio* deal with the theme of the "new life"; but all the love poems do not refer to Beatrice, while other pieces are philosophical and bridge over to the *Convivio* (c. 1307), an unfinished philosophic treatise in which are to be read some of the finest passages of early Italian prose. About the literary language of Italy Dante expressed original views in another unfinished work in Latin (*De vulgari eloquentia*, c. 1305); just as later, in 1313, he expounded his political system in the Latin *Monarchia* and in some letters. Towards the end of his life he composed a short treatise *De aqua et terra* and two Latin eclogues of great interest. But the work which made him immortal is of course the *Divina Commedia* which was probably written between 1307 and 1321. In 100 cantos Dante describes a vision, during which he visited Hell, Purgatory and Paradise under the guidance of Virgil, symbolizing human reason, and later of Beatrice (human reason illumined by Revelation). Many incidents in this pilgrimage, as well as the pilgrimage itself, have an allegorical meaning, and Dante succeeded in expressing his opinion upon all the subjects that principally interested him in the course of an anticipated Last Judgment to which he dared to summon some men of past ages and many of those who had lived or were living in his own time. It was so clear to him that he had a mission to fulfill and a message to deliver, that he felt inspired to greater effort by the very daring of his undertaking. And though as a pilgrim through the after-world he described himself as having risen from human to celestial heights, as a poet he kept faith to the same moral and political ideals for which he had fought and suffered. Even those readers who may be unequal to the effort of making out the grand lines of his majestic structure, cannot fail to see and to remember the ineffable charm of some particular passages tender or ghastly, stern or moving.

Dante is often said to have summed up the middle ages for the men who came after him; it should not be overlooked, however, that there is much in his work that seems to herald the age which was to follow. He claimed to have learned his literary style from the classics and from Virgil in particular; and if his was not yet a scholarly return to the classics, the angle from which he looked upon them was no longer completely mediaeval.

Petrarch (1304-1374).—The next step was to be taken by Petrarch, and it will be easier to grasp its significance if one bears in mind that his principal aim was a rebellion against the philosophy of the Schoolmen and against the deductive method in science and philosophy by which every truth could only be derived from what Aristotle and his commentators had said. This rebellion he fostered by holding up Plato, whose works and ideas were only indirectly known to him, in opposition to Aristotle, and by summoning to his aid the results of his own introspection. The data of introspection he compared with the records which great writers of antiquity had set down of their own experiences. It was in order to render the study of such ancient records possible and fruitful that it became necessary to know exactly what the ancients had written, and therefore to discover and to collate as many of the manuscripts of their works as were still traceable. Scholarship and antiquarianism were means to an end, and not ends in themselves for Petrarch. He was the first humanist, and at the same time the first lyric poet of the modern school. His career was long and tempestuous. He lived for many years at

Avignon, cursing the corruption of the papal court; he travelled through nearly the whole of Europe; he corresponded with emperors and popes; he was considered the first man of letters of his time; he had honours and moderate riches; and he always bore about within him discontent, melancholy and incapacity for satisfaction—three characteristics of the modern man. He loved Laura, whoever the lady was, and Laura may have for a time countenanced his courtship, but ever remained out of his reach. His life was passed in pining for her, admiring her beauty, sorrowing for her coldness and also in rebelling against love; for love of woman and desire for worldly fame hindered, in his view, the spiritual freedom of man and his striving toward Christian perfection. These perpetual alternations of his moods he embroidered upon with faultless technique, whether or not he happened to be prompted by feeling and strong inspiration, throughout the *Rime sparse*, as he seems to have called his Italian lyrics when, long after Laura's death (1348), he revised and collected them, including also a few political and occasional poems. A clearer but far less successful expression of his views is to be found in the vision that he called *I trionfi*, clearly imitated from Dante's *Commedia*; but no one could hope to penetrate the world of Petrarch's thought who did not read his *Secretum*, a dialogue between St. Augustine and himself, the treatise *De vita solitaria*, the great body of his Latin epistles, and last but not least his epic poem *Africa* by which he sometimes expected to be remembered by posterity.

Boccaccio (1313-1375).—Boccaccio had the same enthusiastic love of antiquity and the same worship for the new Italian literature as Petrarch. He supervised the work of Leon Pilatus, a Greek born in Calabria, who put together a Latin translation of the *Iliad* and the *Odyssey*. Boccaccio's vast classical learning was shown specially in the work *De genealogia deorum*, in which he enumerates the gods according to genealogical trees constructed on the authority of the various authors who wrote about the pagan divinities. Boccaccio was also the first historian of women in his *De claris mulieribus*, and the first to undertake to tell the story of the great unfortunate in his *De casibus virorum illustrium*. He continued and perfected former geographical investigations in his interesting book *De montibus, silvis, fontibus, lacubus, fluminibus, stagnis, et paludibus, et de nominibus maris*, for which he made use of Vibius Sequester, but which contains also many new and valuable observations. Of his Italian works his lyrics do not approach the perfection of Petrarch's. His narrative poetry is better. He was the first to use *ottava rima* in a work of some length and written with artistic skill, such as is his *Teseide*, the oldest Italian romantic poem. The *Filostrato* relates the loves of Troilo and Griseida (Troilus and Cressida). The *Ninfale fiesolano* tells the love story of the nymph Mesola and the shepherd Africo. The *Amorosa Visione*, a poem in *terza rima*, doubtless owed its origin to the *Divina Commedia*. The *Ameto* is a mixture of prose and poetry, and is the first Italian pastoral romance.

The *Filocolo* takes the earliest place among prose romances. In it Boccaccio tells in a laborious style, and in the most prolix way, the loves of Florio and Biancifiore. The *Fiammetta* is another romance, about the loves of Boccaccio and Maria d'Aquino, a supposed natural daughter of King Robert, whom he always called by this name of Fiammetta.

The Italian work which principally made Boccaccio famous was the *Decameron*, a collection of 100 novels, related by a party of men and women, who had retired to a villa near Florence to escape from the plague in 1348. Novel-writing, so abundant in the preceding centuries, especially in France, now for the first time assumed an artistic shape. The rudeness of the old *fabliaux* gives place to the careful and conscientious work of a mind that has a feeling for what is beautiful, that has studied the classic authors, and that strives to imitate them as much as possible. Over and above this, in the *Decameron* Boccaccio is a delineator of character and an observer of passions. In this lies his novelty. Much has been written about the sources of the novels of the *Decameron*. Probably Boccaccio made use both of written and of oral sources.

Unlike Petrarch, Boccaccio felt for Dante something more than

love—enthusiasm. He wrote a biography of him, of which the accuracy has been unsuccessfully challenged in the past, and he gave public lectures on the poem in Santa Maria del Fiore at Florence.

IMITATORS OF DANTE AND BOCCACCIO

Dante and Boccaccio were not without their imitators. Fazio degli Uberti and Federigo Frezzi imitated the *Divina Commedia*, but only in its external form. The former wrote the *Dittamondo*, a long poem, in which the author supposes that he was taken by the geographer Solinus into different parts of the world, and that his guide related the history of them. Frezzi, bishop of his native town, Foligno, wrote the *Quadriregio*, a poem of the four kingdoms—Love, Satan, the Vices and the Virtues. The poet has Pallas for a companion.

Ser Giovanni Fiorentino wrote, under the title of *Pecorone*, a collection of tales, which are supposed to have been related by a monk and a nun in the parlour of the monastery of Forlì. He closely imitated Boccaccio, and drew on Villani's chronicle for his historical tales. Franco Sacchetti wrote tales too, for the most part on subjects taken from Florentine history. His book gives a life-like picture of Florentine society at the end of the 14th century. A third novelist was Giovanni Sercambi of Lucca, who after 1374 wrote a book, in imitation of Boccaccio, about a party of people who were supposed to fly from a plague and to go travelling about in different Italian cities, stopping here and there telling stories. Later, but important, names are those of Masuccio Salernitano (Tommaso Guardato), who wrote the *Novellino*, and Antonio Cornazzano whose *Proverbi* became extremely popular.

Chroniclers and Ascetic Writers.—At the end of the 13th century we find a *chronicle* by Dino Compagni. Little is known about the life of Compagni. Noble by birth, he was democratic in feeling, and was a supporter of the new ordinances of Giano della Bella. As prior and gonfalonier of justice he always had the public welfare at heart. He belonged to the party of the Bianchi and opposed the claims which Boniface VIII. made on Florence. His chronicle relates the events that came under his own notice from 1280 to 1312. It bears the stamp of a strong subjectivity. The narrative is constantly personal. It often rises to the finest dramatic style. He is one of the most important authorities for that period of Florentine history, notwithstanding the not insignificant mistakes in fact which are to be found in his writings. On the contrary, Giovanni Villani, born c. 1276, was more of a chronicler than an historian. He relates the events up to 1347. The journeys that he made in Italy and France, and the information thus acquired, account for the fact that his chronicle, called by him *Istorie fiorentine*, comprises events that occurred all over Europe. What specially distinguishes the work of Villani is that he speaks at length, not only of events in politics and war, but also of the stipends of public officials, of the sums of money used for paying soldiers and for public festivals, and of many other things of which the knowledge is very valuable. Matteo, the brother of Giovanni Villani, continued the chronicle up to 1363. It was again continued by Filippo Villani. Gino Capponi, author of the *Commentari dell' acquisto di Pisa* and of the narration of the *Tumulto dei ciompi*, belonged to both the 14th and the 15th centuries.

Neither Petrarch nor Dante could be classified among the pure ascetics of their time. But many other writers come under this head. St. Catherine of Siena's mysticism was political. She was a really extraordinary woman, who aspired to bring back the Church of Rome to evangelical virtue, and who has left a collection of letters written in a high and lofty tone to all kinds of people, including popes. She joins hands on the one side with Jacopone of Todi, on the other with Savonarola. Hers is the strongest, clearest, most exalted religious utterance that made itself heard in Italy in the 14th century.

Another Sienese, Giovanni Colombini, founder of the order of Jesuati, preached poverty by precept and example, going back to the religious idea of St. Francis of Assisi. His letters are among the most remarkable in the category of ascetic works in the 14th century. Passavanti, in his *Specchio della vera penitenza*, attached instruction to narrative. Cavalca translated from the Latin the *Vite dei santi padri*.

Poetry in the 14th Century.—In direct antithesis to this is a kind of literature which has a strong popular element. Humorous poetry, the poetry of laughter and jest, which as we saw was largely developed in the 13th century, was carried on in the 14th by Bindo Bonichi, Arrigo di Castruccio, Cecco Nuccoli, Andrea Orgagna, Filippo de' Bardi, Adriano de' Rossi, Antonio Pucci and other lesser writers. Antonio Pucci was superior to all of them for the variety of his production. He put into *terza rima* the chronicle of Giovanni Villani (*Centiloquio*), and wrote many historical poems called *Serventesi*, many comic poems, and not a few epico-popular compositions on various subjects. A little poem of his in seven cantos treats of the war between the Florentines and the Pisans from 1362 to 1365.

Many poets of the 14th century have left us political works. Of these Fazio degli Uberti, the author of *Dittamondo*, who wrote a *serventese* to the lords and people of Italy, a poem on Rome, a fierce invective against Charles IV. of Luxemburg, deserves notice, and Francesco di Vannozzo, Frate Stoppa and Matteo Frescobaldi. From this period also dates that literary phenomenon known under the name of Petrarchism. The Petrarchists, or those who sang of love, imitating Petrarch's manner, were found already in the 14th century. But others treated the same subject with more originality, in a manner that might be called semi-popular. Such were the *ballate* of Ser Giovanni Fiorentino, of Franco Sacchetti, of Niccolò Soldanieri, of Guido and Bindo Donati.

There cannot have been an entire absence of dramatic literature in Italy in the 14th century, but traces of it are scarce, although we find them again in great abundance in the 15th century. The 14th century had, however, one drama unique of its kind, the *Ecerinis* written by Albertino Mussato of Padua in 1315. Mussato, a political man and the historian of Henry VII., aimed at strengthening the antagonism against Cangrande della Scala by describing the evils of the tyrannical government of Ezzelino da Romano in a Senecan style.

The revival of learning which Petrarch had fostered as a means to a philosophical, moral and political revolution so fascinated many of his admirers that it became for them an end in itself. Petrarch had affected to look upon his works in Italian as trifles; he called them *nugellae vulgares*; the scholars who took over the literary leadership after him, Coluccio Salutati and partly Luigi Marsili, still admired Dante, Petrarch and Boccaccio's Italian works, but always wrote in Latin themselves, and for many decades Latin triumphantly rivalled Italian.

THE RENAISSANCE

In the 15th century a number of men arose, all learned, laborious, indefatigable, and all intent on one great work. Such were Niccolò Niccoli, Giannozzo Manetti, Palla Strozzi, Leonardo Bruni (L. Aretino), Francesco Filelfo, Poggio Bracciolini, Lorenzo Valla. Manetti spent his time in translating from Greek, studying Hebrew, and commenting on Aristotle. Palla Strozzi sent into Greece at his own expense to search for ancient books, and had Plutarch and Plato brought for him. Poggio Bracciolini went to the Council of Constance, and found in a monastery in the dust-hole Cicero's *Orations*. He copied Quintilian with his own hand, discovered Lucretius, Plautus, Pliny and many other Latin authors. Guarino went through the East in search of codices. Giovanni Aurispa returned to Venice with many hundreds of manuscripts. What was the passion that excited all these men? What did they search after? These Italians were but handing on the solemn tradition which, although partly latent, was the informing principle of Italian mediaeval history, and now at length came out triumphant. This tradition was that same tenacious and sacred memory of Rome, that same worship of its language and institutions, which at one time had retarded the development of Italian literature, and now grafted the old Latin branch of ancient classicism on the flourishing stock of Italian literature. Men came to have a more just idea of nature: the world was no longer cursed or despised as in the middle ages; man was born again; and human reason resumed its rights. Everything, the individual and society, were changed under the influence of new facts.

First of all there was formed a human individuality, which was

wanting in the middle ages. As J. Burckhardt has said, the man was changed into the individual. He began to feel and assert his own personality, which was constantly attaining a fuller realization. As a consequence of this, the idea of fame and the desire for it arose. The mediaeval idea of existence was turned upside down; men who had hitherto turned their thoughts exclusively to heavenly things, and believed exclusively in the divine right, now began to think of beautifying their earthly existence, of making it happy and gay, and returned to a belief in their human rights. This was a great advance, but one which carried with it the seeds of many dangers. The conception of morality became gradually weaker. The "fay ce que vouldras" of Rabelais became the first principle of life. Religious feeling was blunted. Besides this, a great literary danger was hanging over Italy. Humanism threatened to submerge her youthful national literature. There were authors who labored hard to give Latin forms to Italian. Provincial dialects tried to reassert themselves in literature. The great authors of the 14th century were by many people of the cultured class forgotten or despised.

It was Florence that saved literature by reconciling the classical models to modern feeling. At Florence celebrated humanists wrote also in the vulgar tongue, and commented on Dante and Petrarch, and defended them from their enemies. Leon Battista Alberti, the learned Greek and Latin scholar, wrote in the vernacular, and Vespasiano da Bisticci, whilst he was constantly absorbed in Greek and Latin manuscripts, wrote the *Vite di uomini illustri*, rivalling the best works of the 14th century in their candour and simplicity. Andrea da Barberino wrote the beautiful prose of the *Reali di Francia*. Belcari and Benivieni carry us back to the mystic idealism of earlier times.

Lorenzo de' Medici.—But it is in Lorenzo de' Medici that the influence of Florence on the Renaissance is particularly seen. His mind was formed by the ancients: he attended the class of the Greek Argyropoulos, sat at Platonic banquets, took pains to collect codices, sculptures, vases, pictures, gems and drawings to ornament the gardens of San Marco and to form the library afterwards called by his name. In the saloons of his Florentine palace, in his villas at Careggi, Fiesole and Ambra, stood the wonderful chests painted by Dello with stories from Ovid, the Hercules of Pollajuolo, the Pallas of Botticelli, the works of Filippino and Verrocchio. And yet if we read Lorenzo's poems we only see the man of his time, the admirer of Dante and of the old Tuscan poets, who takes inspiration from the popular muse, and who endeavours to give to his poetry the colours of the most pronounced realism as well as of the loftiest idealism, who passes from the Platonic sonnet to the impassioned triplets of the *Amori di Venere*, from the grandiosity of the *Selve to Nencia* and to *Beoni*, from the *Canto carnascialesco* to the *Lauda*.

Next to Lorenzo comes Politian (Angelo Ambrogini), who also united, and with greater art, the ancient and the modern, the popular and classical styles. In his *Rispetti* and in his *Ballate* the freshness of imagery and the plasticity of form are inimitable. He, a great Greek scholar, a forerunner of scientific methods in textual criticism, wrote Italian verses with polished simplicity and refinement; the purest elegance of the Greek sources pervaded his art in all its varieties, in the *Orfeo* as well as the *Stanze per la giostra*.

As a consequence of the intellectual movement towards the Renaissance, there arose in Italy in the 15th century three academies, those of Florence, of Naples and of Rome. The Florentine academy was founded by Cosimo I. de' Medici. Having heard the praises of Platonic philosophy sung by Gemistus Pletho, who in 1439 was at the council of Florence, he took such a liking for those opinions that he soon made a plan for a literary congress which was especially to discuss them. Marsilio Ficino has described the occupations and the entertainments of these academicians. Here, he said, the young men learnt, by way of pastime, precepts of conduct and the practice of eloquence; here grown-up men studied the government of the republic and the family; here the aged consoled themselves with the belief in a future world. Among the members of the academy were besides the Medicis such men as Pico della Mirandola, Politian, L. B. Alberti. The Roman academy

was founded by Giulio Pomponio Leto, with the object of promoting the discovery and the investigation of ancient monuments and books. It was a sort of religion of classicism, mixed with learning and philosophy. Platina, the celebrated author of the lives of the first hundred popes, belonged to it. At Naples, the academy known as the Pontaniana was instituted. The founder of it was Antonio Beccadelli, surnamed Il Panormita, and after his death the head was Il Pontano, who gave his name to it, and whose mind animated it.

Romantic Poetry.—Italy never had any true epic poetry in its period of literary birth. Still less could it have any in the Renaissance. It had, however, many poems, called *Cantari* because they contained stories that were sung to the people dealing with the heroes of Charlemagne and King Arthur. But the first to introduce elegance and a new life into this style was Luigi Pulci, who grew up in the house of the Medici, and who wrote the *Morgante Maggiore* at the request of Lucrezia Tornabuoni, mother of Lorenzo the Magnificent. The material of the *Morgante* is almost completely taken from an obscure chivalrous poem of the 15th century later discovered by Prof. Pio Rajna. On this foundation Pulci erected a structure of his own, often turning the subject into ridicule, burlesquing the characters, introducing many digressions, now capricious, now scientific, now theological. With a more serious intention Matteo Maria Boiardo, count of Scandiano, wrote his *Orlando innamorato*, in which he seems to have aspired to embrace the whole range of Carolingian legends; but he did not complete his task. We find here too a large vein of humour and burlesque. Still the Ferrarese poet is drawn to the world of romance by a profound sympathy for chivalrous manners and feelings—that is to say, for love, courtesy, valour and generosity. A third romantic poem of the 15th century was the *Mambriano* by Francesco Bello (Cieco of Ferrara). He showed the influence of Boiardo, especially in something of the fantastic which he introduced into his work.

As the work of Boiardo originated from the popular *cantari*, the *Sacra Rappresentazione* developed from the mediaeval *Mistero* ("mystery-play"). Although it belonged to popular poetry, some of its authors were celebrated men of letters. It is enough to notice Lorenzo de' Medici, who wrote *San Giovanni e Paolo*, and Feo Belcari, author of the *San Panunzio*, the *Abramo ed Isac*, etc. From the 15th century, some comic and profane elements found their way into the *Sacra Rappresentazione*. From its biblical and legendary conventionalism Politian emancipated himself in his *Orfeo*, which, although in its exterior form belonging to the sacred representations, yet substantially detaches itself from them in its contents and in the artistic element introduced.

The eclogues of Virgil, Nemesianus and others had enjoyed great favour during the middle ages particularly during the so-called Carolingian Renaissance. Dante imitated Virgil when composing his eclogues to Giovanni del Virgilio, Mussato followed in his steps, so did Petrarch and Boccaccio, who also wrote a pastoral novel, the *Ameto*. This artificial conception of a pastoral world, so far removed from rural and real life, pleased the Italians no less than it had pleased other Romance peoples. Winsome and gentle shepherdesses appear in the poems of Cavalcanti, Sacchetti and many other poets in Tuscan and other dialects down to Lorenzo de' Medici who also attempted a more definitely rural form with his *Nencia da Barberino* which was imitated by Luigi Pulci (*Beca da Dicomano*). Boiardo composed eclogues in Italian, but it was left to Jacopo Sannazaro, the author of some piscatory eclogues in Latin, finally to fix the characteristics of pastoral poetry in his immensely popular *Arcadia* (1504). It is a partly allegorical story of prose mingled with verse, forming in all sections a mosaic of classical reminiscences and ever tinged with a melancholy charm. With Sannazaro the realm of shepherds and nymphs finally became something akin to the Golden Age, a dream-world whither men would fly seeking refuge from the dismal realities of an age in which the collapse of political independence, wars and violence caused more suffering than men of letters cared to describe realistically.

Lorenzo in his livelier mood had favoured masquerades and festivals for which he and his friends had composed poems such

as the *trionfi* and the *canti carnascialeschi*. The moral laxity and the heathen ideals that such poems expressed, the Dominican, Girolamo Savonarola of Ferrara, set himself to reform from the first day of his arrival in Florence (1489). He directed his attack against Lorenzo, the promoter of classical studies, the patron of pagan literature, rather than against the political tyrant. Animated by mystic zeal, he took the line of a prophet, preaching against the reading of voluptuous works, against the tyranny of the Medici, and calling for popular government. His attempt to put himself in opposition to his time, to arrest the course of events, to bring the people back to the faith of the past, the belief that all the social evils came from a Medici and a Borgia, his not seeing the historical reality as it was, his aspiring to found a republic with Jesus Christ for its king—all these things show that Savonarola was more of a fanatic than a thinker. Nor has he any great merit as a writer. He wrote Italian sermons, hymns (*laudi*), ascetic and political treatises, but they are roughly executed, and only important as throwing light on the history of his ideas. The religious poems of Girolamo Benivieni are better than his, and are drawn from the same inspirations. In these lyrics, sometimes sweet, always warm with religious feeling, Benivieni and with him Feo Belcari carry us back to the literature of the 14th century.

HISTORY IN THE RENAISSANCE

The Italian historians of the 15th century mostly wrote in Latin and were often readier to consider "eloquence" of style and the interests of their patrons than truthfulness; notable exceptions were Lorenzo Bruni, who made good use of the documents to which he had access in his history of Florence, and Lorenzo Valla of Forlì, who gave evidence of his pugnacious temperament in some historical tracts, among which that one disproving the legend about the donation of Constantine is the most famous. Pontano wrote the history of Naples in elegant Latin, B. Corio that of Milan in far less admirable Italian.

Leonardo da Vinci wrote a treatise on painting, Leon Battista Alberti one on sculpture and architecture. But the names of these two men are important, not so much as authors of these treatises, but as being embodiments of a characteristic of the age of the Renaissance—versatility of genius, power of application along many and varied lines, and of being excellent in all.

The fundamental characteristic of the later Renaissance is that it perfected itself in every kind of art, in particular uniting the essentially Italian character of its language with classicism of style. This period lasted from about 1494 to about 1560.

Niccolò Machiavelli and Francesco Guicciardini were the chief originators of the science of history. Machiavelli's principal works are the *Istorie fiorentine*, the *Discorsi sulla prima deca di Tito Livio*, the *Arte della guerra* and the *Principe*. The peculiarity of Machiavelli's genius lay in his artistic feeling for the treatment and discussion of politics in and for themselves, without regard to an immediate end—in his power of abstracting himself from the partial appearances of the transitory present, in order more thoroughly to possess himself of the eternal and inborn kingdom, and to bring it into subjection to himself. He was the creator of the experimental science of politics.

Next to Machiavelli both as an historian and a statesman comes Francesco Guicciardini. Guicciardini was very observant, and endeavoured to reduce his observations to a science. His *Storia d'Italia*, which extends from the death of Lorenzo de' Medici to 1534, is full of political wisdom, is skilfully arranged in its parts, gives a lively if rather cynical picture of the character of the persons it treats of, and is written in a grand style. He shows a profound knowledge of the human heart, and depicts with truth the temperaments, the capabilities and the habits of the different European nations.

Other historians were Jacopo Nardi, Benedetto Varchi, Giambattista Adriani, Bernardo Segni; and, outside Tuscany, Camillo Porzio, who related the *Congiura de' baroni* and the history of Italy from 1547 to 1552, Angelo di Costanzo, Pietro Bembo, Paolo Paruta and others.

Ariosto (1474-1533).—It was Boiardo's success that encouraged Ariosto to write his *Orlando furioso*. The world of chivalry

interested him mainly as a canvas on which to embroider his beautiful patterns. Under the influence of classicism he rendered the structure of his poem more compact and harmonious, and if his characters lack some of the vigour with which Boiardo had endowed them, they are given a perfection of poise and of artistic delineation such as only a master craftsman could create. He worked for many years with unflagging enthusiasm at the revision of his poem, being fully aware that no poet could ever treat the octave stanza with the same easy grace and dazzling perfection.

Meanwhile there was an attempt at the historical epic. Gian Giorgio Trissino of Vicenza composed a poem called *Italia liberata dai Goti*, in which he forced himself to observe all the rules of Aristotle; Trissino's work is poor in invention and without any poetical colouring.

Originality was entirely wanting in lyrical poetry, since it seemed as if nothing better could be done than copy Petrarch. Still, even in this style there were some vigorous poets. Monsignore Giovanni Guidiccioni of Lucca (1500-41) showed that he had a generous heart. Giovanni della Casa (1503-56) and Pietro Bembo (1470-1547), were technically refined. Even Michelangelo Buonarroti was at times a Petrarchist, but his poems bear the stamp of his original genius. And a good many ladies are to be mentioned with these poets, such as Vittoria Colonna (Michelangelo's friend), Veronica Gamba, Gaspara Stampa and Giulia Gonzaga, who could hold their own with some of the men.

The first to occupy the tragic stage during the 16th century was Trissino with his *Sofonisba*, following the "rules" of the art most scrupulously. The *Oreste* and the *Rosmunda* of Giovanni Rucellai were no better, nor Luigi Alamanni's *Antigone*. Sperone Speroni in his *Canace* and Giraldo Cintio in his *Orbecche* tried to ensure success by barren innovations of technique. Superior to these was the *Torrismondo* of Torquato Tasso.

The Italian comedy of the 16th century was almost entirely modelled on the Latin comedy. There appear to be only two writers who should be distinguished among the many who wrote comedies—Machiavelli and Ariosto. In his *Mandragora* Machiavelli, unlike all the others, composed a comedy of character, creating types which seem living even now. Ariosto was far less original. The notorious Pietro Aretino might also be included in the list of the best writers of comedy.

The 15th century was not without humorous poetry; Antonio Cammelli, surnamed Pistoia, is specially deserving of notice. But it was Francesco Berni who carried this kind of literature to perfection in the 16th century. From him the style has been called "bernesque" poetry. It was art for art's sake that inspired and moved Berni to write, as well as Anton Francesco Grazzini, called Il Lasca, and other lesser writers. Bernesque poetry is the clearest reflection of that religious and moral scepticism which was one of the characteristics of Italian social life in the 16th century, and which showed itself more or less in all the works of that period. The Berneschi, and especially Berni himself, sometimes assumed a satirical tone. But theirs could not be called true satire. Pure satirists, on the other hand, were Antonio Vinciguerra, a Venetian, and Lodovico Alamanni. Ariosto's *Satire* read as chapters of a humorous autobiography.

In the 16th century there were not a few didactic works; such are the *Api* of Giovanni Rucellai and Baldassare Castiglione's *Cortegiano*, in which the author imagines a discussion in the palace of the dukes of Urbino between knights and ladies as to what are the gifts required in a perfect courtier. This book is valuable as an illustration of the intellectual and moral state of the highest Italian society in the first half of the 16th century.

Of the novelists of the 16th century, the two most important were Anton Francesco Grazzini and Matteo Bandello—the former as playful and bizarre as the latter is ponderous and solemn. During the 16th century much attention was paid to translating Latin and Greek authors. Among the very numerous translations of the time those of the *Aeneid* and of the *Pastorals* of Longus the Sophist by Annibal Caro are still famous; as are also the translations of Ovid's *Metamorphoses* by Giovanni Andrea dell' Anguillara, of Apuleius's *Golden Ass* by Firenzuola, and of Plutarch's *Lives* and *Moralia* by Marcello Adriani.

Tasso (1544-1595).—In the middle of the 16th century two events exercised a considerable influence upon Italian thought and consequently upon literature and art:—the Council of Trent and the rediscovery of Aristotle's *Poetics*. The Council of Trent having failed to find a compromise with the northern Reformers set itself to restore discipline within the ranks of the Roman Church by a strict enforcement of authority. It was then realized that the assimilation of classical ideas, symbolized by such popes as Nicholas V., Pius II. and Leo X., had imperilled the very existence of the church by its consequent laxity of morals. The Jesuit Order and the Index of forbidden books were the more conspicuous organs by which a deadening discipline was brought to bear on the men of the later Renaissance. At the same time the *Poetics* were re-discovered and commented on, and the principle of authority which prevailed in politics and religion was thus introduced in literature as well: only such literary forms were considered legitimate, as could be supposed to have Aristotle's support. Tasso, who was perpetually obsessed by religious scruples and critical uncertainties, well symbolizes that period. He was only 18 years old when, in 1562, he tried to reconcile the Aristotelian rules with the variety of Ariosto in his *Rinaldo*. He afterwards wrote the *Aminta*, a pastoral drama of exquisite grace. But the work to which he had long turned his thoughts was an heroic poem, and that absorbed all his powers. He himself explains what his intention was in the three *Discorsi* written whilst he was composing the *Gerusalemme*: he would choose a great and wonderful subject, not so ancient as to have lost all interest, nor so recent as to prevent the poet from embellishing it with invented circumstances; he meant to treat it rigorously according to the rules of the unity of action observed in Greek and Latin poems, but with a far greater variety and splendour of episodes, so that in this point it should not fall short of the romantic poem; and finally, he would write it in a lofty and ornate style. This is what Tasso has done in the *Gerusalemme liberata*, the subject of which is the liberation of the sepulchre of Jesus Christ in the 11th century by Godfrey of Bouillon. Tasso possessed an unparalleled gift for melodious verse; power he lacked, and occasionally, in order to bring in the element of surprise so persistently advocated by the commentators of the *Poetics*, he had recourse to tiresome antitheses and exaggerated metaphors.

THE SECENTISMO

Spanish oppression and the tyranny of the Counter-Reformation seem to have exhausted Italian creative power which was already worn out by the great output of the Renaissance. From about 1559 began a period of decadence in Italian literature. The suspicious rulers fettered all freedom of thought and word; they tortured Campanella, burned Bruno, made every effort to extinguish all freedom of thought. This period is known in the history of Italian literature as the Secentismo. Its writers, devoid of sentiment, resorted to exaggeration; the utter poverty of the matter tried to cloak itself under exuberance of forms.

Marini.—At the head of the school of the "Secentisti" comes Giovan Battista Marini of Naples, born in 1569, especially known by a poem called *L'Adone*. His aim was to excite wonder by novelties; hence the most extravagant metaphors, the most forced antitheses, the most far-fetched conceits, are to be found in his book. Achillini of Bologna followed in Marini's steps. In general, we may say that all the poets of the 17th century were more or less infected with "Marinism." Thus Alessandro Guidi, although he does not attain to the exaggeration of his master, is empty bombastic, inflated, turgid, while Fulvio Testi is artificial and affected. Yet Guidi as well as Testi felt the influence of another poet, Gabriello Chiabrera, born at Savona in 1552. In him the Secentismo took another character. Enamoured as he said he was of the Greeks, he made new metres, especially in imitation of Pindar, treating of religious, moral, historical and amatory subjects. Chiabrera, though elegant in form, proves empty of matter, and, in his vain attempt to dissemble this vacuity, has recourse to poetical ornaments of every kind.

Filicaja, the Florentine, has a certain lyric *élan*, particularly in the songs about Vienna besieged by the Turks; but even in him we

see clearly the rhetorical artifice and the falseness of the conceits. In consequence of all this Italian literature fell into disrepute in other countries and was severely criticised in Italy herself.

The Arcadia.—The belief then arose that it would be sufficient to change the form in order to restore literature. Weary of the bombastic style men said—let us follow an entirely different line, let us fight the turgid style with simplicity. In 1690 the "Academy of Arcadia" was instituted. Its founders were Giovan Maria Crescimbeni and Gian Vincenzo Gravina. The Arcadia was so called because its chief aim and intention were to imitate in literature the simplicity of the ancient shepherds, who were fabulously supposed to have lived in Arcadia in the golden age. This was obviously nothing else than the substitution of a new artifice for the old one; and they fell from bombast into effeminacy, from the turgid into the over-refined. The poems of the "Arcadians" fill many volumes, and are made up of sonnets, madrigals, canzonets and blank verse. The one who most distinguished himself among the sonneteers was Felice Zappi. Among the authors of songs Paolo Rolli was illustrious. Innocenzo Frugoni was more famous than all the others.

Scientific Prose and Satire.—Neither "secentismo" nor Arcadianism pervaded the whole field of thought. There were some strong and independent thinkers, such as Bernardino Telesio, Giordano Bruno, Tommaso Campanella, Lucilio Vanini, who turned philosophical inquiry into fresh channels, and opened the way for the scientific conquests of Galileo Galilei. Galileo was not only a great man of science, but also occupied a conspicuous place in the history of letters. His prose is in perfect antithesis to the poetry of his time; it is clear, goes straight to the point, is without rhetorical ornaments and without vulgar slips, artistic without appearing to be so.

Another symptom of revival, a sign of rebellion against the prevailing conditions, is given us in satire and in particular in that of Salvator Rosa and Alessandro Tassoni. Salvator Rosa, born in 1615, near Naples, was a painter, a musician and a poet. His exhortation to Italian poets to turn their thoughts to the miseries of their country as a subject for their song and certain passages where he deprecates the effeminacy of Italian habits, make Salvator Rosa a forerunner of the 18th century. Tassoni was superior to Rosa. He showed independent judgment, and his *Secchia Rapita* proved that he was an eminent writer. This is a mock-heroic poem, which is at the same time an epic and a personal satire. He was bold enough to attack the Spaniards in his *Filippiche*, in which he urged his patron, Carlo Emanuele of Savoy, to persist in the war against them. The work of Traiano Boccalini was also of great significance.

THE 18TH CENTURY

Having for the most part freed itself from the Spanish dominion in the 18th century, the political condition of Italy began to improve. Promoters of this improvement, which was shown in many civil reforms, were Joseph II., Leopold I. and Charles I.

Giambattista Vico was a token of the awakening of historical consciousness in Italy. In his *Scienza nuova* he applied himself to the investigation of the laws governing the progress of the human race, and according to which events are developed. From the psychological study of man he endeavoured to infer the "comune natura delle nazioni," i.e., the universal laws of history, or the laws by which civilizations rise, flourish and fall.

From the same scientific spirit which animated the philosophical investigation of Vico, there was born a different kind of investigation, that of the sources of Italian civil and literary history. Lodovico Antonio Muratori, after having collected in one entire body (*Rerum Italicarum scriptores*) the chronicles, the biographies, the letters and the diaries of Italian history from 500 to 1500, after having discussed the most obscure historical questions in the *Antiquitates Italicae mediæ ævi*, wrote the *Annali d'Italia*, minutely narrating facts derived from authentic sources. Muratori's associates in his historical researches were Scipione Maffei of Verona and Apostolo Zeno of Venice. In his *Verona illustrata* the former left, not only a treasure of learning, but an excellent specimen of historical monograph. The latter added much to the

erudition of literary history, both in his *Dissertazioni Vossiane* and in his notes to the *Biblioteca dell' eloquenza italiana* of Monsignore Giusto Fontanini. Girolamo Tiraboschi and Count Giovanni Maria Mazzuchelli of Brescia devoted themselves to literary history. Literary criticism also attracted great attention; Muratori, Vico, Gravina, Maffei and several others, while advocating the imitation of the classics as a cure of literary decadence, well realized that such imitation must needs be cautious, and thus forecast critical standpoints that were later to come into favour during the age of Romanticism.

The new spirit of the times also led men to inquire into the mechanism of economical and social laws. Francesco Galiani wrote on currency; Gaetano Filangieri wrote a *Scienza della legislazione*. Cesare Beccaria, in his treatise *Dei delitti e delle pene*, made a contribution to the reform of the penal system and promoted the abolition of torture.

Parini.—Giuseppe Parini, born in a Lombard village in 1729 and educated at Milan, seems to embody the literary revival of the 18th century. In a collection of poems that he published at 23 years of age, under the Arcadian name of Ripano Eupilino, there are some pastoral sonnets not devoid of realistic touches, and also some satirical pieces in which he exhibits a spirit of somewhat rude opposition to his own times. This, however, was only the beginning of the battle. In Parini's days the nobles and the rich consumed their lives in ridiculous trifles or in shameless self-indulgence, wasting themselves on immoral "Cicisbeismo." It was against this social condition that Parini's muse was directed. In the *Odi* the satirical note is already heard. But it came out more strongly in the poem *Il giorno*, in which he imagines himself to be teaching a young Milanese patrician all the habits and ways of gallant life; he shows up all its ridiculous frivolities, and with delicate irony unmasks the futilities of aristocratic habits. Dividing the day into four parts, the *Mattino*, the *Mezzogiorno*, the *Vespere*, the *Notte*, by means of each of these he describes the trifles of which they were made up, and the book thus assumes a social and historical value of the highest importance. As a work of art, the *Giorno* is notable for the skill with which that delicate irony is constantly kept up by which he seems to praise what he effectually blames. The verse has new harmonies; sometimes it is a little hard and broken, not by accident, but as a protest against the Arcadian monotony.

Gasparo Gozzi's satire was less elevated, but directed towards the same end as Parini's. In his *Osservatore*, something like Addison's *Spectator*, in his *Gazzetta veneta*, in the *Mondo morale*, by means of allegories and novelets he hit the vices with a delicate touch, and inculcated a practical moral with much good sense. Gozzi's prose is very graceful and lively. Another satirical writer of the first half of the 18th century was Giuseppe Baretti of Turin. In a journal called the *Frusta letteraria* he took to lashing without mercy the works which were then being published in Italy. He had learnt much by travelling; and especially his long stay in England and the friendship of Dr. Johnson had contributed to give independence to his criticism.

Also the drama felt the influence of the times. Apostolo Zeno and Metastasio (the Arcadian name for Pietro Trapassi, a native of Rome) had endeavoured to make "melodrama and reason compatible." The latter in particular succeeded in giving fresh expression to the affections, a natural turn to the dialogue and some interest to the plot. Comedy was reformed by Carlo Goldoni, a Venetian, who created the comedy of character. No doubt Molière's example helped him in this. Goldoni's characters are always true, but often a little superficial. He studied nature, but he did not plunge into psychological depths. In most of his creations, the external rather than the internal part is depicted. Goldoni wrote much (more than 150 comedies), and had no time to correct, to polish, to perfect his works, which are all rough cast. A good many of his comedies were written in Venetian dialect, and these are perhaps the best.

Return to Classicism.—The ideas that were making their way into French society in the 18th century, and afterwards brought about the Revolution of 1789, gave a special direction to Italian literature of the second half of the 18th century. Love of ideal

liberty, desire for equality, hatred of tyranny, created in Italy a literature which aimed at national objects, seeking to improve the condition of the country by freeing it from the double yoke of political and religious despotism. But all this was associated with another tendency. The Italians who aspired to a political redemption believed that it was inseparable from an intellectual revival, and it seemed to them that this could only be effected by a reunion with ancient classicism—in other words, by putting themselves in more direct communication with ancient Greek and Latin writers.

Patriotism and classicism then were the two principles that inspired the literature which began with Alfieri (1749–1803). He worshipped the Greek and Roman idea of popular liberty in arms against the tyrant. He took the subjects of his tragedies almost invariably from the history of these nations, made continual apostrophes against the despots, made his ancient characters talk like revolutionists of his time; he did not trouble himself with, nor think about, the truth of the characters; it was enough for him that his hero was Roman in name, that there was a tyrant to be killed, that liberty should triumph in the end. But even this did not satisfy Alfieri. Before his time and all about him there was the Arcadian school. It was necessary to arm the patriotic muse also against this. If the Arcadians, not excluding Metastasio, diluted their poetry with languishing tenderness, if they poured themselves out in so many words, it behoved the others to do just the contrary—to be brief, concise, strong, bitter, to aim at the sublime as opposed to the lowly and pastoral. The stern example set by Parini and Alfieri's grand manner exercised a potent influence.

Ugo Foscolo was an eager patriot, who carried into life the heat of the most unbridled passion, and into his art an occasionally rhetorical manner, but always one inspired by classical models. The *Lettere di Jacopo Ortis* is a love story containing a violent protest against the treaty of Campoformio. Foscolo's passions were sudden and violent; they came to an end as abruptly as they began. To one of these passions *Ortis* owed its origin. The style is somewhat strained owing to an excessive sentimental tension. It is truly eloquent, on the contrary, in the lectures *Dell' origine e dell' ufficio della letteratura*, in which Foscolo for the first time gave evidence of his profound critical insight, and in which he may be said to have pointed the way to modern Italian criticism. His poem *I sepolcri* had a great and well deserved success. In less than 300 lines Foscolo succeeded in giving lyrical expression to a fundamental trait of Italian history which he probably learned indirectly from Vico, for the Italians have ever sought inspiration in their past, and in this poem past glories are extolled as incentives to, and good omens of, a great future. Among his prose works a high place belongs to his translation of the *Sentimental Journey* of Sterne, a writer by whom one can easily understand how Foscolo should have been deeply affected. He went as an exile to England, and died there. He wrote for English readers some *Essays* on Petrarch and on the texts of the *Decamerone* and of Dante, which are truly remarkable pieces of constructive criticism.

If in Foscolo patriotism and classicism were united, and formed almost one passion, as much cannot be said of Vincenzo Monti, in whom the artist was absolutely predominant. Yet Monti was a patriot too, but in his own way. He had no one deep feeling that ruled him, or rather the mobility of his feelings is his characteristic; but each of these was a new form of patriotism, that took the place of an old one. He saw danger to his country in the French Revolution, and wrote the *Pellegrino apostolico*, the *Bassvilliana* and the *Feroniade*; Napoleon's victories caused him to write the *Prometeo* and the *Musagonia*; in his *Fanatismo* and his *Superstizione* he attacked the papacy; afterwards he sang the praises of the Austrians. Thus every great event made him change his mind, with a readiness which was due to his absorption in art and literature. It would be unjust to accuse Monti of baseness. If we say that nature in giving him only one faculty had made the poet rich and the man poor, we shall speak the truth. Knowing little Greek, he succeeded in making a translation of the *Iliad* which is remarkable for its Homeric feeling.

Monti was born in 1754, Foscolo in 1778. Four years later still was born another poet of the same school, Giambattista Niccolini. In literature he was a classicist and in politics a staunch supporter of the monarchical idea. In his tragedies he set himself free from the excessive rigidity of Alfieri, and partly approached the English and German tragic authors. He nearly always chose political subjects, striving to keep alive the love of liberty in his compatriots. Such are *Nabucco*, *Antonio Foscari*, *Giovanni da Procida*, *Lodovico il Moro*, etc. He assailed papal Rome in *Arnaldo da Brescia*, a long tragic piece, not suited for acting, and lyric rather than dramatic.

The prevailing political preoccupations were not without effect on historical studies; one passed from the purely documentary researches of the previous century to the interpretation of past ages from a modern angle. One of the most interesting historians of the earlier part of the 19th century was the Neapolitan, Carlo Troya, who investigated the events of mediaeval Italy with a view to encouraging his contemporaries by the account of the deeds of their forefathers. His *Storia d'Italia nel medio evo* (1839) expressed a new conception of life. The Piedmontese, Carlo Botta, also was prompted to write history by political considerations, but his work was notable for rhetorical eloquence of exposition, not, like Troya's, for penetration and originality. Botta wrote a *History of Italy from 1789 to 1814*; later on he continued Guicciardini's *History* up to 1789, and wrote *Guerra dell'indipendenza americana*.

Close to Botta comes Pietro Colletta, a Neapolitan, born nine years after him. He also in his *Storia del reame di Napoli dal 1734 al 1825* had the idea of defending the independence and liberty of Italy in a style borrowed from Tacitus. He has a rapid, brief, nervous style, which makes his book attractive reading.

The Purists.—It need not strike one as strange that precisely when so great a political agitation prevailed the question of the Italian language should be heatedly discussed, for it had raged during the 16th century already, when Bembo, Machiavelli and Castiglione, among others, had discussed it, and it was to be finally settled a little later by Manzoni and his friends. For the time being it took the form of a pedantic classicism in the choice of words and expressions as a reaction against the excessive Gallicism which had been favoured in theory and in practice by some of the 18th century innovators, such as Verri and Beccaria. "Purismo," as this tendency was called, appeared to its supporters to be a manner of patriotism. Among them may be mentioned Antonio Cesari of Verona, who republished ancient authors, and brought out a new edition, with additions, of the *Vocabolario della Crusca*. He wrote a dissertation *Sopra lo stato presente della lingua italiana*, and endeavoured to establish the supremacy of Tuscan and of the three great writers Dante, Petrarch, Boccaccio. But patriotism in Italy has always had something municipal in it; so to this Tuscan supremacy there was opposed a Lombard school, which would not admit the supremacy of Tuscan. At the head of the Lombard school were Monti and his son-in-law Count Giulio Perticari. This gave Monti an occasion to write *Proposta di alcune correzioni ed aggiunte al vocabolario della Crusca*, in which he attacked the Tuscanism of the *Crusca*. The dispute about language took its place beside literary and political disputes, and all Italy took part in it—Basilio Puoti at Naples, Paolo Costa in the Romagna, Marc' Antonio Parenti at Modena, Salvatore Betti at Rome, Giovanni Gherardini in Lombardy, Luigi Fornaciari at Lucca, Vincenzo Nannucci at Florence.

A patriot, a classicist and a purist all at once was Pietro Giordani, born in 1774; he was almost a compendium of the literary movement of the time. His works were few and comparatively unimportant but his position among his contemporaries was such as to single him out as the last great exponent of "Purism."

THE 19TH CENTURY

The French domination in Italy had a twofold effect—it caused people to realize that the ancient and often purely sentimental aspirations towards political unity and independence were within the range of possibilities, for all divisions and little tyrants had been swept away by Napoleon, and it convinced Italians that

no reliance could be placed on foreign help if such an aim was to be attained, for the French themselves, who had entered Italy as liberators, had proved oppressive masters. With the Napoleonic pre-eminence there was associated an artificial form of classicism, so that when Napoleon fell, there were released forces antagonistic to classicism. The 18th century critics had long since denounced some of the exaggerations of the classicists; literary romanticism had won favour in France, and French romanticists, if erroneously, considered their tendencies akin to those of the German romanticists. Between 1816 and 1818 a battle was fought for romanticism particularly at Milan where a romanticist periodical, *Il Conciliatore*, was published. G. Berchet, S. Pellico, L. di Breme, Giovita Scalvini, E. Visconti were among its principal contributors; their polemical efforts were silenced when several of their group were arrested by the Austrian police (1820) on account of their liberal opinions; among the accused was Pellico, who was later to write a famous account of his experiences (*Le mie prigioni*, 1832). It appears from the articles in the *Conciliatore* and from other essays that the new school, though advocating the study of modern works in different languages, a certain independence from classical imitation and the discarding of classical conventions, was on the whole consistent with the Italian tradition, a point that was made even clearer by the works of Manzoni, who was hailed as the chief exponent of this school. Manzoni's ideal was "a true subject, a moral purpose and a pleasing form as a means of attraction." And it is precisely realism in art that characterizes Italian literature from Manzoni onwards. The *Promessi Sposi* is the work that has made him immortal. No doubt the idea of the historical novel came to him from Sir Walter Scott, but he produced something more than an historical novel in the narrow meaning of that word; he created an eminently realistic work of art. The attention is entirely fixed on the powerful objective creation of the characters. From the greatest to the least they have a wonderful verisimilitude; they are living persons standing before us, not with the qualities of one time more than another, but with the human qualities of all time. Manzoni is able to unfold a character in all particulars, to display it in all its aspects, to follow it through its different phases. As a poet too he had gleams of genius, especially in the Napoleonic ode, *Il Cinque Maggio*, and where he describes human affections, as in some stanzas of the *Inni* and in the chorus of the *Adelchi*.

Leopardi (1798-1837).—The great poet of the age was Leopardi, born 13 years after Manzoni at Recanati, of a patrician family, bigoted and avaricious. He became so familiar with Greek authors that he used afterwards to say that the Greek mode of thought was more clear and living to his mind than the Latin or even the Italian. Solitude, sickness, domestic tyranny, prepared him for profound melancholy. From this he passed into complete religious scepticism, from which he sought rest in art. Everything is terrible and grand in his poems, which are the most agonizing cry in modern literature, uttered with a solemn quietness that at once elevates and terrifies us. But besides being the greatest poet of nature and of sorrow, he was also an admirable prose writer. In his *Operette morali*—dialogues and discourses marked by a cold and bitter smile at human destinies which freezes the reader—the clearness of style, the simplicity of language and the depth of conception are such that perhaps he is not only the greatest lyrical poet since Dante, but also one of the most perfect writers of prose that Italian literature has had.

As realism in art gained ground, the positive method in criticism kept pace with it. From the manner of Botta and Colletta history returned to its spirit of learned research, as is shown in such works as the *Archivio storico italiano*, established at Florence by Giampietro Viesseux, the *Storia d'Italia nel medio evo* by Carlo Troya, a remarkable treatise by Manzoni himself, *Sopra alcuni punti della storia longobardica in Italia*, and the very fine history of the *Vespro siciliano* by Michele Amari. But alongside of the great artists Leopardi and Manzoni, alongside of the learned scholars, there was also in the first half of the 19th century a patriotic literature. To a close observer it will appear that historical learning itself was inspired by the love of Italy. Giampietro Viesseux had a distinct political object when in 1820 he estab-

lished the monthly review *Antologia*. And it is equally well known that his *Archivio storico italiano* (1842) was, under a different form, a continuation of the *Antologia*, which was suppressed in 1833 owing to the action of the Russian Government. Florence was in those days the asylum of all the Italian exiles, and these exiles met and shook hands in Vieuzeux's rooms, where there was more literary than political talk, but where one thought and one only animated all minds, the thought of Italy. (A. BA.; C. F.)

THE RISORGIMENTO

Since 1821 the literature of Italy has been mainly concerned with political events. The names of romanticists and classicists survived, but the representatives of either school were actuated by patriotism. Pellico's *Mie Prigioni* and Niccolini's *Arnaldo* have been mentioned; Leopardi and Manzoni themselves had given expression to patriotic sentiments in their poems. Both of them had produced works too masterly to allow of successful imitations. Despite this Manzoni's novel created so deep an impression that several writers of little merit followed in his tracks. The novels of Varese, Rosini, Sacchi and many others are scarcely deserving of record; but there were also written works that cannot so lightly be dismissed. T. Grossi (1790-1853), Manzoni's friend, composed a historical novel, *Marco Visconti*, lacking in vigour of characterization and conventional in its description of the middle ages, which enjoyed, however, a large measure of popularity. Massimo Tapparelli d'Azeglio (1798-1866), a painter and a statesman as well as an author, had a political object in view in writing his *Ettore Fieramosca* on a heroic episode of the Renaissance, and his *Niccolò de' Lapi* on the private life of a Florentine family of the middle classes during the siege of 1530. Though it is overcrowded with incidents, the first of these two novels is full of zest. Later D'Azeglio became a political man and was several times prime minister; during a period of leisure he composed an excellent book of memoirs, *I miei ricordi*. D'Azeglio was a Piedmontese and a monarchist. Yet another author of historical novels, F. D. Guerrazzi (1804-73), was born at Leghorn and was a republican and a follower of Mazzini. With him writing was a means of fighting against oppression; he led the Tuscan revolution of 1848 and in the intervals of political activity he brought out several novels of which the *Assedio di Firenze* is the most notable. His style is frankly rhetorical and his historical accuracy is open to criticism, nevertheless there was such vigour and conviction in his writing as strongly to impress his readers. Garibaldi knew Foscolo's *Sepolcri* by heart and his followers called each other by the names of Guerrazzi's characters. It is among Garibaldians that one finds the last historical novelists. G. C. Abba, the historian of the Thousand, wrote *Sulle rive della Bormida* on an episode of the French domination in Piedmont; and the Friulian Ippolito Nievo, who also was one of the Thousand, wrote besides several volumes of poems and tales, *Le memorie di un ottuagenario*, a cyclic novel that just falls short of being a masterpiece through lack of revision, Nievo having been drowned in 1861 in his 29th year.

The pressure of political events caused many works to be written, most of which were of course of ephemeral value, though not a few are of notable importance. G. Mazzini wrote profusely on art, literature and music; at first he championed romanticism, later he opposed it as laying too great a stress on the individual, but at all periods his style was as vigorous as his convictions were sincere; among his political works may be mentioned *Fede ed avvenire* (1835), *Doveri degli uomini* (1844) and *Ai giovani d'Italia* (1860). Balbo, the historian, should also be recorded here as the author of the essay *Le speranze d'Italia*, but more important was V. Gioberti (1801-52), a Piedmontese priest who left his country and the clergy owing to his love of liberty, a philosopher and a man of wide vision. In 1843 he published his *Primato morale e civile degli Italiani* in which he urged the moral and historical right of the Italians to independence, and the creation of an Italian confederation under the presidency of the pope. This book formed the basis of the political creed of the Italians, other than the followers of Mazzini, who took part in the events of 1848-49. The failure of the revolution caused him to revise his

opinions and to advocate the institution of a monarchy under the house of Savoy in his *Rinnovamento civile d'Italia* (1851).

In view of the object of their works it is not inappropriate to mention some poets among the political writers. The lyrics of Puerio, Mercantini and Mameli, who died at the age of 21 fighting at Rome in 1849, are little better than impromptu poems, but particularly those of Mameli are so sincere and vigorous as to have survived the generation for which they were composed. G. Giusti's (1809-49) poems have greater literary merit. His satires, not unlike Béranger's, were greedily read, but he seldom gave the full measure of his capabilities as in the lyric *Sant' Ambrogio*. Dall' Ongaro, Aleardi and G. Prati were sentimental romanticists and patriots, but there was little beyond melody and sentimentality in their poems. They and the mediocre imitators of Manzoni brought romanticism into disrepute and prepared the way for Carducci's reaction. In other departments of literature there was no outstanding figure. P. Cossa was a successful playwright who composed tragedies on Roman subjects; P. Ferrari of Modena (1822-89) transformed the romantic comedy of Gherardi del Testa into modern drama either illustrating a historical period or stating a social problem.

Carducci (1835-1907).—The great figure of the age was Giosuè Carducci. He lived through the feverish period of 1859-60 and his patriotic enthusiasm was changed to disillusionment by the difficulties in which the new kingdom was involved and the manner in which they were faced by the politicians. He looked to history for inspiration, to the classics as models; and he believed his literary gifts to invest him with a political mission. As poet-seer endowed with a forceful personality, much learning and uncompromising sincerity he exercised a kind of literary dictatorship. His poems dating from 1861 to 1900 and published under various titles are collected in his *Poesie*. He was also a polished writer of prose and a scholarly historian of literature; a constructive critic he was not, and philosophical criticism such as that of De Sanctis was distasteful to him. F. de Sanctis (1818-83), who was exiled by the Bourbons of Naples, considered literature the expression of social and moral conditions, and on the basis of a sound philosophical training on the works of Vico and Hegel he inaugurated aesthetic criticism. His *Saggi critici* and particularly his masterly *Storia della letteratura italiana* were not fully or generally appreciated in his days, but have since received recognition and formed the starting point of the philosophical revival of the later 19th century.

In creative literature his generation turned for inspiration to foreign realism. The forceful style and rugged personality of A. Oriani (d. 1909), a novelist, essayist and historian (*La lotta politica in Italia*), passed almost unnoticed and has only received due attention in recent years. Minor if popular novelists were S. Farina and G. Rovetta; G. Verga's success was not immediate but proved lasting (1840-1922). He was a realist, and his two best novels (*I Malavoglia*; *Mastro don Gesualdo*) describe with great power the dismal conditions prevailing in Sicily during the first part of the century. A friend and a follower of his was L. Capuana, and the much younger F. de Roberto (d. 1927), who wrote a masterly novel (*I Vicerè*), must be considered as belonging to the same group. In order to secure a realistic reproduction of life all these writers kept to local subjects, as if feeling the appeal of regional life, and the same may be said of the Neapolitan Matilde Serao and the Sardinian Grazia Deledda. To some extent it could be said of A. Fogazzaro of Vicenza (1842-1911) although his characters move in a wider circle. He was a deeply religious man and was much influenced by Manzoni and the German romanticists. Among his novels *Daniele Cortis* and particularly *Piccolo mondo antico* are the finest, while *Il Santo* is better known outside Italy owing to the criticism which it called forth from the ecclesiastical authorities. Together with these "regionalist" novelists may be mentioned dialectal playwrights of whom there were many and of great merit. The Venetian Giacinto Gallina and the Neapolitan S. di Giacomo (b. 1860) wrote plays of great emotional power. Di Giacomo is also an inspired poet and with him may be mentioned C. Pascarella, some of whose poems in Roman dialect are extraordinarily incisive.

While Carducci was still active G. Pascoli (1855-1912) acquired a great reputation and succeeded him in the chair at Bologna. His art was impressionistic and fragmentary, and his language occasionally childish and laborious; despite this there are passages of great beauty in some of his poems, particularly in *Myricae*, so that he shared popular favour with G. d'Annunzio (b. 1863). D'Annunzio is so exceptional a writer as to be difficult to classify; as a novelist and tragedian he has echoed in turn Verga, Dostoevsky, Tolstoi and Nietzsche. He attained a large measure of success, but such success as he achieved was due to the glittering wealth of his elaborate style rather than to any intrinsic merit. His genius is essentially lyrical, and it is in some sections of his long poem *Laudes creaturarum* that he has shown himself at his best. Beside men of such stature, lesser men, however deserving of notice, almost pale into insignificance—poets as honest and highminded as G. Giacosa of Turin, novelists as thoughtful as E. de Marchi and E. A. Butti, poets as gifted as A. Graf, G. Marradi and M. Rapisardi.

The political reorganization following upon the establishment of the kingdom offered opportunities to scholars, and, during the second part of the 19th century, under the inspiration of such teachers as A. d'Ancona, A. Bartoli, C. de Leva, P. Villari and other professors, a great amount of scholarly research was carried out and expounded in learned monographs. Facts were ascertained and obscure points were cleared up in political and literary history. The historical method prevailed. It was due to B. Croce (b. 1864), a follower of De Sanctis, that aesthetic criticism won recognition. By his *Estetica* and his many critical essays Croce changed the whole outlook of the younger generation on literary matters. Though his evaluation of individual authors is occasionally at fault, his influence has been most beneficial. Such praise he must share with another philosopher, G. Gentile, whose works on literary criticism are models of penetration. He is an active teacher and has among the young men of the day a larger and more enthusiastic following than Croce. (H. O.; C. F.)

CONTEMPORARY LITERATURE

The works produced during the present century are characterized by a spirit of daring, restlessness and youth; by intellectual curiosity, love of novel experiments and experiences, and above all by self-analysis. Writers aimed at the discovery of new forms of expression to supersede the old; thus, the Futurists were of service to the new literature, if only by reason of their attempt to break down inherited and stereotyped traditions in prose and verse. Prose underwent a remarkable change. It became crisper and at the same time more flexible, while language attained the unity long since advocated by Manzoni.

Fresh interest was awakened in the most varied forms of criticism, in history, culture and philosophy of all times and in all countries. In this eclectic tendency Renato Serra, a young and promising critic who was killed in the War, saw the beginnings of a new form of classicism. Interest in foreign literatures, including those of the East as well as of the West, produced a vast library of translations varying in quality, but on the whole showing a marked tendency towards treating translation as an art.

Fiction.—Although strictly belonging to the preceding generation, Carlo Dossi (1847-1910) did not receive due recognition until after his death. By his harsh and elliptical style and his original and vivid treatment of his subject matter, he opened out new paths to his successors. Of an entirely different character is the work of Alfredo Panzini (b. 1863) one of Carducci's best pupils. Possessing a quiet sense of humour tinged with irony, his attitude towards life is detached but not aloof. In what are generally considered to be his masterpieces *Le Fiabe della Virtù* (1905), *La Lanterna di Diogene* (1909), Panzini is acutely sensitive to all forms of beauty and to the conflict between them and the evils and uglinesses of the world. It is worthy of notice that most of the novelists, dramatists and critics of to-day—men and women—have tried their hand at the short story of the magazine type. Of these A. Albertazzi (b. 1865), Luciano Zuccoli (b. 1870), Virgilio Brocchi (b. 1876), Antonio Beltramelli (b. 1880), Guido da Verona (b. 1881) and Ugo Ojetti (b. 1871) who is also a very

highly esteemed art critic and a polished essayist (*Cose viste*), and among the women writers Clarice Tartufari (b. 1868), Sibilla Aleramo (b. 1879), Neera (1846-1916), Amalia Guglielminetti (b. 1885) and Carola Prosperi (b. 1883) are the most popular.

Recent Developments.—A rebellious and combative group of young men showed their activity, during the first years of the 20th century, mainly by uncompromising attacks on all established reputations. This group is known as "Gruppo della Voce," from the periodical of that name founded by Giovanni Papini and Giuseppe Prezzolini about 1909, itself the offspring of an earlier review—*La Leonardo* (1903-07), which gave a great impulse to philosophical studies. Not all of the contributors were of equal merit, but they showed the presence of a new spirit and vitality much needed, and exerted an influence as far-reaching as it was important and often superior to their individual achievements. Papini (b. 1881), however, is the only one who is at all known outside Italy mainly on account of the much-advertised *Storia di Cristo* (1921), a work which has added little to a reputation really founded upon his autobiography, *Un uomo finito* (1912), *Cento pagine di Poesia* (1915), and the brilliant, provocative, and at times superficial critical essays *Stronature* (1916). Giuseppe Prezzolini also wrote some excellent critical essays, mostly on his contemporaries, but later abandoned literature and philosophy for politics. Of the other principal contributors to *La Voce*, Scipio Slataper (1888-1915), a Triestino killed in the War, is best known for his noteworthy lyrical autobiography in prose, *Il mio Carso* (1912) and a suggestive study on Ibsen published posthumously (1916).

Ardengo Soffici's (b. 1879) best writings are a fragment of a novel, *Lemmonio Boreo* (1912), two autobiographical journals, *Giornale di Bordo* (1915) and *Kobilek* (1918), and the art criticism in *Il caso Medardo Rosso e l'impressionismo* (1909) and *Scoperte e massacri* (1919). Soffici as a writer is both thoughtful and forceful and uses language impressionistically, frequently introducing exact and unexpected similes. Serra was one of the most promising of the younger writers, and is best known for his remarkable psychological document, the *Esame dè coscienza di un letterato* (1916), in which he examines the attitude of an artist and an intellectual towards the War with great acuteness. Several other writers, such as Federigo Tozzi (1883-1920), Ferdinando Paolieri (b. 1878), Bruno Cicognani (b. 1879) and Piero Jahier (b. 1884), also have points of contact, in spirit and in style, with the Florence group. And other journalistic and literary coteries, in Rome and elsewhere, brought into notice essayists, such as E. Cecchi (b. 1884), one of the most polished writers of the day, A. Baldini (b. 1889) and R. Bacchelli (b. 1891) who was to make his mark as a novelist.

Other and more extreme innovators were led by F. T. Marinetti (b. 1878) and called themselves Futurists. In the first Futurist manifesto published in 1909 Marinetti announced the new aesthetic of the machine, considered as symbol, source and teacher of a new artistic sensibility, and preached the beauty of speed. Apart from its sensationalism and self-advertisement and its principles of destructiveness, Futurism none the less acted as an irritant and forced writers, and particularly poets, to react against stagnation and to define poetry anew and the difference between it and prose. With the possible exception of some of Marinetti's and L. Folgore's (b. 1888) works, and Palazzeschi's (b. 1885) booklet of free verse *L'incendiario*, their literary contributions were of scant significance.

Poets and Playwrights.—The poetic output was not very plentiful or attractive. Besides belated imitators of Carducci and D'Annunzio, there were poets such as M. Moretti (b. 1885), Enrico Pea (b. 1881), Amalia Guglielminetti (b. 1889), who gave evidence at first of technical skill and lyrical vein which has since degenerated into affectation and mannerisms. The Piedmontese G. Gozzano (1883-1916) and the Neopolitan F. Gaeta (d. 1927) came nearest to the expression of contemporary feeling in a style free from all conventionalities.

There have been since D'Annunzio some successful attempts at poetic drama such as Benelli's historical tragedies *Maschera di Bruto* (1909) and *Cena delle Befe* (1909), written in effective

blank verse. Some of the other playwrights like Dario Nicodemi have portrayed society life, according to the formula derived from the French dramatists. Others have written light comedies or dramas in dialect. Many of these are very charming and well constructed, especially the Florentine ones, *L'acqua cheta* (1908) by Augusto Novelli and *I Pateracchio* (1910) by F. Paolieri. Some notable plays of the grand-guignol type have been written in Neapolitan dialect by Salvatore di Giacomo (*Assunta Spina* and *O' Mese Mariano*, 1910), Ernesto Murolo and Roberto Bracco, and, in Sicilian, by Pirandello (*Liola*, 1917). The fame of Roberto Bracco as a dramatist rests, however, on *Piccola Fonte* (1905) and *Piccolo Santo* (1912). Most of his plays present psychological and spiritual tragedies with hardly any external action, and are pronouncedly feminist in sympathies.

The essential difference between Bracco and Pirandello is that one is intellectual, the other cerebral. In Pirandello (*q.v.*) the dramatic form is a natural step from the novel and the short stories, in which the characters are *dramatis personae* always talking among themselves but unable to make each understood to the other, until they begin to doubt whether they really exist and are not shadowy forms conjured up by the imagination of those among whom they live and by which they are bound. The dramatic situations arise out of the contrast between what the individual is, what he conceives himself to be and what others think him.

Next to Pirandello, Rosso di San Secondo (b. 1887), a Sicilian known also for his short stories, and Federico Valerio Ratti, author of a remarkable tragedy on Judas Iscariot, are the most promising dramatists. Luigi Chiarelli's play, *La Maschera e il Volto* (1917), presents in light comedy form many of Pirandello's ideas.

Criticism and History.—Among the older idealist—though not Crocean—critics, Arturo Farinelli, author of *Il Romanticismo in Germania* (1911), *Il Romanticismo nel mondo latino* (1927), and several other valuable works; C. de Lollis, and A. Galletti, who succeeded Pascoli in the chair of Italian literature at the University of Bologna and to whom he has devoted a brilliant critical study, are the most important. To these three university professors should be added the name of a younger man—G. Toffanin—who has already given several proofs of originality and scholarship of a high order. The work of the militant critics is represented by Thovez's essays *Il pastore il gregge e la zampogna* (1910) and *Mimi del Moderno* (1919); by Renato Serra's *Scritti critici* (1910), and *Le Lettere* (1914), a brilliant survey of contemporary literature and its characteristics, as well as by the critical writings of Papini and G. A. Borgese (b. 1882) who, besides the *Storia della critica romantica in Italia* (1903) has also written *Rubé* (1921) an interesting autobiographical novel. Borgese is a regular contributor to the daily press, for which write also R. Simoni, a playwright, A. Tilgher, a philosopher, F. Palazzi and G. Zucca, novelists.

Historians no less than critics have felt the Crocean influence. Croce has himself written many historical works, including the *Storia di Napoli* (1926) and the *Storia d'Italia dal 1870 al 1915* (1928); and the modern tendencies in historical studies are well represented in the works of R. Caggese, G. Volpe and a few others.

A general improvement in prose style has been one of the most striking features of the 20th century literature; there are now numbers of young men who write with an easy grace that was uncommon if not inexistent in earlier days. A lively controversy has recently begun. Massimo Bontempelli presided over a group of writers, among whom were O. Vergani and A. Campanile, who called themselves "novecentisti" and wished to give Italian literature a fanciful and cosmopolitan tone; against them a twofold reaction is taking place led by the "strapaesisti" who wish for a simple and direct form of art, and the traditionalists who advocate a return to Italian classicism. Among these opponents of "novecentismo" are C. Malaparte, G. B. Angioletti and R. Bacchelli, who has written a remarkable novel, *Il diavolo al Pontelungo* (1927). (A. DEL R.; C. F.)

BIBLIOGRAPHY.—The history of Italian literature written by F. de

Sanctis in 1870 and several times reprinted is still the best aesthetic account of the subject. English readers are referred to J. A. Symonds's *Renaissance in Italy*, especially but not exclusively vols. iv. and v. German works of note are Gaspary's history of Italian literature up to the 14th century (1884–89; Eng. trans., only to the death of Dante, 1901), and Casini's contribution in Groeber's *Grundr. d. rom. Philologie* (Strasbourg, 1896–99). A useful summary is Hauvette's *Histoire de la lit. ital.* (1913). Of fundamental importance are the two elaborate series:—*Storia della letteratura italiana scritta da una società di professori* (Milan, 1900 sqq., 11 vols., each with a complete bibliography), and *Storia dei generi letterari* (Milan, 1902 sqq.), of which only ten volumes have been published so far. Excellent bibliographical notes are to be read in D'Ancona e Bacci, *Manuale della letteratura italiana* (Florence, new ed., 1920, 6 vols.). For the later period see B. Croce, *La letteratura della nuova Italia* (Bari, 1914) and the series of *Guide bibliografiche* published by the Istituto Leonardo (Rome, 1919 sqq.), of which 30 numbers have so far appeared. A select bibliography also appears in C. Foligno, *Italian Literature* (1920).

ITALIAN WARS. The war which broke out in 1848 had for its theatre the northern provinces of Italy and was due to the inhabitants endeavouring to gain their national unity. To expel the Austrians who were in possession of Lombardy and Venetia was the principal aim of the inhabitants. The Austrians had for a long time made themselves odious by their continued repressive measures, especially during the last 20 years. The Austrian statesmen in Vienna, though receiving warnings from their representatives, appeared unable to comprehend the gravity of the situation. Grave disorders which had to be put down by the military, occurred in 1846 on the elevation of pope Pius IX. to the chair. At that period he was known for his liberal tendencies, and the populace placed their hopes on his influence to shake off the Austrian domination. If the Austrian authorities in Vienna failed to grasp the danger that was threatening their power in Lombardy and Venetia, the same cannot be said of Count Radetsky, the veteran commander-in-chief, one of the ablest leaders of the 19th century. Though his reports failed to rouse the Government to the imminent danger, he had carefully trained his troops in Italy and had supervised the erection of fortifications on the Mincio and Adige. It was mainly due to him that Austria was able to retain her Italian provinces.

THE FIRST WAR

March 1848.—News of the outbreak of the Revolution in Vienna in March 1848 together with the revolt of the Hungarians, was the signal for the Italian patriots to rise in Milan four days later (March 17) against the Austrians. Radetsky, the military governor, disposing of but 10,000 men, constituting the Milan garrison, decided after severe street fighting to retire into the citadel. Seeing that his force was too small to cope with the rising, he evacuated the citadel, taking with him the troops in the district. On the 23rd he was already at Lodi. Here news was brought to him of the intended march of the Sardinians on Milan and of the fact that Venice had fallen. The Austrian position was grave, and the only available reinforcements, those in Tirol, were being hurried to Italy.

King Charles Albert, who assumed command of the Sardinians, did not favour a revolutionary war, but he was forced on March 23 to accede to the popular clamour. Ascertaining that Radetsky had evacuated Milan, he crossed the Ticino at Pavia and Bufalora intending to pursue the enemy, thought to be in flight. By the first week in April, he was at Cremona with 70,000 men. It was hoped by the Sardinians that in three months their forces would be doubled. Charles Albert wished to capture Mantua but, giving up the idea, he marched to Pastrengo intending to bar Radetsky's retreat to Tirol. After the action at Goito, April 8, the king crossed the Mincio, while Radetsky retreated to a position west of Verona. The Sardinian attack failed on May 6 at St. Lucia, but Radetsky refrained from following the enemy till reinforcements arrived. He was prepared even to sacrifice Peschiera which was invested by the enemy. Nugent with part of the expected reinforcements, 15,000 strong, moved from Gorizia to Verona, harassed by the inhabitants. Evading battle with the Papal forces under Durando and Ferrari, 25,000 strong, he joined Radetsky on May 23.

The Austrian leader assumed the offensive threatening the Sar-

While Carducci was still active G. Pascoli (1855-1912) acquired a great reputation and succeeded him in the chair at Bologna. His art was impressionistic and fragmentary, and his language occasionally childish and laborious; despite this there are passages of great beauty in some of his poems, particularly in *Myricae*, so that he shared popular favour with G. d'Annunzio (b. 1863). D'Annunzio is so exceptional a writer as to be difficult to classify; as a novelist and tragedian he has echoed in turn Verga, Dostoevsky, Tolstoi and Nietzsche. He attained a large measure of success, but such success as he achieved was due to the glittering wealth of his elaborate style rather than to any intrinsic merit. His genius is essentially lyrical, and it is in some sections of his long poem *Laudes creaturarum* that he has shown himself at his best. Beside men of such stature, lesser men, however deserving of notice, almost pale into insignificance—poets as honest and highminded as G. Giacosa of Turin, novelists as thoughtful as E. de Marchi and E. A. Butti, poets as gifted as A. Graf, G. Marradi and M. Rapisardi.

The political reorganization following upon the establishment of the kingdom offered opportunities to scholars, and, during the second part of the 19th century, under the inspiration of such teachers as A. d'Ancona, A. Bartoli, C. de Leva, P. Villari and other professors, a great amount of scholarly research was carried out and expounded in learned monographs. Facts were ascertained and obscure points were cleared up in political and literary history. The historical method prevailed. It was due to B. Croce (b. 1864), a follower of De Sanctis, that aesthetic criticism won recognition. By his *Estetica* and his many critical essays Croce changed the whole outlook of the younger generation on literary matters. Though his evaluation of individual authors is occasionally at fault, his influence has been most beneficial. Such praise he must share with another philosopher, G. Gentile, whose works on literary criticism are models of penetration. He is an active teacher and has among the young men of the day a larger and more enthusiastic following than Croce. (H. O.; C. F.)

CONTEMPORARY LITERATURE

The works produced during the present century are characterized by a spirit of daring, restlessness and youth; by intellectual curiosity, love of novel experiments and experiences, and above all by self-analysis. Writers aimed at the discovery of new forms of expression to supersede the old; thus, the Futurists were of service to the new literature, if only by reason of their attempt to break down inherited and stereotyped traditions in prose and verse. Prose underwent a remarkable change. It became crisper and at the same time more flexible, while language attained the unity long since advocated by Manzoni.

Fresh interest was awakened in the most varied forms of criticism, in history, culture and philosophy of all times and in all countries. In this eclectic tendency Renato Serra, a young and promising critic who was killed in the War, saw the beginnings of a new form of classicism. Interest in foreign literatures, including those of the East as well as of the West, produced a vast library of translations varying in quality, but on the whole showing a marked tendency towards treating translation as an art.

Fiction.—Although strictly belonging to the preceding generation, Carlo Dossi (1847-1910) did not receive due recognition until after his death. By his harsh and elliptical style and his original and vivid treatment of his subject matter, he opened out new paths to his successors. Of an entirely different character is the work of Alfredo Panzini (b. 1863) one of Carducci's best pupils. Possessing a quiet sense of humour tinged with irony, his attitude towards life is detached but not aloof. In what are generally considered to be his masterpieces *Le Fiabe della Virtù* (1905), *La Lanterna di Diogene* (1909), Panzini is acutely sensitive to all forms of beauty and to the conflict between them and the evils and uglinesses of the world. It is worthy of notice that most of the novelists, dramatists and critics of to-day—men and women—have tried their hand at the short story of the magazine type. Of these A. Albertazzi (b. 1865), Luciano Zuccoli (b. 1870), Virgilio Brocchi (b. 1876), Antonio Beltramelli (b. 1880), Guido da Verona (b. 1881) and Ugo Ojetti (b. 1871) who is also a very

highly esteemed art critic and a polished essayist (*Cose viste*), and among the women writers Clarice Tartufari (b. 1868), Sibilla Aleramo (b. 1879), Neera (1846-1916), Amalia Guglielminetti (b. 1885) and Carola Prosperi (b. 1883) are the most popular.

Recent Developments.—A rebellious and combative group of young men showed their activity, during the first years of the 20th century, mainly by uncompromising attacks on all established reputations. This group is known as "Gruppo della Voce," from the periodical of that name founded by Giovanni Papini and Giuseppe Prezzolini about 1909, itself the offspring of an earlier review—*La Leonardo* (1903-07), which gave a great impulse to philosophical studies. Not all of the contributors were of equal merit, but they showed the presence of a new spirit and vitality much needed, and exerted an influence as far-reaching as it was important and often superior to their individual achievements. Papini (b. 1881), however, is the only one who is at all known outside Italy mainly on account of the much-advertised *Storia di Cristo* (1921), a work which has added little to a reputation really founded upon his autobiography, *Un uomo finito* (1912), *Cento pagine di Poesia* (1915), and the brilliant, provocative, and at times superficial critical essays *Stronature* (1916). Giuseppe Prezzolini also wrote some excellent critical essays, mostly on his contemporaries, but later abandoned literature and philosophy for politics. Of the other principal contributors to *La Voce*, Scipio Slataper (1888-1915), a Triestino killed in the War, is best known for his noteworthy lyrical autobiography in prose, *Il mio Carso* (1912) and a suggestive study on Ibsen published posthumously (1916).

Ardeno Soffici's (b. 1879) best writings are a fragment of a novel, *Lemmonio Boreo* (1912), two autobiographical journals, *Giornale di Bordo* (1915) and *Kobilek* (1918), and the art criticism in *Il caso Medardo Rosso e l'Impressionismo* (1909) and *Scoperte e massacri* (1919). Soffici as a writer is both thoughtful and forceful and uses language impressionistically, frequently introducing exact and unexpected similes. Serra was one of the most promising of the younger writers, and is best known for his remarkable psychological document, the *Esame di coscienza di un letterato* (1916), in which he examines the attitude of an artist and an intellectual towards the War with great acuteness. Several other writers, such as Federigo Tozzi (1883-1920), Ferdinando Paolieri (b. 1878), Bruno Cicognani (b. 1879) and Piero Jahier (b. 1884), also have points of contact, in spirit and in style, with the Florence group. And other journalistic and literary coteries, in Rome and elsewhere, brought into notice essayists, such as E. Cecchi (b. 1884), one of the most polished writers of the day, A. Baldini (b. 1889) and R. Bacchelli (b. 1891) who was to make his mark as a novelist.

Other and more extreme innovators were led by F. T. Marinetti (b. 1878) and called themselves Futurists. In the first Futurist manifesto published in 1909 Marinetti announced the new aesthetic of the machine, considered as symbol, source and teacher of a new artistic sensibility, and preached the beauty of speed. Apart from its sensationalism and self-advertisement and its principles of destructiveness, Futurism none the less acted as an irritant and forced writers, and particularly poets, to react against stagnation and to define poetry anew and the difference between it and prose. With the possible exception of some of Marinetti's and L. Folgore's (b. 1888) works, and Palazzeschi's (b. 1885) booklet of free verse *L'incendiario*, their literary contributions were of scant significance.

Poets and Playwrights.—The poetic output was not very plentiful or attractive. Besides belated imitators of Carducci and D'Annunzio, there were poets such as M. Moretti (b. 1885), Enrico Pea (b. 1881), Amalia Guglielminetti (b. 1889), who gave evidence at first of technical skill and lyrical vein which has since degenerated into affectation and mannerisms. The Piedmontese G. Gozzano (1883-1916) and the Neapolitan F. Gaeta (d. 1927) came nearest to the expression of contemporary feeling in a style free from all conventionalities.

There have been since D'Annunzio some successful attempts at poetic drama such as Benelli's historical tragedies *Maschera di Bruto* (1909) and *Cena delle Beffe* (1909), written in effective

blank verse. Some of the other playwrights like Dario Nicodemi have portrayed society life, according to the formula derived from the French dramatists. Others have written light comedies or dramas in dialect. Many of these are very charming and well constructed, especially the Florentine ones, *L'acqua cheta* (1908) by Augusto Novelli and *I Pateracchio* (1910) by F. Paolieri. Some notable plays of the grand-guignol type have been written in Neapolitan dialect by Salvatore di Giacomo (*Assunta Spina* and *O' Mese Mariano*, 1910), Ernesto Murolo and Roberto Bracco, and, in Sicilian, by Pirandello (*Liola*, 1917). The fame of Roberto Bracco as a dramatist rests, however, on *Piccola Fonte* (1905) and *Piccolo Santo* (1912). Most of his plays present psychological and spiritual tragedies with hardly any external action, and are pronouncedly feminist in sympathies.

The essential difference between Bracco and Pirandello is that one is intellectual, the other cerebral. In Pirandello (*q.v.*) the dramatic form is a natural step from the novel and the short stories, in which the characters are *dramatis personae* always talking among themselves but unable to make each understood to the other, until they begin to doubt whether they really exist and are not shadowy forms conjured up by the imagination of those among whom they live and by which they are bound. The dramatic situations arise out of the contrast between what the individual is, what he conceives himself to be and what others think him.

Next to Pirandello, Rosso di San Secondo (b. 1887), a Sicilian known also for his short stories, and Federico Valerio Ratti, author of a remarkable tragedy on Judas Iscariot, are the most promising dramatists. Luigi Chiarelli's play, *La Maschera e il Volto* (1917), presents in light comedy form many of Pirandello's ideas.

Criticism and History.—Among the older idealist—though not Crocean—critics, Arturo Farinelli, author of *Il Romanticismo in Germania* (1911), *Il Romanticismo nel mondo latino* (1927), and several other valuable works; C. de Lollis, and A. Galletti, who succeeded Pascoli in the chair of Italian literature at the University of Bologna and to whom he has devoted a brilliant critical study, are the most important. To these three university professors should be added the name of a younger man—G. Toffanin—who has already given several proofs of originality and scholarship of a high order. The work of the militant critics is represented by Thovez's essays *Il pastore il gregge e la zampogna* (1910) and *Mimi del Moderno* (1919); by Renato Serra's *Scritti critici* (1910), and *Le Lettere* (1914), a brilliant survey of contemporary literature and its characteristics, as well as by the critical writings of Papini and G. A. Borgese (b. 1882) who, besides the *Storia della critica romantica in Italia* (1903) has also written *Rubé* (1921) an interesting autobiographical novel. Borgese is a regular contributor to the daily press, for which write also R. Simoni, a playwright, A. Tilgher, a philosopher, F. Palazzi and G. Zucca, novelists.

Historians no less than critics have felt the Crocean influence. Croce has himself written many historical works, including the *Storia di Napoli* (1926) and the *Storia d'Italia dal 1870 al 1915* (1928); and the modern tendencies in historical studies are well represented in the works of R. Caggese, G. Volpe and a few others.

A general improvement in prose style has been one of the most striking features of the 20th century literature; there are now numbers of young men who write with an easy grace that was uncommon if not inexistent in earlier days. A lively controversy has recently begun. Massimo Bontempelli presided over a group of writers, among whom were O. Vergani and A. Campanile, who called themselves "novecentisti" and wished to give Italian literature a fanciful and cosmopolitan tone; against them a twofold reaction is taking place led by the "strapaesisti" who wish for a simple and direct form of art, and the traditionalists who advocate a return to Italian classicism. Among these opponents of "novecentismo" are C. Malaparte, G. B. Angioletti and R. Bacchelli, who has written a remarkable novel, *Il diavolo al Pontelungo* (1927). (A. DEL R.; C. F.)

BIBLIOGRAPHY.—The history of Italian literature written by F. de

Sanctis in 1870 and several times reprinted is still the best aesthetic account of the subject. English readers are referred to J. A. Symonds's *Renaissance in Italy*, especially but not exclusively vols. iv. and v. German works of note are Gaspari's history of Italian literature up to the 14th century (1884–89; Eng. trans., only to the death of Dante, 1901), and Casini's contribution in Groeber's *Grundr. d. rom. Philologie* (Strasbourg, 1896–99). A useful summary is Hauvette's *Histoire de la lit. ital.* (1913). Of fundamental importance are the two elaborate series:—*Storia della letteratura italiana scritta da una società di professori* (Milan, 1900 sqq., 11 vols., each with a complete bibliography), and *Storia dei generi letterari* (Milan, 1902 sqq.), of which only ten volumes have been published so far. Excellent bibliographical notes are to be read in D'Ancona e Bacci, *Manuale della letteratura italiana* (Florence, new ed., 1920, 6 vols.). For the later period see B. Croce, *La letteratura della nuova Italia* (Bari, 1914) and the series of *Guide bibliografiche* published by the Istituto Leonardo (Rome, 1919 sqq.), of which 30 numbers have so far appeared. A select bibliography also appears in C. Foligno, *Italian Literature* (1920).

ITALIAN WARS. The war which broke out in 1848 had for its theatre the northern provinces of Italy and was due to the inhabitants endeavouring to gain their national unity. To expel the Austrians who were in possession of Lombardy and Venetia was the principal aim of the inhabitants. The Austrians had for a long time made themselves odious by their continued repressive measures, especially during the last 20 years. The Austrian statesmen in Vienna, though receiving warnings from their representatives, appeared unable to comprehend the gravity of the situation. Grave disorders which had to be put down by the military, occurred in 1846 on the elevation of pope Pius IX. to the chair. At that period he was known for his liberal tendencies, and the populace placed their hopes on his influence to shake off the Austrian domination. If the Austrian authorities in Vienna failed to grasp the danger that was threatening their power in Lombardy and Venetia, the same cannot be said of Count Radetsky, the veteran commander-in-chief, one of the ablest leaders of the 19th century. Though his reports failed to rouse the Government to the imminent danger, he had carefully trained his troops in Italy and had supervised the erection of fortifications on the Mincio and Adige. It was mainly due to him that Austria was able to retain her Italian provinces.

THE FIRST WAR

March 1848.—News of the outbreak of the Revolution in Vienna in March 1848 together with the revolt of the Hungarians, was the signal for the Italian patriots to rise in Milan four days later (March 17) against the Austrians. Radetsky, the military governor, disposing of but 10,000 men, constituting the Milan garrison, decided after severe street fighting to retire into the citadel. Seeing that his force was too small to cope with the rising, he evacuated the citadel, taking with him the troops in the district. On the 23rd he was already at Lodi. Here news was brought to him of the intended march of the Sardinians on Milan and of the fact that Venice had fallen. The Austrian position was grave, and the only available reinforcements, those in Tirol, were being hurried to Italy.

King Charles Albert, who assumed command of the Sardinians, did not favour a revolutionary war, but he was forced on March 23 to accede to the popular clamour. Ascertaining that Radetsky had evacuated Milan, he crossed the Ticino at Pavia and Bufalora intending to pursue the enemy, thought to be in flight. By the first week in April, he was at Cremona with 70,000 men. It was hoped by the Sardinians that in three months their forces would be doubled. Charles Albert wished to capture Mantua but, giving up the idea, he marched to Pastrengo intending to bar Radetsky's retreat to Tirol. After the action at Goito, April 8, the king crossed the Mincio, while Radetsky retreated to a position west of Verona. The Sardinian attack failed on May 6 at St. Lucia, but Radetsky refrained from following the enemy till reinforcements arrived. He was prepared even to sacrifice Peschiera which was invested by the enemy. Nugent with part of the expected reinforcements, 15,000 strong, moved from Gorizia to Verona, harassed by the inhabitants. Evading battle with the Papal forces under Durando and Ferrari, 25,000 strong, he joined Radetsky on May 23.

The Austrian leader assumed the offensive threatening the Sar-

dinian right and rear and intending to relieve Peschiera. He entered Mantua on May 28. Encountering strong resistance, after the fall of Peschiera, Radetsky attacked Durando with 30,000 men, and forced him to surrender with 18,000 men on June 11. Restoring order in the Brenta Valley, Radetsky, reinforced, returned to Verona with 60,000. Charles Albert with 75,000 men occupied the hilly country around Custozza and the Rivoli plateau. After four days fighting the Sardinians were driven across the Mincio and in full retreat. Charles Albert tried in vain to obtain an armistice. Radetsky, moving by parallel roads, defeated the hostile right at Crema and Lodi and reoccupied Milan on August 4. The Sardinians having crossed the Ticino, an armistice was concluded on August 9.

The Second Campaign.—By the beginning of 1849, the civil war raging throughout Austria and Hungary inspired Italian patriots to make a new bid for independence. Charles Albert was again forced to take up arms in March, entrusting command to Chrzanowski a former Polish general. His forces amounted to 80,000 men divided into seven divisions, three being thrown forward to the Ticino at Galiate, Tregate and Vigevano, with two others at Novara and Ollegio, while another stood under Ramorino south of the Po opposite Pavia instead of occupying Cava to threaten a possible hostile advance. Chrzanowski's mistaken objective was to occupy Milan instead of advancing against the main enemy's force. He hoped thereby to force the Austrians to retire to the Quadrilateral. Radetsky, disposing of 75,000 men, not including detached posts, intended to concentrate at Pavia, interposing between the two Sardinian forces north and south of the Po, and then to march against the principal force. He evacuated Milan on March 17 feigning to retire towards Piacenza. Two days later he wheeled to his right and made for Pavia so as to cross the frontier as soon as the armistice expired, seven days being given by the Sardinians. Firmly believing the Austrians were retreating Chrzanowski gave orders to cross the Ticino at Magenta on March 20.

Radetsky crossed the Ticino and destroyed the bridge at Mezzano Corte, whereby Ramorino was cut off from Chrzanowski's main army. Two divisions of the latter crossed the river, the remaining three stood at Vigevano and Novara. Hearing of Radetsky's advance, Charles Albert decided to meet him at Vigevano with three corps, calling the other two from Magenta. Radetsky sent three corps to Mortara, outflanking the enemy's right with one and with another guarding his own right flank at Vigevano. Mortara fell, the Sardinians hardly pressed retreating to Novara. Next day, Radetsky advanced towards Vespolate, with an outflanking detachment on Robbio. The five Sardinian divisions were drawn up at Novara, ready to receive battle that day. Owing to a false report, Radetsky believing he was faced by a rearguard, changed his plan of a massed advance on Novara, to a left wheel towards Vercelli with but one corps going to Novara.

The following morning the Austrian II. corps encountered the whole hostile army at Novara and for hours was in the greatest danger. The III. corps coming up saved the situation in the afternoon and was, in its turn, followed by IV., which threatened the enemy's right. The Reserve Corps arriving, Radetsky ordered a general advance, the Sardinians falling back in disorder on Novara. An armistice was arranged that night, Charles Albert abdicating in favour of his son, Victor Emmanuel, and Radetsky giving up the advance on Turin. Thus terminated a campaign which will ever rank as a model—rapidity and secrecy, two leading military principles, being realized by Radetsky most brilliantly.

Sardinia.—The unfortunate campaign of 1848-49 could not dispel the hopes of the Italian patriots to liberate their country eventually from the foreign dominion. Their one idea was to unify all the provinces under the sceptre of the king of Sardinia, but they felt that their forces were hardly adequate to cope with such a formidable power as the empire of the Habsburgs. The victory of Austria in 1849 only postponed hostilities to a more favourable moment. At the time of the Crimean War Sardinia had joined the Allies, despatching a force of 15,000 men to aid them in Jan. 1855. At the close of hostilities Sardinia took her place at the peace conference in Paris among the great European

powers, and all the minor Italian states now considered her as their leader.

The clever policy of Cavour, her foreign minister, consolidated her position in the years following the war. He had paid many visits to Paris and tried his utmost to persuade the emperor Napoleon III. to help Italy to liberate the country from the Austrians. In the middle of July, 1858, the emperor was finally convinced by Cavour that it was for the interest of France to join Sardinia in a war against Austria. These conversations were held between him and Cavour at Plombières, when it was decided in principle that should hostilities break out between Sardinia and Austria, France would send two army corps, gradually increasing the number to 200,000 men. No plan of campaign was drawn up, but a French officer was to be despatched to Turin to discuss technical matters with the leading Sardinian generals on the spot.

By Dec. 1858 events began to move more rapidly. Napoleon at the annual New Year reception of the Diplomatic corps openly declared to Baron Hubner, the Austrian ambassador, that the relations between France and Austria were not as good as heretofore, though his friendship to the emperor Francis Joseph remained unchanged. From that moment it became evident that hostilities were not far distant.

France.—Early in the year France promised to support Sardinia with 200,000 men in case of a conflict with Austria and began discussing projects, which continually fluctuated, Napoleon being uncertain what plan to adopt. Spurred on by Cavour, Sardinia, since the Crimean War had reorganized her army, which now numbered 50,000 men, increased to 60,000 in April. It consisted of three divisions and was concentrated at Alessandria acting as an advance guard to the French.

Both France and Austria reinforced their forces by slow degrees the result being to hamper military operations. In Austria's case it was dictated by policy as every effort was used to persuade Prussia to join her in the conflict with France. Should this be possible the principal blow would be struck by the united forces from southern Germany, the Austrians in Lombardy remaining on the defensive. By the middle of April it became evident that Austria could not hope for this assistance, but valuable time was lost in assembling sufficient forces to crush the Sardinians prior to the arrival of the French. Austria mustered 150,000 men in five Army Corps: II., III., V., VII. and VIII., commanded by Gyulai. His plan was to fall back on Verona and await there reinforcements, but Kuhn his chief of staff suggested a march against the Sardinians, thereby forcing Prussia to a decision.

France, fearing Prussia's attitude, on her part was obliged to retain considerable forces by the Rhine, yet this was no excuse for her vacillation during the first period of the campaign. Having had three clear months she began hostilities ill prepared; these would have ended in disaster if she had been faced by an energetic opponent. No definite plan of action was decided upon before actual fighting began, though Jomini, on Napoleon's request to give a suggestion, advised a flank attack by way of Magenta against the Austrian right. The Sardinians meanwhile were massed between Casale-Alessandria covering Turin and Genoa.

THE SECOND WAR

Austria's Ultimatum.—War began on April 26. Sardinia had rejected the Austrian ultimatum to disarm, despatched on the 10th, and Gyulai ordered the frontier to be crossed the following day. Having crossed the Ticino at Pavia and Bereguardo, Gyulai reached Valenza on May 3 when a report coming from Vienna stating the French were already in Turin in great strength stopped his advance. He now decided to move on Turin and attack the French columns debouching from Suza. On May 8 the Austrians reached the Sesia at Vercelli, but reports announcing the advance of strong hostile forces on Piacenza forced Gyulai to retire to the Lomellino, with his headquarters at Mortara. A bridge was constructed at the confluence of the Po and Ticino to facilitate a retirement to the south if necessary. The French were already on Sardinian soil and were rapidly joining their allies. Some had come across the Alps by Mont Cenis and Mont Genevre, while the rest had arrived by sea, disembarking at

Genoa.

By the second week in May the Allies stood: I. Corps, Voghera; II. Sale; III. and Guards, Alessandria-Tortona; IV. Valenza-Bassegna; a division of the V. watching the roads leading to the Duchies of Central Italy; the French mustered 150,000, with 60,000 Sardinians. Napoleon assuming command, continued undecided whether to advance to Piacenza south of the Po or to move via Magenta on Milan. The first encounter took place at Montebello on May 20 when Stadion was sent with 24,000 to ascertain the strength of the enemy at Voghera. After a brisk fight with Forey's division 8,000 strong, the Austrians fell back but were not pursued. This confirmed Gyulai in the belief that the French would march on Piacenza, while Napoleon imagined the Austrians intended a big offensive south of the Po.

He now gave orders to move north by a long flank march on Magenta, as proposed by Jomini. The Sardinians started on May 25, reaching Vercelli on the 29th, while the French made for Casale-Valenza, their right being protected by a division at Voghera and Valenza. Gyulai soon heard of the Sardinian march, but mistook it for a feint to divert his attention from the Po.

An action occurred on May 30 at Palestro, which the Sardinians were to hold, to facilitate the French crossing of the Sesia at Vercelli. Fighting was resumed the next day, when the French III. Corps participated in repulsing the enemy. The French main army was approaching Novara on June 1, while the Sardinians with the remaining French forces were around Palestro-Vercelli, the river Agogna being between them; the Austrians might have attacked them knowing how widely they were spread out, but Gyulai decided to retreat across the Ticino, which he did next day. His idea was to retreat to the Mincio, but Kuhn, his chief of staff protested against so hurried a retirement.

Meanwhile the Allies approached the Ticino, seizing the crossings at San Martino and Turbigo. The II. French Corps together with the 2nd Guard Division crossed the river and occupied Robecchetto early on June 3. The Allies now stood as follows: I. Corps at Lumellogno and IV. Corps at Novara; Guard with the III. Corps, at Novara; Sardinians at Galiate. A detachment guarded the extreme right flank at Mortara. The French G.H.Q. being badly served by the cavalry, ascertained only early on June 4 that Gyulai had crossed the Ticino the previous evening.

Napoleon intended to attack the Austrian right flank with the II. Corps and Sardinians, while advancing with the main body consisting of III. and IV. Corps with the Guards against the bridges of San Martino and to force his way across. Gyulai on his part wished to give battle on June 5 holding the enemy with his right, V. and VI. Corps, at Magenta, and to strike the enemy debouching from San Martino with his remaining five corps. Events turned out differently, Mac-Mahon's detachment advanced in two columns early on June 4, but on approaching Buffalora at midday, met with an obstinate resistance, which held up his advance. The Austrians had 12,000 men posted there, 8,000 at Magenta, 12,000 to defend the bridges and 27,000 at Abbiategrasso. A second move was made at about 4 P.M., when the Austrians were driven back to Magenta.

Meantime Napoleon, having in hand but a small force at San Martino, awaited Mac-Mahon's advance, which would open the road for his own troops. Hearing firing from the direction of Mac-Mahon's force Napoleon sent a division of the Guards to storm the bridges and support Mac-Mahon towards Buffalora. A desperate struggle ensued, Mellinet's guards encountering 18,000 Austrians, who were trying to wreck the bridges. Urgent messages were sent to the III. and IV. Corps to forward reinforcements. The French across the Ticino were now able to hold their own for the time being, and it was fortunate for them that Mac-Mahon shortly afterwards renewed his effort to press forward, the Austrians gradually giving way before him. Hearing that Magenta had been captured by the enemy, Gyulai gave orders to retreat late that night in the direction of Cremona-Piacenza. The French feared an attack on June 5, and rightly so, as the Austrians could have collected 110,000 men for a renewed battle, but hearing of the retreat of the enemy, they

entered Milan on June 7. Next day they drove back the Austrian rear-guard at Milegnano, the enemy retreating to the Mincio, which was crossed on June 16. That day the Emperor Francis Joseph took command of the army, having Baron Hess as his chief of staff.

THE AUSTRIAN OFFENSIVE

Contact with the enemy was lost at the crossing of the Chiese June 15, but little skill being shown by the Allied cavalry, the Austrians assembling in full security behind the Mincio. By the 21st the Allies were over the Chiese with headquarters at Montechiaro, numbering 107,000 French with 48,000 Sardinians. No fighting was expected west of the Mincio, isolated hostile horsemen alone being visible. A balloon detachment made an ascent at Castiglione June 23 but no enemy was to be seen.

The Austrians decided to take the offensive and crossed the Mincio on June 23 over 12 bridges. By the evening they stood on the line Pozzolengo-Solferino-Medole and were 160,000 strong. They were divided into two armies: I., Wimpffen, 70,000 men comprising III., IX., and XI. Corps with a cavalry division; II., Schlick, with I., V., VII. and VIII. Corps, including cavalry division, 90,000 combatants. The II. Corps was left at Mantua against the hostile V. Corps, which was known to be moving south of the Po. A division from the II. Corps was sent to Marcara. Neither opponent expected a battle on the 24th. The Austrians believed the enemy would be encountered in two or three days time, while the Allies did not expect them this side of the Mincio, which they had to cross on the 24th. The Austrians had every chance of success, had they utilised the II. Corps at Mantua against the French flank and rear. Lack of initiative and excessive centralisation prevailed in their army. The battlefield can be divided into two parts: the hilly (northern) part around San Martino-Solferino, the (southern) plain between Guidizzolo-Medole. The Allies stood as follows: the Sardinians on the left at Lonato; the centre: I., II. Corps and guards Castiglione-Montechiaro; the right: III. and IV. Corps Medole-Castelfreddo. The Austrians advanced in close formation: VIII. Corps, Pozzolengo; V. Solferino; I. Cavriana; III. Guidizzolo; IV. Volta; IX. Robecco-Medole; XI. Cereta. Their plan was to hold the Allies by incessant attacks, while making for Carpendolo from the south against the allied right. Their march forward was to begin at 9 A.M. on the 24th.

Firing between the outposts began at 5 A.M. east of Castiglione and gradually the I. and II. French Corps were involved in fighting around Solferino. To the south the IV. Corps was also shortly engaged in a fierce encounter at Medole. The III. delayed by crossing the Chiese, was hurrying forward, but on approaching Castel Goffredo heard rumours of a hostile movement from the south which did not take place. The II. Corps being held up at Casa Morino asked in vain for help from the IV. and the latter in turn pressed the III. to assist it. In the north the Austrian VIII. Corps was hotly engaged from day-break and held up the Sardinians, after seizing San Martino, by incessant attacks throughout the day. By 11 A.M. the Austrians were desperately defending Solferino and to ease the situation, the Austrian emperor ordered the II. Army to advance on Castiglione, instead of Carpendolo. But all attempts were made in vain against the French III. and IV. Corps which were attacking in their turn. At 2 P.M. Solferino was captured, thanks to the assistance of the guards. The II. Army, receiving a second order from Francis Joseph, made a fresh effort, but at 3 P.M., the I. army having begun to fall back, the battle was practically lost and the Austrians began their retreat to the Mincio. On the extreme right the VIII. Corps repulsed every Sardinian attack, falling back only when informed of the II. Army's retreat. There was no pursuit. The Austrians fell back on Verona, having lost 22,000 men, while the Allies counted 17,000 casualties. An armistice was concluded at Villafranca, on July 8, Austria ceding Lombardy, while Napoleon received Savoy and Nice from Sardinia.

Venetia.—Seven years had elapsed since the war of 1859, but the Italians still cherished hopes of annexing Venetia, which with Rome, were the remaining Italian states not incorporated

in the kingdom. Foreseeing that the Schleswig-Holstein disputes between Austria and Prussia would certainly end in hostilities, Italy signed a treaty of alliance with Prussia on April 8, 1866. It was stipulated that they were to demand Venetia from Austria, support by force of arms the reforms for a German confederation, and not to sign peace separately.

Austria was forced by her political circumstances to assemble two armies, one on her northern frontiers, against Prussia, and a much smaller one against Italy. She relied, to make up for her numerical inferiority, on her small but highly-trained forces, and on her strong defensive position in the Quadrilateral. The Italians now numbered 250,000 infantry and 13,000 cavalry, with 480 guns. By an agreement with Prussia, Italy was to invade Venetia, mobilizing her forces, for that purpose, in the middle of April, 1866, and concentrate them in two groups: Three army corps 110,000 strong at Lodi, Cremona and Piacenza under King Victor Emmanuel, La Marmora acting as Chief of Staff. Cialdini with eight divisions was on the south bank of the Po with headquarters at Bologna, and had 70,000 men. A volunteer force under Garibaldi guarded the extreme left flank and was to invade Tirol. The Italians, knowing the Austrians were weak in numbers, believed they would await them around Verona. They would cross the Mincio, advancing on Custoza and hold the Austrians, while Cialdini passing over the Po would invade Venetia in the rear of the enemy.

The Austrians under the Archduke Albert, with General John as Chief of Staff, disposed of but 75,000 well trained troops. He took up a central position between Montagnana and Lonino within reach of either Rovigo or Verona, as he learned the enemy would advance in two separate armies from two directions: one from the Mincio, the other from south of the Po. On June 20 orders were issued to advance to Verona, the Archduke intending to attack the Italian king; hostile cavalry was known to be along the Mincio and Po, and Garibaldi was advancing into Tirol. On the 23rd the Archduke having completed his concentration between Verona-Pastrengo sent his troops into the hills, his plan being to take the offensive the next day, striking the Italians when they would be advancing towards the Adige. The Italians not expecting serious resistance, advanced with little precaution.

When at Villafranca the Italians were checked by artillery and cavalry, and 20,000 remained inactive all day. Meanwhile they fell in with the main hostile forces on the heights of Peschiera-Custoza. The Austrians in their turn began the attack along the whole line. Battle raged all day with varying success till about 5 P.M. when the Italians were forced to retire to the Mincio. A fortnight later the Archduke and the bulk of the army were transported to defend Vienna against the Prussians and when hostilities closed in Austria the Archduke was sent with 155,000 men to Isonzo. No further fighting took place, however, and peace was signed October 3, Austria losing Venetia, though the Italian navy sustained a crushing defeat at Lissa on July 20 when attacked by Tegetthof. Only in 1870 however did Rome once again become the capital of Italy the French being obliged to withdraw their garrison from the Eternal City after the French Empire had fallen.

(A. SMT.)

ITALIC, *i.e.*, Italian, in Roman archaeology, history and law, a term used of that which relates to the non-Roman parts of Italy (*see ITALY: Ancient Languages and Peoples*). In architecture the Italic order means the Composite order (*see ORDER*). The term was applied to the Pythagorean school of philosophy in Magna Graecia, and to an early, pre-Vulgate, Latin version of the Bible, known also as *Itala*. Its technical use is of a form of type, in which the letters slope to the right, now used, in printing, chiefly to emphasize, to indicate a foreign language, or to mark titles of books, etc. It was introduced by the Aldine Press (*see MANUTIUS and TYPOGRAPHY*).

ITALIC LANGUAGES. The Italic group of languages comprises Latin, Oscan and Umbrian (*qq.v.*). There were certainly other, perhaps many other, dialects, which by political conditions were prevented from spreading or attaining any importance.

ITALO-CELTIC. In many important respects the Celtic languages (*q.v.*) resemble the Italic languages (*q.v.*) so closely that it has been proposed to group them together as a unit group of the Indo-European family. When historical evidence became available, differentiation had progressed so far that, while an earlier unity is permissible, they should be kept separate. Ligurian and Sicilian were certainly spoken Greek or Latin. There are affinities with Venetic.

See Walde, *Über Älteste Sprachliche Beziehungen zwischen Kelten und Italienern* (1917).

ITALO-TURKISH WAR. Following the diplomatic discussions which took place between Rome and Constantinople during the summer of 1911, an ultimatum from Italy was delivered to the Porte on Sept. 28, demanding Turkey's consent to a military occupation of Tripolitania and Cyrenaica. A period of 24 hours was set by the ultimatum, and as the Turkish reply did not meet the Italian demands a state of war was declared as from 2.30 P.M. on Sept. 29.

Italian Naval Activity.—Military action was slow to succeed the formal declaration of war, and it was not till Oct. 11 that the first transports reached Tripoli. Meanwhile the Italian navy had been busy. On Sept. 28 a squadron appeared off Tripoli, and notice was given that if the town were not surrendered it would be bombarded. The obsolete fortifications were bombarded for two hours on Oct. 3, after the Turkish authorities had declined to surrender the town. By next day, the Turkish garrison, acting upon order received from Constantinople, had retired into the sandy plains, and on Oct. 5, a force of 1,600 sailors was disembarked. Meanwhile hostilities had been begun elsewhere. On Sept. 29 and 30 Italian destroyers under the command of the duke of the Abruzzi sank the Turkish torpedo-boats off Prevesa in Epirus and on Oct. 1 Admiral Aubry left Augusta to go in search of the Turkish fleet, which the declaration of war had found at Beirut. But the orders given him were suddenly countermanded, and instead of steaming to the Aegean in order to intercept the Turks, he was sent to Tobruk, which was occupied by a detachment of sailors on Oct. 4. The renunciation of the attempt to cut off the Turkish fleet was inspired by political reasons.

Italian Expeditionary Force.—A week elapsed between the landing of the sailors at Tripoli and the arrival of the expeditionary force, and it was not till Oct. 20 that all the equipment had been put on shore. The force consisted of some 9,000 rifles with a few field and mountain batteries and two squadrons of cavalry. There was very little transport, for it had not been anticipated that the Turks would retreat towards the interior and receive support from the native tribesmen. That Neshat Bey, the Turkish commander in Tripoli, did receive this support was largely due to two men—Ferhat Bey, deputy for Tripoli, and Suleiman el Baruni, a Berber from Fessato, who was deputy for the Jebel region. Meanwhile Homs, Derna and Benghazi had been occupied. There was some resistance at each place, especially at Benghazi, but the first fighting of any importance was a sudden attack on Oct. 23 upon the Italian lines at Shara Shat in the Tripoli oasis, backed by a rising behind the lines. Two companies of Bersaglieri were cut to pieces, and the rest of the regiment were hard put to it to hold their own. Further attacks led to a withdrawal of the line, and to the clearing of the oasis behind the trenches. Large reinforcements were sent from Italy, and by the fourth week in November General Caneva, who was in command of the expedition, had about 25,000 rifles and 16 batteries. He took the offensive, and in two actions cleared the oasis and sent the Turks and their tribesmen allies packing. Turkish headquarters were established at Aziziya, some 30m. south of Tripoli.

Political Aspect.—At the beginning of November the Italian Government had considered the possibility of extending the theatre of war, on the sea at least, hoping to induce Turkey to give up the struggle. Austro-Hungary intervened, backed by Germany, invoking Article VII. of the Triple Alliance. Italy's action being limited in this way, it was necessary to solve the problem directly, but the task was more difficult than it need have been owing to the limitations laid upon General Caneva by the Italian Government. General Caneva's orders appear to have

been that he must not risk reverses or suffer heavy loss. In the circumstances, an expedition in pursuit of the Turks, and their mobile allies seemed hardly practical. In any event, months went by without any action of importance in Tripolitania. In Cyrenaica there was one fight near Benghazi, when a force of Arabs who had come near the town were attacked and severely punished. Derna was closely beset throughout the winter, and Enver Bey, who had succeeded in reaching Cyrenaica towards the end of the year, organized a formidable resistance, securing relative unity among the tribesmen, and a willingness to co-operate with the Turks, which had never before existed.

Italian Offensive Renewed.—In April, the long spell of inaction in the western province came to an end, and from that time onward the resistance of the Turks and Arabs was gradually broken by a series of operations at various points. In April Italian warships appeared off the entrance to the Dardanelles. They were fired on by the Turkish forts and their answer drew a fresh and very energetic protest from Vienna. The northern Aegean was left alone by the Italians henceforth, but in May the island of Rhodes and 12 small islands of the Sporades (subsequently famous as the Dodecanese) were occupied by Italy. During the summer there were a number of successful actions in Tripolitania, and peace negotiations were begun at Ouchy in August. Progress was very slow, and it was not until Oct. 15, when two important victories had been won by the Italians, at Derna and Sidi Bilal (near Zan-zur) that the Treaty of Ouchy was signed.

Conclusions.—The conduct of the Tripoli campaign was prejudiced, first, by the failure of the Italian Government to judge the situation correctly, and secondly, by the limitations which were laid upon the military command. It was not possible at once to launch a desert expedition, and the difficulties of an advance to the Jebel, through country largely waterless, may be said to justify the adoption of a less ambitious plan. What is difficult to understand is the practical veto upon action of any kind, which immobilized large forces from December till April and delayed the carrying out of the policy which eventually put an end to hostilities, the policy of extending the area of operations and striking a blow whenever the chance offered.

The operations of the summer changed the situation, but Italian prestige was not wholly restored by the later successes, or by the subsequent actions against the tribesmen who did not lay down their arms when the treaty was signed. The policy of the Government bore heavily upon the army, which came in for much unfair criticism and increased the difficulties of those who undertook the administration of the country after the peace. The troubles which were to come with the outbreak of the World War may be traced in part at least to the hesitations and uncertainties of the six months following the landing.

ITALY (*Italia*), the name applied both in ancient and in modern times to the great peninsula that projects from the mass of central Europe far to the south into the Mediterranean sea, where the island of Sicily may be considered as a continuation of the continental promontory. The portion of the Mediterranean commonly termed the Tyrrhenian sea forms its limit on the west and south, and the Adriatic on the east; while to the north, where it joins the main continent of Europe, it is separated from the adjacent regions by the mighty barrier of the Alps, which sweeps round in a vast semicircle from the head of the Adriatic to the shores of Nice and Monaco.

TOPOGRAPHY

The land thus circumscribed extends between the parallels of 46° 40' and 36° 38' N., and between 6° 30' and 18° 30' E. Its greatest length in a straight line along the mainland is from north-west to south-east, in which direction it measures 708 m. in a direct line from the frontier near Courmayeur to Cape Sta Maria di Leuca, south of Otranto, but the great mountain peninsula of Calabria extends about 2° farther S. to Cape Spartivento in lat. 37° 55'. Its breadth is, owing to its configuration, very

irregular. The northern portion, measured from the Alps at the Monte Viso to the mouth of the Po, has a breadth of about 270 m., while the maximum breadth, from the Mont Cenis to Fiume, is far greater. The peninsula of Italy, which forms the largest portion of the country, nowhere exceeds 150 m. in breadth and does not generally measure more than 100 m. across. Its southern extremity, Calabria, forms a complete peninsula, being united to the mass of Lucania or the Basilicata by an isthmus only 35 m. in width, while that between the gulfs of Sta Eufemia and Squillace, which connects the two portions of the region, does not exceed 20 miles. The area of the kingdom of Italy is 120,956 sq.m., or, excluding Sicily and Sardinia, 101,575. Though the Alps form throughout the northern boundary of Italy, the exact limits at the extremities of the Alpine chain are not clearly marked. Ancient geographers appear to have generally regarded the remarkable headland which descends from the Maritime Alps to the sea between Nice and Monaco as the limit of Italy in that direction, and in a purely geographical point of view it is probably the best point that could be selected. But Augustus, who was the first to give to Italy a definite political organization, carried the frontier to the river Varus or Var, a few miles west of Nice, and this river continued in modern times to be generally recognized as the boundary between France and Italy. But in 1860 the annexation of Nice and the adjoining territory to France brought the political frontier farther east, to a point between Mentone and Ventimiglia which constitutes no natural limit.

Towards the north-east, Augustus carried the frontier far enough to include Tergeste (Trieste), and the little river Formio (Risano) was in the first instance chosen as the limit, but this was subsequently transferred to the river Arsia (the Arsa), which flows into the Gulf of Quarnero, so as to include almost all Istria; and the circumstance that the coast of Istria was throughout the middle ages held by the republic of Venice tended to perpetuate this arrangement, so that Istria was generally regarded as belonging to Italy, as it now does.

To the north the frontier is now fixed at the Brenner pass, at the head of the valley of the Adige. Here the main chain of the Alps (as marked by the watershed) recedes much farther to the north. In ancient times the upper valleys of the Adige and its tributaries were inhabited by Raetian tribes and included in the province of Raetia; and the line of demarcation between that province and Italy was purely arbitrary, as it was until after the war. Tridentum (Trento) was in the time of Pliny included in the tenth region of Italy or Venetia, but he tells us that the Tridentini were a Raetian tribe. Until 1919 the frontier between Austria and the kingdom of Italy crossed the Adige about 30 m. below Trento (*q.v.*).

While the Alps thus constitute the northern boundary of Italy, its configuration and internal geography are determined almost entirely by the great chain of the Apennines, which branches off from the Maritime Alps between Nice and Genoa, and, after stretching in an unbroken line from the Gulf of Genoa to the Adriatic, turns more to the south, and is continued throughout central and southern Italy, of which it forms as it were the backbone, until it ends in the southernmost extremity of Calabria at Cape Spartivento. The great spur or promontory projecting towards the east to Brindisi and Otranto has no direct connection with the central chain.

One chief result of the manner in which the Apennines traverse Italy from the Mediterranean to the Adriatic is the marked division between northern Italy, including the region north of the Apennines and extending thence to the foot of the Alps, and the central and more southerly portions of the peninsula. No such line of separation exists farther south, and the terms central and southern Italy, though in general use among geographers do not correspond to any natural divisions.

Northern Italy.—By far the larger portion of northern Italy is occupied by the basin of the Po, which comprises the whole of the broad plain extending from the foot of the Apennines to that of the Alps, together with the valleys and slopes on both sides of it. From its source in Monte Viso to its outflow into the Adriatic—a distance of more than 280 m. in a direct line—the Po receives all the waters that flow from the Apennines north-

wards, and all those that descend from the Alps towards the south, Mincio (the outlet of the Lake of Garda) inclusive. The next river to the east is the Adige, which, after pursuing a parallel course with the Po for a considerable distance, enters the Adriatic by a separate mouth. Farther to the north and north-east the various rivers of Venetia fall directly into the Gulf of Venice.

The geography of northern Italy will be best described by following the course of the Po. That river has its origin as a mountain torrent descending from the north flank of Monte Viso, at more than 6,000 ft. above the sea; and after less than 20 m. it enters the plain at Saluzzo, between which and Turin (30 m.) it receives three considerable tributaries—the Chisone on its left bank, and the Varaita and Maira on the south. A few miles below Valenza it is joined by the Tanaro, which brings the waters of several minor rivers.

More important are the rivers that descend from the main chain of the Graian and Pennine alps and join the Po on its left bank. Of these the Dora (called for distinction's sake Dora Riparia), which unites with the greater river just below Turin, has its source in the Mont Genève, and flows past Susa at the foot of the Mont Cenis. Next comes the Stura, which rises in the glaciers of the Roche Melon; then the Orca, flowing through the Val di Locana; and then the Dora Baltea, which has its source in the glaciers of Mont Blanc, and thence descends through the Val d'Aosta for about 70 m. till it enters the plain at Ivrea, and, after 20 m. more joins the Po below Chivasso. (See SAINT BERNARD PASSES.) About 25 m. further on, the Po receives the Sesia, which rises at the southern foot of Monte Rosa, and falls into the Po 14 m. below Vercelli. A little above this confluence, at Casale Monferrato, the navigable portion of the river begins (337 m. to the mouth, minimum width 656 ft., minimum depth 7 ft. with many shallows and sandbanks. About 16 m. E. of Vercelli it is joined by the Ticino, a large and rapid river, which brings the outflow of Lago Maggiore (*q.v.*). The next great affluent, the Adda, flows out of the lake of Como at Lecco, and thence traverses the plain for 70 m. till it enters the Po between Piacenza and Cremona. It receives the waters of the Brembo, descending from the Val Brembana, and the Serio from the Val Seriana above Bergamo. The Oglio rises in the Monte Tonale above Edolo, and descends through the Val Camonica to Lovere, where it expands into the Lago d'Iseo (*q.v.*). From its south-west extremity, the Oglio has a long and winding course through the plain reaching the Po above Borgoforte. In this lower part it receives the smaller streams of the Mella, which flows by Brescia, and the Chiese, from the small Lago d'Idro, between the Lago d'Iseo and that of Garda.

The last great tributary of the Po is the Mincio, which flows from the Lago di Garda (*q.v.*) and has a course of about 40 m. from Peschiera, at its south-eastern angle, till it joins the Po. About 12 m. above the confluence it passes under the walls of Mantua (*q.v.*) and expands into a broad lake-like reach so as entirely to encircle that city.

The Adige, joined by the Isarco below Bolzano descends as far as Verona, where it enters the great plain, with a course from north to south nearly parallel to the rivers last described, but below Legnago it turns eastward and runs parallel to the Po for about 40 m., entering the Adriatic by an independent mouth about 8 m. from the northern outlet of the greater stream. The two rivers have, however, been joined by artificial cuts and canals, thus permitting free circulation between them.

The Po itself, which is here a very large stream, with an average width of 400 to 600 yd., parts into two arms, known as the Po della Maestra and Po di Goro, at S. Maria di Ariano, and these again are subdivided into several other branches, forming a delta above 20 m. in width from N. to S. The point of bifurcation, at present about 25 m. from the sea, was formerly much farther inland, more than 10 m. W. of Ferrara, where a small arm of the river, still called the Po di Ferrara, branches from the main stream. Previous to the year 1154 this channel was the main stream, and the two small branches into which it subdivides, called the Po di Volano and Po di Primaro, were in early times the two main outlets of the river. The southernmost of these, the Po di Primaro, enters the Adriatic about 12 m. N. of Ravenna, so that

if these two arms be included, the delta of the Po extends about 36 m. from S. to N. The whole course of the river, including its windings, is estimated at 417 m.

In the first 21 m. of its course, down to Revello (west of Saluzzo), the Po descends no less than 5,250 ft., a fall of 47.3:1,000. From the confluence of the Ticino its fall is about 0.3:1,000; from the beginning of the delta below Ferrara, 0.08:1,000. At Turin it has an average width of 400 to 415 ft., a mean depth of 3½ to 5½ ft., and a velocity of 1 to 3 ft. in the second. The mean depth from the confluence of the Ticino (altitude 217 ft.) downwards is 6 ft. to 15 ft. The total length of the embankments exceeds 600 miles. Owing to its confinement between these high banks, and to the great amount of sedimentary matter which the river brings down with it, its bed has been gradually raised, so that in its lower course it is often above the level of the surrounding country. A result is the rapid growth of the delta (1300–1600, 127 ac.; 1823–93, 174 ac.). The Po della Maestra advances 282 ft. annually, the Po delle Tolle 262 ft., the Po della Gnocca 111½ ft., and the Po di Goro 259 ft. The low ground between the lower Po and the lower Adige and the sea is known as Polesine.

Besides the delta of the Po and the large marshy tracts which it forms, there exist on both sides of it extensive lagoons of salt water, generally separated from the Adriatic by narrow strips of sand or embankments, partly natural and partly artificial, but having openings which admit the influx and efflux of the sea-water, and serve as ports for communication with the mainland. The best known and the most extensive of these lagoons is that in which Venice is situated, which extends from Torcello in the north to Chioggia and Brondolo in the south, a distance of above 40 m.; but they were formerly much more extensive, and afforded a continuous means of internal navigation by what were called "the Seven Seas" (Septem Mare), from Ravenna to Altinum, a few miles north of Torcello. That city, like Ravenna, originally stood in the midst of a lagoon; and the coast east of it to near Monfalcone, where it meets the mountains, is occupied by similar expanses of water, which are, however, becoming gradually converted into dry land.

The tract adjoining this long line of lagoons is, like the basin of the Po, a broad expanse of perfectly level alluvial plain, extending from the Adige eastwards to the Carnic alps, where they approach close to the Adriatic between Aquileia and Trieste, and northwards to the foot of the great chain, which here sweeps round in a semicircle from the neighbourhood of Vicenza to that of Aquileia. The space thus included was known in ancient times as Venetia, a name applied in the middle ages to the well known city; the eastern portion of it became known in the middle ages as Frioul or Friuli, a district still interesting because of its peculiar form of Romance speech.

Returning to the south of the Po, the tributaries of that river on its right bank below the Tanaro which flow from the Ligurian Apennines, generally dwindle in summer into insignificant streams. The principal are: (1) the Scrivia, a small but rapid stream flowing from the Apennines at the back of Genoa; (2) the Trebbia, a much larger river which rises near Torriglia within 20 m. of Genoa, flows by Bobbio, and joins the Po a few miles above Piacenza; (3) the Nure, a few miles east of the preceding; (4) the Taro, a more considerable stream; (5) the Parma, flowing by the city of the same name; (6) the Enza; (7) the Secchia, which flows by Modena; (8) the Panaro, a few miles to the east of that city; (9) the Reno, which flows by Bologna, but instead of holding its course till it discharges its waters into the Po, as it did in Roman times, is turned aside by an artificial channel into the Po di Primaro. The other small streams east of this have their outlet in like manner into the Po di Primaro, or by artificial mouths into the Adriatic between Ravenna and Rimini. The river Marecchia, which enters the sea immediately north of Rimini, may be considered as the natural limit of northern Italy. (See RUBICON.) The Savio is the only other stream of any importance which has always flowed directly into the Adriatic from this side of the Tuscan Apennines.

The narrow strip of coast-land between the Maritime Alps, the Apennines, and the sea (called in ancient times Liguria [*q.v.*]),

is throughout its extent, from Nice to Genoa on the one side, and from Genoa to Spezia on the other, almost wholly mountainous. The steep slopes facing the south enjoy so fine a climate as to render them very favourable for the growth of fruit trees, especially the olive, which is cultivated in terraces to a considerable height up the face of the mountains, while the openings of the valleys are generally occupied by towns or villages, some of which are favourite resorts.

From the proximity of the mountains to the sea the rivers in this part of Italy are generally mere mountain torrents. The largest descend from the Maritime Alps between Nice and Albenga. The Roja, which rises in the Col di Tenda and descends to Ventimiglia; the Taggia, between San Remo and Oneglia; and the Centa, which enters the sea at Albenga. The Lavagna, which enters the sea at Chiavari, is the only stream of any importance between Genoa and the Gulf of Spezia. But immediately east of that inlet (a remarkable instance of a deep land-locked gulf with no river flowing into it) the Magra, which descends from Pontremoli down the valley known as the Lunigiana, is a large stream, and brings with it the waters of the Vara. The Magra (Macra), in ancient times the boundary between Liguria and Etruria, may be considered as constituting on this side the limit of northern Italy.

The Apennines (*q.v.*), as has been already mentioned, here traverse the whole breadth of Italy, cutting off the peninsula properly so termed from the broader mass of northern Italy by a continuous barrier of considerable breadth, though of far inferior elevation to that of the Alps. The Ligurian Apennines are in fact only a continuation of the Maritime Alps. From the neighbourhood of Savona to that of Genoa they do not rise to more than 3,000 to 4,000 ft., and are traversed by passes of less than 2,000 feet. As they extend towards the east they increase in elevation; the Monte Bue rises to 5,915 ft., while the Monte Cimone (7,103 ft.) is the highest point in the northern Apennines, and thence between Tuscany and what are now known as the Emilian provinces a continuous ridge from the mountains at the head of the Val di Mugello (due north of Florence) runs to the point where they are traversed by the celebrated Furlo pass. The highest point in this part of the range is the Monte Falterona, above the sources of the Arno, which attains 5,410 feet. Throughout this tract the Apennines are generally covered with extensive forests of chestnut, oak and beech; while the upper slopes afford admirable pasturage.

2. Central Italy.—The geography of central Italy is almost wholly determined by the Apennines, which traverse it in a direction from about north-north-east to south-south-west, almost precisely parallel to that of the coast of the Adriatic from Rimini to Pescara. The line of the highest summits and of the watershed ranges is about 30 m. to 40 m. from the Adriatic, while about double that distance separates it from the Tyrrhenian sea on the west. In this part of the range almost all the highest points of the Apennines are found. Beginning from the group called the Alpi della Luna near the sources of the Tiber, which attain 4,435 ft., they are continued by the Monte Nerone (5,010 ft.), Monte Catria (5,590 ft.), and Monte Maggio to the Monte Penino near Nocera (5,169 ft.), and thence to the Monte della Sibilla, at the source of the Nar or Nera, which attains 7,663 feet. Proceeding thence southwards, there are in succession the Monte Vettore (8,128 ft.), the Pizzo di Sevo (7,945), and the two great mountain masses of the Monte Corno, commonly called the Gran Sasso d'Italia, the most lofty of all the Apennines, attaining to a height of 9,560 ft., and the Monte della Maiella, its highest summit measuring 9,170 feet. Farther south no very lofty summits are found till we come to the group of Monti del Matese, in Samnium (6,660 ft.), which according to the division here adopted belongs to southern Italy. Besides the lofty central masses enumerated there are two other lofty peaks, outliers from the main range, and separated from it by valleys of considerable extent. These are the Monte Terminillo, near Leonessa (7,278 ft.), and the Monte Velino near the Lake Fucino, rising to 8,192 ft., both of which are covered with snow from November to May.

But the Apennines of central Italy, instead of presenting, like

the Alps and the northern Apennines, a definite central ridge, with transverse valleys leading down from it on both sides, in reality constitute a mountain mass of very considerable breadth, composed of a number of minor ranges and groups of mountains, which preserve a generally parallel direction, and are separated by upland valleys, some of them of considerable extent as well as considerable elevation above the sea. Such is the basin of Lake Fucino (*q.v.*) while the upper valley of the Aterno, in which Aquila is situated, is 2,380 ft. above the sea. The valley of the Gizio (*see* SULMONA) communicates with the upper valley of the Sangro by a plain called the Piano di Cinque Miglia, at an elevation of 4,298 feet. Nor do the highest summits form a continuous ridge of great altitude for any considerable distance; they are rather a series of groups separated by tracts of very inferior elevation forming natural passes across the range, and broken in some places (as is the case in almost all limestone countries) by the waters from the upland valleys turning suddenly at right angles, and breaking through the mountain ranges which bound them. Thus the Gran Sasso and the Maiella are separated by the deep valley of the Aterno, while the Tronto breaks through the range between Monte Vettore and the Pizzo di Sevo. This constitution of the great mass of the central Apennines has in all ages exercised an important influence upon the character of this portion of Italy, which may be considered as divided by nature into two great regions, a cold and barren upland country, bordered on both sides by rich and fertile tracts, and enjoying a warm but temperate climate.

The district west of the Apennines coincides in a general way with Etruria and Latium. The northern part of Tuscany is indeed occupied to a considerable extent by the underfalls and offshoots of the Apennines, which, besides the slopes and spurs of the main range that constitutes its northern frontier towards the plain of the Po, throw off several outlying ranges or groups. Of these the most remarkable is the group between the valleys of the Serchio and the Magra, commonly known as the mountains of Carrara. Two of the summits of this group, the Pizzo d'Uccello and the Pania della Croce, attain 6,155 feet and 6,100 feet. Another lateral range, the Prato Magno, which branches off from the central chain at the Monte Falterona, and separates the upper valley of the Arno from its second basin, rises to 5,188 feet.

The rest of this tract is for the most part a hilly, broken country, of moderate elevation, but Monte Amiata, near Radicofani, an isolated mass of volcanic origin, attains a height of 5,650 feet. South of this the country between the frontier of Tuscany and the Tiber is in great part of volcanic origin, forming hills with distinct crater basins, in several instances occupied by lakes (Lake of Bolsena, Lake of Vico and Lake of Bracciano). This volcanic tract extends across the Campagna of Rome, till it rises again in the lofty group of the Alban hills, the highest summit of which, the Monte Cavo, is 3,160 ft. above the sea. In this part the Apennines are separated from the sea, distant about 30 m., by the undulating volcanic plain of the Roman Campagna, from which the mountains rise in a wall-like barrier, of which the highest point, the Monte Gennaro, attains 4,165 feet. South of Palestrina again, the main mass of the Apennines throws off another lateral mass, known in ancient times as the Volscian mountains (now called the Monti Lepini), separated from the central ranges by the broad valley of the Sacco, a tributary of the Liris or Garigliano, and forming a large and rugged mountain mass, nearly 5,000 ft. in height, which descends to the sea at Terracina, and between that point and the mouth of the Liris throws out several rugged mountain headlands, which constitute the natural boundary between Latium and Campania, *i.e.*, of central Italy. Besides these offshoots of the Apennines there are in this part of central Italy several detached limestone mountains, rising like islands, of which the two most remarkable are the Monte Argentaro on the coast of Tuscany near Orbetello (2,087 ft.) and the Monte Circeo (1,771 ft.) at the extremity of the Pontine Marshes. The two valleys of the Arno (*q.v.*) and the Tiber (*q.v.*) form the key to the geography of central Italy west of the Apennines.

Towards the Adriatic the central range approaches much nearer

to the sea, and hence, the rivers that flow from it are of little importance. From Rimini southwards they are: (1) the Foglia; (2) the Metaurus (*q.v.*); (3) the Esino; (4) the Potenza; (5) the Chienti; (6) the Aso; (7) the Tronto; (8) the Vomano; (9) the Aterno; (10) the Sangro; (11) the Trigno, which forms the boundary of the southernmost province of the Abruzzi, and may therefore be taken as the limit of central Italy. This district is much broken up by these rivers and by smaller torrents, but is fertile, especially in fruit trees, olives and vines; and it has always been populous, with many small towns, but no great cities. Its chief disadvantage is the absence of ports, the coast preserving an almost unbroken straight line, with the single exception of Ancona, the only port worthy of the name on the eastern coast of central Italy.

3. **Southern Italy.**—The great central mass of the Apennines, which has traversed central Italy from north-west to south-east, continues in the same direction for about 100 m. farther, from the basin-shaped group of the Monti del Matese (which rises to 6,660 ft.) to the neighbourhood of Potenza, in the heart of the province of Basilicata, corresponding nearly to the ancient Lucania. The whole of the district known in ancient times as Samnium is occupied by an irregular mass of mountains, of much inferior height broken up into a number of groups, intersected by tortuous rivers. This mountainous tract, which has an average breadth of from 50 m. to 60 m., is bounded west by the plain of Campania, now called the Terra di Lavoro, and east by the much broader and more extensive tract of Apulia, composed partly of level plains, but for the most part of undulating downs, contrasting strongly with the mountain ranges of the Apennines, which rise abruptly above them. The central mass of the mountains, however, throws out two outlying ranges, the one to the west, which separates the Bay of Naples from that of Salerno, and culminates in the Monte S. Angelo above Castellammare (4,720 ft.), while the detached volcanic cone of Vesuvius (nearly 4,000 ft.) is isolated from the neighbouring mountains by an intervening strip of plain. On the east side the Monte Gargano (3,465 ft.), a detached limestone mass projects in a bold spur-like promontory into the Adriatic, forming the only break in the otherwise uniform coast-line of Italy on that sea.

From the neighbourhood of Potenza, the main ridge of the Apennines runs nearly due south, within a short distance of the gulf of Policastro, and thence to the Monte Pollino, the last lofty summit. The range is, however, continued through the modern Calabria, to the southern extremity or "toe" of Italy, but the broken limestone range which is the true continuation of the chain as far as the neighbourhood of Nicastro and Catanzaro, and keeps close to the west coast, is flanked on the east by a great mass of granitic mountains, rising to about 6,000 ft., and covered with vast forests, from which it derives the name of La Sila. A similar mass, separated from the preceding by a low neck of Tertiary hills, fills up the whole of the peninsular extremity of Italy from Squillace to Reggio. (*See ASPROMONTE.*)

The long spur-like promontory which projects towards the east to Brindisi and Otranto is merely a continuation of the low tract of Apulia, with a dry calcareous soil of Tertiary origin. The Monte Vulture, which rises in the neighbourhood of Melfi and Venosa to 4,357 ft., is of volcanic origin. Eastward from this the ranges of low bare hills called the Murgie of Gravina and Altamura gradually sink into those which constitute the peninsula between Brindisi and Taranto as far as the cape of Sta Maria di Leuca, the south-east extremity of Italy. This projecting tract, the "heel" of Italy, in conjunction with the great promontory of Calabria, forms the Gulf of Taranto, about 70 m. in width, and somewhat greater depth.

Of the rivers of southern Italy the Liris (*q.v.*) which has its source in the central Apennines above Sora, not far from Lake Fucino, and enters the gulf of Gaeta about 10 m. E. of the city of that name brings down a considerable body of water; as does also the Volturno, which rises in the mountains between Castel di Sangro and Agnone, flows past Isernia, Venafro and Capua, and enters the sea about 15 m. from the mouth of the Garigliano. About 16 m. above Capua it receives the Calore, which flows by

Benevento. The Silarus or Sele enters the gulf of Salerno a few miles below the ruins of Paestum. Below this the watershed of the Apennines is near to the sea on the west. Hence the rivers that flow into the Adriatic and the gulf of Taranto have much longer courses, though all partake of the character of mountain torrents. Proceeding south from the Trigno, there are: (1) the Biferno and (2) the Fortore, both rising in the mountains of Samnium, and flowing into the Adriatic west of Monte Gargano; (3) the Cervaro, south of this great promontory; (4) the Ofanto, the *Aufidus* of Horace, which rises about 15 m. W. of Conza, and in its lower course flows near Canosa and traverses the battlefield of Cannae (*q.v.*); and (5) the Bradano, which rises near Venosa, almost at the foot of Monte Vulture and flows towards the south-east into the gulf of Taranto, as do the Basento, the Agri and the Sinni. The Crati, which flows from Cosenza northwards, and then turns abruptly eastward to enter the same gulf, is the only stream worthy of notice in Calabria; while the arid limestone hills projecting eastwards to Capo di Leuca have no rivers at all. The only important lakes in Italy are those on or near the north frontier, already mentioned.

The lakes of central Italy, which are comparatively of trifling dimensions, belong to a wholly different class. The most important of these was the Lacus Fucinus (*q.v.*). Next in size is the Trasimene lake (*q.v.*). The neighbouring lake of Chiusi is of similar character, but much smaller dimensions. All the other lakes of central Italy, in the volcanic districts west of the Apennines, occupy deep cup-shaped hollows, which have undoubtedly at one time formed the craters of extinct volcanoes. Such is the Lago di Bolsena, the smaller Lago di Vico (Ciminian lake), and the Lago di Bracciano, while to the south of Rome the lakes of Albano and Nemi have a similar origin.

The only lake in southern Italy is the small Lago del Matese in the heart of the mountain group of the same name. On the coast of the Adriatic north and south of the promontory of Gargano are brackish lagoons communicating with the sea.

For the three great islands of Sicily, Sardinia and Corsica, *see* the separate articles. Of the smaller islands that lie near the coasts of Italy, the most considerable is that of Elba (*q.v.*). North of this, and about midway between Corsica and Tuscany, is the small island of Capraia (*q.v.*). Gorgona (*q.v.*), about 25 m. farther N., is still smaller. South of Elba are the equally insignificant islets of Pianosa (*q.v.*) and Montecristo (*q.v.*), while Giglio (*q.v.*) lies much nearer the mainland, immediately opposite the mountain promontory of Monte Argentaro. The islands farther south in the Tyrrhenian Sea are of an entirely different character. Of these Ischia and Procida, close to the northern headland of the bay of Naples, are of volcanic origin, as is the case also with the more distant group of the Ponza islands (*q.v.*). The island of Capri, on the other hand, opposite the southern promontory of the Bay of Naples, is a precipitous limestone rock. The Aeolian or Lipari islands (*q.v.*), a remarkable volcanic group, belong rather to Sicily than to Italy.

The Italian coast of the Adriatic presents a great contrast to its opposite shores, for while the coast of Dalmatia is bordered by a succession of islands, great and small, the long and uniform coast-line of Italy from Otranto to Rimini presents not a single adjacent island; and the small outlying group of the Tremiti islands (north of the Monte Gargano and about 15 m. from the mainland) alone breaks the monotony of this part of the Adriatic.

Geology.—The geology of Italy is mainly dependent upon that of the Apennines (*q.v.*). On each side of that great chain are found extensive Tertiary deposits, sometimes, as in Tuscany, the district of Monferrato, etc., forming a broken, hilly country, at others spreading into broad plains or undulating downs, such as the Tavoliere of Puglia, and the tract that forms the spur of Italy from Bari to Otranto.

Besides these, and leaving out of account the islands, the Italian peninsula presents four distinct volcanic districts. In three of them the volcanoes are entirely extinct, while the fourth is still in great activity.

1. The Euganean hills form a small group extending for about

10 m. from the neighbourhood of Padua to Este, and separated from the lower offshoots of the Alps by a portion of the wide plain of Padua. Monte Venda, their highest peak, is 1,890 ft. high.

2. The Roman district extends from the Alban hills (*see* ALBANUS MONS) to the Ciminian hills, and thence to the mountains of Radicofani and Monte Amiata (*q.v.*). It is generally held that these volcanoes were at first submarine (which would account for the stratification found, and for the excellent quality of the volcanic tufa so much used for building stone) and that the coast was gradually raised. (*See* LATIUM.)

3. The volcanic region of the Terra di Lavoro is separated by the Volscian mountains from the Roman district. The highest cone of Roccamonfina, at the north-north-west end of the Campanian plain called Montagna di Santa Croce, is 3,291 feet. The Phlegraean fields embrace all the country round Baiae and Pozzuoli and the adjoining islands. Monte Barbaro (Gaurus), north-east of the site of Cumae; Monte San Nicola (Epomeus), 2,589 ft. in Ischia; and Camaldoli, 1,488 ft., west of Naples, are the highest cones. The lakes Averno (Avernus), Lucrino (Lucrinus), Fusaro (Palus Acherusia), and Agnano are within this group, which has shown activity in historical times. A stream of lava issued in 1198 from the crater of the Solfatara, which still continues to exhale steam and noxious gases; the Lava dell' Arso came out of the north-east flank of Monte Epomeo in 1302; and Monte Nuovo, north-west of Pozzuoli (455 ft.), was thrown up in three days in Sept. 1538. Since its first historical eruption in 79, Vesuvius (*q.v.*) has been in constant activity.

4. The Apulian volcanic formation consists of the great mass of Monte Vulture.

The whole of the great plain of Lombardy is covered by Pleistocene and recent deposits. It is a great depression—the continuation of the Adriatic sea—filled up by deposits brought down by the rivers from the mountains. The depression was probably formed during the later stages of the growth of the Alps.

Climate and Vegetation.—The geographical position of Italy, extending from about 46° to 38° N., renders it one of the hottest countries in Europe. But the effect of its southern latitude is tempered by its peninsular character, bounded as it is on both sides by seas of considerable extent, as well as by the great range of the Alps with its snows and glaciers to the north. There are thus irregular variations of climate. Great differences also exist with regard to climate between northern and southern Italy, due in great part to other circumstances as well as to differences of latitude. Thus the great plain of northern Italy is chilled by the cold winds from the Alps, while the damp warm winds from the Mediterranean are to a great extent intercepted by the Ligurian Apennines. Hence this part of the country has a cold winter climate, so that while the mean summer temperature of Milan is higher than that of Sassari, and equal to that of Naples, and the extremes reached at Milan and Bologna are a good deal higher than those of Naples, the mean winter temperature of Turin is actually lower than that of Copenhagen. The lowest recorded winter temperature at Turin is 5° F. Throughout the region north of the Apennines no plant will thrive which cannot stand occasional severe frosts in winter, so that not only oranges and lemons but even the olive tree cannot be grown, except in specially favoured situations. But the strip of coast between the Apennines and the sea is not only extremely favourable to the growth of olives, but produces oranges and lemons in abundance, while even the aloe, the cactus, and the palm flourish in many places. The climatic frontier between Italy and Central Europe is thus formed rather by the Apennines than by the Alps.

Central Italy also presents striking differences of climate and temperature according to the greater or less proximity to the mountains. Thus the greater part of Tuscany, and the provinces thence to Rome, enjoy a mild winter climate, and are well adapted to the growth of olives as well as vines, but it is not till after passing Terracina, in proceeding along the western coast towards the south, that the vegetation of southern Italy develops in its full luxuriance. Even in the central parts of Tuscany, however, the climate is very much affected by the neighbouring mountains, and the increasing elevation of the Apennines

as they proceed south produces a corresponding effect upon the temperature. But it is when we reach the central range of the Apennines that we find the coldest districts of Italy. In all the upland valleys of the Abruzzi snow begins to fall early in November, and heavy storms occur often as late as May. The district from the south-east of Lake Fucino to the Piano di Cinque Miglia, enclosing the upper basin of the Sangro and the small lake of Scanno, is the coldest and most bleak part of Italy south of the Alps. Still farther south-east, Potenza has almost the coldest climate in Italy, and certainly the lowest summer temperatures. But nowhere are these contrasts so striking as in Calabria.

The shores, especially on the Tyrrhenian sea, present almost a continued grove of olive, orange, lemon, and citron trees, which attain a size unknown in the north of Italy. The sugar-cane flourishes, the cotton-plant ripens to perfection, date-trees are seen in the gardens, the rocks are clothed with the prickly-pear or Indian fig, the enclosures of the fields are formed by aloes and sometimes pomegranates, the liquorice-root grows wild, and the mastic, the myrtle, and many varieties of oleander, and cistus form the underwood of the natural forests of arbutus and evergreen oak. But 5 or 6 m. from the shore, and often even less, the scene changes. High districts covered with oaks and chestnuts succeed to this almost tropical vegetation; a little higher up and we reach the elevated regions of the Pollino and the Sila, covered with firs and pines, and affording rich pastures even in the midst of summer, when heavy dews and light frosts succeed each other in July and August, and snow begins to appear at the end of September or early in October. Along the shores of the Adriatic, which are exposed to the north-east winds, blowing coldly from over the Albanian mountains, delicate plants do not thrive so well in general as under the same latitude along the shores of the Tyrrhenian sea.

Southern Italy indeed has in general a very different climate from the northern portion of the kingdom; and, though large tracts are still occupied by rugged mountains of sufficient elevation to retain the snow for a considerable part of the year, the districts adjoining the sea enjoy a climate similar to that of Greece and the southern provinces of Spain. Unfortunately several of these fertile tracts suffer severely from malaria (*q.v.*), and especially the great plain adjoining the Gulf of Tarentum, which in the early ages of history was surrounded by a girdle of Greek cities (some of which attained to almost unexampled prosperity), has for centuries past been given up to almost complete desolation.

It is remarkable that, of the vegetable productions of Italy, many of which are at the present day among the first to attract the attention of the visitor are of comparatively late introduction, and were unknown in ancient times. The olive, indeed, in all ages clothed the hills of a large part of the country; but the orange and lemon are a late importation from the East, while the cactus or Indian fig and the aloe, both of them so conspicuous on the shores of southern Italy, as well as of the Riviera Ponente, are of Mexican origin, and consequently could not have been introduced earlier than the 16th century. The same remark applies to the maize or Indian corn. Many botanists are even of opinion that the sweet chestnut, which now constitutes so large a part of the forests that clothe the sides both of the Alps and the Apennines, and in some districts supplies the chief food of the inhabitants, is not originally of Italian growth; it is certain that it had not attained in ancient times to anything like the extension and importance which it now possesses. The eucalyptus is of quite modern introduction; it has been extensively planted in malarious districts. The characteristic cypress, ilex and stone-pine, however, are native trees, the last-named flourishing especially near the coast. The proportion of evergreens is large and has a marked effect on the landscape in winter.

Fauna.—The chamois, bouquetin and marmot are found only in the Alps, not at all in the Apennines. In the latter the bear was found in Roman times, and there are still a few remaining. Wolves are more numerous, though only in the mountainous districts; the flocks are protected against them by large white sheep-dogs, who have some wolf blood in them. Wild boars are also found in mountainous and forest districts. Foxes are common in

the neighbourhood of Rome. The sea mammals include the common dolphin (*Delphinus delphis*). The birds are similar to those of central Europe; vultures, eagles, buzzards, kites, falcons, and hawks are found in the mountains. Partridges, woodcock, snipe, etc., are among the game birds; but all kinds of small birds are also shot for food, and their number is thus kept down, while many members of the migratory species are caught by traps in the foothills on the south side of the Alps, especially near the lake of Como, on their passage. Large numbers of quails are shot in the spring. Among reptiles the various kinds of lizard are noticeable. There are several varieties of snakes, of which three species (all vipers) are poisonous. Of sea-fish there are many varieties, the tunny, the sardine, and the anchovy being commercially the most important. Some of the other edible fish, such as the palombo, are not found in northern waters. Small cuttlefish are in common use as an article of diet. Tortoiseshell, an important article of commerce, is derived from the *Thalassochelys caretta*, a sea turtle. Of fresh-water fish the trout of the mountain streams and the eels of the coast lagoons may be mentioned. The tarantula spider and the scorpion are found in the south of Italy.

CONSTITUTION AND GOVERNMENT

The Vatican palace, the Lateran palace, and the papal villa at Castel Gandolfo, declared extraterritorial by the law of 1871, are now included in the new Papal State. The small republic of San Marino is the only other enclave in Italian territory. Italy is a constitutional monarchy, in which the executive power belongs exclusively to the sovereign, while the legislative power is shared by him with the parliament. He holds supreme command by land and sea, appoints ministers and officials, promulgates the laws, coins money, bestows honours, has the right of pardoning, and summons and dissolves the parliament. Treaties with foreign powers, however, must have the consent of parliament. The sovereign is irresponsible, the ministers, the signature of one of whom is required to give validity to royal decrees, being responsible. Parliament consists of two chambers, the senate and the chamber of deputies, which are nominally on an equal footing, though practically the latter is more important. The senate consists of princes of the blood who have attained their majority, and of an unlimited number of senators above 40 years of age, who are qualified under any one of 21 specified categories—by having either held high office, or attained celebrity in science, literature, etc. In 1928 there were 375 senators exclusive of ten members of the royal family. Nomination is by the king for life. Besides its legislative functions, the senate is the highest court of justice in the case of political offences or the impeachment of ministers.

Under the electoral law of 1928, the chamber is to consist of 400 deputies, and the whole kingdom is to form a single constituency. The 13 National Confederations of industry (*Confederazioni nazionali dei sindacati*) can propose 400 candidates between them (being eventually to be represented by a fixed number of deputies; but in the first instance they are to propose double the number of candidates by which they will ultimately be represented) and other associations, approved by a special committee of five senators and five deputies, can propose candidates up to the number of 200. The Grand Council of the Fascist Party will then form and publish in the *Official Gazette* the final list of candidates, not being restricted in its choice to those already proposed; and this list is to be voted on on the third Sunday after its publication as a whole, and by a simple "Yes" or "No." If the list is rejected (which may be regarded as extremely improbable) the court of appeal will order and fix the date of fresh elections. In these, lists of candidates may be submitted by all associations etc., which contain as many as 5,000 members who are qualified as electors; but these lists may not include more than three-quarters of the deputies to be elected. Each list is to be marked by an emblem, and, after approval by the court of appeal is to be voted on as a whole, that which obtains the majority of votes being carried as a whole *i.e.*, on the *scrutin de liste* system. The remaining seats in the chamber are to be distributed among the remaining lists in pro-

portion to the votes they receive, *i.e.*, on a system of proportional representation.

What, if any, is the rôle of the Fascist Grand Council under this contingency is, as has been pointed out, not altogether clear; and it is probable that the rejection of its list has hardly been seriously contemplated; for the Grand Council, though its position was not regularized until 1928, has been the source from which all the acts of Fascism have emanated, and approval of the laws, which it has proposed by the chamber and the senate, has been a formality. It has now been enacted that it must be consulted on all constitutional questions (such as questions regarding the throne and the king, relations between Church and State, the nomination and prerogatives of the head of the Government); that it is the supreme co-ordinating organ of the régime; that ministers are *ex officio* members; and that it is to keep a list of possible ministers; that its decisions must be unanimous and its meetings secret; that it is to be summoned by the Duce, who settles all its agenda. Its members belong to three categories—members for an undetermined period, such as the Quadrumviri, the four leaders of the "march on Rome"; members of the Fascist hierarchy, during the period of their service, and members for three years (subject to prolongation) "who have deserved well of the nation and of the revolution." The right to vote is extended to all Italian citizens of 21 years of age and over, or to married men with children of 18 years of age and over. The elector must be either a contributor to a syndicate or confederation, or pay at least 100 lire a year in direct taxation, or be an employee of, or receive a pension from the State or a commune, or be a priest of the Roman Catholic or any other Church or denomination recognized by the State. The number of electors for 1929 was 9,460,727.

Senators and deputies receive no salary but have free passes on railways throughout Italy and on certain lines of steamers. Parliaments are quinquennial, but the king may dissolve the chamber of deputies at any time, being bound, however, to convoke a new chamber within four months. The executive must call parliament together annually. Each of the chambers has the right of introducing new bills, as has also the Government but all money bills must originate in the chamber of deputies. The consent of both chambers and the assent of the king is necessary to their being passed. Ministers may attend the debates of either house but can only vote in that of which they are members. The sittings of both houses are public and an absolute majority of the members must be present to make a sitting valid. The prime minister and head of the Government as his official title now runs holds the portfolios of the interior, foreign affairs, colonies, war, marine and air. The other ministries are finance, public instruction, communications, corporations (guilds), justice. Each minister is aided by an under-secretary of State. There is a Council of State with advisory functions, which can also decide certain questions of administration, especially applications from local authorities and conflicts between ministries, and a court of Accounts, which has the right of examining all details of state expenditure.

The corporative or guild state is organized so as to give an efficient representation and an authoritative voice to associations of both employers and employed. Both are systematically organized in local, provincial and inter-provincial syndicates and unions leading up to national confederations of employers and workers representing all branches of production and all forms of activity. Those employed in State and Government service and in public charities are represented by special associations, comprising in 1928 62% of Italian manufacturers and 82% of all industrial workers, percentages which it is intended shall gradually rise until all are included. There are also intermediate national federations for each branch of industry, which are to study technical and administrative problems so as to improve output and reduce production costs; and there is a confederation of workers' syndicates, all under the general Fascist Confederation of industry, with a ministry of guilds (*corporazioni*) representing the authority of the State.

Provincial economic councils under the presidency of the prefects have also been formed, which have to carry out the orders

of the ministry of national economy and have taken the place of the old chambers of commerce. Their members are partly elective and partly Government functionaries resident in the locality. Agreements on wages and conditions of labour stipulated between these unions become binding on all employers and workers for the territories concerned, whether they have become members of the unions or not, and they must, if employers, contribute one day's wages per annum for each man in their employ, and, if workers, one day's pay, to these unions. Strikes and lock-outs are forbidden, and disputed points must be settled by the labour courts. The legal working day is eight hours, with a weekly day of rest and a yearly holiday. At the same time, in its labour charter the State declared in favour of private initiative—only when occasion demands will the State step in to safeguard national interest. The workers cannot be dismissed on the score of illness (unless prolonged) or military service, and are entitled to contributory insurance against accidents, sickness (including tuberculosis), unemployment and old age. The unions are to provide vocational training and organize employment bureaux, to which the employers must have recourse, giving preference to Fascists.

For the *Opera Nazionale Dopolavoro* see section on Education.

The provincial administration has similarly been brought completely under the control of the central Government. Each province has a prefect as its head directly responsible to the minister of the interior; he is the direct representative of the central executive, and is to act, not only against the enemies of the régime, but also against violence of any sort or kind, preserving order and exercising a strict control in matters of finance. The secretaries of the various federations and organizations dependent on the Fascist party are to work in subordination to and in collaboration with the prefects. There are provincial "rectorates," taking the place of the previously existing provincial deputations and councils, each consisting of a presiding officer and "rectors," all of whom are to be appointed by royal decree. The sittings of these bodies are to be private.

Titles of Honour.—The former existence of so many separate sovereignties and "fountains of honour" gave rise to a great many hereditary titles of nobility. Besides many hundreds of princes, dukes, marquesses, counts, barons and viscounts, there are a large number of persons of "patrician" rank, persons with a right to the designation *nobile* or *signori*, and certain hereditary knights or cavalieri. In the "Golden Book of the Capitol" (*Libro d'Oro del Campidoglio*) are inscribed 321 patrician families, and of these 28 have the title of prince and eight that of duke, while the others are marquesses, counts or simply patricians. For the Italian orders of knighthood see KNIGHTHOOD AND CHIVALRY: *Orders of Knighthood*. The king's uncle is duke of Aosta, his son is prince of Piedmont and his cousin is duke of Genoa.

Justice.—The judiciary system of Italy was mainly framed on the French model. Italy has courts of cassation at Rome, Naples, Palermo, Turin, Florence, 22 appeal court districts, 116 tribunal districts and 1,063 *mandamenti*, each with its own magistracy (*pretura*), 116 assize court districts and 327 detached *sezioni di pretura*. In 17 of the principal towns there are also *pretori* who have exclusively penal jurisdiction. For minor civil cases involving sums up to 100 lire, *giudici conciliatori* have also jurisdiction, while they may act as arbitrators up to any amount by request. The Roman court of cassation is the highest, and in both penal and civil matters has a right to decide questions of law and disputes between the lower judicial authorities, and is the only one which has jurisdiction in penal cases.

The *pretori* have penal jurisdiction concerning all misdemeanours (*contravvenzioni*) or offences (*delitti*) punishable by imprisonment not exceeding three months or by fine not exceeding 1,000 lire. The penal tribunals have jurisdiction in cases involving imprisonment up to ten years, or a fine exceeding 1,000 lire while the assize courts, with a jury, deal with offences involving imprisonment for life or over ten years, and have exclusive jurisdiction (except that the senate is on occasion a high court of justice) over all political offences. Appeal may be made from the sentences of the *pretori* to the tribunals, and from the tri-

bunals to the courts of appeal; from the assize courts there is no appeal except on a point of form, which appeal goes to the court of cassation at Rome. This court has the supreme power in all questions of legality of a sentence, jurisdiction or competency.

The penal code is now being unified and reformed. A special military tribunal for crimes against the state or the Fascist régime has recently been instituted. In civil matters there is appeal from the *giudice conciliatore* to the *pretore* (who has jurisdiction up to a sum of 1,500 lire), from the *pretore* to the civil tribunal, from the civil tribunal to the court of appeal, and from the court of appeal to the court of cassation.

The statistics of civil proceedings vary greatly from region to region. Whereas the general average for the whole country was 29.7 per 1,000 inhabitants in 1924, the figure for Tuscany (the lowest) was only 14.4, and no region of northern Italy exceeded 26.7 (Liguria). Farther south, on the other hand, the figures are much higher—Abruzzi 32.3; Sicily 35.3; Basilicata 41.1; Campania and Molise 42.9; Lazio 46.4; Apulia 53.2; Calabria 57.4; while Sardinia has the enormous figure of 95.9. For criminal proceedings, if we exclude mere offences against regulations, or *contravvenzioni* (see below) with a general average of 16.71 per 1,000 for 1924, the variation is similar, the Marches and Umbria coming lowest with 9.89 per 1,000 inhabitant, while Liguria (18.59) and Venezia Giulia (19.57) are the highest for northern Italy. For the south the figures are: 15.23 for Sicily; 20.99 for Lazio; 22.18 for Apulia; 25.19 for Campania and Molise; 25.86 for Basilicata; 26.46 for the Abruzzi; 31.72 for Sardinia and 32.85 for Calabria, in most cases showing a considerable diminution on those for 1923.

A royal decree of 1891 established three classes of prisons: judiciary prisons, for persons awaiting examination or persons sentenced to arrest, detention or seclusion for less than six months; penitentiaries of various kinds (*ergastoli*, *case di reclusione*, *detenzione* or *custodia*), for criminals condemned to long terms of imprisonment; and reformatories, for criminals under age and vagabonds. Capital punishment was abolished in 1877, penal servitude for life being substituted. This generally involves solitary confinement of the most rigorous nature, and, as little is done to occupy the mind, the criminal not infrequently becomes insane. Capital punishment has, however, been reintroduced for crimes against the State. Certain types of dangerous individuals and political prisoners are relegated after serving a sentence in the ordinary convict prisons, and by administrative, not by judicial process, to special penal colonies known as *domicilii coatti* or "forced residences." The establishments are, however, unsatisfactory, being mostly situated on small islands, where it is often difficult to find work for the *coatti*, who are free by day, being only confined at night. They receive a small and hardly sufficient allowance for food of 10 lire a day, which they are at liberty to supplement by work if they can find it or care to do it. "Confinio politico" or forced residence under surveillance, may also be inflicted: but as to this no figures are available.

Notwithstanding the construction of new prisons and the transformation of old ones, the number of cells for solitary confinement is still insufficient for a complete application of the penal system established by the code of 1890, and the moral effect of the association of the prisoners is not good, though the system of solitary confinement as practised in Italy is little better. The total number of prisoners, including minors and inhabitants of enforced residences, was 76,066 (2.84 per 1,000 inhabitants) in 1871 and on Dec. 31, 1903 was 65,819 (including 6,044 women, or less than 10%). Of these 31,219 were in lockups, 25,145 in penal establishments, 1,837 minors in Government and 4,547 in private reformatories, and 3,071 (males) were *coatti*, or inmates of forced residences (all on small islands). In 1928 there were 30,423 men and 3,566 women in prisons, of whom about two thirds were awaiting trial; 11,317 men and 293 women in penal establishments; 1,932 males in Government and 564 in private reformatories (the females, 941 in number, being sent only to the latter); and 564 *coatti* were inmates of forced residences.

Crime.—Statistics of offences, including *contravvenzioni* or

breaches of by-laws and regulations, exhibit a considerable increase per 100,000 inhabitants since 1887, and even some increase on the figures of 1897. The figure was 1,783.45 per 100,000 in 1887; 2,164.46 in 1892; 2,546.49 in 1897; 2,497.90 in 1902; and 3,159 in 1924 (1,671 crimes and 1,488 *contravvenzioni*). The increase is partly covered by *contravvenzioni*, but almost every class of penal offence shows a rise including homicide, and that has risen considerably since 1902: 5,418 in 1880; 3,966 in 1887; 4,408 in 1892; 4,005 in 1897; 3,202 in 1902; and 4,259 in 1924 (of the last many must have been due to political disputes); and Italy remains, owing to the use of the knife, the European country in which homicide is most frequent.

Procedure, both civil and criminal, is somewhat slow, and the preliminary proceedings before the *juge d'instruction* occupy much time; and in murder trials, by the large number of witnesses called (including experts) and the lengthy speeches of counsel, have sometimes been dragged out to an unconscionable length; but much has been done recently to "speed up" the procedure. In 1902, of 884,612 persons accused of penal offences, 13.12% were acquitted during the period of the *instruction*; 30.31 by the courts; 46.32 condemned; and the rest acquitted in some other way. This shows that charges, often involving preliminary imprisonment, had been brought against an excessive proportion of persons who either were not or could not be proved to be guilty; but in 1925 the figures were very different. Of 984,095 persons accused, 15.4% were acquitted during the *instruction*; 22.6% by the courts; and the remaining 62% were condemned.

As in most civilized countries, the number of suicides in Italy has increased from year to year and the rate which was 63.6 per 1,000,000 in 1901, has gone up to 92 per 1,000,000. Trieste has the highest rate (446 per 1,000,000) of any city of Italy.

POPULATION AND STATISTICS

National Growth.—A remarkable general increase of the Italian population took place between 1910 and 1925. The losses due to the war, to epidemics and disasters and to the decrease of births in the years 1916-19, failed to check the increase, since they were balanced by the return of a number of emigrants (estimated at about 1,000,000) while comparatively few, about 363,000 have since left the country. Thus, it is estimated that the 34,600,000 enumerated in the 1911 census, giving a density of 121 to the sq.km. had increased at the end of 1925 to 40,548,683, or 131 to the sq.m. (including the restored territories, which are more sparsely populated than the peninsula), and this in a country two-thirds mountainous or very hilly, poor in minerals and with a soil exploited by some 3,000 years of cultivation.

The birth-rate, like that of most countries, shows a continuous decline since the '70s, but infant mortality has also diminished. The increase in the number of marriages has compensated for the decrease during the war, but the birth-rate per marriage is only at the pre-war level.

This rapid increase has resulted in the flooding of the labour market. The number of workers between the ages of 16 and 25 is probably about 24,000,000 as against about 20,500,000 in 1911. The difficulty of absorbing this mass of labour would have been even greater than it has been were it not for improvements in industrial equipment, factory organization, agricultural technique and also the extension of Italian territory. The pressure, however, is increased by the great number of war victims, who are unable to contribute their full share of work. Notwithstanding the difficulty of finding an outlet for Italy's surplus population by emigration and the existence of a certain amount of unemployment (the official figures for the end of July 1928, were 247,021), the present régime is desirous of effecting a large increase in it, being firmly persuaded that man power counts high in the greatness of a nation. Various measures have been taken to this end, such as the formation of a national maternity and infancy board, the imposition of a tax on bachelors (35 lire between 25 and 35, 50 lire between 35 and 50, 25 lire between 50 and 65 per annum, which is susceptible of increase), from which priests, seriously wounded soldiers, officers (whose marriage is subject to conditions) and all foreigners are exempt, and a large measure

of exemption from taxation for the heads of families with seven or more children. Any attempt at spreading Malthusian tenets is to be sternly dealt with, and general and family morality are being upheld in various ways.

The new reclamation scheme, to which 3,800,000,000 lire has been allotted, to be spread over 30 years (an equal sum being spent by the landowners), while the scheme itself is to be completed in 14 years, will provide more land for cultivation: and a migratory scheme whereby families are removed from over-populated districts to places where labour is required, will also help in this regard. 5,962,508 ac. are to be reclaimed as follows: 3,301,665 in Northern, 590,058 in Central, and 1,635,648 in Southern Italy, 114,935 in Sicily and 317,202 in Sardinia. Five million acres more have been declared to be fit for more intensive cultivation and if the landowners do not undertake this in accordance with the plans of the Government experts, so that the transformation of agriculture may be carried out with the least possible delay, the prefect of the province may step in and take the work over; or if no improvements are carried out at all, the State will (as has already been done near Rome) simply take possession of the land—on the principle that the State takes precedence of the individual, and that on his good conduct depends the continuance of private ownership. Compensation is to be fixed by the State, and the Savings Banks of Lombardy and Turin, two of the most important, have been placed under Fascist presidents, who are not likely to cause any delay in granting the necessary funds. It has been calculated that some 200,000 men will be eventually employed in carrying out the scheme, and that food for some 10,000,000 more Italians will eventually be grown at home. For comparison it may be stated that from the union of Italy to March 1928, 2,720,647,059 lire had been spent on land reclamation, of which 1,086,189,757 lire had been provided by the present Government (since October 1922), though, owing to the fall in the value of the lire, this is in reality only about one-tenth of the whole. A new *Ente Nazionale pu la Cooperazione*, instituted in 1926, is charged with the reorganization of the co-operative system, which has been most successful in the case of the War Veterans Association (*Opera Nazionale dei Combattenti*) in the sphere of land reclamation and land settlement.

Census Figures.—The table on p. 756 gives the area and population of each province and region in Italy in 1881. By 1927, as a result of the war of 1914-18, new provinces had been acquired and many of the old provinces had been reorganized, and so the table also shows the area of the acquired provinces and of the new divisions of the old provinces. In addition, the distribution of the 1921 population in these new administrative divisions, along with the density of the population per square mile, and the number of communes in each province, is indicated.

The actual population (not the resident or the "legal") of Italy since 1770 is approximately given in the following table (the first census of the kingdom as a whole was taken in 1871):—

1770	.	.	.	14,680,317	1871	.	.	.	26,801,154
1800	.	.	.	17,237,421	1881	.	.	.	28,459,628
1825	.	.	.	19,726,977	1901	.	.	.	32,475,253
1848	.	.	.	23,617,153	1911	.	.	.	34,671,377
1861	.	.	.	25,016,801	1921	.	.	.	38,756,433

It is estimated that the total population resident in Italy in 1927 was 40,799,000.

The average density increased from 257.21 per sq.m. in 1881 to 293.28 in 1901 and 320 in 1921. In Venetia, Emilia, the Marches, Umbria and Tuscany, the proportion of "concentrated" population (*i.e.*, population resident in the town or village which forms the centre of each commune) was only from 45 to 59% in 1921: in Calabria, the Abruzzi, Piedmont, Liguria, Lombardy, Venezia Tridentina, the proportion rose from 72 to 82%; in Venezia-Giulia, Lazio, Campania, Basilicata, Apulia, Sicily and Sardinia, it ran from 84 to 93%, being highest of all in the last named.

The following towns had a population of over 100,000 in 1922 (city only, not commune) Bari delle Puglie 109,990, Bologna,

162,111, Catania 234,871, Florence 747,791, Genoa 316,217, Messina 114,051, Milan 712,844, Naples 757,251, Palermo 317,735, Rome 656,266, Turin 482,117, Trieste 228,583, Venice 162,695.

A comparison with the 1901 "town" figures is frequently misleading: for that was in reality the *popolazione agglomerata* not merely in the principal centre of the commune, but in all the centres (*frazioni*) or villages—as distinct from the *popolazione sparsa*, or scattered population. In 1921 the figures for the principal centre are given. On the other hand, it is to be noticed that the often surprisingly large increase in the town population since the 1901 census is not always accompanied by a corresponding increase in that of the commune: and in that case it will generally be found that the town boundaries have been enlarged, so as to include a large number of the population within the *dazio* (or *octroi*) area. There have been, however, bitter complaints of the decrease of population in some of the cities of north Italy, notably Turin and Bologna; and in most large towns except Rome and Naples the deaths exceed the births.

A decrease in population similar to that in the Alpine valleys of Piedmont (*q.v.*) may be noticed, also in those of Lombardy, e.g., the Valtellina. These valleys often have no through routes and do not attract tourists as much as the corresponding French valleys.

The population of the different parts of Italy differs in character and dialect; and there is little community of sentiment between north and south. Modes of life and standards of comfort and morality in north Italy and in Calabria are widely different; the former being far in front of the latter. Much, however, is effected towards unification, by compulsory military service, it being the principle that no man shall serve within the military district to which he belongs. In almost all parts the idea of personal loyalty (e.g., between master and servant) retains an almost feudal strength. The inhabitants of the north—the Piedmontese, Lombards and Genoese especially—have suffered less than those of the rest of the peninsula from foreign domination and from the admixture of inferior racial elements, and the cold winter climate prevents the heat of summer from being enervating. They, and also the inhabitants of central Italy, are more industrious than the inhabitants of the southern provinces, who have hardly recovered from centuries of misgovernment and oppression, and are naturally more hot-blooded and excitable. The Sicilians and Sardinians have something of Spanish dignity, but the former are one of the most mixed and the latter probably one of the purest races of the Italian kingdom. Physical characteristics differ widely; but as a whole the Italian is somewhat short of stature, with dark or black hair and eyes, often good looking. Both sexes reach maturity early.

Births, Marriages, Deaths.—Birth and marriage rates vary considerably, being highest in the centre and south (Umbria, the Marches, Apulia, Abruzzi and Molise and Calabria) and lowest in the north (Piedmont, Liguria and Venetia), and in Sardinia. The death-rate is highest in Apulia, in the Abruzzi and Molise, and in Sardinia, and lowest in the north, especially in Venetia and Piedmont.

Taking the statistics for the whole kingdom, the annual marriage-rate for the years 1876–80 was 7.53 per 1,000; in 1881–85 it rose to 8.06; in 1886–90 it was 7.77; in 1891–95 it was 7.41, and in 1896–1900 it had gone down to 7.14 (a figure largely produced by the abnormally low rate of 6.88 in 1898), and in 1925 was 7.42 (having been as high as 13.99 in 1920, 11.54 in 1921), and below 3 per 1,000 in 1916–18. Divorce is forbidden by the Roman Catholic Church, and only 1,337 judicial separations were obtained from the courts in 1924, more than half of the demands made having been abandoned. Of the whole population in 1901, 57.5% were unmarried, 36.0% married, and 6.5% widowers or widows, and in 1921 the figures were much the same, only 45,070 persons being noted as legally separated. The illegitimate births show a decrease, having been 6.95 per 100 births in 1872, 5.72 in 1902 and 5 in 1925 with a rise, however, in the intermediate period as high as 7.76 in 1883. The birth-rate shows a corresponding decrease from 38.10 per 1,000 in 1881 to 33.29 in 1902, 27.79 in 1925 and 27.2 in 1926. The male births are now

about 6% in excess of the female, but there is a greater male mortality, so that, while in 1871 there was an excess of 143,370 males over females in the total population, in 1881 the excess was only 71,138, and in 1901 there were 169,684, and in 1921, 531,506 more females than males. The death-rate (excluding still-born children) was, in 1872, 30.78 per 1,000; in 1899 it had decreased to 21.89, and in 1925 to 16.79. The excess of births over deaths varies considerably—in 1880 it was only 3.12 per 1,000 owing to a very low birth-rate, but has averaged about 11.05 per 1,000 from 1896 to 1925. In 1926 the total of births was 1,134,616, and in 1927 1,121,072 (4% still-born); the deaths were 680,074 and 631,897, giving natural increases of about 409,000 and 444,000 respectively. The influence of the war period will be seen in the subjoined table:—

Period	Marriages per 1,000 of pop.	Births per 1,000 of pop.	Deaths per 1,000 of pop.	Natural increase§ per 1,000 of pop.
1908–10 Normal pre-War* period	8.01	33.30	20.07	11.40
War period†	7.53	31.86	19.61	12.14
Post War period‡	3.43	20.53	22.99	1.83
Average of years 1911–24.	10.31	30.00	17.60	12.60
	7.40	27.80	19.60	8.25

*1909–15 for births, 1909–14 for all other columns.

†1916–19 for births, 1915–18 for all other columns.

‡1919–24 for births, 1920–24 for all other columns.

§Excess of live births over deaths.

Occupations.—The population over 10 years of age was divided as follows in the census of 1921:

	Males	Females	Total
1. Agriculture (including hunting and fishing)	7,146,884	3,117,222	10,264,106
2. Industrial	4,081,204	1,273,391	5,354,595
3. Commerce	875,151	226,826	1,101,977
4. Administration, public and private (including defence)	675,889	46,735	722,624
5. Religion, liberal professions and arts	310,475	231,815	542,295
6. Domestic service	65,017	380,614	445,631
7. Non-professional	1,984,302	10,547,093	12,531,395

Emigration.—The movement of emigration before 1914 was divided into two currents, temporary and permanent—the former going chiefly towards neighbouring European countries and to North Africa, and consisting of manual labourers, the latter towards trans-oceanic countries, principally Brazil, Argentina and the United States. These emigrants remained abroad for several years, even when they did not definitively establish themselves there. There was a tendency towards increased emigration during the last quarter of the 19th century, owing to growth of population, and the over-supply of and low rates of remuneration for manual labour in various Italian provinces.

Year	Temporary emigration		Permanent emigration	
	Total no. of emigrants	Per every 100,000 of population	Total no. of emigrants	Per every 100,000 of population
1881	94,225	333	41,607	147
1891	118,111	389	175,520	578
1901	281,668	865	251,577	772

From the next table will be seen the direction of emigration in the years specified:—

	1900	1901	1902	1903	1904	1905
Europe	181,047	244,298	236,066	215,943	209,942	266,982
N. Africa	5,417	9,499	11,771	9,452	14,709	11,910
U.S. and Canada	89,400	124,636	106,723	200,383	173,537	322,627
Mexico (Central America)	2,069	997	766	1,311	1,828	2,044
South America	74,168	152,543	85,097	78,699	74,209	111,943
Asia and Oceania	691	1,272	1,086	2,168	2,966	2,715
Total	352,792	533,245	531,509	597,956	477,191	718,221

In 1911 the Italians abroad numbered 5,500,000, including those who had emigrated long before that date but had retained their nationality, and whose children had declared themselves Italians. In the 40 years 1872-1913 emigration had effected a reduction of at least 3,800,000 persons in the natural increase of the population of Italy. During the war the movement naturally slackened. Conscription, and the intense demand for man-power at home removed alike the possibility of and the incentive to migration. The total number of emigrants in the four years was, in fact, barely three-fifths of the pre-war annual average. With the return of peace began a feverish race abroad, which was at its height in 1920 when those who had returned from the United States during the war realized that if they delayed they might not be able to get back at all. The number of those repatriated in 1921-22 amounted to about half the total number of emigrants, but in 1926 were not much more than a quarter. In all probability the proportion was formerly greater, since nearly all of those in Europe and about 55% of those overseas returned for the winter. Nevertheless, when a census of Italians abroad was taken in 1924 it was found that there were 9,910,676 of them scattered about the world. For statistics of the movement of population and the restriction of migration to the United States see MIGRATION.

The present stream of emigrants differs considerably from that of 1909-13 in respect of quantity and quality, countries of destination and districts of origin. The restrictions introduced by the United States and other countries have not only reduced the total number of emigrants, but have tended especially to exclude the southern Italians. The number of Italian emigrants to the United States fell from 142,514 in 1921 to 52,182 in 1922, and in 1926 to 34,524.

Percentage Distribution of Italian Emigration

Destination	From North Italy		From Central Italy		From South Italy	
	1909-13	1922-24	1909-13	1922-24	1909-13	1922-24
Europe and the Mediterranean basin	31	46	7	6	4	6
Countries overseas	9	13	7	5	42	24

The following table shows the number of emigrants for the last few years for which statistics are available:

	1922	1923	1924	1925	1926
France	99,464	167,982	201,715	145,529	111,252
Other European countries	51,091	31,692	30,728	26,101	23,306
Africa	4,485	5,496	7,044	6,685	6,888
Asia	865	406	168	140	159
Oceania	4,226	963	4,498	5,182	4,783
North America	45,737	59,944	39,369	31,834	37,759
Central America	227	470	754	614	369
South America	75,175	123,004	80,378	63,987	79,294
Total	281,270	389,957	364,614	280,081	263,810

The character of the emigrants may be seen from the following table:

Percentage of Emigrants

Period	Agriculturists	Labourers	Bricklayers, masons, etc.	Industrial workers	Domestic servants	Other occupations
1909-13	32	30	12	12	3	11
1919	16	13	9	17	17	28
1920	26	20	10	22	12	10
1926	28	12	12	18	22	8

Emigration has, however, been much reduced since 1926 as a result of a definitely adopted policy. In the first half of 1927 50,825 Italians emigrated, the majority permanently; while for the first three months of 1928 the figures were: Permanent emigrants, 11,946; temporary emigrants, 12,044; Italians making temporary visits abroad for reasons of business, study, etc., 6,976. Passports are no longer granted without due cause shown.

It should be noted that Italian emigration into France—the only country to which they now go in at all considerable numbers, for not only the United States, but the Argentine Republic, Australia and Canada, have all stiffened their immigration laws—is carefully disciplined, the emigrants being formed into groups and subjected to supervision by the Italian consular authorities, with a view to the preservation of their national character and civilization. The institution of the *Fasci all'estero* (see FASCISM) will undoubtedly tend to this end in all countries; and it is quite clear that the absorption of the emigrants into the country which receives them is the last thing that Italy desires. Those Fascists, for instance, who do not send their children to Italian schools, where such are available, are to be expelled from the party; and they are required to wear the party badge, except where this is expressly forbidden by the laws of the country in which they are. Provision is made for the return of expectant mothers so that their children may be born in Italy.

See *L'Emigrazione Italiana dal 1910 al 1923* (Rome, 1926) and *L'Emigrazione Italiana negli anni 1924, 1925* (Rome, 1927).

EDUCATION

Public instruction in Italy is regulated by the State, which maintains public schools of every grade, and requires that other public schools shall conform to the rules of the State schools. No private person may open a school without State authorization. Schools may be classed thus:—

1. Elementary, of two grades, of the lower of which there must legally be at least one for boys and one for girls in each commune; while the upper grade elementary school is required in communes having normal and secondary schools or over 4,000 inhabitants. In both the instruction is free. They are maintained by the communes, sometimes with State help. The age limit is six to nine years for the lower grade, and up to 12 for the higher grade, attendance being obligatory at the latter also where it exists.
2. Secondary, instruction (i.) classical in the *ginnasi* and *licei*, the latter leading to the universities; (ii.) technical.
3. Higher education—universities, higher institutes and special schools.

Of the secondary and higher educatory methods, in the normal schools and *licei* the State provides for the payment of the staff and for scientific material, and often largely supports the *ginnasi* and technical schools, which should by law be supported by the communes. The universities are maintained by the State and by their own ancient resources; while the higher special schools are maintained conjointly by the State, the province, the commune and (sometimes) the local chamber of commerce.

In education, as in other matters, the State, according to the Fascist conception of it (see FASCISM) must intervene from the very beginning. Boys from the age of five or six join the *Balilla* under the *Opera Nazionale Balilla* (*Balilla* was a boy, who, by throwing a stone at an Austrian, began the insurrection of Dec. 5-10, 1746, in Genoa), while girls are enrolled by the *Opera Nazionale delle Piccole Italiane*, and eventually pass to the women's *Fasci*. New text-books are to be written in order that the children may be brought up in the Fascist spirit, and all teachers who are found to be lacking in it are to be dismissed. A number of women teachers of boys' classes have already been weeded out. From the *Balilla* the boys pass, at 15, to the *Avanguardisti*, and, having previously received a semi-military training, at the age of 18, are qualified to take the oath of allegiance to the king and to Fascist principles and receive their rifles. Eventually, all young Italians will, so it is intended, pass through these stages; so that, when the young children of the present generation have come to maturity, citizenship and Fascism will be synonymous and conterminous, which they are at present far from being, as the Fascist party only numbers about a million members, and refuses to admit more of the older generation to its ranks.

Higher education has not been exempt from the general evolution of the State in the Fascist sense; i.e., that the individual is subservient to the State, which has his well-being at heart, but refuses to be ruled by those countless units of which society is composed. Whereas the reforms of Giovanni Gentile allowed the

free creation of new institutions for secondary education, permission to do so was suspended for five years from 1926, and the Government now has the right to modify, create or suppress professorships and faculties in all universities, the complaint having been raised that they were too numerous (e.g., no less than 25 faculties of jurisprudence in Italy). The number of small universities is, as a fact, excessive; and if economics can be effected in this direction, funds will be released for the encouragement of research. But the universities, too, are to be investigated in order to test their efficiency in carrying out Fascist principles, and the general aim is to complete the "Fascistization" of all education in regard both to staff and curriculum.

In this connection the *Opera Nazionale Dopolavoro* (O.N.D.), with its million members, may be mentioned as doing excellent work. It is a movement which rightly claims to be both humanitarian and utilitarian; being intended to help and direct the working-classes in spending their hours of leisure and repose, co-ordinating what is already done by individual firms and employers, and by already existing societies and clubs, for the work-people. Thus it concerns itself with both physical and mental culture—the latter including evening schools, lectures, etc., etc.—the two being combined in excursions to places of interest. Membership is granted to clubs or societies, and not to individuals; and considerable reductions in price of railway fares, admission fees to museums, discounts, etc., etc., are allowed. The federal political secretaries of the Fascist party are, as a rule, provincial commissioners, and therefore are able to keep a check on the associations admitted and their political activities.

In a higher social grade, the same tendency is apparent, and the *Confederazione Olimpica Nazionale Italiana* (C.O.N.I.) is now the superior organization for all forms of physical recreation in which Italy can be represented at the Olympic games. Its authority can be carried to considerable lengths—as when it declared two tennis players who refused to play in an international match against France to have lost their amateur status. Indeed, one of the features of the Fascist régime is the attention devoted to physical culture. A training college for physical instructors has been started in Rome; and activity in promoting games and sports may be seen on every side. Playing fields are being provided everywhere. Englishmen, however, cannot lose sight of the fact that the persistent retention, in some cities, and especially in Rome, of the long break at midday for a heavy meal, with the consequent double journey home (and even its institution in cases where it did not exist), in all professions and employments which do not involve actual manual labour, detains the workers, at almost all times of the year, too late in the evening to render it possible for them to take any physical exercise; whereas in spring and autumn, at any rate, a different time-table would certainly allow of this. Once this reserve has been made, one can have nothing but praise for the new spirit, and for the way in which the work is practically being carried out. The latest game adopted by the athletic clubs is Rugby football.

The number of persons unable to read and write has very greatly decreased, both absolutely and in proportion to the number of inhabitants. The census of 1871 gave 73% of illiterates, that of 1881, 67%, and that of 1901, 56% (i.e., 51.8 for males and 60.8 for females), while that of 1921 gave 24 for males and 30 for females. In Piedmont there were 17.7% of illiterates above six years (the lowest) and in Calabria 78.7% (the highest), the figures for the whole country being 48.5, while in 1921 there were 7% in Piedmont, and only 2% in Venezia Tridentina, while there were still 58% in Calabria and 50% or more in the rest of the south, and in Sicily and Sardinia, the figures for the whole country being 27%. As might be expected, progress has been most rapid wherever education, at the moment of national unification, was most widely diffused. For instance, the number of bridegrooms unable to write their names in 1872 was in the province of Turin 26%, and in the Calabrian province of Cosenza 90%; in 1899 the percentage in the province of Turin had fallen to 5%, while in that of Cosenza it was still 76%. In 1925 it was 0.5 in Piedmont and 30% in Calabria, where 48% of the brides were illiterate. Infant asylums (where the first rudiments of in-

struction are imparted to children between two and a half and six years of age) and elementary schools have increased in number. There has been a corresponding increase in the number of scholars. Thus:—

Year	Infant asylums (Public and private)		Daily elementary schools (Public and private)	
	Number of asylums	Number of scholars	Number of schoolrooms	Number of scholars
1885-86	2,083	240,365	53,628	2,252,898
1890-91	2,296	278,204	57,077	2,418,692
1901-02	3,314	355,594	61,777	2,733,349
1924-25	5,828	473,652	116,031	3,644,606

The teachers in 1901-02 numbered 65,739 and in 1924-25, 94,197, or about 40 scholars per teacher.

The rate of increase in the public State-supported schools has been much greater than in the private schools. School buildings have been improved and the qualifications of teachers raised. Nevertheless, many schools are still defective, both from a hygienic and a teaching point of view; while the economic position of the elementary teachers, who in Italy depend upon the communal administrations and not upon the State, is still in many parts of the country extremely low.

The law of 1877 rendering education compulsory for children between six and nine years of age has been the principal cause of the spread of elementary education. The law has been, however, imperfectly enforced, for financial reasons. In 1901-02 only 65% out of the whole number of children between six and nine years of age were registered in the lower standards of the elementary and private schools, and in 1924-25 there were still 1,174,830 children who, though theoretically obliged to go to school, did not do so. In 1925-26 the Government supplementary schools (*Scuole Complementari*) numbered 429, with 55,586 scholars, 234 private schools taking another 9,155 scholars. Private institutions and working-class associations have striven to improve the intellectual conditions of the working classes, and popular universities have attained considerable development. The number of institutes devoted to secondary education remained almost unchanged between 1880-81 and 1895-96. In some places the number was even diminished by the suppression of private educational institutes. But the number of scholars increased considerably, and showed a ratio superior to the general increase of the population. The greatest increase has taken place in technical education, where it has been much more rapid than in classical education. There are three higher commercial schools, with academic rank, at Venice, Genoa and Bari, and 11 secondary commercial schools; and technical and commercial schools for women at Florence and Milan. The number of agricultural schools has also grown, although the total is relatively small when compared with population. The attendance at the various classes of secondary schools in 1925-26 is shown by the table on p. 765.

The schools, generally much smaller, which do not obtain equality with Government schools are some of those conducted by religious orders, or else those in which a sufficient standard is not reached.

The total attendance of students in the various faculties at the different universities and higher institutes is as follows:—

	1882	1902	1925-26
Law			
Philosophy and letters	4,801	8,385	9,391
Medicine and surgery	410	1,703	3,649
Professional diploma, pharmacy	4,428	9,055	10,540
Mathematics and natural science	798	3,290	3,424
Engineering	1,364	3,500	6,122
Agriculture	982	1,293	5,589
Commerce	145	507	860
Various	128	167	4,909
Total	13,065	27,900	45,512

The professors are ordinary and extraordinary, and free professors (*liberi docenti*), corresponding to the German *Privatdozenten*, are also allowed to be attached to the universities.

The total expenditure on all counts proposed and authorized for the financial year 1927-28 by the Ministry of Public Instruction amounted to 1,359,473,000 lire.

Academies.—The Accademia dei Lincei was founded in 1603 by Federico Cesi, but ceased to exist in 1651. After various attempts it was revived in 1847 by Pius IX., and in 1875 by Victor Emmanuel II. It now has two classes—physical, mathematical and natural sciences, with 65 Italian ordinary members and the same number of corresponding members, and 100 foreign members, and moral, historical and philological sciences, with 58 members in each of the three categories mentioned. It produces important publications, and is able to encourage research by means of the valuable prizes in its gift. It occupies the Palazzo Corsini in Rome.

The Accademia d'Italia, recently founded, is to consist of not more than 60 members, with an annual stipend of 30,000 lire: but so far only a few of them have been appointed. Its official residence is the Farnesina, which has been purchased by the Government for that purpose (famous for Giulio Romano's frescoes of the story of Psyche), almost opposite the Palazzo Corsini.

Libraries.—These are numerous in Italy, those even of small cities being often rich in manuscripts and valuable works. Statistics collected in 1893-94 and 1896 revealed the existence of 1,831 libraries, either private (but open to the public) or completely public. The public libraries have been enormously increased since 1870 by the incorporation of the treasures of suppressed monastic institutions, but have suffered seriously from lack of funds during and immediately after the war. The richest in manuscripts is that of the Vatican, especially since the purchase of the Barberini library in 1902; it now contains over 34,000 mss. The Vatican archives are also of great importance. Most large towns contain important State or communal archives, in which a considerable amount of research is being done by local investigators; the various societies for local history in the various regions of Italy (*Società di Storia Patria*) do very good work and issue valuable publications; the treasures which the archives contain are by no means exhausted. The private archives of the great families often contain documents of the highest interest: but only the Caetani family has so far felt their publication to be a duty, and acted accordingly. (See GAETA.) Libraries and public archives are under the superintendence of the ministry of public instruction. A separate department of this ministry under a director-general has the charge of antiquities and fine arts, making archaeological excavations and supervising those undertaken by private persons (permission to foreigners, even to foreign schools, to excavate in Italy is rarely granted), and maintaining the numerous State museums and picture galleries, for which admission fees far higher than in any other country are charged. The exportation of works of art and antiquities from Italy without leave of the ministry is forbidden (though it has in the past been sometimes evaded). An inventory of those objects, the exportation of which can in no case be permitted, has been prepared; and the ministry has at its disposal a fund of 500,000 lire for the purchase of important works of art of all kinds.

Religion.—The great majority of Italians—97.12%—are Roman Catholics. Besides the ordinary Latin rite, several others are recognized. The Armenians of Venice maintain their traditional characteristics. The Albanians of the southern provinces still employ the Greek rite and the Greek language in their public worship, and their priests, like those of the Greek Church, are allowed to marry. Certain peculiarities introduced by St. Ambrose distinguish the ritual of Milan from that of the general church. Up to 1871 the island of Sicily was, according to the bull of Urban II., ecclesiastically dependent on the king, and exempt from the canonical power of the pope.

The territorial authority of the papal see was practically abolished in 1870 but it was re-established by the Lateran treaty of 1929 which gave the pope sovereignty over his Vatican City. (See FASCISM, VATICAN.) In the same city in which the administrative functions of the body politic are centralized there has always existed the court of the spiritual potentate, ruling over the

Catholic world. Protestants numbered some 65,000, of whom half were Italian and half foreign in 1901. Figures were not given in the last two censuses. Of the former 22,500 were Waldensians. The number of Jews was returned as 36,000, but is certainly higher. There are, besides, in Italy some 2,500 members of the Greek Orthodox Church. There were in 1901 20,707 parishes in Italy, 68,444 secular clergy and 48,043 regulars (monks, lay brothers and nuns). The size of parishes varies from province to province, Sicily having larger parishes in virtue of the old Sicilian church laws, and Naples, and some parts of central Italy, having the smallest. The Italian parishes had in 1901 a total gross revenue, including assignments from the public worship endowment fund, of £1,280,000 or an average of £63 per parish; 51% being revenue from glebe lands.

The kingdom is divided into 271 sees and ten abbeys, or prelatures *nullius in dioceseos*. The dioceses are as follows:—

A. 6 suburbicarian sees—Ostia and Velletri, Porto and Sta. Rufina, Albano, Frascati, Palestrina, Sabina—all held by cardinal bishops.

B. 39 ecclesiastical provinces, each under a metropolitan, composed of 150 suffragan dioceses not counting 7 in Jugo-Slavia. Their position is indicated in the following table:—

Metropolitans	Suffragans
Acerenza-Matera	Anglona-Tursi, Tricarico, Venosa.
Bari	Conversano, Ruvo-Bitonto.
Benevento	S. Agata de' Goti, Alife, Ariano, Ascoli Satriano, Cerignola, Avellino, Bojano, Bovino, Larino, Lucera, S. Severo, Teleso (Cerreto), Termoli.
Bologna	Faenza, Imola.
Brindisi and Ostuni	No suffragan.
Cagliari	Galtelli-Nuoro, Iglesias, Ogliastro.
Capua	Caiazzo, Calvi-Teano, Caserta, Isernia-Venafro, Sessa.
Chieti and Vasto	No suffragan.
Conza and Campagna	S. Angelo de' Lombardi-Bisaccia, Lacedonia, Muro Lucano.
Fermo	Macerata-Tolentino, Montalto, Ripatransone, S. Severino.
Florence	Borgo S. Sepolcro, Colle di Val d'Elsa, Fiesole, S. Miniato, Modigliana, Pistoia-Prato.
Genoa	Albenga, Bobbio, Chiavari, Savona-Noli, Tortona, Ventimiglia.
Gorizia and Gravesca	Parenzo, Pola, Trieste, Capodistria.
Lanciano and Ortona	No suffragan.
Manfredonia and Viesti . . .	No suffragan.
Messina	Lipari, Nicosia, Patti.
Milan	Bergamo, Brescia, Como, Crema, Cremona, Lodi, Mantua, Pavia.
Modena	Carpi, Guastalla, Mass-Carrara, Reggio.
Monreale	Caltanissetta, Girgenti.
Naples	Acerra, Ischia, Nola, Pozzuoli.
Oristano	Ales-Terralba.
Otranto	Gallipoli, Lecce, Ugento.
Palermo	Cefalù, Mazzara, Trapani.
Pisa	Leghorn, Pescia, Pontremoli, Volterra.
Ravenna	Bertinoro, Cervia, Cesena, Comacchio, Forlì, Rimini, Sarsina.
Reggio Calabria	Bova, Cassano, Catanzaro, Cotrone, Gerace, Nicastro, Oppido, Nicotera-Tropea, Squillace.
Salerno	Acerno, Capaccio-Vallo, Diano, Marsico-Nuovo and Potenza, Nocera dei Pagani, Nusco, Policastro.
Sassari	Alghero, Ampurias and Tempio, Bisarhio, Bosa.
S. Severino	Cariati.
Siena	Chiusi-Pienza, Grosseto, Massa Marittima, Sovana-Pitigliano.
Syracuse	Caltagirone, Noto, Piazza-Armerina.
Sorrento	Castellammare.
Taranto	Castellaneta, Oria.
Trani-Nazareth-Barletta, Bisceglie	Andria.
Turin	Acqui, Alba, Aosta, Asti, Cuneo, Fossano, Ivrea, Mondovì, Pinerolo, Saluzzo, Susa.
Urbino	S. Angelo in Vado-Urbania, Cagli-Pergola, Fossombrone, Montefeltro, Pesaro, Sinigaglia.
Venice (patriarch)	Adria, Belluno-Feltre, Ceneda (Vittorio), Chioggia, Concordia-Portogruaro, Padua, Treviso, Verona, Vicenza.

VIEWS IN ROME AND SCENES ALONG ITALIAN COASTS

1. View of the Colosseum, taken from the Palatine Hill, Rome
2. Air view of Rome, showing the monument of Victor Emmanuel II. in the foreground and the old city with the ruins of the Forum in the back. The monument by Giuseppe Sacconi, symbolizing the achievement of Italian unity, was begun in 1885 and dedicated in 1911
3. The Lake of Orta, the most western of the Italian lakes, situated among the foot hills of the Alps, not far from the Swiss border. The small island, San Giulio, is occupied chiefly by villas
4. View on the Italian Riviera near Genoa
5. The road to Anacapri on the Island of Capri. Constructed in 1874 and restored in 1923, the road winds its way up the face of the cliff for a thousand feet. In many places it is hewn in the solid rock
6. Amalfi, a small town on the Gulf of Salerno, southeast of Naples. It has been the seat of an archbishop since 987, and as a maritime republic in the early Middle Ages rivalled Genoa and Pisa
7. A view of Capri from the Anacapri road (see fig. 5). The mountainous island of Capri lies three miles from the Punta della Campanella in the Bay of Naples

Metropolitans

Vercelli

Suffragans

Alessandria della Paglia, Biella, Casale, Monferrato, Novara, Vigevano.

Twelve archbishops and 64 bishops are independent of all metropolitan supervision, and hold directly of the Holy See. The archbishops are those of Amalfi, Aquila, Camerino and Treia. Catania, Cosenza, Ferrara, Gaeta, Lucca, Perugia, Rossano, Spoleto, and Udine, and the bishops those of Acireale, Acquapendente, Alatri, Amelia, Anagni, Ancona-Umana, Aquino-Sora-Pontecorvo, Arezzo, Ascoli, Assisi, Aversa, Bagnorea, Bressanone, Cava-Sarno, Città di Castello, Città della Pieve, Cività Castellana-Orte-Gallese, Corneto-Civita Vecchia, Cortona, Fabriano-Matelica, Fano, Ferentino Fidenza, Foggia, Fiume, Foligno, Gravina-Montepeloso, Gubbio, Jesi, Luni-Sarzana and Bragnato, S. Marco-Bisignano, Marsi (Pescina), Melfi-Rapolla Mileto, Molfetta-Terlizzi-Giovenazzo, Monopoli, Montalcino, Montefiascone, Montepulciano, Nardo, Narni, Nocera in Umbria, Norcia, Orvieto, Osimo-Cingoli, Parma, Penne-Atri, Piacenza, Poggio Mirteto, Recanati-Loreto, Rieti, Segni, Sutri-Nepi, Teramo, Terni, Terracina-Piperno-Sezze, Tivoli, Todi, Trento, Trivento, Troia, Valva-Sulmona, Veroli, Viterbo-Toscanello. In each diocese there is to be found a seminary or diocesan school.

Religious Foundations.—In 1855 an act was passed in the Sardinian States for the disestablishment of all houses of the religious orders not engaged in preaching, teaching or the care of the sick, of all chapters of collegiate churches not having a cure of souls or existing in towns of less than 20,000 inhabitants, and of all private benefices for which no service was paid by the holders. The property and money thus obtained were used to form an ecclesiastical fund (*Cassa Ecclesiastica*) distinct from the finances of the State. This act resulted in the suppression of 274 monasteries with 3,733 friars, of 61 nunneries with 1,756 nuns and of 2,722 chapters and benefices. In 1860 and 1861 the royal commissioners (even before the constitution of the new kingdom of Italy had been formally declared) issued decrees by which there were abolished—(1) in Umbria, 197 monasteries and 102 convents with 1,809 male and 2,393 female associates, and 836 chapters or benefices; (2) in the Marches, 292 monasteries and 127 convents with 2,950 male and 2,728 female associates; (3) in the Neapolitan provinces, 747 monasteries and 275 convents with 8,787 male and 7,493 female associates.

There were thus disestablished in seven or eight years 2,075 houses of the regular clergy occupied by 31,649 persons; and the confiscated property yielded a revenue of £398,298. And at the same time there had been suppressed 11,889 chapters and benefices of the secular clergy, which yielded an annual income of £199,149. The value of the capital thus potentially freed was estimated at £12,000,000; though hitherto the ecclesiastical possessions in Lombardy, Emilia, Tuscany and Sicily had been untouched. As yet the *Cassa Ecclesiastica* had no right to dispose of the property thus entrusted to it; but in 1862 an act was passed by which it transferred all its real property to the national domain, and was credited with a corresponding amount by the exchequer. The property could now be disposed of like the other property of the domain; and except in Sicily, where the system of emphyteusis was adopted, the Church lands began to be sold by auction. To encourage the poorer classes of the people to become landholders, it was decided that the lots offered for sale should be small, and that the purchaser should be allowed to pay by five or ten yearly instalments. By a new act in 1866 the process of secularization was extended to the whole kingdom. All the members of the suppressed communities received full exercise of all the ordinary political and civil rights of laymen; and annuities were granted to all those who had taken permanent religious vows prior to Jan. 18, 1864. To priests and choristers, for example, of the proprietary or endowed orders were assigned £24 per annum if they were upwards of 60 years of age, £16 if upwards of 40, and £14, 8s. if younger.

The *Cassa Ecclesiastica* was abolished, and in its stead was instituted a *Fondo pel Culto*, or public worship fund. From the general confiscation were exempted the buildings actually used for public worship, as episcopal residences or seminaries, etc., or

which had been appropriated to the use of schools, poorhouses, hospitals, etc.; as well as the buildings, appurtenances, and movable property of the abbeys of Monte Cassino, La Trinità della Cava dei Tirreni, San Martino della Scala, Monreale, the Certosa near Pavia, and other establishments of the same kind of importance as architectural or historical monuments. An annuity equal to the ascertained revenue of the suppressed institutions was placed to the credit of the fund in the Government 5% consols. A fourth of this sum was to be handed to the communes to be employed on works of beneficence or education as soon as a surplus was obtained from that part of the annuity assigned for the payment of monastic pensions; and in Sicily, 209 communes entered on their privileges as soon as the patrimony was liquidated. Another act in 1867 decreed the suppression of certain foundations which had escaped the action of previous measures, put an extraordinary tax of 30% on the whole of the patrimony of the Church, and granted the Government the right of issuing 5% bonds sufficient to bring into the Treasury £16,000,000, which were to be accepted at their nominal value as purchase money for the alienated property.

The public worship endowment fund has relieved the State exchequer of the cost of public worship; has gradually furnished to the poorer parish priests an addition to their stipends, raising them to £32 per annum, with the prospect of further raising them to £40; and has contributed to the outlay incurred by the communes for religious purposes. The monastic buildings required for public purposes have been made over to the communal and provincial authorities, while the same authorities have been entrusted with the administration of the ecclesiastical revenues previously set apart for charity and education, and objects of art and historical interest have been consigned to public libraries and museums. By these laws the reception of novices was forbidden in the existing conventual establishments the extinction of which had been decreed, and all new foundations were forbidden, except those engaged in instruction, and the care of the sick. But these laws have not been enforced of late years; and the ecclesiastical possessions seized by the State were thrown on the market simultaneously, and so realized very low prices, being often bought up by wealthy religious institutions. The large number of these institutions was increased when these bodies were expelled from France.

In 1926 the patrimony of the endowment fund amounted to 427,865,000 lire of which only 4,380,000 lire were represented by buildings. The rest was made up of capital and interest. Monastic pensions represented a rapidly diminishing sum of 4,643,000 lire payable to 587 persons. The chief items of annual expenditure drawn from the fund are the supplementary stipends to priests, namely, 453,145,000 lire, distributed among 17,993 parishes, the minimum stipend having been fixed at 3,500 lire per annum.

Roman Charitable and Religious Fund.—The law of June 19, 1873, contained special provisions, in conformity with the character of Rome as the seat of the papacy which were modified by the concordat concluded in 1929. According to the census of 1871 there were in the city and province of Rome 474 monastic establishments (311 for monks, 163 for nuns), occupied by 4,326 monks and 3,825 nuns, and possessing a gross revenue of 4,780,891 lire. Of these, 126 monasteries and 90 convents were situated in the city, 51 monasteries and 22 convents in the "suburbicariates." The law of 1873 created a special charitable and religious fund of the city, while it left untouched 23 monasteries and 49 convents which had either the character of private institutions or were supported by foreign funds. New parishes were created, old parishes were improved, the property of the suppressed religious corporations was assigned to charitable and educational institutions and to hospitals, while property having no special application was used to form a charitable and religious fund. (T. A.)

ARCHAEOLOGY

Origin.—Archaeology had its beginnings in Italy in the attempt, made even before the Renaissance, to satisfy the curiosity of religious pilgrims regarding the marvels of ancient Rome. A more unscientific guide-book than the *Mirabilia Urbis*

Romae, first issued in ms. before the days of printing, could hardly be found, but its very flaws betrayed the need for more adequate statements, and revisions soon came. A more fruitful spur to accurate knowledge of antiquities was the desire of artists to collect and study the ancient fragments in order to improve their own workmanship. The Pisani in the 13th century turned to antiquarian studies for this purpose, Donatello shaped his later style on antique models, and Michelangelo began his modelling with a study of the collection of antiques that the Medicis had made in Florence. Similarly painters sought for hints in the buried rooms that contained the wall decorations of Rome's imperial palaces.¹ In a room of Nero's "Golden House," discovered and first entered in the 14th century, Pinturicchio scratched his name while going through with torch and notebook, and designs from the same rooms were copied and used by Giovanni da Udine and Raphael in decorating the loggia of the Vatican. Even more diligent and exact was the study of Roman architectural remains by the Renaissance architects. Brunelleschi made an exhaustive study of the Roman monuments before he began the construction of the dome of Santa Maria del Fiore in 1417, Raphael, who for several years was commissioner of antiquities at Rome, drew up elaborate plans for the publication of ancient monuments, Bramante and Michelangelo, who had to prepare themselves for the task of designing St. Peter's, spent much time in the study of such structures as the Pantheon and Constantine's Basilica. The voluminous notebooks of architects, some of which have only recently been published² (of Sangallo, Peruzzi, Ligorio, Palladio, Labacco and others), reveal a keener study and saner comprehension of the principles of Roman architecture than was possessed by students of the 17th century. Since many structures seen by these men have since disappeared their notebooks have proved to be of inestimable value to modern archaeologists. Finally, there were men at the very dawn of the Renaissance who comprehended the value of the information contained in ancient inscriptions. Cola di Rienzi, for instance, in 1347 read to the people the fragment of Vespasian's *Lex de Imperio*, engraved on bronze and then stored at the Lateran, to prove that in antiquity the emperors of Rome derived their power from the people.

THE RENAISSANCE

The First Museum.—The Renaissance had a far larger store of architectural remains to draw upon than we, but of statuary, however, there was but little. Though the Constantinian description of the city had mentioned the existence of 3,785 bronze statues in Rome in the 4th century, Poggio, when travelling through the city in the 15th century, could find only the "Capitoline wolf" and the equestrian statue of Marcus Aurelius; and to-day we have but few more. Bronze, of course, had suffered most from the vandals of the dark ages, but antique marble statues were almost as scarce in Poggio's day. However, the great activity in building which set in at Rome in the 15th century led to quarrying in the old ruins in search of building materials and in such delving many marble statues were found which if noticed by artists were saved from the contractors' limekilns. Pope Sixtus IV., who was guilty of destroying several old structures in his search for materials, is to be thanked for starting the good custom at Rome (the Medicis had anticipated him at Florence) of saving such statuary by founding the Capitoline museum in 1471. A generation later (1506) Julius II. set apart the Belvedere court in the Vatican palace for a museum, and the Laocoön group found that year was placed there, to be accompanied soon by the Apollo Belvedere and the Apollonius torso. Soon after, Michelangelo at public expense set up the equestrian statue of Marcus on the Capitoline and arranged the fragments of the consular fasti, recently found, in a room in the Capitoline especially adapted for them.

Destruction of Ancient Remains.—Excavations were not yet conducted purely for the acquisition of knowledge of art or of

the past. In Lanciani's four valuable volumes on the *Storia degli Scavi di Roma* (1902-12), which gives the documentary reference to discoveries made before 1600, there is rarely a mention of excavations made purely in the interest of science. The digging was more or less haphazard mining for objects to sell or to use in decorating villas, or it was conducted under papal concession with stipulations to produce so many cartloads of marble or travertine. In such cases the fragmentary statues found all too frequently went into the limekiln. For constructional work Roman marble had gone far and wide. There are precious marbles in the cathedral of Aix-la-Chapelle that were brought from Rome by Charlemagne; a large part of the cathedral of Pisa was built in the 11th century from stuff quarried out of Roman ruins. The Baptistery of Florence and the cathedral of Orvieto are largely of Roman material and even portions of Westminster Abbey. Practically all the palaces and churches of Renaissance Rome had their marbles out of the old ruins. Nearly half the Colosseum, a large part of the Basilica Julia, of the Circus Maximus and of many other buildings were sold to contractors. Almost all the buildings of the Forum now represented by rubble heaps of concrete and brick had their marble walls stripped off by quarrymen long before the scientific excavator cleared away the débris in the 19th century. Fortunately the art-loving draughtsman was often at hand to sketch the architectural decorations before they were hauled off, and the scholar often had a chance to copy the inscriptions before they were destroyed. And though marble made a very fine lime, and fragments of statuary therefore risked much in being discovered, there was a good demand for statuary after the end of the 14th century. From that time most of the best objects brought to the surface doubtless survived.

In 1466 Flavio Biondo published a *Roma instaurata* which was much more than an improvement on the traditional guide-books. It rejected mediaeval legends, and described old Rome from a careful study of classical texts, attempting also (with no little success) to identify the ruins then existing. The book is modern in the spirit of its scholarship, and its publication proves that many were interested in what may legitimately be called archaeology. In 1453 Biondo's *Italia Illustrata* did the same work for a large part of Italy. To be sure the modern reader discovers many errors in these two books, but if we approach them from the *Mirabilia* rather than from the point of view of nearly 400 years of research we can only admire the merits of this courageous scholar. In many respects he reminds one of Laurentius Valla, a contemporary, who has been called the first of the moderns because of his keen historical criticism. Biondo's spirit was equally critical, though he usually gives the results of his solitary argumentation rather than his argument. We are not surprised that in 1478 Rome had an Academy of Antiquarii devoted to the study of topography and monuments as well as of texts.

After the disastrous looting of Rome by Charles V. in 1527, interest in ancient art wanes for a time. The popes of the 16th century after Julius II. did little for the museums and were very free in giving grants to contractors to tear down and use the materials of old monuments. Thus the tomb of Caecilia Metella and the Ianus Quadrifrons were saved only by the remonstrances of the populace after grants had been given to dispose of them. The famous Septizonium stood till 1588 when Sixtus V. ordered Fontana to use its materials for the repairs of several churches and public buildings.

Inscriptions.—Meanwhile a scientific interest in inscriptions was growing. We have seen how Rienzi made use of one to demonstrate an historical fact. Ciriaco of Ancona¹ (c. 1390-c. 1450), attracted to the subject by a collection of inscriptions made by Poggio, made careful copies in his extensive mercantile journeys, inspired by the conviction that these stones often gave facts of history more reliably than the texts. His collection, made before the invention of printing, did not survive as a unit, but his mss. were generously used by other scholars. After him others made similar collections, often catching the stone on the way to the limekiln and rescuing its readings. The large collection of Panvinus (1529-68) seems to have fallen into the hands of

¹See Sandys, *Latin Epigraphy* (1927), p. 22.

²E.g., Bartoli, *I Monumenti Antichi nei Disegni degli Uffizi*; Ashby, *Drawings attributed to Andreas Coner* (Brit. School, 1904).

Smetius, a diligent Dutch epigrapher, and his in turn (as published with additions by Lipsius, 1588) went into the first great corpus of inscriptions that purported to be complete, the famous collection of Gruter (1603). Scaliger (1540-1609) made this corpus available for antiquarian studies by classifying its great store of facts in 24 indexes. Fabretti (1619-1700) was the next scholar who gathered and interpreted inscriptions with success, publishing his great work on the Roman aqueducts in 1680. Maffei (1675-1755) did valuable service by submitting to keen criticism the large collection of Muratori; Marini (1742-1815) emended and explained the difficult inscriptions of the Frates Arvales (1795), and finally Count Borghesi (1781-1860) by his keen analysis of the accumulated material and his vast series of studies in history and administration which were based largely upon epigraphical sources, determined and illustrated the methods of epigraphy. Mommsen, inspired by the work of Borghesi, elaborated a plan for a new and more scientific collection of all Latin inscriptions and, publishing a volume to serve as a model, persuaded the Berlin Academy to undertake the publication of a complete corpus on this plan. Since 1863 the volumes of this *Corpus Inscriptionum Latinarum* have been issued in a consistent stream.

17TH AND 18TH CENTURIES

Private Collections.—To return to the subject of sculpture, it was chiefly in the 16th century that the great princely collections of Italy were formed, the older Borghese (later sold to Napoleon), the Barberini, the Pamphili treasures, the even more remarkable ones of the Ludovisi and the Giustiniani, not to mention a number of smaller ones. Parts of these were made up by purchase, but digging on the vast estates of the princes themselves yielded no small part of them. When some of these nobles were forced to sell portions of their collections, the courts of Madrid and Dresden began to buy antiquities extensively, and in the 17th and 18th centuries Englishmen made purchases for the decoration of their country places (see Poulsen, *Greek and Roman Portraits in English Country Houses*, 1922). Thus English, French and German dilettanti became interested in Greek and Roman art and had no small share in encouraging a more careful study of the subject. It was because of such expansion of interest that Spon and Wheler made their valuable records in Italy and Greece in 1676, and Stuart and Revett followed their lead to Athens in 1751. Indeed a "Society of Dilettanti" was formed in London in 1733 to encourage not only travel and collecting but the explanation and respectable publication of antiquities. It was in fact this society which supported the sumptuous publication of Stuart and Revett. And it was through the wider archaeological interests encouraged by this society that English critics of art were competent to appreciate the real value of the Elgin marbles when they reached London, thus escaping the consequences of Winckelmann's incompletely based judgments.

Herculaneum.—Meanwhile Herculaneum and Pompeii had become known. In 1709 an Austrian count sunk a shaft through the lava where it was known that the ruins of Herculaneum lay. By good fortune the ancient theatre was soon found and many pieces of statuary recovered. In 1738 King Charles of Naples continued the work with the use of French engineers. Diaries of valuable objects found were now kept, though not yet systematic records of the daily excavations. In 1753 the splendid "villa of the papyri" with its scores of statues was discovered. Two years later the Accademia Ercolanese was formed which between 1757 and 1792 published eight finely illustrated volumes of excavated objects, and these, though deficient in aesthetic analyses, are still of value as a record. Charles III. also made trial excavations at Pompeii, where the debris was more easily moved. His engineers began with some 12 men, burrowing here and there for chance finds. Not till 1763, when the advice of the Accademia Ercolanese was followed, was the debris permanently removed from the excavated portions. Notes of finds were still kept in desultory fashion. A careful record of daily work was not thought of, and no attempt made to preserve what was not immediately taken to the museum.

Winckelmann.—In 1755 Winckelmann, inspired by the col-

lection of antiquities which Dresden had acquired from Rome, went south to study. He spent years with the collections of Rome and Herculaneum, and as a fruit of this study issued in 1764 his epoch-making *History of Ancient Art*. Here for the first time after antiquity an attempt was made to outline the history of art from early Egyptian times (the Vatican had a few examples of Egyptian art discovered in the debris of Rome) to late Roman times. To be sure there were at Rome and Naples very few examples of genuine Greek art; consequently Winckelmann could not produce a well-proportioned history. Indeed the English dilettanti of the period had acquired in their travels in Greece a more accurate comprehension of the best in ancient art though they were at the time more concerned in describing and analyzing portions than in recording the story of the whole. It is of course a small matter whether or not we call Winckelmann the father of archaeology. Several artists of the Renaissance had as sure an appreciation of aesthetic values as he, some of his contemporaries knew Greek art better, the historical perspective and the critical sense were by no means new. The services of Winckelmann were of the kind that particularly appeal to the scholar in that his book provided a model of careful description, aided the memory and gave points of view for the classification of new discoveries. The book was very influential at the time, and when before the end of the century the new Pio-Clemente museum was opened in the Vatican the elder Visconti wrote the catalogue of the splendid collection with a mastery of the technique that owed much to Winckelmann.

The Napoleonic period brought new funds and some enthusiasm for excavations. The work at Pompeii was pushed with more vigour and with some system. The architect Mazois brought out a valuable publication of objects found there. The eagerness to find works of art worthy of the museum was still dominant, but it was no longer the sole object; the savants in Napoleon's train cannot be denied an appreciation of the encyclopaedists' view-point. At Rome the most important archaeological work of this régime was the very costly excavation of the centre of Trajan's forum, a work not then finally completed. During this very period, however, Italian archaeology came near receiving a severe blow in that Napoleon removed to Paris many of the best works of the art of Rome (1797), and with them the able archaeologist Visconti. However with the fall of Napoleon the papal delegate to the peace conference successfully reclaimed most of the treasures that had belonged to the Vatican and Capitoline museums. Italy thus regained its position of first importance for students of classical archaeology.

THE 19TH CENTURY

Upon the re-establishment of the papal government the good work of excavation continued. Carlo Fea began systematic excavations in the upper end of the Forum in 1813 which he continued till 1820. His meticulous records he published in his *Miscellanea*, which were rightly considered models of accuracy. He has a strong claim to be considered the founder of scientific excavations, though Fabretti's excellent study of the Roman aqueducts in 1680 and Marini's brilliant exposition of the Arval brothers' records (1795) rank as high among publications. An epoch in archaeology is marked by the foundation of the Istituto di Corrispondenza Archeologica in 1829 by an international group of some 70 scholars, about equally divided between Italian, German, French and English savants. Its purpose was to get support from as wide a circle of scholars and dilettanti as possible for good reporting and publication of finds, to raise the standards of work, to discuss antiquities in frequent sessions and to gather an adequate library at Rome. The head of the institute was the duc de Blacas, while the more active spirits were the German savants, Gerard and Bunsen, the Italian, Carlo Fea and the Dane, Zoega. The annual publications, called the *Annali* and the *Bullettino*, and the occasional *Monumenti Inediti* kept the members all over Europe well informed in careful reports of all important work progressing, and did much to encourage excavators to do their work in the most approved fashion. After many vicissitudes the body finally (in 1871) emerged as the German Archae-

ological Institute, which is still doing excellent work at Rome.

During the 19th century official and unofficial excavations were carried on all over Italy. (See Michaelis, *A Century of Archaeological Discoveries*, Eng. trans. 1908.) A brief survey of what was accomplished in the Roman Forum will best reveal the trend of archaeological work. Since 1800 there has at least been no more sheer vandalic quarrying. Indeed the wholesale mining of the 15th and 16th centuries had not left many usable pieces of building material in the débris. Hence the excavators of the last century had little hope of finding much except bare foundations with which to reconstruct the ground plans of the old Forum. However, the spirit of historical criticism, revealed in the works of Vico, Gibbon and Niebuhr, was now also the driving spirit of the archaeologists. Hence we are not surprised to find that Carlo Fea, placed in charge of excavations by Pope Pius VII. in 1803, determined upon a thorough removal of all débris, and an orderly recording of finds for the central purpose of reconstructing the plans of the buildings of which he should find traces. He worked systematically at both ends of the Forum, near the arch of Septimius Severus and near the arch of Constantine. The French Government continued with no loss of zeal from 1810 to 1813, adding the Velia near the arch of Titus to the programme. (A few years later, 1821, Valadier was commissioned by Pius VII. to restore the arch.) With the return of Pius VII. Carlo Fea again was placed in charge, now delving into the débris near the three columns of Castor. Some aid was now accepted from foreigners interested in the work, as the duchess of Devonshire and the duc de Blacas, who was the French ambassador. From 1827 to 1835 much was accomplished near the Temple of Concord, and a portion of the Basilica Iulia was uncovered under the direction of Nibby. Pius IX. employed the somewhat too imaginative Canina who continued the work at the west end of the Forum. Fea, Nibby and Canina unfortunately were all somewhat misled by the fantastic plans of the Forum drawn by the 17th century architects. Piale, in 1832, submitted these plans to sharp criticism, but failed to carry conviction against the voluminous and picturesque publications of Canina. It was not till about the middle of the century that archaeologists reached some degree of consensus about the correct orientation of the Forum and the right designation of several of the foundations. After Canina's death excavations progressed very slowly until 1870 when the new royal government took up the work with vigour, placing in charge Pietro Rosa, who had excavated on the Palatine for Napoleon III.; Rosa cleared a large part of the Basilica Iulia and of the central part of the Forum during the next six years. Unfortunately he sometimes left his finds in tantalizing confusion. In 1876 Fiorelli, who had developed an excellent technique at Pompeii (1860-75), came to Rome to take charge. He knew the value of meticulous reporting and was influential in having the Royal Academy (dei Lincei) begin in 1876 the very valuable official publication of excavations in the *Notizie degli Scavi*. He cleared most of the area along the Sacred Way from the Temple of Divus Iulius to the Arch of Titus; and in 1882-84 Lanciani, to whom Roman topography owes very much, demonstrated in the clearing of the *atrium Vestae* that archaeologists needed not only to excavate and report but so to protect the ruins and dispose of the objects found that the student might correctly read the meaning of what was left.

The imperial street level had now been reached throughout the central part of the Forum, and after 1884 the State suspended work until more properties could be bought. However, several individuals, notably Huelsen, Nichols and Richter, were permitted to make researches which proved fruitful. Meanwhile historical criticism was somewhat influencing archaeology in that it demanded data on the period of early Rome, and insisted that the spade must penetrate beneath the imperial pavements. In 1898, when Guido Baccelli was minister of public instruction, the energetic and imaginative architect Giacomo Boni was placed in charge of excavations and permitted to dig to lower levels. The results were startling. In 1899 the "black stone" was found and beneath it the famous archaic inscription with many primitive objects about it. Then there came to light the old Vulcanal,

primitive drains, foundations and decorative terra-cottas of the early republic, and finally in 1901-03 the primitive *sepulcretum* on the edge of the Forum, which at once explained many traditions regarding primitive Rome. The public was perhaps more ready to appreciate the new researches than the archaeologists to interpret them, but scholars of all nations, especially of the archaeological schools now established in Rome, men like Huelsen, Richter and Ashby aided in the publication and in the discussion of the finds. The Istituto, which had become the German Institute in 1871, had excellent scholars on its staff, the French school had been established in 1873, the American school of classical studies in 1894, and the British school in 1901. The Forum was to these a fruitful laboratory of observation. After 1904 Boni shifted his interests more and more to the Palatine, but since his notes on excavations there have not yet been published the end of the story must be omitted.

Meantime there were many sporadic finds of importance all through Italy, some in systematic excavations, others in the course of private building operations. The Alexander mosaic, which indirectly contributed much to the history of painting, came to light at Pompeii in 1831, the Lateran Sophocles at Terracina in 1837, the Vatican copy of the Apoxyomenus of Lysippus at Rome in 1849, the Augustus of Prima Porta in 1863, the foundations of the Capitoline Temple in 1865, the house of Livia in the French excavations of the Palatine in 1869, the house of the Farnesina gardens in 1878, the Apollonius bronze pugilist in 1884, the Ludovisi throne in 1887, the silver treasure of Boscoreale in 1895 and the last fragments of the Ara Pacis in 1903.

ETRUSCAN AND PREHISTORIC

Etruria.—In Etruria occasional finds had been made ever since the Renaissance and gathered to public and private museums. These had created a local interest in Etruscan art, but a general enthusiasm was hardly aroused until 1827, when some tombs with remarkable wall-paintings were opened at Corneto (Tarquinia). The very next year Lucien Bonaparte found that his estate in Etruria contained a large part of the vast cemetery of ancient Vulci, and the feverish excavations that followed brought to light hundreds of the finest Greek vases. When these were carefully published by Gerhard in the *Rapporto Volcento* of the Archaeological Institute in 1831, which contained the first logical classification of such ware, the real study of Greek vase-painting began. When in 1836 Regolini and Galassi found the remarkable tomb which bears their name at Cervetri and the objects were placed by Pope Gregory XVI. in the Vatican, the artistic outlook was at once widened by connecting Etruria with the East. François, in 1844, found the splendid black-figured vase at Chiusi which is now in Florence, and this proved stimulating to archaeological study by filling a serious lacuna in the story of vase-painting. When in 1848 Dennis issued his remarkable work called *Cities and Cemeteries of Etruria*, which may still be read with pleasure and admired for its exact observation, most of the important sites of Etruria had been discovered and to a large extent exploited.

Meanwhile Campana had, in private excavations conducted largely for the sake of enlarging his own collection, found the tomb at Veii, named after him (1842). It was not till 1850 that he disclosed the *Grotta dei rilievi* at Cervetri, with its painted stuccoes and its remarkable terra-cotta sarcophagus. He was exceedingly successful in the Etruscan field, but in his enthusiasm he neglected sadly to record his excavations, and when because of bankruptcy his magnificent collection was sold, the larger parts to Paris and St. Petersburg (Leningrad), Italy had lost not only very precious relics of past art but also much of the evidence that is essential to the proper comprehension of the art. Campana was, of course, a man of his times, working for himself in a divided Italy where uniform State supervision of excavations could not exist. During this period it was largely due to the activities of the Archaeological Institute at Rome that specialists were at times allowed to inspect diggings, report them with some care, and by their reports shame exploiters into some respect for scientific interests. But it was only after the unification of Italy, when

such excavations were placed under the supervision of a State department, that they could be properly controlled and adequately published. It would be difficult to overstate the debt that art and archaeology owe to the royal government of Italy for its enlightened interest, its generous expenditure of funds for excavations, museum buildings and publications, and for its intelligent choice of genuine scholars to conduct the necessary work where political jobbery might otherwise have crept in.

Prehistoric Archaeology.—Prehistoric archaeology has come to be exceedingly important in Italy, but was slow in awaking notice because of the wealth of classical works of art to be found. The Terremare sites of the Po valley were locally known in the 18th century, but were pronounced Cimbric or Boian sites of little interest. Carlo Fea had the breadth of view to give a valuable description of the Iron Age cemetery found by chance in the Alban hills in 1817, but the objects found were not properly cared for nor was their importance generally understood. The real interest was awakened only after the first Hallstatt finds had attracted scholarly attention in 1846 and the pile-dwellings of Zurich had been found in 1854. In 1853 the Villanovan cemetery near Bologna was discussed by Senator Gozzadini, who proposed the theory, which is now again receiving attention, that the "Villanovans" were Proto-Etruscans. Mortillet, excited by the discoveries at Zurich, set out to find similar settlements on the borders of the Italian lakes, and succeeded in 1860. The next year Gastaldi made a first attempt at explaining the construction of the Terremare sites, and Pigorini, with an enthusiasm and keen judgment which have for 60 years been so fruitful for Italian prehistory, turned to the problem in 1862 and in 1864. After giving a good survey of this field of study at the anthropological congress at Stockholm in 1874, he founded in 1875 the *Bullettino di Paletnologia Italiana*, which at once became a leading publication distinguished for thoroughness and sanity. He now built up a remarkable prehistoric museum at Rome and induced the government to grant funds for systematic excavations on prehistoric sites and to impose a careful supervision over private excavations. Colini, who later had charge of the museum in the Villa Giulia (devoted largely to Etruscology), also turned his talents to the study of prehistoric remains, issuing an important series of studies in this field. Taramelli has also worked tirelessly on the island of Sardinia, and Orsi, while chiefly interested in the Greek civilization of Sicily and Magna Graecia, has by no means neglected the prehistoric sites of his field. Montelius, with his monumental work *La Civilisation primitive en Italie*, was useful in spreading a knowledge of this work, as were in England Peet's *The Stone and Bronze Ages in Italy* (1909), and Randall-MacIver's *The Villanovans* (1924) and the *Iron Age in Italy* (1927). The remarkable corpus of prehistoric finds contained in Von Duhn's *Italische Gräberkunde I.* (1924) is a work of profound erudition by a scholar who has for 50 years been reporting all the important excavations with a steady judgment and unsurpassed grasp of the subject.

Recent Excavations.—During the last 20 years excavations have continued with renewed vigour by the Government, and usually in the charge of the most competent scholars. Of these we can mention only the most important. In the north the researches at Este and in Picenum have led to discoveries of very great importance to anthropology, and abundant material has been found at Bologna, Vulci, Veii, Terni and in the Alban hills for the further study of the Villanovan period.

For Etruscan studies, Caere has yielded exceedingly fine Greek vases besides valuable funerary objects and inscriptions, which will aid in restoring the history of Etruscan culture from the earliest days till Roman times. Unfortunately, very few of these tombs have been published (for a summary report on recent work see Mengarelli in *Studi Etruschi*, 1926, p. 145). Veii has proved unexpectedly fruitful. The foundations of a three-cella temple were found, and near it considerable fragments of a 6th-century terra-cotta group representing a contest between Apollo and Hercules, possibly an *akroterion* of the temple. The Apollo, removed to the Villa Giulia, is a masterpiece of its century (*Not. d. Sc.*, 1919). On the acropolis of the city have been found parts of

the old city wall, foundations of several Etruscan dwellings, two public buildings, and a large elliptical basement, which is supposed to be the foundation for a straw-thatched town hall of very early date. Farther north were discovered the stone walls of a 7th-century dwelling-house of five rooms—the oldest structure of its kind in Italy (*Not. d. Sc.*, 1913 and 1922, 206, 380). The tombs have proved that Veii was once a Villanovan city which fell into the hands of Etruscan rulers some time before Rome's foundation.

At Populonia, which prospered on the manufacture of the iron ore of Elba, many important finds have been made. During the World War numerous shiploads of iron slag from the ancient Etruscan furnaces were removed for re-smelting, and in the process an old cemetery was uncovered. These graves and others near by were found to be well-stored with urns, arms and ornaments, the first harvest of which A. Minto has published in a volume entitled *Populonia*. A similar series of excavations at Marsiliana has also been published by the same scholar. At Orvieto a 4th-century Etruscan temple with excellent pedimental terra-cottas has been found, important especially because of the tendencies of contemporary Greek art which they reflect. Good illustrations of these finds were published in *Dedalo* (1925, p. 136). Vignanello has yielded good Greek vases as well as much Etruscan ware. A grave at Todi has been found to contain numerous red-figured vases and some good Etruscan armour. Finally, at Rome, on Monte Mario behind the Vatican, casual building operations revealed a very interesting 7th-century Etruscan village built over the site of an early Bronze age settlement. A special journal for Etruscology called the *Studi Etruschi* was launched at Florence in 1926. The corpus of Etruscan inscriptions has also been advanced by several fascicles with many new inscriptions, but no real advance has yet been made toward their interpretation.

RECENT FINDS IN ROME

The city of Rome still yields a constant stream of ancient works of art. The Government has secured possession of the Capitoline hill and with characteristic zeal at once ordered the excavation of the site of Rome's chief temple. The massive foundations of Tarquin's structure were laid bare and found to agree with the dimensions recorded by ancient authorities (*Not. d. Sc.*, vol. xviii., 1921). Unfortunately, none of the decorative terra-cottas of the old temple have as yet come to light, but an interesting deposit of early votive objects have been found not far from it. On the Palatine the rear of the Imperial palace was cleared in 1905, and excellent wall paintings and mosaics of the Claudian and Neronian periods brought to light in abandoned rooms beneath. In similar rooms found under the front of the palace were discovered wall decorations of great historical interest dating from the Ciceronian period (see *ROME, Palatine*). Recently the so-called "Villa Mills" has been stripped of its modern decorations to facilitate the examination of the walls which prove to be ancient. The most valuable treasure yielded by the Palatine in recent years is the exquisite but still unpublished *Nike*.

The Government has now excavated a large part of the Augustan Forum. The numerous architectural fragments found from the Temple of Mars Ultor, the portico near by and the marble covering of the enclosing wall are of great beauty and precision, and several inscriptions of historical importance have also come to light. This excavation is continuing north-west into Trajan's forum and south-east into Nerva's forum. Furthermore the Theatre of Marcellus has been freed from its clutter of ugly shops, the temple of Fortuna in the Forum Boarium, two unidentified temples near S. Nicola dei Cesarini have been liberated, and the Mausoleum of Augustus is being thoroughly studied.

Many rooms of Nero's "Golden House" near the Colosseum were cleared. The débris had been searched long ago for works of art, but the walls, protected by the super-imposition of Hadrian's buildings, were found to be decorated in a style resembling that of the "Claudian" rooms of the Palatine. The small and richly coloured panels set in embroidered stucco are excellently executed but overloaded in design, as are the Renaissance loggia arabesques which they inspired. In many places on the walls

were found the signatures of Renaissance artists who had crawled over the débris to study the ceiling decorations (partial report in *Jahrb. Arch. Inst.*, 1913, p. 217). Among statues recently found there should be mentioned, besides the *Nike*, an excellent portrait of Augustus (*Not. d. Sc.*, 1910, 223), an "Artemis" from Aricia (*Jahrb. Arch. Inst.* 1922, 112), an excellent bronze representing a youth of the Julio-Claudian house, taken to New York (*Am. Jour. Arch.*, 1915). Furthermore, some forgotten fragments of great importance, which have long been lying and awaiting study in the basement of the Vatican, include a fine head from a Parthenon metope and a good copy of one of the "Tyrannicides."

During the World War there was discovered under the railway outside of Porto Maggiore a mysterious underground "Basilica" in almost perfect preservation, probably of the 1st century A.D. It had been built by sinking shafts in which the concrete walls and the piers of the nave were moulded. After a concrete vault had been cast over the walls, the enclosed earth had been removed and the walls and ceiling plastered and very richly stuccoed in low relief with mythological and genre scenes. It is, perhaps, the best preserved monumental structure of the Roman world, and the lavish stucco work, though not quite as delicate as that of the house found in the Farnesina garden, shows an ease and freedom of execution which gives it high rank. Scholars incline to the belief that it was the meeting-place of a group devoted to some mystical cult (Carcopino, *La Basilique Pythagoricienne*, 1927). The tomb of the Aurelii found on the Viale Manzoni (*Mon. Ant.*, 1922) has awakened much comment because of its excellent figures in fresco and the Christian symbolism that some of the paintings seem to contain. There is a seated figure before a flock that seems to symbolize Christ as judge. Eleven excellent standing figures have with less certainty been identified with the Apostles. The new excavations of imperial Rome constantly disclose the evidence of oriental cults. The two largest Mithraea known have also come to light in this period, one under S. Clemente, the other under the baths of Caracalla (*Not. d. Sc.*, 1912). The tomb of the Scipios has at last been carefully examined and restored.

Beneath the church of San Sebastian were found a number of decorated columbaria of the 1st century made for pagan cremation, which in the 2nd century were converted into Christian burial places. The area was then levelled off and a room for funeral banquets constructed. The walls of this room contained a great number of invocations to Peter and Paul rudely scratched. These finds will have an important place in early Christian history (*Not. d. Sc.*, 1923). Recent restorations of the churches of Santa Sabina, S. Quattro Coronati and S. Giorgio in Velabro have also revealed earlier structures of value to church history. In the rapid expansion of Rome since 1918 a very large number of tombs with sarcophagi, hundreds of important inscriptions, and three new series of catacombs have been found. These have been reported with commendable speed in the *Notizie degli Scavi*.

Outside of Rome the most important excavations in Latium have disclosed Horace's villa on his Sabine farm (*Mon. Antichi*, 1926, 457), an important votive deposit at Tivoli, details of Domitian's palace at Albano, of Hadrian's villa near Tivoli, a splendid and very old temple with fine terra-cottas at Lanuvio (*Mon. Ant.*, vol. 27, 1921), valuable fragments of a pre-Julian calendar at Anzio (*Not. d. Sc.*, vol. xviii., 1921), and a very important part of the seaport town of Ostia. At Ostia the finds are so numerous that a mere enumeration would require pages. The walls and gates of the oldest settlement (4th century ?), which Virgil seems to describe in his 7th book, have been disclosed; the more extensive wall of the 1st century B.C. has been traced throughout, and two of its excellently constructed gates cleared; the Forum of the late republic has been excavated, a temple of Rome and Augustus found at one end, and beneath the pavement of the Forum a series of barrack-rooms and offices of the oldest town. Many new temples, the offices of the city guard, the offices of the foreign shippers, the large cistern of the city, numerous State granaries, the foundations of what seems to be the earliest Temple of Jupiter, the municipal senate house, a very interesting safety storage house, and much else can now be studied. Of par-

ticular interest in revealing the plan of city dwellings are the extensive ruins of the "Casa di Diana" which, rising to three or four storeys, contained many suites of independent apartments which received their light through windows opening to the streets. This rather than the Pompeian type of dwelling we must now assume for the city of Rome. (*See Calza, Guida di Ostia*, 1925, and continued reports in *Notizie d. Scavi*.)

The excavations at Pompeii in 1925 yielded a magnificent Greek bronze Ephebus, perhaps the best work of art that the buried city has disclosed. The work of clearing the western part of the city has progressed uninterruptedly. A large number of houses of moderate size with fair wall paintings have been found, among them several of religious import—a Cybele group, a Pompeian Venus, a group of the twelve gods, and a series of interesting mythological scenes (*Not. d. Scavi*, 1927 ff.). Of particular interest are several houses with picturesque balconies, and an office decorated with representations of armour, supposed by some to be the headquarters of the *iuvenes*, the ancient "boy scouts." The newly found structures have been carefully restored and the paintings well protected from weathering and decay, but until recently publication has not always kept pace with excavations.

Finally, very important excavations have been diligently and carefully conducted on the Greek sites of lower Italy and Sicily. Gabrici published in two sumptuous volumes the discoveries made before the World War at Cumae (*Mon. Ant.*, vol. xxii.). Since Cumae was for centuries the Greek tutor of Italian barbarians, these volumes are indispensable to students of Greek and Italian history. Unfortunately, the excavations of the Temple of Apollo, the home of the sibyl whose oracles brought so many Greek rites to Rome, were stopped by the World War and left incomplete, but the sibyl's cave has been excavated in honour of Virgil's 20th centenary. In southern Italy Orsi has excavated Locri, Caulonia, Medma and other sites with striking finds of Greek vases, remarkably fine architectural decorations in terra-cotta, early Greek entablatures of great beauty, and large numbers of terra-cotta votive figures of no mean artistic value. ("Caulonia," *Mon. Ant.*, vol. xxiii. [1914-16], Oldfather, *Locri* in Pauly-Wissowa; *Not. d. Sc.*, 1917 for Medma.) At Ciro in Calabria he has found a remarkable head of an acrolithic Apollo of about 460 B.C. (*Atene e Roma*, 1925), and at Velia the remains of three important temples. Orsi has also published the finds from an important archaic Temple of Megara Hyblaea in *Mon. Ant.*, p. 110, (1921). But the most important work of the kind has been Orsi's extensive excavations in Syracuse, especially of the site and ruins of the great Temple of Athena. Here were found a rich store of objects from pre-Greek huts, of early Greek edifices and especially many exquisitely executed fragments of the 5th-century temple (*Not. d. Sc.*, 1910, and *Mon. Ant.*, 1918, pp. 354-762). The State has also begun a thorough-going archaeological survey of Italy, the first fascicle of which has been published by Prof. Lugli. (*See also ROME: Archaeology*.) (T. F.)

ECONOMIC AND SOCIAL CONDITIONS

Natural Economic Resources.—On the asset side of Italy's economic balance-sheet must be placed man-power, brains, geographical position, water-power; on the debit side, the absence of coal and fuel oils in commercial quantities, limited mineral resources, a high percentage of rocky mountainous territory, either unproductive or of low productive value.

For thousands of years Italian land has fed large populations, and its natural fertility would long ago have been exhausted had not human skill, aided in the last century by scientific knowledge, reintegrated the depleted wealth of its soil.

The recently reclaimed marsh lands in Venetia and Romagna possess a high degree of natural fertility, but there are no rich tracts of black alluvial soil as in the Ukraine, Hungary and Rumania. In Italy soil fertility is largely the work of man, the result of drainage, irrigation, careful tillage, and the copious use of natural and chemical fertilizers. Of these latter 104.7 kg. per hectare of arable land (exclusive of grass lands) were used in North Italy in 1925, 92.1 kg. in Central Italy, 26.5 in the South and the Islands. Their use is steadily increasing.

Mineral Resources.—There is some reason to believe that Italy's mineral resources have been underestimated in the past. This has certainly been the case with her iron ores, estimated in 1910 by Professor Sjögren in his work, *The Iron Ore Resources of the World*, at a maximum of 8,000,000 tons. Since that date some 13,000,000 tons of iron ore have been excavated from Italian mines, and their potential output is now placed as high as 150,000,000 tons. Deposits of ores of various kinds are found in various parts of the peninsula. The more important iron mines are in Elba, the Tuscan mainland, and in the high Alps in the province of Aosta. The most important Italian lignite beds are in Tuscany, which also has large deposits of iron pyrites, from which sulphuric acid is obtained, while the ash is treated and used for smelting iron. Sardinia, geologically a prolongation of the Iberian peninsula, is rich in ores:—iron, copper, zinc, lead, silver and mercury. Istria possesses important quicksilver mines, large bauxite deposits (with a potential output conservatively estimated at 10,000,000 tons), zinc mines, and a soft-coal bed of some importance. In Sicily and in Romagna, Italy has a European monopoly of sulphur. Some authorities maintain that considerable quantities of petroleum exist in her sub-soil, more especially in Emilia, but so far the output obtained is negligible. A strenuous effort is being made to utilize latent resources, such as leucite, a volcanic ash of which vast deposits are found in Italy, which is now made to yield potash salts and alumina.

The output of Italian mines 1876-1927 has been as follows:—

(Metric Tons)

Year	Iron ores	Pyrites	Zinc and lead	Coal, lignite, etc.	Total value gold lire
1876	255,035	4,460	98,438	116,399	53,317,353
1898	201,260	67,191	126,029	341,327	67,125,428
1911	380,268	165,263	178,177	557,137	81,067,675
1922	314,410	486,000	126,241	946,230	98,343,318
1927	426,300	604,300	231,120	1,106,070	152,393,775

It will be seen that the production of coal, the former sole basis of modern industry, is insignificant.

The insufficiency of the present production of ores to meet current needs is shown by the fact that in 1927 the output of iron ore was estimated at 426,000 tons against imports of scrap iron and steel amounting to 693,000 tons. Italy produced just over one million tons of coal and lignite and imported over 14 million tons of coal; she produced 5,800 tons of mineral oils and imported over 146.8 thousand tons. It is therefore evident that for these essentials she is dependent on foreign supplies.

Italy is abundantly supplied with excellent stone for all building requirements; her quarries of white and coloured marbles are famous and well-nigh inexhaustible. She has large supplies of borax and boric acid, and extensive beds of clay, lime, marl, kaoline, etc., for the needs of the brick, cement, porcelain and glass industries.

Output of Quarries

Quarries	1911-13 average	1924	1925	1926
	Tons	Tons	Tons	Tons
White and coloured marbles	509,723	468,398	577,640	590,250
Granite and porphyry	389,312	100,441	298,093	156,400
Talcum and steatite	18,620	32,168	33,620	35,000
Magnesite	453	13,436	15,146	15,150
Refractory clays	7,740	64,180	72,000	
Pumice stone	16,233	31,090	47,900	37,000
Other stone, etc.	17,540,470	25,078,559	31,341,360	33,382,647

Agriculture.—Agriculture is by far the most important of Italian industries. About one third of the population over 10 years of age was returned as employed on the land by the census of 1921.

The average value of agricultural and forestry products for the three year period 1924-26 has recently been estimated between

48 and 50 thousand million lire, distributed as follows: Live stock 25%, wine 22%, cereals 19%, oil 5%, industrial plants 4%, roots 3%, legumes 2%, fruits and vegetables 15%, forests 4%.

Italian agriculture is extremely diversified; differences of altitude, soil, and climate allow the production of all European crops, from rye to rice, from apples to oranges, from hemp to cotton (of which a small quantity is grown in Sicily); while the very varied forms of land tenure prevailing in the different sections exhibit farming in its most evolved and its most primitive forms.

Of the total national area (approximately 310,055 sq.km.) 91.7% is productive, 25.85% being under cereal crops, 3.03% legumes, 0.86% industrial crops (hemp, sugar-beet, tobacco, flax and linseed), 0.92% roots, 0.56% garden truck, 15.02% forage crops. Arable land thus accounts for 46.24% of the productive total, 23.96% is under permanent grass and pasture; 4.39% is uncultivated but productive, and a little over one quarter (25.36%) under trees, shrubs, bushes and forests. These latter, including fine chestnut forests, cover 55,854 sq.km.

The following table shows that, while the area under cereals declined somewhat in the period 1923-26, as compared to 1909-13, total and per hectare yield increased, and *per capita* yield rose from 257 to 269 kg.

Area and Yield of Cereal Crops

	Average area 1923-26	% of 1909-13	Average production 1923-26	Yield per ha.	% of 1909-13
	ha.		(metric tons)		
Wheat	4,720,000	-1.3	5,827,400	1.2	+22.0
Rye	124,870	+1.8	163,800	1.3	+22.5
Oats	481,750	-3.7	585,100	1.2	+14.1
Barley	233,120	-5.3	233,400	1.0	+8.4
Rice	137,400	-5.0	598,800	4.3	+30.7
Maize	1,492,800	-7.1	2,609,600	1.7	+4.5

A national effort, promoted by the Government, was started in 1925 to increase the output of wheat, of which Italy now has to import on an average 2,400,000 tons, or approximately one-third of her annual requirements. Apart from some hundred thousand hectares, which may yet be added by land reclamation, it is not economically desirable to increase the large acreage already sown to this crop, but it is generally admitted that the yield could be raised from the present average of 1.2 metric tons per ha., to at least 1.5.

Rice, grown almost exclusively in a limited section of north Italy, is the only cereal crop of which Italy is an exporter. The rice area has declined in the last twenty years, but the yield per hectare has increased considerably.

Hemp of fine quality is an important industrial crop, and is exported in considerable quantities. The *Sugar Beet* crop, introduced into north Italy since 1895, has spread rapidly, giving rise to a sugar refining industry of considerable importance. Though the area devoted to *Tobacco* is limited, it has grown rapidly since the war, supplying the Tobacco Monopoly, formerly a large importer, with all the Kentucky and Levantine varieties it requires and leaving a considerable margin for export.

Area and Production of Industrial Crops

	Average area 1923-26	% of 1909-13	Average production 1923-26	Yield per ha.	% of yield in 1909-13
	ha.		(metric tons)		
Sugar beet	87,800	+75	2,573,900	2.9	+64
Hemp	88,700	+10	94,800	1.0	+15
Tobacco	35,875	+344	30,721	1.1	+294

Roots, tomatoes, and fresh vegetables are very important crops, meeting all home requirements and exported in large quantities. They supply the raw material for a large and growing canning and preserving industry. Their steady development is shown by the following figures:

	Average area 1923-26	% of 1909-12	Average produc- tion 1923-26	Yield per ha.	% of 1909-12
	ha.		(metric tons)		
Fresh vegetables . . .	98,000	+79	891,300	..	+24
Tomatoes	42,000	+40	617,200	1.4	+43
Potatoes	398,340	+22	2,055,600	5.9	+26

Italian climate and soil are pre-eminently suited to fruit growing, but heretofore this potential source of wealth has been inadequately considered. This is due to the fact that the farm has been first and foremost a self-supporting unit, but now that agriculture is increasingly thought of in terms of the leading national industry there is evidence that fruit-growing and preserving will take their proper place as important wealth-producing assets. Data for the total area under deciduous fruits are not available. Specialized commercial orchards are a recent development, confined mainly to north Italy, the general practice being to plant fruit trees in union with other crops. The total production of deciduous fruits and nuts in 1926 was estimated by the Ministry of National Economy at some 900,000 metric tons.

In Calabria and Sicily citrus fruit is of great economic importance. If Italian oranges rank second on the world's markets to those of Spain, her lemons, accounting for 54% of her citrus crop, hold the first place.

Wine accounts for nearly a quarter of the total money yield of Italian agriculture. Italy ranks next to France for the quantity produced (average 1922-26: 45,200,000 hectolitres) and boasts a great variety of wines, many of choice quality, but little known beyond her own frontiers, the chief exceptions being Marsala, Vermouth, Chianti and Barolo. Large quantities of the ordinary red wine from Apulian vineyards are exported to France for cutting native wines. Wine making is still mainly a farm industry. The trend is towards improving quality, standardizing types, concentrating and industrializing production.

Olive Oil.—Italy ranks second to Spain as a producer of olive oil. The area planted to olives shows a slight decline since the war, when the fuel famine led to their destruction in some districts. The annual money value of the oil has averaged in the post-war period over 2,000,000,000 lire. Apulia, Calabria, Tuscany and Sicily are the chief oil-producing centres.

Silk.—Some 600,000 farm families, mainly in north Italy and along the eastern coast, are engaged in rearing silk-worms. An abundant supply of mulberry leaves, the food of the worms, is essential, and steps are being taken to encourage the cultivation of this tree in other sections of the country where the industry could flourish. The cocoon crop dropped heavily during 1915-20, but has since regained the pre-war level, approximating, with seasonal variations, 45 million kilograms.

	Average area 1923-26	% of 1909- 12	Average yield 1923-26	Per ha.	% of 1909- 12 yield
	Ha.				
Vineyards	896,000	+5.4	Wine (hl.) 45,276,000	10.6	+1.8
Vines grown with other crops	3,434,000	+3.6			
Olives grown with other crops	1,715,000	+2.4	Oil (hl.) 1,918,000	1.8	+4.8
Olives— special Mulberry leaves	579,000	+2.6			
Cocoons	Metric tons 1,398	..	+33.2
			Kg. 43,500,000	..	+1.1

Fully one-third of the agricultural area (13,200,000 hectares) is under *forage crops*, three-fourths being natural pastures. As practically no land susceptible of economic cultivation is so used, this large area indicates the extent unsuited to other uses. The

average production of forage, expressed in terms of hay, amounted in 1923-26 to 23.8 million metric tons.

As the latest *live stock* census was taken in 1918, when the major portion of the Venetian province was in enemy hands, we must go back to the 1908 census for complete data. An enquiry made in 1926, places the total number of cattle at 7.4 million, a 19% increase over the 1908 figures; sheep 12.3 million (106%); goats 3.1 million (14.1%); pigs 2.85 million (13.6%); horses 1.05 million (9.8%), and asses and mules 1,500,000 (49.2%). This estimate gives 26 head of cattle and 43.4 sheep per sq.km. of farm and forest land. The distribution of live stock is very uneven. The 1908 census shows 15.3 head of cattle per sq.km. of farm land in north, 3.5 in central, 2.6 in south Italy, and 2.2 in the islands. This points to one of the causes of the comparative agricultural poverty of the south, *i.e.*, the insufficiency of the live stock on the farm. Sheep and goats are more numerous south than north: 3.9 sheep per sq.km. in north, 12.9 in central, 14.8 in south Italy and 10.8 in the islands.

The *dairy industry* is of great economic importance with an output estimated in 1925 at some 250,000 metric tons of cheese and 50,000 of butter. Of the 50 odd varieties of Italian cheese, the best known are the hard *parmesan* and *pecorino* (the latter made from ewes' milk) and the soft *gorgonzola* and *bel paese*, in all of which a large export trade is done for an annual value approximating 450,000,000 lire.

Land Tenure.—*Farm land tenure* is of four main types: small freeholds, cash tenancy, crop sharing tenancy, and large estates. A small farm, whether freehold or leasehold, is defined by Italian economists as one affording steady work and a subsistence to the average sized farm family. When such crops as vines, citrus fruits or garden truck are raised, the area may be only a few "are" (0.025 acre), increasing to 10 or 20 hectares in districts where extensive farming prevails, and to as many as 30 in mountain districts where part of the land is uncultivated or wooded. In north Italy peasant proprietorship, now on the increase, is found mainly in the hill and mountain districts; in the south along the fertile and densely populated coast lands.

Cash tenancy is prevalent in the rich valley of the Po and in parts of Venetia, Emilia and Piedmont; but crop-sharing is the more prevalent and characteristic form of tenancy, leading to a highly diversified agriculture, the farm under this system being a self-supporting unit worked by the tenant and his family without hired labour. This form of farming is found in its most typical aspects in Tuscany, Umbria and the Marches.

Italian agriculture suffers from two opposite evils: the *latifundia* of the south, and the exceedingly small, one might say "pulverised" peasant ownership prevailing in mountain districts and in the south and Sardinia. The *latifundia* consist of undivided estates, varying from 200 to 1,000 hectares, cultivated in the time of the Romans by slave labour, and now by permanent labourers and their families hired by the bailiffs to whom the estates are farmed out by their absentee owners.

Agricultural Population.—The 1921 census classifies the *agricultural population* by families according to the occupation of their heads, as follows: operating owners, 1,392,642 (7,115,001 persons), being 162 per mil of total families composing the population; cash tenants 249,926 (1,592,295 persons) or 29 per mil; crop-sharing tenants 452,368 (3,096,447 persons) or 53 per mil; farm labourers, woodmen, shepherds, cattlemen, etc. 1,821,399 (8,293,983 persons) or 211 per mil. This represents a total of 3,916,325 families, consisting of 20,097,726 persons, or 455 per mil.

Prior to 1922 Italy had no distinct *agricultural policy*. In the north, agriculture made great progress during the fifty years of national unity, thanks to the energy and self-help of an enterprising population. Land reclamation in the Venetian provinces and in Romagna, a good network of roads and rails, irrigation, the spread of education and science all contributed to build up sound rural prosperity. In central Italy agriculture stagnated; some progress was made, but on the whole conditions were unsatisfactory. In the south the tariff war with France in the late '80s, the ravages of the phylloxera and the olive-fly,

aggravated by taxation too heavy for its feeble economic resources, led to widespread and severe depression, accompanied by poverty bordering on destitution among the peasantry. Towards 1885 emigration, mainly to North and South America, was resorted to, and was soon practised on a scale of alarming proportions. The first result was to aggravate the economic crisis by rendering labour scarce and relatively expensive, leading to the suspension of farming over considerable areas. But after an interval of years things began to right themselves. The remittances sent home by emigrants provided a steady influx of capital.

Land reclamation is another item on the programme. Since 1870 900,000 hectares have been drained, mostly in the Venetian provinces, of which approximately one-third since 1922. Much of the land is extremely fertile. Work is now going forward on another 600,000 ha. and plans, already approved, provide for a further 700,000. This will bring the total up to the 2,200,000 hectares requiring such treatment. Not only is provision made for draining these lands, but the work is completed by bringing them under cultivation, providing roads, farm-buildings and water supply, and, where necessary, irrigation. A law enacted in 1927 provides for the "integral" reclamation of all land susceptible of such treatment estimated at some 2,500,000 hectares.

Power.—The possession of water power has enabled Italy to take her place in the ranks of modern industrial countries. An official estimate published in 1919 placed the total hydraulic power of Italian watercourses at 5,000,000 h.p. under normal conditions, falling to 2,500,000 in exceptionally dry seasons. In 1918 Government concessions for watercourses with a potential of 1,500,000 h.p. had been granted. Since then Italy has acquired the mountainous province of the upper Adige with its many waterfalls, and much has been done to increase and control her hydraulic resources by building dams, reservoirs, and artificial lakes for storing the overflow of the rainy season, allowing of its utilization throughout the year. At the end of 1925, 800,000,000 c.m. of water could be thus stored, and dams and reservoirs were under construction to provide for the storage of a further 600,000,000.

The Italian Alps and pre-Alps cover an area of 32,000 sq.km. and it is estimated that, by utilizing all their available water, 2 kw. per sq.m. could be secured under favourable conditions, equivalent to 16 to 20 thousand million kw.h. of current, or as much power as could be obtained from 20,000,000 tons of coal. According to the same estimates, the Apennines could yield 5 to 6 thousand million kw.h. per annum to swell the potential total.

In Italy the development of the hydro-electric industry followed close on the discovery of the revolving magnetic field by Gallileo Ferraris and of the converter by Gaulard. In 1892-95 the important hydraulic power stations supplying electric current to Rome and Milan were erected, and a programme was soon under way for utilizing the watercourses of each hydrological basin. The need of co-ordinating the industrial requirements of each zone with available resources led to the growth of a complex high-tension system, supplying the needs of several consuming centres. Installed units grew rapidly: 86,000 kw. in 1898; 426,000 in 1908; 1,240,000 in 1918; 2,370,000 in 1926. At the beginning of 1928 the figure exceeded 2,600,000 kw., out of an estimated potential total of 6 million. About three-quarters of this installed power is derived from the Alps.

The consumption of electric power expressed in millions of kw.h. has grown as follows: 1908, 1,000; 1918, 4,111; 1923, 6,166; 1927, 8,887, of which about one-tenth for lighting.

The power system is based on the exchange of current between the several regions. The water supply in the north is most abundant during the summer months when the Alpine snows melt; in the central sections the winter rains swell the torrents of the Apennines. By developing long distance high-tension transmission, much has been done to compensate these ups and downs. At the end of 1925 over 45,000 km. of high-tension lines had been laid, besides the hundreds of thousands of kilometres required for local distribution. In 1927 over 1,600 km. of electric cable lines had a voltage exceeding 100,000 volts.

This magnificent power system has been built up by private

enterprise with private capital. Under the Act of October 1919, concessions for the use of watercourses, over which the State claims preeminent domain, can be granted to companies for a fixed term of years, a subsidy of 80 lire per kw. installed being paid for a period of 15 years. When the concession lapses, the hydraulic plants revert to the State, which enjoys a right of pre-emption on the electric plants connected therewith.

Notwithstanding the remarkable development of hydraulic power, Italy's coal requirements have not fallen below the pre-war level; indeed, they tend to increase with the erection of new steam power-stations, the heavier railway traffic, the growing use of gas, and the general development of productive activities. There is considerable talk of utilizing on a larger scale national fuel resources, consisting mainly of lignite of low calorific content, but in 1927 they supplied barely one of the 15,000,000 tons of coal and kindred fuels consumed in that year. War and post-war conditions reduced imports from an average of 10,800,000 tons in 1913 to 5,600,000 in 1920; but from that year on they gradually recovered, and in 1927 exceeded 14,000,000 tons, of which Great Britain supplied 6,400,000 (as against 9,400,000 in 1913), while Germany's contribution rose to 5 million, including deliveries on reparation account and from the Saar.

The need for integrating hydraulic by steam-power stations is increasingly felt. In 1926, 200,000 tons of coal were used by such plants with a potential total of about 500,000 kw.; railway and tram services consumed 3,400,000 tons; steel foundries 1,500,000; gasometers 1,300,000 and shipping 1,000,000 to 1,500,000.

The following table shows Italian fuel consumption (coal, liquid fuels and electric power) expressed in terms of coal.

Year	Metric tons	Year	Metric tons
1872 . . .	1,132,544	1912 . . .	12,554,137
1882 . . .	2,327,600	1922 . . .	13,602,863
1892 . . .	4,120,201	1927 . . .	24,779,838
1902 . . .	5,726,760		

The use of fuel oils as a source of power is hindered by heavy customs and sales duties; nevertheless, the growing importance of motor traffic and the large tonnage fitted with oil engines has greatly raised consumption, and imports have risen from 250,000 tons in 1913 to nearly 1,000,000 in 1927.

Industrial Policy.—When Italy attained national unity her traditions were those of a trading rather than a manufacturing country, and her major economists, among them the great statesman, Count Cavour, were free traders. But her position as a debtor country, the dependence of the south on an impoverished agriculture, and the desire to foster infant industries, gradually led to the adoption of a moderately protectionist policy, embodied in the tariff of 1887. Changed conditions made it necessary to enact in 1921 a new tariff, amended in 1923.

Geographically, north Italy is the industrial section of the country, for although its splendid, intensive agriculture is by far its biggest industry, yet proximity to large export markets, the cheap electric power available for the past 20 years, and the more advanced social status of the population have led to an economy characterised by a fine balance between farming and manufactures. From central Italy downwards agriculture predominates, though special legislation enacted since 1896 has favoured industrial growth in Naples and its vicinity. In the past decade the metal, shipbuilding and textile trades of that section have developed rapidly, and a considerable growth of these activities may be expected in other southern sections as a result of the power which the great hydro-electric plants erected since the war in Calabria and elsewhere are making available.

Industries.—The industrial census taken in Oct. 1927, returns 728,150 industrial establishments occupying 3,965,501 persons. Although a very large aggregate of Italian production comes from small workshops and factories run by their owners, a bird's-eye view of industrial progress is afforded by the following data for joint-stock companies engaged in leading industries, showing growth in the past fifty years. To facilitate comparisons the capital investment is expressed in gold lire:

Capital Invested in Industrial Joint-stock Companies
(Millions of gold lire)

	1872	1882	1892	1902	1912	1922	1927
Textiles (including artificial silk)	15.7	18.6	124.7	171.6	490.0	928.4	1,431.5
Mining	32.5	37.1	47.2	73.2	178.3	349.8	564.7
Metals and engineering	11.7	22.9	52.3	141.0	799.5	1,794.4	1,769.7
Electrical	0.5	0.5	15.5	116.5	463.0	1,211.3	2,122.3
Chemical and rubber	14.5	24.0	48.6	107.4	290.8	649.0	824.4
Food industries	22.4	30.6	42.4	126.4	355.4	714.6	874.0

While the large proportion of small and medium sized concerns continues to be a characteristic feature of Italian industry, there is a growing tendency toward industrial concentration through amalgamations and mergers.

The largest investment is that in the hydro-electric industries: 504 million lire in 1913, 6,656 million paper lire in 1927. The 1927 census returns the number of works engaged in generating or distributing power, light and water at 5,913, in which 62,060 persons were occupied.

In 1913 the *mining industry* had an output valued at 191.5 million lire and employed some 120,000 workers, of whom 19,000 in the sulphur mines. American competition has since led to a severe crisis in the Italian sulphur industry, whose output fell from an average of 511,040 tons a year for the 10 year period 1900-09 to 167,339 tons in 1922, a crisis only partially remedied by a subsequent marketing agreement. The war greatly stimulated the output of Italian iron and fuel ores, but in 1919 depression set in, and notwithstanding the additional mines acquired in the annexed territories, output in 1922 fell far below pre-war levels in quantity and value. Since 1925 conditions have improved. The 1927 census returns 5,107 concerns engaged in mining and quarrying, employing 96,479 persons; the reduction in number as compared to 1913 is essentially due to the situation in the sulphur mines.

The importance of the Italian *metal industries* is limited. In this field Italy aims at becoming self-sufficient, but here her ambitions cease. Under the stimulus of war needs important modern plants were erected and productive capacity greatly enlarged. With peace came industrial deflation and keen depression, followed since 1923 by a moderate revival. At the end of 1927 the steel industry had a potential output of 1 million tons of pig iron and 2,500,000 tons of steel. The actual output of Italian steel-works in the 3 year period 1925-27 averaged 1.7 million tons, while imports averaged 0.9 million. The *iron and steel industries* consume an annual average of 1 million tons of ore, of which 754,000 tons are Italian; 2 million tons of coal; 1,500,000 tons of scrap of which 700,000 Italian; 480,000 tons of pig iron of which 380,000 Italian. Some 40,000 men are employed at an annual wage cost of 200 million lire. The fixed and circulating capital investment is estimated at 2,000 million lire. The high cost of coal and the limited market, unsuited to standardized mass production, account for high production costs.

Since the war Italy is smelting her *zinc ores*, formerly exported. The production of aluminium is another recent development; large new works have been erected for treating Italian bauxite, and others for obtaining alumina from the large volcanic leucite beds, and it is expected that Italy in the next few years will become independent of foreign supplies of aluminium.

The 1927 census returns 2,225 establishments employing 111,263 persons engaged in the metal industries.

The output of iron and steel, mercury and refined sulphur, 1876-1927, has been, in metric tons:—

Year	Pig iron	Iron and steel	Mercury	Refined sulphur
1876	18,599	94,080	93	116,041
1898	12,387	254,966	173	502,351
1911	302,931	1,001,181	955	414,161
1922	157,599	1,045,955	1,541	167,339
1927	596,100	1,530,600	1,999	395,500

After a period of war expansion, the engineering trade experienced a severe deflation crisis in 1922, potential production having greatly outstripped demand. The more important branches of the industry are *shipbuilding* with 220,000 tons of shipping in 1926 as against an average of 29,400 tons in 1909-13, or 64,900 including the tonnage built in the important yards then under Austrian rule and since annexed to Italy; *automobile construction*, with an annual output of some 60,000 cars in 1927 as against a pre-war 5 to 6 thousand; *railway rolling stock and locomotives* supplying all home needs and exporting a small margin. The manufacture of textile machinery has greatly developed since 1919 and is rendering Italy independent of foreign supplies. The trend is toward amalgamation and standardization, the goal in view being quality production. The 1927 census returns 80,277 engineering shops occupying 469,185 persons.

The Italian *chemical industries* grew up as a by-product of the farm: citrate of lime, citric acid, tartaric acid, essential oils, and tans being characteristic products, and the manufacture of fertilizers the main activity. Here again war needs acted as a stimulus, multiplying the manufacture of caustic alkalis and creating the dye industry. Since 1919 *artificial silk*, rightly grouped with the chemical industries, has leapt into prominence, and in 1926 Italy held the second place among producers of this important fibre. These industries are organized in three National Federations: (1) *Chemical trades*, approximately 1,000 firms, over 2,200 million lire capital, over 70,000 workers; (2) *fertilizers*, 55 firms, over 1,300 million lire capital, 10-15 thousand workers; (3) *artificial silk*, 16 firms, 2,000 million lire capital, over 30,000 workers. The 1927 census returns 5,175 establishments (exclusive of artificial silk) occupying 97,531 persons. Amalgamation and rationalization have increased efficiency. The growth of output is notable:

Year	Inorganic acids	Alkali	Explosives	Compressed gas	Hydrogen	Oxygen
	Met. tons	Met. tons	Met. tons	Cu. met.	Cu. met.	Cu. met.
1893	66,038	..	3,044	1
1901	244,988	2,500	2,920	183	10,849	5,601
1914	657,040	11,000	3,200	2,269	600,000	300,000
1920	481,810	46,390	1,882	2,230	917,150	1,334,300
1926	1,197,620	250,050	5,304	8,100	995,000	7,871,000

The *textile trades* are the most important branch of Italian industry, supplying about 80% of home requirements and leaving a large margin for export. *Silk*, of which Italy produces the raw material, ranks first. The raw silk industry is equipped with some 48,000 reeling basins, and 1,466,435 spindles, and has an annual average output (1924-25) of 5 million kg. of reeled and thrown silk, and 1.7 million kg. of spun silk. The output of the silk weaving industry is expanding; in 1926 there were 250 silk weaving mills with 22,000 power looms, employing 38,000 workers.

Cotton spinning and weaving has been carried on in all its branches for the past 50 years, the period of most rapid growth being that comprised within the years 1904-08. In 1926 the industry was equipped with 5 million spindles, 150,000 power looms, and 160 printing machines. The average output is estimated at 180,000 metric tons of yarn and 165,000 metric tons of cloth, valued around 6,000 million lire. Some 272,000 workers are employed in the mills which produce all qualities and descriptions of yarns and materials, the trend being toward higher counts and finer fabrics.

In 1926 the Italian *woollen and worsted* mills had 630 combing machines, 600,000 carding spindles, 20,500 power looms, the number having more than doubled since 1907. Some 60,000 workers are engaged in this industry, the output of which has greatly improved in quality during the last 15 years. It was valued in 1926 at 2,500 million lire.

The 1927 census returns for the textile industries, inclusive of artificial silk, show that they are carried on in 10,355 establishments employing 636,687 persons.

The *clothing industries* covering those engaged in the manu-

facture of hats, shoes, gloves, hosiery, ready made clothing, dress-making, etc., employ nearly half a million people; 339,520 are employed in the food industries, inclusive of the important canning and preserving industry, working largely for the export market, and large sugar refineries with an average output in 1923-25 of 350,000 metric tons of sugar.

The importance of the *small and artistic* industries is evidenced by the figure of 1,200,000 artisans, returned by the recent census taken in connection with the professional organization of the artisan class under the guild law.

Transport and Communications.—The topography of the Italian peninsula, cut off from Europe by the Alpine massif, traversed from north to south by the Apennines, with no navigable rivers, places great natural difficulties in the way of transport and communications. These have been enhanced by the difference in wealth and general progress between north and south, a difference reflected in road and railway development.

Roads.—The north is well supplied with roads while the economic life of the south has been greatly hampered by their insufficiency. In 1926 Italy had 62,000 km. of main roads, of which 19,759 were national highways financed by the Government. An important road-building programme is now being put into effect in the southern provinces.

Railways.—Formidable natural difficulties had to be overcome to provide the country with an adequate railway system. Italian railway engineers had to tunnel great mountains; build railroads at steep gradients very often in sharp zig-zag curves along narrow ledges overhanging the sea and passing through an almost uninterrupted series of tunnels, as in the case of the Spezia-Genoa line. The eastern and western coasts, separated, as they are, by high mountain chains, had to be connected through a series of tunnels.

The Italian railway system was built by private initiative and, with the exception of 1,600 km., since 1860. In 1905 the main lines (13,422 km.) were nationalized, 3,053 km. remaining in the hands of private companies. In 1925 the State and private railways had a total length of 23,042 km.; 52.8 km. per 100,000 inhabitants and 6.8 km. per 100 sq. km. In that year the State railways carried 114 million passengers and 65.2 million metric tons of goods, the traffic varying from a maximum of 8.8 million tons for the Milan district to a minimum of 0.6 million for that of Reggio Calabria. To intensify traffic between north and south and offset the economic disadvantage to southern agriculture of the long haul, differential tariffs were introduced when the railways were nationalized, the rate per km. being lower as the distance traversed increases.

Electric traction is of special importance to Italy as offering an escape from her dependence on foreign coal supplies. This was recognized before the war and a beginning had been made. In 1922, 689 km. had been electrified. In 1928 the length so run had risen to 1,700 km. for the State and 1,005 km. for private railways. The programme in hand provides for the electrification of a further 650 km. by 1930. Inter-urban electric tram lines are a very important subsidiary service, running a total length of 4,501 km.

Motor Traffic.—The growth of motor traffic is retarded in Italy by low *per capita* income, high cost of petrol, and heavy taxation of motor cars. This is reflected in the comparatively small number of motor vehicles in circulation: 104,449 automobiles, 16,767 taxi-motors in 1927. Nevertheless public automobile services play an important part in the transport of passengers and goods, connecting up the more remote localities with railway stations and urban centres. In 1926, 3,295 autobuses ran regularly along 61,847 km. of road, in the ratio of one for each 19 km. Practically all the important roads are served by automobile lines, often running in competition with electric trams and railway services.

Shipping.—The possession of a strong merchant marine is a matter of vital importance to a country with so long a sea-coast as Italy. Progress in this direction has been constant: in 1881 net D.W. tonnage 93,698 tons, in 1913 876,885 tons. Heavy losses occurred during the war and in 1919 tonnage had been reduced to 631,822 tons. In that year Italy acquired the shipping belong-

ing to the registers of the ports of Julian Venetia, building went on steadily, and in 1927 the net steam tonnage stood at 1,750,997 tons and net motor tonnage at 162,122 tons, mostly built in Italian yards. Regular services are run to all parts of the world, and the percentage of cargo entering and clearing Italian ports in Italian bottoms rose from 51.60 in 1913 to 67.78 in 1927.

Ports.—There are over 150 sea ports in Italy, of which 66 have an annual goods traffic exceeding 250,000 tons. At the close of the war a credit of 900 million lire, payable in 70 annual instalments, was voted for enlarging and improving the leading ports. By far the most important is Genoa, with a goods traffic of 7.7 million metric tons in 1927, followed at a distance by Trieste (2.5 million tons), Naples (2.3 million tons), Venice (2.5 million tons), Leghorn (2.2 million tons), Savona (1.4 million tons), and Palermo (0.8 million tons).

An average annual tonnage of 113.2 million tons entered and cleared Italian ports during the years 1911-13, and 31.0 million tons of goods were handled; for the period 1925-27 the figures stood respectively at 127.7 and 34.7 million tons. Free zones exist in the fourteen leading ports.

Inland navigation is of very limited importance. Since the war a canal system connecting the Lombard and Venetian provinces with the Port of Venice has been completed, known as the Victory Canal, and there is some local traffic on the Italian Lakes. In central and southern Italy such communications are practically non-existent.

Air Lines.—A beginning has been made with air transport. In April 1928 four regular air lines were open to the public: Rome-Venice-Vienna, Genoa-Rome-Naples-Palermo, Rome-Cagliari, and Brindisi-Vallona-Constantinople. Lines are being organized connecting Rome with Munich, Barcelona, and Bengasi, besides a daily Rome-Milan return service. Italian air lines carried 12,506 passengers in 1927.

Posts and telegraphs (including wireless) are Government services. So were the telephones until 1923 when, with the exception of international and a few inter-urban lines, they were leased to private companies. In 1922 there were 1,470 inter-urban telephone lines covering circuits of 73,426 km. In 1927 the number had risen to 2,720 and the length of the circuits to 121,273 km.; international lines rose from 20 to 58, and their length from 1,195 to 3,408 km. The number of urban lines rose from 439 to 757.

In 1927 the development of *broadcasting and radio telephony* was still in its infancy, but active measures were being taken under Government auspices to encourage its expansion through more general use.

The industrial census (1927) returns the total number of concerns engaged in transport and communications of all descriptions by land and sea (inclusive of Government services and State railways) at 106,897 employing 508,587 persons.

Fisheries.—The yield of the Italian fishing industry does not suffice to meet home requirements, as shown by the fact that Italy imports annually from 5 to 6 thousand tons of fresh, and some 70,000 tons of dried, smoked, and salted fish. Tunny fish is caught in considerable quantities off Sicily and sardine fisheries are of importance. Some sponges and coral are also obtained. But the waters of the Mediterranean and Adriatic are poor as compared to those of the North and other seas. Over 42,000 men are engaged in the fishing trades, carried on mostly as a small industry, though here again the trend, encouraged by the Government, is towards organization on modern industrial lines, not only of fishing but of the fish market.

Foreign Trade.—In the 50 odd years of Italian unity trade has steadily expanded as shown by the following figures, calculated for the sake of comparability on the basis of 1913 prices:

	Imports (millions of lire)	Exports (millions of lire)	Total trade (millions of lire)
Average 1871-73 . . .	865.5	876.0	1,741.5
Average 1911-13 . . .	3,578.9	2,370.9	5,949.8
Average 1924-26 . . .	3,999.5	3,303.5	7,303.0

The percentage increase (average 1871-73=100) has been:

	Imports	Exports	Total trade
Average 1871-73 . . .	100	100	100
Average 1911-13 . . .	404	270	341
Average 1924-26 . . .	462	377	419

Allowing for the increase of population (26.8 million in 1871-73; 40.4 million in 1924-26) per capita trade has increased as follows:

	Imports	Exports	Total trade
1871-73 Lire . . .	32	33	65
1911-13 „ . . .	100	68	168
1924-26 „ . . .	99	82	181

Agricultural and industrial expansion is evidenced by the changes in the percentages for the several categories of imports and exports:

	Percentage of total trade					
	Imports			Exports		
	1871-73	1911-13	1924-26	1871-73	1911-13	1924-26
Raw materials . . .	13.9	22.8	21.0	8.8	5.8	4.7
Semi-manufactured . . .	8.9	11.3	11.6	13.3	9.5	9.8
Finished products . . .	14.3	14.1	9.8	6.0	12.6	19.5
Foods and animals . . .	12.5	12.0	12.3	22.3	11.9	11.3

While the percentage of food imports has not increased and that of food exports has declined, the figures indicate that, on the whole, home production of food has grown with the growth of population, and also that Italy has become an importer of raw materials and an exporter of manufactured goods.

The *per capita* difference between imports and exports in the three periods considered was as follows (excess of imports = +; excess of exports = -):

Class of goods	(Lire)		
	1871-73	1911-13	1924-26
Raw materials . . .	+3.30	+29	+29.50
Semi-manufactured . . .	-2.80	+2.90	+3.30
Finished products . . .	+5.40	+2.50	-17.0
Foods and animals . . .	-6.30	-0.10	+1.90

The modified economic situation is reflected and confirmed by the percentage figures showing the participation of agriculture and manufactures:

Percentage of Exports Classified According to Their Nature

Class of goods	1871-73	1911-13	1924-26
Agricultural raw materials . . .	35.0	25.6	24.1
Do semi-manufactured . . .	6.9	14.0	8.5
Manufactures obtained from agric. raw materials . . .	42.3	27.2	24.8
Do from non-agric. raw materials . . .	15.8	33.2	42.6
	100	100	100

The one class of goods for which exports exceed imports is that of textile fibres and their products, with a favourable balance of 2,268.5 million lire in 1926, and of 2,789.3 million in 1927. Raw and artificial silk yarns and cotton goods are big items in these totals.

The distribution of Italy's foreign trade between the several markets has also changed considerably. In 1871-73 five-sixths of her exports were sold on European markets, France absorbing over one-third of all Italian exports. In 1913 Germany had taken the place of France both for imports and exports. In 1925 the American continents took over one-fifth of total Italian exports, the

share of Europe had fallen from five-sixths to less than two-thirds, 6.6% was sold to African countries, and a small percentage went to Australia. As regards imports, the United States has become the chief source of supply since 1915, far out-distancing any other country. In Europe the Italian import trade is distributed fairly equally between France, Germany and Great Britain. Imports from Argentina and India are increasing. The predominating position of the United States is largely due to the elimination of Russia as a leading grain exporting country. The difficulties met with in securing coal have led Italy to distribute her purchases of this commodity among several countries, instead of relying almost exclusively on Great Britain, as in pre-war days.

Italy has a second and very effective remedy in the increasing use of "white coal," through the rapid development of hydro-electric generation in her mountain streams.

Two items account for Italy's unfavourable trade balance, wheat and coal. In 1927 the trade deficit amounted to 4,753 million lire. In that year Italy imported 3,535 million lire of wheat, and 1,918 million lire of coal, apart from the quantities obtained on account of German reparations. Thus the cost of imported wheat and coal exceeded the total trade deficit by 700 million lire. Hydro-electric development and electric traction notwithstanding, coal imports are likely to increase rather than decline; the efforts to increase the yield of wheat will have achieved much if they avoid the need of expanding imports as population grows. The probabilities of increasing exports depend largely on the possibility of reducing costs by further rationalization of production and more especially by improved credit facilities and the better organization of the export market. To promote these ends the Government established in 1926 the National Export Institute, a semi-official body placed under the direction of eminent business men. Among other matters it is promoting the determination of official standards for staple exports and the grading of farm products sent abroad under a national export mark.

The Balance of International Payments.—Italy's trade balance showed an average annual deficit of 129.4 million lire for the ten year period 1875-84; of 344.9 million for the period 1885-95; of 227.3 million for 1895-1904; of 978.2 million from 1905-14; of 8,281.3 million paper lire for the 5 war years 1914-19; of 7,651.2 lire for the 8 year period 1920-27, inclusive of the huge trade deficit of 15,048 million lire of 1920. A comparison of the average deficit for the last three pre-war years 1911-13—L.1,208 million—with that for the three years 1924-26, reduced for purposes of comparison to 1913 values—L.696 million—shows however that the balance between imports and exports is now improving as compared to the situation prior to 1913. The large and ever growing trade deficit was met before the war by Italy's invisible exports. In 1910 her balance of international debits and credits was set forth by Bonaldo Stringher, Director of the Bank of Italy, in the following statement:

Italian balance of payments	Debits	Credits
	(millions of lire)	
Trade deficit . . .	1,166	..
Deficit on ocean carriage of emigrants . . .	15	..
Deficit on service of Govt. and industrial securities . . .	68	..
Deficit on profits as between foreign establishments in Italy and Italian estab'ts abroad . . .	45	..
Net emigrant remittances	470
Net tourist expenditures	450
Surplus on postal settlements	200
Net gold exports	17
Ocean freights, railway receipts, banking commissions, Peter's pence etc.	157
Millions of lire . . .	1,204	1,204

In 1913, according to calculations made by the *Credito Italiano* Bank, the balance of debits and credits closed for Italy with a surplus of 56 million lire, of which 50 million invested abroad.

A recent study (Pasquale Jannaccone, *La Bilancia del dare e dell'avere internazionale*, 1927) shows the following situation for the war years 1915-18:

Balance of payments	Debits	Credits
	(millions of lire)	
Trade deficit	30,000	..
Deficit on service of Govt. and industrial securities	1,000	..
Surplus on ocean freights	5,000
Emigrant remittances	2,500
Foreign charters	3,330	..
	34,330	7,500
Creation of foreign debt	23,330
Foreign credits on Italian banks	3,500
	34,500	34,500

This statement shows a big economic deficit, payments being balanced by the creation of a debt of 26,830 million lire.

In 1919 and 1920 the situation became yet more serious; the trade deficit, according to the recently revised figures of the Central Statistical Institute, amounted to 19,400 million lire, the cost of foreign charters stood at 2,000 million, offset by barely 10,000 million for net receipts from ocean freights, emigrant remittances and tourist expenditure. The deficit was covered by further creation of foreign debt and by the sale of Government securities abroad.

An improvement set in with 1921 as shown by the following situation for the 3 years 1922-24:

Balance of payments	Debits	Credits
	(millions of lire)	
Trade deficit	16,000	..
Ocean freight surplus	2,000
Emigrant remittances	7,400
Tourist expenditures	7,500
Deficit on profits and dividends paid abroad over those cashed in Italy	2,170	..
Peter's Pence and sundry receipts	1,200
	18,170	18,170
Foreign investments	1,145	..
Govt. and ind. securities repurchased from foreigners	650	..
Govt. loans placed abroad	47
Private indebtedness abroad and foreign lira credits	1,818
	19,965	19,965

This statement shows an economic balance, the trade deficit being covered by invisible exports.

As the above tables show, the decade 1915-24 closed with an economic deficit of over 40,000 million lire, and the creation of a like amount of foreign debt, of which 30,000 million national and 10,000 million private indebtedness.

In 1925 and 1926 Italy once more closed her international balance of debits and credits with an economic surplus, according to the studies made by Prof. Borgatta and quoted by the Minister of Finance, the trade deficit for those years being more than offset by invisible exports. In 1926 a new asset item was provided by the large loans secured by Italian business enterprises in the United States and in Great Britain, amounting by the end of 1927 to L.5,756,904,639, at the stabilized rate of 19 lire to the dollar. As these loans have been made for productive purposes, more especially the further development of hydro-electric enterprises, they may fairly be considered as a source of wealth rather than as a drain on national resources.

Banking and Credit.—The latest statistical data available for banks are those for 1926, which give 430 ordinary joint-stock, 530 co-operative, 307 private, 162 savings and 4,000 rural co-operative banks: a total of 5,429. Besides these there are the non-profit making public utility pledge banks and special institutions for agricultural and land credit.

The ordinary joint-stock banks fall into three classes: national, regional, and provincial or local. The growth of joint-stock banking is shown by the figures for the capital investment in such companies, expressed, for purposes of comparability, in gold lire:

Capital Invested in Joint-stock Banks

Millions of gold lire						
1872	1882	1892	1902	1912	1922	1927
738.9	478.7	450.3	341.6	719.7	1,408.6	1,728.1

On Dec. 31, 1914, there were 197 joint-stock banks with a capital of 800 million lire, on Dec. 31, 1927, 508 banks with 5,262.6 million lire (paper) capital.

The movement of leading items on balance sheets of a group of banks (about half the total) is given at the bottom of this page. Although the number considered differs, the growth shown by the several items holds good as the increase in the number considered is approximately proportionate to the increase in the total number existing, which grew from 189 at the end of 1913 to 416 at the end of 1924.

These figures show growth, despite the progressive depreciation of the lira. Taking 100 as the index in 1913, capital and reserves stood at 444 in 1924, bank deposits at 747, cheques in circulation at 2,113; debts to correspondents at 1,657; cash balances and discounts at 1,076; brokers' loans and advances at 1,046 and securities at 912.

The recent rapid growth of banking activities is reflected in the following figures:

	Capital and reserves (millions of lire)		Deposits and current account (millions of lire)	
	1924	1926	1924	1926
Joint-stock banks (No. 367)	2,950.9	4,207.5	8,073.9	8,945.1
Co-operative banks (No. 432)	433.5	624.3	4,957.2	5,174.1
Savings banks (No. 137)	693.7	815.7	10,593.1	12,132.0

Prior to 1926 no special legislation regulated banking activities; since then, the consent of the Minister of Finance must be had for amalgamating existing banks and for opening new ones or branches thereof. National joint-stock banks must have a capital of not less than 50 million lire, regional banks of not less than 10 million, provincial banks of not less than 5 million. The ratio between capital and deposits and the maximum credit assignable to one customer is laid down, and joint-stock banks are placed under the supervision of the bank of issue. (*See BANCA D'ITALIA.*)

Co-operative Banking has played an important part in Italian agricultural and industrial development. The movement started in 1864, when Luigi Luzzatti was instrumental in organizing the first *Banca Popolare* (Peoples' Bank) on the lines of the German *Schultz Delitzsche* Banks, modified to meet Italian requirements by introducing the principle of limited liability. Besides supplying credit to small manufacturers and traders, the *Banche Popolari* make a special feature of short term agricultural credit. In 1924

Year	No. of banks	Capital and reserve	Deposits	Cheques	Debts to correspondents	Cash balances and discounts	Brokers' loans and advances	Securities
1913	92	646.1	1,415.9	47.5	1,079.4	1,641.7	351.6	425.7
1918	126	913.1	3,275.4	213.3	4,705.2	5,338.1	589.0	915.0
1919	138	1,308.7	4,581.5	741.9	7,092.3	8,271.3	753.5	1,562.9
1920	152	1,716.4	6,524.6	998.6	10,599.5	11,191.6	1,785.0	2,146.7

they numbered 827, with 495,000 members, and a share capital of L. 4,576,146, property valued at L. 218,665,000, deposits standing at 4,168,247,000 and discounts at L. 2,742,841,000.

Rural co-operative banks, introduced in 1883 mainly through the efforts of Senator Leone Wollemborg, on the pattern of the Raiffesen banks of Germany, provide personal credit for small farmers on the collective guarantee of all their members. They have played a valuable part in freeing the peasant farmer from usury. The latest available figures show an aggregate of 3,500, with deposits of over 1,000 million lire and outstanding loans for 700 million lire.

The following figures for the 10 Italian Clearing Houses reflect the growth of banking activity:

Year	Cheques, etc. cleared	Difference settled % of total cleared
	Million lire	
1910	58,064	7.7
1913	65,622	7.1
1926	1,297,535	3.5
1927	768,107	..

A series of laws enacted between 1897 and 1914 organized special regional *agricultural credit banks* to supply circulating capital and credit for farm improvements. The results secured were, however, inadequate. The total loans amounted in 1926 to 515.7 million lire. In 1927 the whole system was revised and unified. A National Consortium for farm improvement credit was formed with the participation of the State, the banks, social insurance funds, land credit, and similar institutes. An initial capital of 275 million lire was subscribed and the Consortium empowered to issue bonds up to ten times that amount against loans extinguishable by annuities in 30 years. Regional agricultural credit institutes were formed to provide circulating capital against a lien on growing crops, stocks and equipment. The capital mobilized for this form of credit amounts approximately to 2,000 million lire.

Land credit is provided by special departments of the leading savings banks and by the *Istituto Italiano di Credito Fondiario* in Rome. In 1926 their outstanding bonds amounted to 1,630 million lire, outstanding loans to 1,669.4 million, mortgage securities to 2,944 million.

The *Istituto Nazionale di Credito Edilizio* finances the building of dwelling houses for the working and middle classes.

The *Post Office Savings Banks*, established in 1875, collect the small savings of the working and lower middle classes. The deposits have grown steadily: 1,773.2 million lire in 1910; 1,971.8 million in 1915; 6,934.7 million in 1920; 10,056.0 million in 1927. These funds are deposited with the *Cassa Depositi e Prestiti*, which also holds security deposits made with the Courts, the capital held for civil service and other pensions, and similar funds, with which it makes loans to provinces, municipalities and consortiums for public works (roads, aqueducts, sanitation, school buildings, etc.) for an amount which, at the end of 1926, totalled 4,505 million lire out of total available funds amounting at the same date to 12,823.5 millions.

Monetary Régime.—When Italy became a united kingdom in 1859, the monetary system was on a gold basis, but in 1866 the needs of the war against Austria led to the issue of inconvertible paper money. Under the law of 1874 the monetary system was revised and the issue privilege confirmed for six of the banks formerly issuing notes for the several States amalgamated to form the new Kingdom. In 1881 a foreign loan of 100 million lire was placed with a view to repealing the inconvertible currency régime, but the times were not yet ripe for such a reform which was formal rather than effective, until a decree of 1889 brought theory into keeping with practice by recognizing the inconvertible nature of the note issue.

Yet in spite of this the lira maintained its gold parity within narrow limits until 1892, when the unfortunate Abyssinian war, coinciding with a banking crisis and economic depression, caused lira exchange to fall, averaging 27.94 to the pound sterling in

1894. From 1901 until 1914 the lira was again at par, the dollar quotation in that year averaging 5.28. With the World War, depreciation set in, checked by official pegging. At the end of 1919 the dollar was quoted at 8.70, but as soon as the market reacquired its freedom the quotation soared to an average of 21.12 in 1920. In July 1926 the bottom was touched, the dollar being quoted that month at an average of 30.53. The Government had recourse to resolute credit and currency deflation, the exchange market was strictly controlled, imports checked, foreign travel curtailed. The market reacted, and in June 1927 the dollar was quoted at 17.93, a gain of nearly 50%. The rapid upward trend, which was dislocating production and trade, was then checked by the Treasury, which had accumulated a large *masse de manœuvre* of foreign valuta, and the lira remained stable around 18.20 to the dollar until the new legal parity was fixed at 19.46 in December 1927, and the currency once more placed on a gold or gold exchange basis. (See BANCA D'ITALIA.)

Prices.—The first decade of the 20th century witnessed in Italy as elsewhere a steady rise in the trend of commodity prices, consequent on the falling value of gold. The wholesale index number in 1910 had risen to 111.8 (100=average 1901-5). The two years 1911-2 witnessed a further rise (13.68%) accounted for by the abnormal conditions arising from Italy's war with Turkey; in 1914 prices had returned to the 1910 level. From then onwards war conditions and progressive currency depreciation demoralized the markets and prices soared, as shown by the following table:

	Average rate of dollar exchange	Bachi wholesale commodity price index	Official rate for gold	Gold price index	Purchasing power of lire
1913	5.28	100	100	100	100
1915	6.18	133	119.3	111	75.18
1916	6.57	200	126.8	157.6	50.00
1917	7.41	306	143.0	213.9	32.67
1918	7.85	409	151.5	260.9	24.44
1919	8.70	366	169.8	215.5	27.32
1920	21.12	624	408.1	152.9	16.02
1921	23.577	578	455.4	126.9	17.30
1922	21.10	562	409	137.4	17.79
1923	21.76	575	420.9	136.9	17.39
1924	23.00	585	444	131.7	17.07
1925	25.09	600	484.4	142.4	14.49
1926	25.72	708	500.71	140.7	14.12
1927	19.61	591	378.3	156.4	16.89

National Finance.—The first twelve years of Italian unity (1862-74) witnessed the administrative consolidation of the new Kingdom and the initial stages of its economic growth, entailing heavy capital outlay on railroads and other essential equipment. During this period the budget closed year after year with a gradually declining deficit until in 1875, as a result of parsimonious and able financial administration, it was balanced. During the next decade economic conditions improved and expenditure was met out of receipts until the financial year 1885-6 opened a new series of deficits, coinciding with acute economic depression. This difficult period closed in 1897-8 when the budget was once more balanced, followed by twelve years of slow but steady progress, notably assisted by the steady inflow of emigrant remittances which had become an important item of national income. The budget closed each year with a substantial surplus, the lira rose to par and stood even at a premium on gold, and in 1906 8,000 million lire of consolidated debt were converted from 4% to 3.75 and subsequently to 3.50% stock. The war declared in 1911 with Turkey for the acquisition of Italy's North African colony of Lybia, initiated a new series of deficits, which from 1914-5 onwards rose to dizzy heights; shown by the table on page 787.

In October 1922 when the Fascist Government came into power the deficit stood at the alarming figure of 15,760.4 million lire and the Treasury account was burdened with a debt of 42,129.6 million lire. It must however be noted that most of the enormous rise in expenditure and the huge figure for Treasury liabilities in

Budget Receipts and Expenditures

Year	Millions of lire		
	Revenue	Expenditure	Deficit
1913-14	2,523.7	2,687.6	-163.9
1914-15	2,560.0	5,359.4	-2,835.4
1919-20	15,207.5	23,093.4	-7,885.9
1921-22	19,700.6	35,461.0	-15,760.4

1921-22 did not represent transactions for that year, but arose from the need of making an accountancy settlement for past and residual war year liabilities, and consisted largely of "giro" items not entailing actual disbursements.

The remedy applied was simple and in keeping with the principles of classic finance: revenue was increased, mainly by extending income tax to farmers until then exempted, by keying up the administration, simplifying taxation, checking evasions, and at the same time reducing expenditure. The deficit was progressively reduced to 3,028.8 million lire in 1922-23 and to 418.4 million in 1923-24; 1924-25 closed with a surplus of 417.2 million lire, the first for 13 years. The mass of Treasury liabilities were revised, settled, and written off. The financial year 1925-26 closed with the conspicuous surplus of 2,268 million lire, of which however 1,800 million were invested in capital outlay to ensure economic reconstruction and national defence, leaving a net surplus of 468.8 million available for the reduction of debt. The National Accounts closed on 31st June 1927 as follows: Revenue L.21,449.8 million, Expenditure L.21,014.0 million, Surplus L.435.7 million.

National Debt.—In the 50 years preceding the World War Italy had incurred a growing national debt (1) to meet budgetary deficits, (2) to build railways and provide the country with other capital equipment, (3) to meet financial and banking difficulties by the issue of Government stock. In 1914 the national debt, funded and floating, stood at 15,766 million lire. War expenditure and post-war reconstruction was met by four internal loans and the issue of Treasury bills on an unprecedented scale, with the following results:

National Internal Debt (millions of lire)

	1914	1919	1922	1927
Funded debt	14,840	34,416	56,600	82,247
Floating debt	926	25,797	36,043	1,176
	15,766	60,213	92,643	86,423

As these figures show, the total debt has been reduced by 6,200 million lire since 1922 and the major portion of the dangerous floating debt retired or funded.

To finance her purchases of munitions and other provisions in the United States and Great Britain, Italy had recourse during the war to loans from those countries, which she funded at the end of 1925 in the amount of \$2,042.3 million and £250 million respectively, payable in 62 annuities. Her liabilities under the agreements are met by an Autonomous Sinking Fund into which all payments from Germany in cash or kind under the Dawes plan on account of reparations are paid, and which provides the funds required for the annual instalments covering interest and capital amortization. The Government estimates that these reparation receipts suffice to cover its war debt liabilities, and has repeatedly stated, both in and out of Parliament, that no further demand can be made of the Italian taxpayer on this account beyond the integral transfer of all reparation receipts to its two allied creditors.

Apart from these war-debts, the service of which is not a budget liability, the only foreign debt is the 100 million dollar loan obtained in 1925 from Morgan and Company, the proceeds of which were used to refund part of the Treasury debt to the Bank of Italy as a preliminary step toward currency stabilization.

In comparing pre- and post-war figures the progressive depreciation of the lira must, of course, be borne in mind, but if this reduces the gold value of the deficits and the debt, it must also be remembered that the depreciation itself represents the heaviest

toll which the war has taken of the nation's accumulated wealth.

Taxation.—As the figures show, the revenue collected in 1926-27 was nearly ten times that of 1913-14, and had approximately twice its gold value. Approximately another 6,000 million lire are levied annually by local government bodies. This places a very heavy burden of taxation on the nation, heavier, in proportion to income, than that of any other country, and equivalent to 20% of total estimated private income, as compared to 13.5% thus levied in 1913-14.

The ratio in which the several sources of revenue contributed to the total in 1926-27 is as follows:

Income from national property (State railways, etc.)	2.38%
Direct taxation	27.49%
Stamp and registration duties on business	16.87%
Tax on note currency and transports	1.09%
Stamp duty on consumption	0.64%
Excise and Customs	25.99%
Surtax on income for war cripples	0.17%
State monopolies	20.60%
Sundry	4.77%
	100.00%

In response to popular demand a capital levy was enacted in 1919 on fortunes exceeding 50,000 lire at rates ranging from 4.5 to 50 per cent. In practice this amounts to a tax on wealth levied over a period of 30 years. Another law of the same period taxed war super-profits at the rate of 100%, a demagogic measure which caused a maximum of trouble to industry, hindering its transition from a war to a peace basis, while yielding a minimum of benefit to the Treasury.

Since 1923 the Government has repealed the innumerable taxes enacted during the war period and simplified the whole fiscal system. Recognizing the need of encouraging the accumulation of wealth in a country which suffers from scarcity of capital, all death duties have been repealed on property transmitted within the family circle up to the third degree of kinship; proportionate rates have replaced progressive in income and other taxes, and the rates themselves are being gradually lowered. A sur-tax on total income, and a tax on bachelors (this last to finance the cost of benevolent legislation in favour of mothers and children) are the two new taxes imposed; wheat growing has been encouraged by the re-enactment of an import duty on wheat and flour.

An effort has been made to reform local taxation by attributing a percentage of certain Government taxes to the provinces and municipalities and curtailing their right to levy rates. Strict control of local government expenditure by the central authority which appoints the Podestàs and the town secretaries who have taken the place of the elected mayors and councils is a feature of the programme for placing local finance on a sound basis.

Social and Industrial Conditions. Wages.—Taking the wage paid in 1914 as 100, the index number in July 1925, a typical post-war year, showed the following increases for leading occupations, reflecting the general wage movement both in industry and in agriculture:

Occupation	Hourly wage		
	Paper lire	Gold	Real wage
Cotton spinning—women	750	150	136
Cotton weaving—women	1,020	206	187
Masons	785	157	142
Navvies	877	175	135
Skilled engineers	765	153	139

The average wage paid in May 1925 for a normal eight hour day in the following trades was:

Average wage in leading occupations	L.
Woolen manufactures	16.22
Cotton manufactures	13.85
Silk weaving	14.68
Artificial silk mills	14.79
Steel works	25.92
Ship yards	20.50
Engineering trades	22.29
Electrical trades	23.19

The foregoing wages represent the average for each of the trades mentioned.

In most of the leading Italian industries the pay of the worker generally consists of a basic wage, corresponding to an average normal level of production, plus a premium for output in excess of this normal; in the period of currency fluctuations it became customary to add to the wage a high cost of living bonus fluctuating with the cost of living index. This index fell considerably in 1927 and toward the close of that year a 20% wage reduction covering this bonus was effected in almost all occupations.

Under recent legislation wages are regulated by collective agreements valid at law for all workers engaged in a given occupation. (See FASCISM, ECONOMICS OF.)

It is estimated that the cost of labour represents from 15% to 20% of total production costs in Italian manufacturing industries.

compulsory as from 1928. These various forms of insurance are on a contributory basis, integrated by Treasury endowments, and are administered by the Social Insurances Fund which in 1926 held on this account 3,565 million lire. A further extension of the system to cover general sickness and other risks is under consideration. (See FASCISM, ECONOMICS OF.)

The cost of social insurance to industry has grown steadily since the war: figures available for 1926 place it at L.841,437,079, of which 58% for old age, invalidity and unemployment insurance, 26% for industrial accident insurance (met out of a separate fund), 3% for sickness insurance in the annexed provinces, 2% for accident insurance in agriculture, 0.4% for maternity benefits, and 8% for sundry special forms of insurance. In 1926 1,249,400 workers were insured with the Social Insurances Fund, and the average per capita cost to the nation was L.20.70.

Unemployed in Italian Industries, 1922-27

Industry	1922		1924		1925		1926		1927	
	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum
Agriculture and fishing	194,125	49,104	82,862	17,420	35,739	9,020	50,172	9,254	130,842	23,764

Total—all industries	606,819	304,242	280,765	115,590	156,659	72,211	181,493	79,678	414,283	214,603

The number of unemployed in Italy declined from the high point of 1922 to a minimum in the summer season of 1925, but increased again to a high level in the winter of 1927. Detailed figures for the different branches of industry are given in the above table:—

Labour Legislation.—Immediately after the war the eight hour day was adopted by agreement in almost all occupations. In 1923 the normal working hours were fixed by law at 8 per day or 48 per week, subject to exceptions for seasonal industries, and overtime was regulated. In 1924 Italy ratified the Washington 8 hour Convention under the proviso that it would come into force only when ratified by Germany, Great Britain, France, Switzerland, and Belgium. Since 1907 the worker is entitled by law to a weekly rest of 24 hours.

Italy has ratified the Washington Convention on night work for women and children; the employment of women before and after childbirth is regulated by law. Children under 12 may not be employed in industry, and between the ages of 12 and 15 employment is conditional on a 6th grade (lower in country districts) school certificate, and on a medical certificate of fitness for the proposed occupation. In heavy or dangerous occupations, specified in the act, the age of admission is higher.

In 1927 the several municipal regulations in force regarding hygienic and other conditions in factories and workshops were replaced by a general law requiring *inter alia* the provision, in large works, of baths, refectories, rest rooms, rooms where mothers can nurse their infants at fixed intervals, and, when conditions require it, temporary or permanent dormitories, all of which must come up to specified standards.

Social Insurances.—Since 1894 a law makes the employer responsible for accidents befalling his workers in connection with their occupation, for which they are entitled to compensation. In 1898 provision for voluntary old age and invalidity insurance was enacted for industrial workers, in 1919 it was made compulsory and extended to unemployment and maternity. General sickness insurance is at present limited to the provinces acquired from Austria under the Peace Treaties, where it was already in force. In 1927 insurance of workers against tuberculosis was made

Relief Work.—From the early middle ages onwards a very great number of charitable works have been founded in Italy to relieve the poor, the sick, the aged, orphans, foundlings, deficient, etc., and vast wealth has been assigned for these purposes, placed almost exclusively under the auspices or the direct administration of the Roman Catholic Church. The unification of Italy in 1859 was followed by legislation to regulate these charitable foundations, which by the laws of 1862 and 1890, subsequently amended and codified in the law of 1927, are placed under municipal Boards of Charity (*Congregazioni di Carità*) now consisting of members appointed by the Podestà and of representatives nominated by the registered occupational unions or syndicates. (See FASCISM, ECONOMICS OF.) The whole system is placed under the supervision of a special division of the Ministry of the Interior whose budget in 1926-27 carried an item of 45 million lire for integrating the cost of relief work. In 1927 there were in Italy approximately 30,000 legally recognized charitable institutions, owning some 3,000 million lire worth of property, engaged in the care of the sick (hospitals, convalescent homes, sea-bathing sanatoriums, etc.), the aged, the infirm, physical or moral defectives, orphans and foundlings. The indigent sick are entitled to hospital care, the cost of their maintenance being refunded to the hospitals by the municipalities to which they belong. Besides this, the care of the sick and necessitous poor is provided for by doctors, midwives, and district nurses paid by the Ministry of the Interior.

Under a law of 1927 all the institutions for the relief and protection of mothers and children have been grouped under a special official *Work for the Relief of Maternity and Childhood*. Acting directly or through its subsidiary organs, it provides for destitute or deserted mothers, extends help to infants and children under 5 years of age belonging to needy families, cares for physically or mentally defective children, and materially or morally neglected or delinquent minors who are placed under its guardianship until the age of 18. It is financed by endowments, donations, Government grants (30 million lire in 1928-29), and the proceeds of the tax on bachelors.

Three other incorporated *Works* care, one for war invalids, another for war orphans, the third for children orphaned by

earthquakes.

Recent legislation in the field of relief and welfare work aims at securing through Government control the co-ordination of all charitable efforts so as to avoid duplication and overlapping, and to ensure efficient and economic administration, while respecting the fundamentally voluntary character which has always been the distinguishing trait of Italian charitable works.

Housing and Sanitation. *Housing.*—With the exception of Naples, there was no housing problem in Italy prior to 1900. It arose with the rise of industrialism. Legislation enacted in the period 1902-08 encouraged the erection of inexpensive dwellings for the working classes and for civil servants by the grant of tax exemptions to co-operative building and loan associations. In 1908 this legislation was codified, and a notable impulse given to the housing movement by the establishment of a central housing commission and the foundation of the *Istituto Case Popolari* and the *Co-operative Institute for Houses for Civil Servants*. The erection of houses for railway servants was encouraged and financed by the Government. To meet the grave housing crisis following the war a 25 year exemption from house tax was granted to new buildings and generous credit facilities were supplied by State subsidized banks, more especially to co-operative building associations—often co-operative only in name. The results obtained were inadequate and often unsatisfactory. Since 1923 a new trend has been given to the effort. Tax exemption had been extended to small apartments so as to encourage private enterprise to meet the demand for houses; special credit facilities are afforded to the *Institute for Houses for Civil Servants*, and to the *Istituto Case Popolari*, both of which sell the apartments they build on the hire-purchase system to their inmates. At the end of 1927 the housing crisis was not solved but its intensity was greatly diminished.

Sanitation.—National health services are placed under the General Direction of Public Health of the Ministry of the Interior, which enforces pure food laws, compulsory vaccination and compulsory notification of infectious disease. Provision is made for organized effort for the prevention of malaria by land and agricultural reclamation, the destruction of mosquitoes and the free distribution of quinine to workers in malarious districts. Deaths from this scourge still average some 4,000 a year, and whole populations, more especially in Sardinia, Latium and southern Italy, are enfeebled by it. The anti-malaria campaign is entrusted to the Red Cross Association. The table which follows shows the prevalence of the more common infectious diseases during the period 1922-1927, inclusive:

Houses Quarantined for Infectious Diseases

Disease	1922	1923	1924	1925	1926
Measles	46,471	75,024	98,279	164,484	98,158
Scarlet fever	11,965	13,418	18,871	16,733	16,062
Typhoid fever	25,316	27,626	28,074	24,264	35,649
Typhus fever	1	3	..	34
Diphtheria and croup	11,347	11,138	15,883	15,383	14,923
Smallpox	534	495	432	195	112

Rabies	5,546	8,012	8,554	9,578	8,727
Malignant blisters	2,029	2,205	2,728	2,383	1,753

The prevention and treatment of venereal diseases has been intensified. A special, nation-wide anti-tuberculosis campaign has been started, working through provincial associations regulated by an act of 1927. Through them, all the efforts in this direction are co-ordinated, and special dispensaries, sea and mountain sanatoriums, hospital accommodation, and open-air schools for pre-disposed children are provided. The funds hitherto assigned are proving inadequate and means to enlarge them are being studied, in connection also with the compulsory insurance of industrial workers against tuberculosis recently enacted. In 1926-27 laws were enacted providing a special institute for cancer research work and the study of radiotherapeutics. The manufacture and

sale of narcotics is strictly regulated. A law of 1927 provides for the opening of municipal and provincial hygiene laboratories for research work in hygiene.

A great and sustained effort has been made to provide all parts of the country with adequate *drainage and water services*. The greatest feat of hydraulic engineering accomplished in this direction in Italy and one of the greatest in the world is the building of the Apulian aqueduct which carries water from the western slopes of the Apennines, above Naples, over and through that mountain chain, to the waterless Apulian provinces. The work of building the 1,600 km. of the main aqueduct was begun in 1906 and completed in 1915. From this main line the water is conveyed to 250 municipalities, previously without water supply. The work is rapidly approaching completion. Minor though important aqueducts have been or are now being built in a great many parts of the south and on the islands, notably in the rich and prosperous island of Sardinia.

Savings.—Scarcity of accumulated capital is a characteristic of the Italian economic situation. This is due not to lack of thrift but to the comparative poverty of the nation, operating in all its categories and classes on a very small margin of profit. The war drew very heavily on Italian reserves, and the depreciation of the lira, now stabilized, after many vicissitudes, at approximately one quarter of its pre-war parity, drained national savings. Yet notwithstanding all these adverse circumstances, aggravated by industrial depression, savings now exceed the pre-war figures:

Savings deposits

	1913	1927	Index No. (1913=100)
	(Millions of lire)		
Post office	2,091.2	10,056.0	481.68
Savings banks	2,727.2	13,906.5	509.92
The 5 leading banks	584.8	3,390.5	579.8
Peoples' banks	144.5	973.8	673.9
Regional banks	516.0	4,024.6	779.9

In 1925 interest bearing postal bonds were issued; at the end of 1927 they represented a saving of 384.8 million lire.

Insurance in its several branches is a form of saving expanding rapidly of late years, the participation of Italian companies in the total rising from 58% in 1912 to over 90% in 1924, due partly to the acquisition of the important insurance companies of Trieste, and partly to the growth of the State Life Insurance Institute which in 1924 accounted for 22% of all the premiums issued. The latest available figures for the whole of the insurance movement are those for 1924.

Premiums Collected by Insurance Companies

	1903	1912	1924
	(Millions of lire)		
<i>Italian companies:</i>			
Life	16.1	29.8	277.8
Other risks	44.2	86.2	544.8
Total	60.3	116.0	822.6
<i>Foreign companies:</i>			
Life	26.5	41.7	2.6
Other risks	25.8	42.8	81.0
Total	52.3	84.5	83.6
Grand total	112.6	200.3	906.2

That insurance is becoming more and more popular in Italy is shown by the fact that in 1924 the State Life Insurance Institute collected 193.8 million lire in premiums, and 338.1 million in 1926.

In 1926 the Social Insurances Fund collected 479.1 million lire in premiums on account of compulsory insurance against invalidity, old age, and unemployment; the National Accident Insurance Fund held 130.5 million at the same date.

The funds held by the State Life Insurance Institute, the Social Insurances and the Accident Insurance Funds are loaned under law for financing works of public utility and land and agricultural credit.

(O. R. A.)

DEFENCE

The defence of Italy will be treated in three sections: Military, Naval and Air Force, in accordance with the several branches of the defensive services concerned.

MILITARY

In her 2,000 years of history, Italy can boast of a proud military tradition, which endured even when the country was divided and occupied by the foreign invader. At the fall of the Roman Empire, Italy was overrun and devastated for a long period by invading barbarians, but towards the end of the 11th and the beginning of the 12th century, an effort was made, in the cities, against feudalism, militia being formed in each town and armed for the defence of their independence. It was the militia who defeated the German legions of the Emperor Frederick Barbarossa at Legnano in 1176, and it was the Communal Militia of the City of Siena who fought and won a brilliant victory over the troops of the Florentine Guelphs.

The Communes, later, were turned into principalities in whose service arose the "Compagnie di Ventura" some of which soon became famous, among which the most famous is that of St. George, founded by Alberico da Barbiano in the 14th century from which emanated such noted leaders as Ugucione della Fagiolà, Braccio da Montone, il Gatamelata; Muzio Attendolo Sforza, Count di Carmagnola and above all Bartolomeo Colleoni. Amongst the various Princes only the head of the house of Savoy, then ruling over Piedmont, formed and personally commanded his army. The Duke Emanuel Filibert was the founder in 1560. Other notable commanders, unable to find a field for their activities in Italy, gave their services to the great powers, then waging war in Europe, and amongst these warriors we find the names of Giovanni dalle Bande Nere, Alessandro Farnese and Ambrogio Spinola in the service of Spain, Raimondo Montecucculi and Prince Eugene of Savoy in the service of Austria.

At the outbreak of the French Revolution, the only national army in existence in Italy was that of Piedmont, and later when Napoleon constituted the Cisalpine Republic, Lahor, his lieutenant, formed a nucleus of Italian troops, who in 1797 defeated the Pontifical army. In 1804 an army commanded by General Lechi was formed, composed solely of Italians; this legion together with the troops of the kingdom of Naples took part in nearly all the Napoleonic campaigns. In 1812 it was the legions of Lechi and Pino which saved the great army from disaster, by overpowering the Russians at Malojaroslavetz on Oct. 24.

Later the idea of Independence caused the initiation of the wars against Austria (1848-49) and attempts at liberation were made by such volunteers as Garibaldi, Manara, Dandolo, Morosini and Bixio. In 1855-56 Piedmont took part in the Crimean War and in 1859, with sturdy help from France, Lombardy was liberated from the Austrians. In 1860-61 Garibaldi with his legendary 1,000 men, crushed the Bourbons in Sicily and Naples, and the Piedmont army wrested the provinces of Marche and Umbria from the Pontifical States. In 1866 the third War of Independence, although meeting with disaster at first, led to the annexation of Venice and in 1870 the kingdom of Italy was formed with Rome as its capital.

The modern army began with the reunion of the Sardinian and Neapolitan forces, with which in the campaign of 1859-60 the contingents of Lombardy, Tuscany, Emilia, Garibaldi and the survivors of the Bourbon army joined forces. In 1880 Italy started her colonial policy with the conquest of Eritrea, where the scanty preparations and the inferiority of the numbers of her troops, resulted in the unfortunate, but nevertheless valourous battles of Dogali, Amba Alagi, and Adua. Very soon after Somaliland was conquered, and in 1911 the expedition of Tripoli and Cirenaica terminated with the victory at Sid Bilal on September 20, 1912 which persuaded the Turks to make peace. On May 24, 1915 Italy entered the European conflict on the side of the Allies. Her army fought for 42 months under extremely difficult conditions on the arid stones of the Carso, and amid the glaciers of the Cadore and Adamello, gaining numerous successes, amongst them the conquest of Gorizia.

In October 1917 a vast Austro-German offensive resulted in a breach of the Italian front at Caporetto (*q.v.*), and in consequence the whole of the Italian army had to fall back on to the line of the Piave where all further attacks were successfully resisted and repulsed. On this line took place the abortive Austrian offensive of June 1918 and subsequently the final decisive victory of the Italians at Vittorio Veneto. Italian troops co-operated with those of the Allies in Albania, Macedonia, France, Palestine, Murmansk, Serbia and Siberia. In the last few years the army has engaged in small but important colonial operations in Somaliland, in Lybia and in Cirenaica for the dispersion of rebels.

Organization.—The organization of the Italian army to-day is based on the following lines:—(1) To ensure, in time of peace, a force sufficiently large to guarantee the safety of the country against sudden aggression. (2) To dispose of a number of large units, which will constitute on their completion to full strength, a force large enough for the necessity of the first period of the war. (3) To train a certain number of recruits every year in order to constitute a reserve force sufficient to complete the actual units, and form new units in time of war.

The Army is divided into:—(a) Permanent Army and (b) Reserve force. The high military authorities are:—1 Ministry of War, 1 Army Council, 4 Army Commands (Chiefs of which take over commands only in time of war).

The Ministry of War is composed of:—The Minister of the Cabinet, the Command of the General Staff, various general directorates and inspectors of the various units.

The Cabinet co-ordinates the work of all the various branches of the Ministry. The Command of the General Staff has the care of all technical questions for the preparation for war. It is composed of:—The Chief of the General Staff, Assistant-Chief of the General Staff, 1 Major General, various officers. The Army Council exists solely for consultative purposes to advise the Minister on military questions of great importance.

The composition of the various corps is: *Infantry Regiments*:—87 Infantry of the Line, 3 Grenadier, 12 Bersaglieri Cyclists, 9 Alpine, 1 Tank. *Cavalry Regiments*:—12 Cavalry. *Artillery Regiments*:—30 Field Artillery, 3 Mountain Artillery (Pack Artillery), 1 Horse Artillery, 12 Heavy Field Artillery, 5 Heavy Artillery, 3 Regiments and 1 group Coast Artillery, 12 Units Anti-aircraft Artillery, Direction and Artillery Works. *Engineer Regiments*:—12 Engineer, 1 Bridging, 1 Railway Engineers, 2 Wireless Telegraphists, Fortification Bureau and Engineer Works.

Artillery Service:—12 Directions of Artillery, 3 Arsenal, 1 Small Arms factory, 1 pyrotechnic factory, 1 fuse factory, 1 powder factory, 1 optical research laboratory, 1 range table office, 2 centres for artillery practice.

Engineer Service:—13 fortification offices (with various numbers of offices detached); 1 Construction Works of Military Engineering; 1 Centre for studies for sappers, miners, teleferists, bridging engineer; 1 Centre for Railway studies; 1 Centre for Telegraphists and Wireless Telegraphists and Telephonists; 1 Centre for Aerostatics; 1 Military Institute of Wireless Telegraphy and Electrotechnics; 1 Wireless and Electrotechnic Works; 34 fixed Military Pigeon Houses.

Medical Corps Services:—12 principal Military Hospitals; 12 secondary Military Hospitals; 8 Garrison Infirmaries; 1 Military Chemist Institute; 2 Bathing Establishments; 1 Military Climatic Camp; 1 Military Chemical Bromatological Laboratory; 1 Medical Stores.

Military Commissariat Service:—4 Central Stores for Clothing and Equipment; 1 Factory for Clothing and Equipment; 2 establishments for the preparation of preserved foodstuffs; a large number of bakeries, mills, etc.

Recruiting and Distribution.—The recruiting regulations in existence are the "Testo Unico delle leggi sul Reclutamento del R^o Esercito" approved by Royal decree N^o 1437 August 5, 1927.

Compulsory service is the rule for all citizens with the following exceptions:—(1) Those who have not full Italian citizenship, (2) Subjects of the Dodecanese Isles, (3) Natives of the Colonies. Those who have been condemned to imprisonment for cer-

Estimates of the War Ministry for the Financial Years 1913-14, 1926-27, 1927-28, 1928-29

Expenditure	1913-14	1926-27	1927-28	1928-29
Ordinary expenditure:				
General expenses . . .	3,843,700	12,820,000	14,545,300	15,285,300
Life debt	39,049,000	161,937,500	165,450,000	180,350,000
Army	279,494,377	1,750,841,000	1,758,436,000	1,735,495,000
Royal carabinieri . . .	29,566,230	462,142,800	460,300,000	438,530,000
Funds at the disposal of the War Ministry	3,616,500	33,288,400	34,000,000	34,000,000
Total ordinary expenditure	355,569,807	2,421,000,000	2,432,731,300	2,403,660,300
Extraordinary expenditure:				
General expenses . . .	216,500	110,665,000	113,100,000	40,640,000
Army	3,6523,900	200,000,000	200,000,000	190,000,000
Expenses depending on the war	22,877,628	4,500,000	3,800,000	2,000,000
Expenses for building for various military uses . . .	380,000	30,027,746	25,027,745	12,027,745
Various expenses	4,300,000
Movement of capital . . .	28,720,000	2,400,000	2,400,000	3,000,000
Appropriation in aid . . .	8,091,542
Total extraordinary expenses	96,809,570	347,592,746	344,327,745	251,967,745
Total expenses	452,379,377	2,768,592,746	2,777,059,045	2,655,628,045

tain crimes are also excluded from military service.

The periods for active service are:—ordinary (18 months), reduced (not less than 6 months), minimum (3 months). The reduced and minimum periods are applied for certain family reasons or for special services rendered to the country by some member of the family. Those who live abroad are exempted temporarily or definitely, as well as Catholic missionaries and parish priests.

Service is sometimes delayed for students, and for those who have a brother already serving. The period of conscription for the ranks is from 21 to 39 years of age. The number of young men to be incorporated every year in the various corps is fixed by the War Ministry. The recruiting system used is regional for the Alpine troops, national for certain specialties (Railways, Aero-statics, Armoured cars and Chemical Services), mixed but almost regional for all the other troops. Mobilisation is almost entirely regional with few exceptions. With this system it is easier to unify the various and different elements of the regions of Italy, and at the same time to allow for a rapid mobilisation.

The whole of the state is subdivided in 13 Military Regions:—11 Regions of Territorial Army Corps Commands; 2 Insular Regions (Sicily and Sardinia). These are in their turn subdivided into 2 or 3 Divisional Zones (altogether 29 zones) comprising in their turn a certain number of Districts (altogether 105). The following organs of Command have no Territorial jurisdiction:—3 superior Commands of Cavalry; 30 Commands of Infantry Brigades; 3 Commands of Alpine Brigades.

Training Doctrine.—The tactical regulations tend to give great importance to the manoeuvres of infantry, and although the scheme recognizes the importance of mechanical means, the infantryman is still considered to be the most important element. The infantry platoon is the smallest unit and is composed of:—1 machine gun section, armed with 2 light machine guns, 3 sections of riflemen. To the rifles of the latter a "blunderbuss" grenade thrower is fixed, which has a capacity of throwing a grenade to a maximum range of 200 metres with a large angle of descent. It is prescribed that the infantry should advance till the minimum distance from the enemy is reached, usually 200 metres, when instead of rifle fire, the bomb is used. Reconnaissance is no longer left to the cavalry divisions, but is the rôle of swift moving units, composed of cavalry, cyclists, mechanised artillery, etc. Tactical direction is entrusted to the army corps commanders. The advance of the large units is made by successive bounds from one position to another.

In the attack, the action of the artillery must begin very early, and the artillery commanders must have a double system of *liaison*, that is, with their own superior commands and with those of the infantry commands, so that the centralisation and decentralisation of the artillery fire should be made possible. The

infantry are taught to advance as far as they can without firing and if possible use only the rifle-grenades to overcome the last resistance of the enemy and to hurl themselves against the enemy lines.

In the defence a position is organized in 3 zones:—(1) outpost zone, (2) position of resistance zone, (3) deployment zone.

Land Frontier.—The land frontier from the Mar Ligure to the Carnaro along the Alps has a length of 1,600 km. of which 450 km. divides Italy from France, 592 from Switzerland, 333 from Austria and 225 from Yugoslavia. Everywhere difficult and rough mountainous ground is prevalent. The frontier line between Italy and France starts from Ponte S. Luigi (between Ventimiglia and Mentone) and follows the mountain crests till it reaches M. Dolent in the Mont Blanc Range. This part of the frontier is crossed by 3 railways (Frejus, Valle Roja, and Cornice) and 6 international roads. The Italo-Swiss frontier runs from M. Dolent to the Piz Lat (passo di Resia) but diverges from the mountain crests to form the big Swiss salient of the Canton Ticino, of a depth of nearly 100 km. (this part is inhabited by a population of Italian nationality) which comes down into the plain of Lombardy within a distance of 35 km. from Milan. The minor salients of Poschiavo and Val Monastero are also Swiss territory. This portion of the frontier is crossed by 3 railways (Sempione, Gotardo, Bernina) and 10 international roads.

The Italo-Austrian frontier runs from Piz Lat to Monte Forno, following the geographical confine between the 2 slopes of the Alps. The frontier line is crossed by 3 railways (Brennero, Dobbiaco and Tarvisio) and 5 international roads.

The Italo-Yugoslavian Frontier goes from Monte Forno to Fiume following the crests of the Alps. It is crossed by 4 railways (Tarvisio-Jesenice; Piedicolle; Postumia-Lubiana; Fiume-Sussak) and 11 international roads.

The whole frontier is a mountainous one, of great height, which explains why Italy must of a necessity keep an army specially trained and equipped for mountain warfare; and the greater importance given to infantry than to mechanised forces, can be readily understood. All the permanent fortifications existing on the frontiers are now obsolete and without any military value.

(A. G. C.)

NAVY

The Italian Navy is a comparatively modern creation. Its rapid growth may be traced from the efforts of the Mingetti Cabinet and more particularly of Admiral Saint-Bon and Signor Brin, who found the naval defences of Italy almost non-existent after the disaster of Lissa (*q.v.*). During his three years of office the admiral laid the foundation upon which Brin afterwards built up the new fleet.

Realising that she could not hope to rival France in numbers,

Statistics Showing the Efforts of the Italian Army and Results Gained During the European War 1915-18

(a) Mobilised Forces to 1918	5,182,000 (of which 114,000 appertained to the R. Navy)	
(b) Forces used in action To May 28, 1915	Officers	22,806
	Ranks	843,419
	Non-military	1,628
	Total	867,853
To January 1, 1916	Officers	33,326
	Ranks	980,889
	Non-military	3,858
	Total	1,018,073
To July 2, 1916	Officers	46,434
	Ranks	1,427,391
	Non-military	3,656
	Total	1,477,481
To January 7, 1917	Officers	53,975
	Ranks	1,694,513
	Non-military	4,616
	Total	1,753,104
To October 6, 1917	Officers	71,758
	Ranks	2,088,686
	Non-military	5,711
	Total	2,166,155
To January 5, 1918	Officers	66,359
	Ranks	1,827,835
	Non-military	3,357
	Total	1,897,551
To October 5, 1918	Officers	78,730
	Ranks	2,092,368
	Non-military	4,164
	Total	2,175,262
(c) Material Artillery	At the outbreak of War, pieces	2,121
	At the Armistice, pieces. (not including 614 pieces on the Territorial anti-aircraft artillery)	7,995
Machine guns	At the outbreak of War	618
	At the Armistice	19,934
Aeroplanes at the front	1915	58
	1918	1,055
Motor vehicles (including motor tractors and motor bicycles)	At the outbreak of War	5,000
	At the Armistice	37,100
(d) Losses	Dead	680,000
	Mutilated	452,000
	Wounded	1,100,000
(e) (Artillery and small arms captured from the Austro-Hungarian Army)	Artillery pieces of various calibre	4,066
	Rifles	490,000
	Machine guns	8,500

Italy devoted her engineering and constructive genius to the creation of individual warships of great strength; in fact, it may be said that she set the example of building monster ships armed with monster guns.

As early as 1901 two battleships had been laid down, carrying two 12 in. and twelve 8 in. guns. It is true that the first Italian "Dreadnought," the "Dante Alighieri," was not laid down until 1909, whereas the first all-12 in. British ship was on the stocks in 1905, but the celebrated Italian designer, Col. Cuniberti, had got out a contemporary design for a ship of twelve 12 in. as compared with the ten 12 in. of the British "Dreadnought."

In the period immediately prior to the World War Italy was pursuing a modest but methodical naval policy dictated primarily by the necessity for maintaining a fleet capable of meeting that

of Austro-Hungary. The eyes of the Italian people and Government turned as naturally to a possible aggressor across the Adriatic as those of the English turned across the Channel in the days before the entente with France. When Italy came into the World War on May 22, 1915, the naval forces of these hostile neighbours were composed as follows:—

	Italy	Austro-Hungary
Battleships	23	20
Light cruisers and scouts	9	7
Torpedo boats	93	87
Submarines	21	7

It will be seen that Italy had an appreciable preponderance of strength in heavy ships, and this proved most valuable both to herself and her allies in neutralising any effective activities on the part of the main Austro-Hungarian fleet.

In the course of the War the Italian Navy lost five battleships, one scout, eight destroyers, six torpedo boats, eight submarines and 11 auxiliary vessels. It was responsible for the destruction of three Austrian battleships, two destroyers, two torpedo boats and eight submarines. Two of the Austrian battleships were sunk in harbour; one in a daring raid with motor launches under Capt. Rizzo Luigi and the second by Surgeon-captain Paulucci Raffaele, who swam into the port of Pola and fixed a mine to the hull of the Austrian flagship. The energies of the Italian Navy were also devoted to maintaining an anti-submarine barrage across the Otranto channel in conjunction with British naval forces, and in coastal operations. (See SUBMARINE CAMPAIGN.)

As a result of the Washington Conference (*q.v.*), Italy agreed to accept a ratio of two in capital ships as compared with five for Great Britain and the United States, three for Japan and two for France.

Since the War she, like France, has concentrated such resources as she can devote to her fleet on modernising her cruiser, destroyer and submarine forces, and on providing for her naval air needs.

In 1928 the Italian fleet was composed as follows:—

	Built	Building
Battleships	5	Nil
Coast defence ship	1	Nil
Cruisers	13	6
Aircraft carriers	1	Nil
Flotilla leaders	11	12
Destroyers	64	3
Torpedo boats	47	Nil
Submarines	45	18
Sloops (including four mine-layers)	24	Nil
Coastal motor boats	132	4
Gun boats and dispatch vessels	9	Nil
River gun boats	2	Nil
Mine sweepers	48	Nil

Of the cruisers "building," two are of 10,000 tons and four of 5,000. Two more 10,000 ton cruisers were projected at that date.

Administration.—The Italian Navy is administered by a Ministry of Marine consisting of the Department of the minister, the Directorates of naval personnel and naval duties, of civil personnel and general questions, of ordnance and armament supply and of naval construction, medical services, accountancy and of naval engineering and works. There is a chief and assistant chief of staff and the naval staff is divided into eight bureaux.

The board of admirals consists of a president, two ordinary members, ten extraordinary members (admirals and generals), a certain number of non-voting extraordinary members (directors of general and central services) and certain officers, not below the rank of captain, whom the minister of marine and the president of the board of admirals may desire to consult.

The Supreme council of the Navy consists of a president, four ordinary members, seven extraordinary members (five military and two civil), a certain number of non-voting extraordinary members (the director and the directors of general and central

services).

The principal naval commands are three in number:—

(1) Commander-in-chief of the upper Tyrrhenian naval department, headquarters at Spezia.

(2) Commander-in-chief of the lower Tyrrhenian naval department, headquarters at Naples.

(3) Commander-in-chief of the Ionian and Adriatic naval department, headquarters at Taranto.

Enlistment.—All Italian subjects are liable to military service and of those who are called up a certain number may be posted to the Royal Navy. These recruits are chosen from men of less than 1.60 metres in height. The higher ratings are engaged on a long service system. (E. A.)

AIR FORCE

The air forces of Italy during the World War and until the end of 1922 were divided into a military air service under the Ministry of War and a naval air service under the Ministry of Marine. On the assumption of power by Signor Mussolini in October 1922 one of his earliest acts was to endeavour to lay the foundations of a strong and independent Air Force.

By Royal Decree No. 62 dated Jan. 24 1923, he created the Commissariato per l'Aeronautica or Air Department and charged it with the duty of drawing up an organization. The Air Department was placed under the control of the Under Secretary of State for Home Affairs with the title of Vice Commissioner for Aeronautics.

As a result of the Air Department's studies the Regia Aeronautica or Royal Italian Air Force was created by Royal Decree No. 645 dated March 28, 1923, and the main lines of its organization were laid down.

The Air Department was divided into two branches: (1) the Comando Generale or Military Branch, and (2) the Intendenza Generale or Civilian Branch, both of which were under the control of the Vice Commissioner for Aeronautics who was directly responsible to the High Commissioner for Air, Signor Mussolini himself. The Comando Generale was responsible for all the air units and flying schools, while the Intendenza Generale became responsible for the development of civil aviation, all questions of supply and technical services, pay and accounts, and initial flying training for the Regia Aeronautica. The marked division of control over the essential services of the military air force led to difficulties, however, and after 18 months the Intendenza Generale was dissolved and its sub-departments were placed directly under the control of the Vice Commissioner who thus found himself responsible for The Comando Generale, The Directorate of Air Engineering and Construction, The Directorate of Administration and Personnel, The Air Traffic Office. In April 1925 an Air Staff was created with a Chief of Staff at the Air Commissariat, and shortly after a decree laying down the definite organization and strength of the Regia Aeronautica and creating a system of territorial commands was issued. In August 1925 the name of the Air Commissariat was changed to Ministry for Aviation, a ministry analogous to the British Air Ministry, responsible for the direction of the Regia Aeronautica and for the furtherance and control of civil aviation.

It will be seen that under Mussolini's powerful direction the Italian Air Services previously languishing and disorganized have been revived in a manner which is little short of miraculous. Recent exploits by chosen pilots of whom the Marchese de Pinedo is *facile princeps* has shown how quickly and brilliantly the revival has been brought about. It can be said that the Regia Aeronautica holds premier place in the imagination and affection of the Italian public, and the appointment of General Balbo as Under Secretary of State for Air has provided during the past year a further spur to its activities and enthusiasm.

Organization.—The combatant branch (or Arma Aeronautica) of the Regia Aeronautica is divided into (a) The Independent

Air Force (Armata Eerea), (b) The Army Air Service (Aeronautica per il Regio Esercito), (c) The Navy Air Service (Aeronautica per la Regia Marina) and (d) the Colonial Air Service (Aeronautica per le Regie Truppe Coloniali). It is proposed to aim at a total of 182 Squadrons, totalling 1,600 aircraft, and 6 airships, by 1931.

The duties of these four branches of the Regia Aeronautica may be briefly stated as follows: (a) The Independent Air Force is designated for offensive and defensive air action in war. (b) The Army Air Service is to provide air power for the various Army Commands. (c) The Navy Air Service is responsible for duties assigned to it by the various Naval Commands in peace and war. All airships are allotted to this branch. (d) The Colonial Air Service operates under orders issued by the Colonial Military authorities and is financed by the Ministry for Colonial Affairs. For the purposes of administration and organization Italy has been divided into Territorial Air Zones the Headquarters of which are situated at Milan, Bologna, Naples, Palermo and Cagliari.

The semi-rigid type of airship is used and 4 ships of varying sizes are now under construction or already in commission. A sum of approximately 650,000,000 lira was voted for the Regia Aeronautica during the year 1927-28. Approximate figures of personnel are: Officers (all categories) 1,500, Pilots (officers and other ranks) 1,200, other ranks (not pilots) 16,000. The number of Aircraft of the 1st Line is: Aircraft 1,000 (approximately), Airships 4. (A. R. B.)

HISTORY

From the fall of the Roman empire till modern times the Italians have had no political unity, no independence, no organized existence as a nation. Their history is not the history of a united people, centralizing and absorbing its constituent elements by a process of continued evolution, but of a group of cognate populations, exemplifying various types of constitutional development.

The early history of Italy will be found under *ROME* and allied headings. The following article is therefore mainly concerned with events succeeding 476 A.D., when Romulus Augustulus was succeeded by Odoacer. Prefixed to this are two sections dealing respectively with (a) ancient languages and peoples in Italy, and (b) the unification of the country under Augustus, the growth of the road system, etc. The subsequent history is divided into three periods: (c) from 476 to 1796; (d) from 1796 to 1914; (e) from 1914 onwards.

Ancient Languages and Peoples.—The ethnography of ancient Italy is involved in obscurity. The country attracted, even in early ages, successive swarms of invaders from the north. Ancient writers are agreed as to the diversity of races that were found within the limits of the peninsula. The traditions transmitted to us are often conflicting, while the idioms that prevailed in Italy in and before the 5th century B.C. are preserved, if at all, only in a few scanty and fragmentary inscriptions. (See, e.g., *LATIN LANGUAGE*, *OSCAN*, *VOLSCI*, *UMBRIAN LANGUAGE*, *ETRUSCAN LANGUAGE*, and below.) These imperfect materials combined with the notices derived from ancient writers and the evidence of archaeological excavations furnished results of reasonable certainty.

The name "Italians" was at one time confined to the Oenotrians. According to Antiochus of Syracuse (*apud* Dion. Hal. *Ant. Rom.* ii. 1), the name of Italy was first applied only to the southern portion of the Bruttium peninsula (now known as Calabria). But in the time of that historian, as well as of Thucydides, the names of Oenotria and Italia, which were then regarded as synonymous, included the shore of the Tarentine gulf as far as Metapontum and thence across to the gulfs of Laus and Poseidonia on the Tyrrhenian sea. It thus comprised only the two provinces subsequently known as Lucania and Bruttium (see references s.v. "Italia" in R. S. Conway's *Italic Dialects*, p. 5). The name seems to be a Graecized form of an Italic *Vitelia*, from the stem *vitlo-*, "calf," and perhaps meant "calf-land," "grazing-land."

The term Italy now comprises the whole peninsula with the northern region as far as the Alps. Only the Etruscans did not

speak an Indo-European language. Apart from Etruscan and the dialects of the Greek colonies, like Cumae, Neapolis, Tarentum, from the south to the north, the different languages or dialects in separate existence between 600 and 200 B.C. were: (1) Sicel, (2) South Oscan and Oscan, (3) Messapian, (4) North Oscan, (5) Volscian, (6) East Italic or "Sabellic," (7) Latinian, (8) Sabine, (9) Iguvine or "Umbrian," (10) Gallic, (11) Ligurian and (12) Venetic.

It is probable that Venetic, East Italic and Messapian are connected, and, with the ancient dialects spoken in Illyria (*q.v.*), might be provisionally entitled the Adriatic group. The Sicel language was of Indo-European character. How far the language or languages spoken in Bruttium and at certain points of Lucania, such as Anxia, differed from Oscan is not clear (*see* BRUTTIUM). No inscriptions can be referred with certainty to the language of the Ligures. Other evidence seems to link them with the -CO-peoples. It is difficult to determine the dates of the earliest appearance of Gallic tribes in the north of Italy. Archaeological stratification shows that the Gallic period supervened upon the Etruscan. The Celtic and Etruscan elements together occupied the greater part of the district between the Apennines and the Alps down to its Romanization in the course of the 2nd century B.C. Their linguistic neighbours were Ligurian in the south and south-west, and the Veneti on the east.

A large force of Gauls came as far south as Rome in the year 390 B.C. Some part of this horde settled in what was henceforward known as the *Ager Gallicus*, the easternmost strip of coast later known as Umbria, including the towns of Caesena, Ravenna and Ariminum. A bilingual inscription (Gallic and Latin) of the 2nd century B.C. was found as far south as Tuder, the modern Todi (*Italic Dialects*, ii. 528; Stokes, *Bezzenberger's Beiträge*, 11, p. 113).

As to the languages of the Italic group in the narrower sense, (a) Oscan; (b) the dialect of Velitrae, commonly called Volscian; (c) Latinian (*i.e.*, Latin and its nearest congeners, like Faliscan); and (d) Umbrian (or, as it may be called, Iguvine), two principles of classification offer themselves; the first purely linguistic, the second linguistic and topographical. There is a broad distinction between the dialects which preserved the Indo-European velars and the dialects which converted the velars wholly into labials; for example, Latinian *quis* contrasted with Oscan, Volscian and Umbrian *pis* (*see* further LATIN LANGUAGE).

The only Latinian dialects of which, besides Latin, we have inscriptions are Faliscan and Marsian (*see* FALISCI, MARSI). The place-names of the Aequi (*q.v.*) suggest that they belong to the same group in this respect. Except, therefore, for a very small and apparently isolated area in the north of Latium and south of Etruria, all the tribes of Italy, though their idioms differed in certain particulars, are left undiscriminated. Tradition asserts very strongly (1) the identity of the Sabines and Samnites; (2) the conquest of an earlier population by this tribe; and (3) evidence of the identity of the Sabines with the ruling class; *i.e.*, the patricians, at Rome itself.

The ethnical or tribal and oppidan names of communities belonging to the Sabine stock are marked by the use of the suffix -NO- as in *Sabini*. There is some linguistic evidence that this stratum of population overcame an earlier population, which used, generally, ethnica in -CO- or -TI- (as in *Morruci*, *Ardeates*, transformed later into *Marrucini*, *Ardeatini*).

From this it follows that:—

(1) Latin will be counted the language of the earlier plebeian stratum of the population of Rome and Latium, probably once spread over a large area of the peninsula, and akin in some degree to the language or languages spoken in north Italy before either the Etruscan or the Gallic invasions.

(2) What is called Oscan represented the language of the invading Sabines (more correctly Safines).

(3) What is called Volscian, known only from the important inscription of the town of Velitrae, and what is called Umbrian, known from the famous Iguvine Tables with a few other records, would be regarded as Safine dialects, spoken by Safine communities more or less isolated in the midst of the earlier and possibly

partly Etruscanized populations. As early as the 4th century B.C. their language had suffered corruptions which it escaped both in the Samnite mountains and in Rome.

CONSOLIDATION OF ITALY

In the very earliest times the name of Italy was correctly applied only to the southern part of the peninsula, and was only gradually extended to the central regions, such as Latium and Campania, which were designated by writers as late as Thucydides and Aristotle as in Opicia. Under Roman rule the term was confined to the regions of the central and southern districts, exclusive of Cisalpine Gaul, and this continued to be its official signification down to the end of the republic. But the name came to be generally employed as a geographical term at a much earlier period. Thus we already find Polybius repeatedly applying it to the whole country as far as the foot of the Alps; and this was a familiar use of the term in the days of Cicero and Caesar. The official distinction was, however, still retained. Cisalpine Gaul still constituted a "province," and it was not till Caesar crossed the Rubicon that he entered Italy.

Augustus gave a definite administrative organization to Italy as a whole, and his division into 11 regions continued in official use till the reign of Constantine.

The first region comprised Latium, including the Volsci, Hernici and Aurunci (*q.v.*), together with Campania and the district of the Picentini. It thus extended from the mouth of the Tiber to that of the Silarus (*see* LATIUM).

The second region included Apulia and Calabria, together with the land of the Hirpini (*q.v.*).

The third region contained Lucania and Bruttium; it was bounded on the west coast by the Silarus, on the east by the Bradanus.

The fourth region comprised all the Samnites (except the Hirpini), together with the Sabini (*q.v.*) and the cognate tribes. It was separated from Apulia on the south by the river Tifernus, and from Picenum on the north by the Matrinus.

The fifth region was composed solely of Picenum, extending along the coast of the Adriatic from the mouth of the Matrinus to that of the Aesis, beyond Ancona.

The sixth region was formed by Umbria, in the more extended sense of the term, as including the *Ager Gallicus*, along the coast of the Adriatic from the Aesis to the Ariminus, and separated from Etruria on the west by the Tiber.

The seventh region consisted of Etruria, extending from the Tiber to the Tyrrhenian sea, and separated from Liguria on the north by the river Macra.

The eighth region, termed Gallia Cispadana, comprised the southern portion of Cisalpine Gaul, and was bounded on the north by the river Padus or Po, from above Placentia to its mouth. It was separated from Etruria and Umbria by the Apennines; and the river Ariminus was substituted for the Rubicon as its limit on the Adriatic.

The ninth region comprised Liguria, extending along the sea-coast from the Varus to the Macra, and inland as far as the river Padus, which constituted its northern boundary from its source in Mt. Vesulus to its confluence with the Trebia just above Placentia.

The tenth region included Venetia from the Padus and Adriatic to the Alps, with the neighbouring peninsula of Istria, and to the west the territory of the Cenomani (*q.v.*).

The 11th region, known as Gallia Transpadana, included all the rest of Cisalpine Gaul from the Padus on the south and the Addua on the east to the foot of the Alps.

Roads.—The mainstay of the Roman military control of Italy was the splendid system of roads. As the supremacy of Rome extended itself over Italy, the Roman road system grew, each fresh conquest being marked by the pushing forward of roads through the newly-won territory, and the establishment of fortresses. It was in Italy that the military value of a network of roads was first appreciated by the Romans. And it was for military reasons that from mere cart-tracks they were developed into permanent highways. From Rome roads radiated in all

directions. Communications with the south-east were mainly provided by the Via Appia and the Via Latina, which met close to Casilinum, 3m. N.W. of Capua, the centre of the road system of Campania. Here the Via Appia turned eastward towards Beneventum, while the Via Popilia continued in a south-easterly direction through the Campanian plain and the mountains of Lucania and Bruttium as far as Rhegium. Other roads ran south from Capua to Cumae, Puteoli (the most important harbour of Campania), and Neapolis. From Beneventum, another important road centre, the Via Appia itself ran south-east through the mountains past Venusia to Tarentum on the south-west coast of the "heel," and thence across Calabria to Brundisium; Trajan's alternative road ran north-east through the mountains and the lower ground of Apulia, reaching the coast at Barium. Both met at Brundisium, the principal port for the East.

The only high road of importance from Rome eastwards, the Via Valeria, was not completed as far as the Adriatic before the time of Claudius; but on the north and north-west started the main highways which communicated with central and northern Italy, and with all that part of the Roman empire which was accessible by land. The Via Salaria, a very ancient road, with its branch, the Via Caecilia, ran north-eastwards to the Adriatic coast as did the Via Flaminia, which reached the coast at Fanum Fortunae, and thence followed it to Ariminum. The Via Flaminia was the earliest and most important road to the north; and it was soon extended (in 187 B.C.) by the Via Aemilia running through Bononia as far as Placentia, in a straight line between the plain of the Po and the foot of the Apennines. In the same year a road was constructed over the Apennines from Bononia to Arretium. Along the west coast the Via Aurelia ran up to Pisa and was continued by another Via Aemilia to Genoa. Thence the Via Postumia led to Placentia and Cremona, while the Via Aemilia and the Via Iulia Augusta continued along the coast into Gallia Narbonensis. The road system of Cisalpine Gaul was mainly conditioned by the rivers which had to be crossed, and the Alpine passes which had to be approached. Cremona, on the north bank of the Po, was an important meeting point of roads, and Hostilia another; so also was Patavium, and Aquileia, farther east.

As to the roads leading out of Italy, from Aquileia roads diverged northward into Raetia, eastward to Noricum and Pannonia, and southwards to the Istrian and Dalmatian coasts. Farther west came the roads over the higher Alpine passes—the Brenner from Verona, the Septimer and the Splügen from Clavenna (Chiavenna), the Great and the Little St. Bernard from Augusta Praetoria (Aosta), and the Mont Genève from Augusta Taurinorum (Turin). Westward two short but important roads led from Rome on each side of the Tiber to the great harbour at its mouth.

FROM 476 TO 1796

The year 476 opened a new age for the Italian people. Odoacer, a chief of the Herulians, deposed Romulus Augustulus, the last emperor of the West, and placed the peninsula beneath the titular sway of the Byzantine emperors. At Pavia the barbarian conquerors of Italy proclaimed him king, and he received from Zeno the dignity of Roman patrician. Thus began that system of mixed government, Teutonic and Roman, which impressed the institutions of new Italy from the earliest date with dualism, and vested supreme authority in a non-resident autocrat.

In 488 Theodoric, king of the East Goths, received commission from the Greek emperor, Zeno, to undertake the affairs of Italy, and in 493 defeated and killed Odoacer. Theodoric respected the Roman institutions which he found in Italy, and governed by ministers chosen from the Roman population. But the Goths, except in the valley of the Po, resembled an army of occupation rather than a people numerous enough to blend with the Italic stock, and in religion they were Arians—circumstances calculated to

excite the Italians to rebellion. When, therefore, Justinian undertook the reconquest of Italy, his generals, Belisarius and Narses, were supported by the south. The struggle between Greeks and Goths lasted from 539 to 553, when Teias, the last Gothic king, was finally defeated. At its close the provinces of Italy were placed beneath Greek dukes controlled by an exarch, who ruled in the Byzantine emperor's name at Ravenna.

This new settlement lasted but a few years. Narses had employed Lombard auxiliaries in his campaigns against the Goths; and when he was recalled in 565, the Lombards and their allies passed southward under King Alboin in 568. Pavia offered stubborn resistance; but after a three years' siege it was taken, and Alboin made it the capital of his new kingdom.

Numerous as they were, the Lombards had not strength nor multitude enough to occupy the whole peninsula. Venice, which since the days of Attila had offered an asylum to Roman refugees from the northern cities, Genoa, Ravenna, Rome and the sea-coast cities of the south, and the islands, Sicily, Sardinia and Corsica, remained untouched. Thus the Lombards neither occupied the extremities nor subjugated the brain centre of the country. The strength of Alboin's kingdom was in the north; but after his murder in 573, the semi-independent chiefs of the Lombard tribe, who borrowed the title of dukes from their Roman predecessors, seem to have been contented with consolidating their power in the districts each had occupied. The duchies of Spoleto in the centre, and of Benevento in the south, were but loosely united to the kingdom at Pavia. Italy was broken up into three separate areas—the new Lombard kingdom; Ravenna, the garrison city of the Byzantine emperor; and Rome, the rallying point of the old nation, under the successor of St. Peter.

The rule of the Lombards proved at first far more oppressive to the native population, and had less understanding of their old customs, than that of the Goths had been. Though the Roman laws were still administered within the cities, yet the Lombard code was that of the kingdom; and the Lombards, being Arians, added the severe oppression of religious intolerance to that of martial despotism and cupidity. The Italians were reduced to the last extremity when Gregory the Great (590-604), having strengthened his position by diplomatic relations with the duchy of Spoleto, and brought about the conversion of the Lombards to orthodoxy, raised the cause of the remaining Roman population throughout Italy. When Leo the Isaurian published his decrees against the worship of images in 726, Gregory II. allied himself with Liudprand, the Lombard king, threw off allegiance to Byzantium, and established the autonomy of Rome. But the Lombards were unnatural allies, and increasingly the pope began to look for help in the Franks. Pippin twice crossed the Alps, and forced the Lombard king Aistolf to relinquish his acquisitions, including Ravenna, the Pentapolis, the coast towns of Romagna and some cities in the duchy of Spoleto. These he handed over to the pope of Rome, in 756, a donation which confirmed the papal see in the protectorate of the Italic party, conferred upon it sovereign rights, and placed the popes in the position held by the Greek exarch. The south of Italy, however, was comparatively unaffected. The dukes of the Greek empire and the Lombard dukes of Benevento, together with a few autonomous commercial cities, still divided southern Italy between them (*see LOMBARDS*).

THE FRANKISH EMPERORS

The Franco-Papal alliance held within itself that ideal of mutually supporting papacy and empire which exercised so powerful an influence in mediaeval history. When Charles the Great (Charlemagne) deposed his father-in-law Desiderius, the last Lombard king, in 774, and when he was crowned emperor by Leo III. at Rome in 800, he did but complete and ratify the compact offered to his grandfather, Charles Martel, by Gregory III. Charles took possession of the kingdom of Italy, as limited by Pippin's settlement. The pope was confirmed in his rectorship of the cities ceded by Aistolf, with the further understanding that in the future he might claim the protectorate of such portions of Italy, external to the kingdom, as he should be able to acquire. The kingdom of Italy, transmitted on his death by Charles the Great, and after-

wards confirmed to his grandson Lothar by the peace of Verdun in 843, stretched from the Alps to Terracina. The duchy of Benevento remained tributary, but independent. The cities of Gaeta and Naples, Sicily and the so-called Theme of Lombardy in South Apulia and Calabria, still recognized the Byzantine emperor. Venice stood aloof, professing a nominal allegiance to the East.

Internally Charles left the affairs of the Italian kingdom much as he found them, except that he appears to have pursued the policy of breaking up the larger fiefs of the Lombards, substituting counts for their dukes, and adding to the privileges of the bishops. We may reckon these measures among the earliest advantages extended to the cities, which still contained the bulk of the old Roman population. It should also here be noticed that the changes introduced into the holding of the fiefs were chief among the causes why the feudal system took no permanent hold in Italy. Feudalism was not at any time a national institution. The hierarchy of dukes and marquises and counts consisted of foreign soldiers; and the rapid succession of conquerors, each endeavouring to weaken the remaining strength of his predecessor, prevented this alien hierarchy from acquiring fixity by permanence of tenure.

The Italians acknowledged eight kings of the house of Charles the Great, ending in Charles the Fat, who was deposed in 888. After them followed ten sovereigns, all more or less alien, the last of whom was Berengar II. who in 961 ceded his rights to Otto the Great. Anarchy and misery are the main features of the long period between the death of Charles the Great and the descent of Otto. Early in the 9th century the Saracens began to occupy Sicily, overran Calabria and Apulia, took Bari and threatened Rome. In 890 the Greeks established themselves again at Bari, and ruled the Theme of Lombardy through an officer entitled the Catapan. Early in the 10th century the papacy fell into the hands of a noble family, known eventually as the counts of Tusculum, who almost succeeded in rendering the office hereditary, and in uniting the civil and ecclesiastical functions of the city under a single member of their house. During this time the popes abandoned, not only their high duties as chiefs of Christendom, but also their protectorate of Italian liberties; while the invasion of the Magyar barbarians, who overran the north of Italy, reduced its fairest provinces to the condition of a wilderness. The cities exposed to pillage by Huns in the north and Saracens in the south, and ravaged on the coast by Norse pirates, asserted their right to defend themselves. Within the circuit of their ramparts, the bishops already began to exercise authority in rivalry with the counts, to whom since the days of Theodoric, had been entrusted the government of the Italian burghs. Agreeably to feudal customs, these nobles retired from the town and built themselves fortresses on points of vantage in the neighbourhood. Thus the titular king of Italy found himself simultaneously at war with those great vassals, with the turbulent factions of the Roman aristocracy, with unruly bishops, and with a multitude of minor counts and barons. The last king of the quasi-Italian succession, Berengar II., marquis of Ivrea (951-961), made a vigorous effort to restore the authority of the kingdom. But he stood alone against a multitude, unanimous in their intolerance of discipline. His predecessor in the kingdom, Lothar, had left a young and beautiful widow, Adelheid. Berengar imprisoned her upon the Lake of Como, but she escaped to the castle of Canossa, where the great count of Tuscany espoused her cause, and appealed in her behalf to Otto the Saxon. The king of Germany descended into Italy, and took Adelheid in marriage; and Berengar, in the extremity of his fortunes, had recourse himself to Otto, making a formal cession of the Italian kingdom to the Saxon as his overlord. By this slender tie the crown of Italy was joined to that of Germany; and the formal right of the elected king of Germany to be considered king of Italy and emperor may be held to have accrued from this epoch.

THE GERMAN EMPERORS

Berengar gained nothing by his act of obedience to Otto. Otto entered Lombardy in 961, deposed Berengar, assumed the crown in Sant' Ambrogio at Milan, and in 962 was proclaimed emperor by John XII. at Rome. Henceforward Italy changed masters ac-

cording as one or other of the German families secured supremacy beyond the Alps. By this revolution the Italian kingdom virtually ceased to exist, and was merged in the German kingdom; and, since for the German princes Germany was of necessity their first care, Italy from this time forward began to be abandoned to the slowly-working influences which tended to divide her into separate states. Among the centrifugal forces which determined the future of the Italian race must be reckoned, first and foremost, the new spirit of municipal independence which Otto encouraged by placing the enclosures of the chief burghs beyond the jurisdiction of the counts. Within those precincts the bishops and the citizens were independent of all feudal masters but the emperor. He further broke the power of the great vassals by red divisions of their fiefs. In this way, feudalism received a powerful check in Italy. The Italian nation was not indeed as yet apparent. But the conditions under which it could arise and reconstruct out of the ruins of its past glories a new civilization of its own now at last existed. The nobles fortified themselves in strong places outside the cities, and gave their best attention to fostering the rural population. Within the cities and upon the open lands the Italians, in this and the next century, doubled, trebled and quadrupled their numbers. A race was formed strong enough to keep the empire itself in check, strong enough, except for its own internecine contests, to have formed a nation equal to its happier neighbours.

Otto III.'s untimely death in 1002 introduced new discords. Rome fell once more into the hands of her nobles. The Lombards chose Ardoïn, marquis of Ivrea, for king, and Pavia supported his claims against those of Henry of Bavaria, who had been elected in Germany. Milan sided with Henry; and this is perhaps the first eminent instance of cities being reckoned powerful allies in the Italian disputes of sovereigns. Ardoïn retired to a monastery, where he died in 1015. Henry nearly destroyed Pavia, was crowned in Rome and died in 1024. After this event, Heribert, the archbishop of Milan, invited Conrad, the Franconian king of Germany, into Italy, and crowned him with the iron crown of the kingdom.

The intervention of this man, Heribert, compels us to turn a closer glance upon the cities of north Italy. In Milan we hear for the first time the word *Comune*, the citizens first form themselves into a *Parlamento*, the archbishop organizes the hitherto voiceless, defenceless population into a community capable of expressing its needs, and an army ready to maintain its rights. To Heribert is attributed the invention of the *Carroccio*, which played so singular and important a part in the warfare of Italian cities. A huge car drawn by oxen, bearing the standard of the burgh, and carrying an altar with the host, this carroccio, like the ark of the Israelites, formed a rallying point in battle, and reminded the armed artisans that they had a city and a church to fight for. It must not, however, be supposed that at this epoch the liberties of the cities were fully developed. The mass of the people remained unrepresented in the government. It still needed nearly a century of struggle to render the burghers independent of lordship, with a fully organized commune, self-governed in its several assemblies. The maritime cities were more advanced than the others. Not to mention Venice, which had not yet entered the Italian community, and remained a Greek free city, Genoa and Pisa were rapidly rising into ill-defined autonomy. Their command of fleets gave them incontestable advantages, as when, for instance, Otto II. employed the Pisans in 980 against the Greeks in Southern Italy, and the Pisans and Genoese together attacked the Saracens of Sardinia in 1017.

Hildebrand.—During the reign of Conrad II., the party of the counts of Tusculum revived in Rome; and Crescentius, claiming the title of consul in the imperial city, sought once more to control the election of the popes. When Henry III., the son of Conrad, entered Italy in 1046, he found three popes in Rome. These he abolished, and, taking the appointment into his own hands, gave German bishops to the see. These German popes were short-lived and inefficient; and unless it could be purged of crying scandals—of the subjection of the papacy to the great Roman nobles, of its subordination to the German emperor and of its internal demoralization—the condition of the church seemed

desperate. The Tuscan monk, Hildebrand, throughout three papacies, during which he controlled the counsels of the Vatican, and before he himself assumed the tiara, laid down a programme of reform including these three points: (1) the celibacy of the clergy; (2) the abolition of ecclesiastical appointments made by the secular authority; (3) the vesting of the papal election in the hands of the Roman clergy and people, presided over by the curia of cardinals. But before turning to the tremendous revolution which Hildebrand inaugurated, it will be necessary to describe events in southern Italy, upon which in no small measure his success depended.

The Norman Conquest of the Two Sicilies.—The moment had arrived when the provinces in the south, hitherto detached from the Italian *regno*, beyond the jurisdiction of Rome, included in no parcel of Italy proper, were about to enter definitely and decisively within the orbit of the Italian community. Some Norman adventurers, on pilgrimage to St. Michael's shrine on Monte Gargano, lent their swords in 1017 to the Lombard cities of Apulia against the Greeks. Twelve years later we find the Normans settled at Aversa under their Count Rainulf. From this central point spread their power in all directions, until they made themselves the most considerable force in southern Italy. William of Hauteville was proclaimed count of Apulia. His half-brother, Robert Guiscard, received from Leo IX. the investiture of all present and future conquests in Apulia, Calabria and Sicily, which he agreed to hold as fiefs of the Holy See. Nicholas II. ratified this grant, and confirmed the title of count. Having consolidated their possessions on the mainland, the Normans, under Robert Guiscard's brother, the great Count Roger, undertook the conquest of Sicily in 1060. After a prolonged struggle of 30 years, they wrested the island from the Saracens; and Roger, dying in 1101, bequeathed to his son Roger a wealthy and important kingdom in Calabria and Sicily. In 1127, upon the death of his cousin Duke William, who ruled in Apulia, Roger united the whole of the future realm. In 1130 he assumed the style of king of Sicily.

By the consolidation of Apulia, Calabria and Sicily into a powerful kingdom, and by recognizing the overlordship of the papal see, the house of Hauteville influenced the destinies of Italy with more effect than any of the princes who had previously dealt with any portion of the peninsula. The southern *regno*, in the hands of the popes, proved an insurmountable obstacle to the unification of Italy, led to French interference in Italian affairs, introduced the Spaniard and maintained in those rich southern provinces the reality of feudal sovereignty long after this alien element had been eliminated from the rest of Italy (*see* NORMANS; SICILY: *History*).

The Investiture Controversy.—In 1073 Hildebrand was elevated to the papacy as Gregory VII. In the next year after his election Hildebrand convened a council, and passed measures enforcing the celibacy of the clergy. In 1075 he caused the investiture of ecclesiastical dignitaries by secular potentates of any degree to be condemned. These two reforms inflamed the bitterest hostility. Henry IV., king of Germany, but not crowned emperor, convened a diet in the following year at Worms, where Gregory was deposed and excommunicated. The pope followed with a counter-excommunication, releasing the king's subjects from their oaths of allegiance. A war was thus declared between the two chiefs of western Christendom, which was not to close until 1122. Gregory received material assistance from Countess Matilda of Tuscany. She was the last heiress of the great house of Canossa, whose fiefs stretched from Mantua across Lombardy, passed the Apennines, included the Tuscan plains, and embraced a portion of the duchy of Spoleto. It was in her castle of Canossa that Henry IV. performed his three days' penance in the winter of 1077; and there she made the cession of her vast domains to the Church. That cession, renewed after the death of Gregory (1085) to his successors, conferred upon the popes indefinite rights, of which they afterwards availed themselves in the consolidation of their temporal power.

Gregory's immediate successors, Victor III., Urban II., and Paschal II., carried on his struggle with Henry IV. and his anti-popes, encouraging the emperor's son to rebel against him, and

stirring up Europe for the first crusade. When Henry IV. died, his own son's prisoner, in 1106, Henry V. crossed the Alps, entered Rome, forced Paschal II. to crown him and compelled the pope to grant his claims on the investitures. Scarcely had he returned to Germany when the Lateran disavowed all that the pope had done, on the score that it had been extorted by force. France sided with the Church. Germany rejected the bill of investiture, but a new seizure of Rome proved of no avail. The emperor at last abandoned the contest which had distracted Europe. By the concordat of Worms, 1122, he surrendered the right of investiture by ring and staff, and granted the right of election to the clergy. The popes were henceforth to be chosen by the cardinals, the bishops by the chapters subject to the pope's approval. On the other hand, the pope ceded to the emperor the right of investiture by the sceptre. But the popes were really victors. They remained independent of the emperor, but the emperor had still to seek the crown at their hands (*see* PAPACY; INVESTITURE).

AGE OF THE COMMUNES

Rise of the Free Cities.—The final gainers, however, by the war of investitures, were the Italians. The antagonism of the popes to the emperors, which became hereditary in the Sacred College, forced the former to assume the protectorate of the national cause. And on the other hand, during the 47 years' war, the communes grew in self-reliance, strength and liberty. The age of real autonomy, signalized by the supremacy of consuls in the cities, had arrived.

In the republics, government was carried on by officers called consuls, varying in number according to custom and according to the division of the town into districts. These magistrates were originally appointed to control and protect the humbler classes. But, in proportion as the people gained more power, the consuls rose into importance, superseded the bishops and began to represent the city in transactions with its neighbours. Popes and emperors who needed the assistance of a city had to seek it from the consuls, and thus these officers gradually converted an obscure and indefinite authority into what resembles the presidency of a commonwealth. They were supported by a deliberative assembly, called *credenza*, chosen from the more distinguished citizens. In addition to this privy council, we find a *gran consiglio*, consisting of the burghers, and a still larger assembly called *parlamento*, which included the whole adult population. Though the institutions of the communes varied in different localities, this is the type to which they all approximated. The privileged burghers formed the aristocracy of the town, who by their wealth, usually derived from trade and industry, and birth, held its affairs within their custody.

Under their consuls the Italian cities rose to a great height of prosperity and splendour. It is also to be noticed that the people now began to be conscious of their past. They recognized the fact that their blood was Latin as distinguished from Teutonic, and the study of Roman law received a new impulse. The very name consul, no less than the Romanizing character of the best architecture of the time, points to the same revival of antiquity.

The rise of the Lombard communes produced a sympathetic revolution in Rome. A monk named Arnold of Brescia stirred up the Romans to shake off the temporal sway of their bishop. Rome, ever mindful of her unique past, listened to Arnold's preaching. A senate was established, and the republic was proclaimed. The title of patrician was revived and offered to Conrad, king of Italy, but not crowned emperor. Conrad refused it, and the Romans conferred it upon one of their own nobles. Though these institutions borrowed high-sounding titles from antiquity, they were in reality imitations of the Lombard civic system. The pope was unable to check this revolution, which is now chiefly interesting as further proof of the insurgence of the Latin as against the feudal elements in Italy at this period (*see* ROME: *History*).

The division of the country between the pope's and emperor's parties inflicted upon Italy the ineradicable curse of party-warfare. Rome attempted to ruin Tivoli, and Genoa Pisa; Milan fought with Cremona, Cremona with Crema, Pavia with Verona, Verona with Padua, Piacenza with Parma, Modena and Reggio with

Bologna, Bologna and Faenza with Ravenna and Imola, Florence and Pisa with Lucca and Siena, and so on through the whole list of cities. The nearer the neighbours, the more rancorous and internecine was the strife. Italy was, in fact, too small for her children. As the towns expanded, they perceived that they must mutually exclude each other. The pope's cause and the emperor's cause were of comparatively little moment to Italian burghers; and the names of Guelph and Ghibelline, which before long began to be heard in every street, on every market-place, had no meaning for them. These watchwords are said to have arisen in Germany during the disputed succession of the empire between 1135 and 1152, when the Welfs of Bavaria opposed the Swabian princes of Waiblingen origin. But in Italy, although they were severally identified with the papal and imperial parties, they really served as symbols for jealousies which altered in complexion from time to time and place to place.

Frederick Barbarossa.—Under the imperial rule of Lothar the Saxon (1125–37) and Conrad the Swabian (1138–52), these civil wars increased in violence owing to the absence of authority. Neither Lothar nor Conrad was strong at home; the former had no influence in Italy, and the latter never entered Italy at all. But when Conrad died, the electors chose his nephew Frederick, surnamed Barbarossa, who united the rival honours of Welf and Waiblingen. Frederick immediately determined to reassert the imperial rights in his southern provinces. When he first crossed the Alps in 1154, Lombardy was, roughly speaking, divided between two parties, the one headed by Pavia professing loyalty to the empire, the other headed by Milan ready to oppose its claims. In reality Frederick came to supersede self-government by consuls, to deprive the cities of the privilege of making war on their own account and to extort his regalian rights of forage, food and lodging for his armies. The diet was opened at Roncaglia near Piacenza, where Frederick listened to the complaints of Como and Lodi against Milan, of Pavia against Tortona and of the marquis of Montferrat against Asti and Chieri. The plaintiffs in each case were imperialists; and Frederick's first action was to redress their supposed grievances. Outside the gates of Rome he was met by a deputation from the senate he had come to supersede, who addressed him in words memorable for expressing the republican spirit of new Italy face to face with autocratic feudalism. Moved only to scorn and indignation by the rhetoric of these presumptuous enthusiasts, Frederick marched into the Leonine city, and took the imperial crown from the hands of Adrian IV. In return for this compliance, the emperor delivered over to the pope his troublesome rival, Arnold of Brescia, who was burned alive by Nicholas Breakspear, the only English successor of St. Peter. The gates of Rome itself were shut against Frederick; and even on this first occasion his good understanding with Adrian began to suffer. The points of dispute between them related mainly to Matilda's bequest, and to the kingdom of Sicily, which the pope had rendered independent of the empire by renewing its investiture in the name of the Holy See. In truth, the papacy and the empire had become irreconcilable. Having obtained his coronation, Frederick was forced to withdraw by the citizens, while Milan prepared herself against the storm which threatened. In the ensuing struggle the citizens of that great city rose to the altitude of patriotic heroism. They rebuilt Tortona, punished Pavia, Lodi, Cremona and the marquis of Montferrat. Then they fortified the Adda and Ticino, and waited for the emperor's next descent. He came in 1158 with a large army and sat down before the walls of Milan. Famine forced the burghers to partial obedience, and Frederick held a victorious diet at Roncaglia. Here the jurists of Bologna appeared, armed with their new lore of Roman law, and expounded Justinian's code in the interests of the German empire. Frederick placed judges of his own appointment, with the title of podestà, in all the Lombard communes; and this stretch of his authority, while it exacerbated his foes, forced even his friends to join their ranks against him. The war, meanwhile, dragged on. Crema yielded after an heroic siege in 1160. Milan was invested in 1161, starved into capitulation after nine months' resistance, and destroyed. Frederick then withdrew across the Alps. But, in the interval between his second and third visit, a league was

formed against him in north-eastern Lombardy. Verona, Vicenza, Padua, Treviso, Venice entered into a compact to defend their liberties; and when he came again in 1163, the imperial cities refused to join his standards.

INTERNECINE STRIFE

The Lombard League.—Meanwhile the election of Alexander III. to the papacy in 1159 added a powerful ally to the republican party. Opposed by an anti-pope whom the emperor favoured, Alexander relied for support upon the anti-imperialist communes. They in return gladly accepted a champion who lent them the prestige and influence of the church. When Frederick once more crossed the Alps in 1166, he advanced on Rome but was again forced to depart. In April 1167 a new league was formed between Cremona, Bergamo, Brescia, Mantua and Ferrara. In December of the same year this league allied itself with the elder Veronese league, and received the addition of Milan, Lodi, Piacenza, Parma, Modena and Bologna. The famous league of Lombard cities was now established. Novara, Vercelli, Asti and Tortona swelled its ranks; only Pavia and the Montferrat remained imperialist between the Alps and Apennines. Frederick fled for his life by the Mont Cenis, and in 1168 the town of Alessandria was erected to keep Pavia and the marquisate in check. In the emperor's absence, Ravenna, Rimini, Imola and Forlì joined the league, which now called itself the "Society of Venice, Lombardy, the March, Romagna and Alessandria." For the fifth time, in 1174, Frederick entered his rebellious dominions. The fortress town of Alessandria stopped his progress with those mud walls contemptuously named "of straw," while the forces of the league assembled at Modena and obliged him to raise the siege. In the spring of 1176 Frederick threatened Milan. His army was near Legnano, when the troops of the city, assisted only by a few allies from Piacenza, Verona, Brescia, Novara and Vercelli, met and overwhelmed it. The victory was complete. Frederick escaped alone and opened negotiations with Alexander in Venice. Here a truce for six years was concluded with the Lombard communes. But although they had humbled and utterly defeated their foreign lord, and proved their strength in combination, all that they claimed was municipal autonomy; the right to manage their own affairs within the city walls, to fight their battles as they chose, and to follow their several ends unchecked. There was as yet no trace of an Italian national spirit.

When the truce expired in 1183, a permanent peace was ratified at Constance. The signatories of the peace of Constance were divided between leaguers and imperialists. On the one side we find Vercelli, Novara, Milan, Lodi, Bergamo, Brescia, Mantua, Verona, Vicenza, Padua, Treviso, Bologna, Faenza, Modena, Reggio, Parma, Piacenza; on the other, Pavia, Genoa, Alba, Cremona, Como, Tortona, Asti, Alessandria. Venice, who had not yet entered the Italian community, is conspicuous by her absence. According to the terms of this treaty, the communes were confirmed in their right of self-government by consuls, and their right of warfare. The emperor retained the supreme courts of appeal within the cities, and his claim for sustenance at their expense when he came into Italy.

The privileges confirmed to the Lombard cities by the peace of Constance were extended to Tuscany, where Florence had begun her career of freedom and prosperity. The next great chapter in the history of Italian evolution is the war of the cities against the nobles. The city communes were everywhere surrounded by castles; and, though the feudal lords had been weakened by the events of the preceding centuries, they continued to be formidable enemies. But, partly by mortgaging their property to rich burghers, partly by entering the service of the cities as *condottieri* (mercenary leaders), partly by espousing the cause of one town against another, and partly by forced submission after the siege of their strongholds, the nobles were gradually brought into connection of dependence on the communes. These, in their turn, forced the nobles to leave their castles, and to reside within the walls. By these measures the counts became citizens, the rural population ceased to rank as serfs, and the Italo-Roman population of the towns absorbed into itself the remnants of Franks, Germans and

other foreign stocks. But while it would be impossible to exaggerate the importance of this revolution, which ended by destroying the last vestige of feudalism and was a decided step forward, it introduced a new source of discord. The nobles fortified their houses, retained their military habits, and carried on feuds in the streets and squares. The war against the castles became a war against the palaces; and the system of government by consuls proved inefficient to control these clashing elements. This led to the establishment of *podestàs*, whose business it was to arbitrate and keep the peace. Invariably a foreigner, elected for a year with power of life and death and control of the armed force, but subject to a strict account at the expiration of his office, the *podestà* might be compared to a dictator invested with limited authority. The citizens chose him, and voluntarily submitted to his rule.

Frederick II.—Barbarossa, perceiving the advantage that would accrue to his house if he could join the crown of Sicily to that of Germany, procured the marriage of his son Henry VI. to Constance, daughter of King Roger, and heiress of the Hauteville dynasty. When William II., the last monarch of the Norman race, died, Henry VI. claimed that kingdom in his wife's right, and was recognized in 1194. Three years afterwards he died, leaving a son, Frederick, to the care of Constance, who in her turn died in 1198, bequeathing the young prince, already crowned king of Germany, to the guardianship of Innocent III. The pope honourably discharged his duty, until his ward outgrew the years of tutelage, and became a fair mark for ecclesiastical hostility. Among the principal events of Innocent's reign must be reckoned the foundation of the two orders, Franciscan and Dominican. A second great event was the fourth crusade, undertaken in 1198, which established the naval and commercial supremacy of the Italians in the Mediterranean. The Venetians, who contracted for the transport of the crusaders, and whose blind doge Dandolo was first to land in Constantinople received "one quarter and a half" of the Greek empire for their spoils. The Venetian ascendancy in the Levant dates from this epoch; for though the republic had no power to occupy all the domains ceded to it, Candia was taken, together with several small islands and stations on the mainland. The formation of a Latin empire in the East increased the pope's prestige; while at home it was his policy to organize Countess Matilda's heritage by the formation of Guelph leagues, over which he presided. From the Tuscan league Pisa, consistently Ghibelline, stood aloof. Rome itself again at this epoch established a republic, with which Innocent would not or could not interfere. Meanwhile the Guelph and Ghibelline factions were beginning to divide Italy into minute parcels. Not only did commune range itself against commune under the two rival flags, but party rose up against party within the city walls. The introduction of the factions into Florence in 1215, owing to a private quarrel between the Buondelmonti, Amidei and Donati, is a celebrated instance of what was happening in every city.

After the death of Otto IV., Honorius III., Innocent's successor, crowned Frederick emperor in Rome (1220). In his single person he combined the prestige of empire with the crowns of Italy, Sicily, Sardinia, Germany and Burgundy; and in 1225, by marriage with Yolande de Brienne, he added that of Jerusalem. There was no prince greater or more formidable in the habitable globe. Italy seemed to lie prostrate before the emperor. In 1227, Frederick, who had promised to lead a crusade, was excommunicated by Gregory IX. because he was obliged by illness to defer his undertaking. The Guelph towns of Lombardy again raised their levies. Frederick enlisted his Saracen troops at Nocera and Lucera, and appointed the terrible Ezzelino da Romano his vicar in the Marches of Treviso, to quell their insurrection. Having established Ezzelino in Verona, Vicenza and Padua, he defeated the Milanese and their allies at Cortenuova in 1237. Gregory IX., fearing lest the Guelph party would be ruined by this check, made alliance with Venice and Genoa, fulminated a new excommunication against Frederick, and convoked a council at Rome to ratify his ban in 1241. The Genoese undertook to bring the French bishops to this council. Their fleet was attacked at Meloria by the Pisans, and utterly defeated. The French prelates went in silver chains to prison in the Ghibelline capital of Tuscany. In

1243 a new pope, Innocent IV. was elected, who prosecuted the war with still bitterer spirit. Forced to fly to France, he there, at Lyons, in 1245, convened a council, which enforced his condemnation of the emperor. The mendicant monks stirred up the populace to acts of fanatical enmity. To plot against him, to attempt his life by poison or the sword, was accounted virtuous. The crimes of his vicar Ezzelino increased the horror with which he was regarded. Parma revolted against him; the only gleam of success which shone on his ill-fortune was the revolution which placed Florence in the hands of the Ghibellines in 1248. Next year Bologna defeated his troops and took his son Enzo prisoner at Fossalta. Hunted to the ground and broken-hearted, Frederick expired at the end of 1250 in his Apulian castle of Fiorentino. By birth and breeding an Italian, highly gifted and widely cultivated, liberal in his opinions, a patron of literature, a founder of universities, he anticipated the spirit of the Renaissance. At his court Italian started into being as a language. His laws were wise. He was capable of giving to Italy a large and noble culture. But the commanding greatness of his position proved his ruin. Emperor and king of Sicily, he was the natural enemy of popes, who could not tolerate so overwhelming a rival.

POPE VERSUS EMPEROR

Guelph and Ghibelline.—The cause of Frederick's son Conrad was sustained in Lower Italy by Manfred, one of his many natural children; and when Conrad died in 1254, Manfred still acted as viceroy for the Swabians, who were now represented by a boy, Conradin. Innocent IV. and Alexander IV. continued to make head against the Ghibelline party. The most dramatic incident in this struggle was the crusade preached against Ezzelino. This tyrant had made himself justly odious; and he was hunted to death in 1259. While the Guelph faction gained in Lombardy by the massacre of Ezzelino, the Ghibellines revived in Tuscany after the battle of Montaperti, which in 1260 placed Florence at their discretion. Manfred headed the Ghibellines, and there was no strong counterpoise against him. In this necessity Urban IV. and Clement IV. invited Charles of Anjou to enter Italy and take the Guelph command. They made him senator of Rome and vicar of Tuscany, and promised him the investiture of the *regno* provided he stipulated that it should not be held in combination with the empire. Charles accepted these terms, and was welcomed by the Guelph party as their chief throughout Italy. Manfred was defeated and killed in a battle near Benevento in 1266; and, when Conradin, aged 16, descended from Germany to make good his claims to the kingdom, he, too, was defeated at Tagliacozzo in 1267. Less lucky than his uncle, Conradin escaped with his life to die upon the scaffold at Naples. The popes had been successful though at a heavy cost; but this first invitation to French princes brought with it incalculable evils.

Charles of Anjou, supported by Rome, and recognized as chief in Tuscany, was the most formidable of the Italian potentates. In his turn he now excited the jealousy of the popes. Gregory initiated the policy of establishing an equilibrium between the parties, which was carried out by his successor Nicholas III. Charles was forced to resign the senatorship of Rome and the overlordship of Lombardy and Tuscany. In 1282 he received a more decided check, when Sicily rose against him in the famous rebellion of the Vespers. He lost the island, which gave itself to Aragon; and thus the kingdom of Sicily was severed from that of Naples, the dynasty in the one being Spanish and Ghibelline, in the other French and Guelph. Meanwhile a new emperor had been elected, the prudent Rudolf of Habsburg, who abstained from interference with Italy, and who confirmed the territorial pretensions of the popes by solemn charter in 1278. Henceforth Emilia, Romagna, the March of Ancona, the patrimony of St. Peter and the Campagna of Rome held of the Holy See and not of the empire. The imperial chancery made a deed of gift which placed the pope in the position of a temporal sovereign. The Guelph party now grew stronger than ever, through the crushing defeat of the Pisans by the Genoese at Meloria in 1284. She never held her head so high again after this victory. The Mediterranean was left to be fought for by Genoa and Venice, while Guelph Florence

grew still more powerful in Tuscany. The Guelph party was held together by a less tight hand even in cities so consistent as Florence. Here in the year 1300 new factions, subdividing the old Guelphs into Neri and Bianchi, had acquired such force that Boniface VIII., a violently Guelph pope, called in Charles of Valois to pacify the republic and undertake the charge of Italian affairs. After quarrelling with the French king, Philip le Bel, Boniface fell into the hands of the Colonna family at Anagni, and died, either because of violence or of mortification, in Oct. 1303.

After the election to the papacy of a Frenchman, Clement V., the seat of the papacy was transferred to Avignon. Thus began that "Babylonian" exile of the popes which placed them in subjection to the French crown and ruined their prestige in Italy. This enfeeblement of the papal authority, coinciding as it did with the practical elimination of the empire from Italian affairs, gave a long period of comparative independence to the nation. This period of Italian history is immortalized by Dante who sets forth the mighty struggle between pope and emperor. But the real conflict is a social one, between civic and feudal institutions, between commercial and military interests, between progress and conservatism. Guelph democracy and industry idealize the pope. The banner of the Church waves above the camp of those who aim at positive prosperity and republican equality. Ghibelline aristocracy and immobility idealize the emperor. The prestige of the empire, based upon Roman law and feudal tradition, attracts imaginative patriots and systematic thinkers. The two ideals are counterposed and mutually exclusive. No city calls itself either Guelph or Ghibelline till it has expelled one-half of its inhabitants; for each party is resolved to constitute the state according to its own conception. The struggle is waged by two sets of men who equally love their city, but would rule it upon diametrically opposite principles, and fight to the death for its possession. Meanwhile each party forms its own organization of chiefs, finance-officers and registrars at home, and sends ambassadors to foreign cities of the same complexion. A network of party policy embraces and dominates the cities of Italy. The victory in the conflict practically falls to the hitherto unenfranchised plebeians. The elder noble families die out or lose their preponderance. New houses rise into importance; a new commercial aristocracy is formed. Burghers of all denominations are enrolled in one or other of the arts or guilds, and these trading companies furnish the material from which the government or *signoria* of the city is composed. Plebeian handicrafts assert their right to be represented on an equality with learned professions and wealthy corporations. The ancient classes are confounded and obliterated in a population more homogeneous, more adapted for democracy and despotism.

In addition to the parliament and the councils which have been already enumerated, we now find a *council of the party* established within the city. The consuls are merged in *ancients* or *priors*, chosen from the arts. A new magistrate, the *gonfalonier of justice*, appears in some of the Guelph cities, with the special duty of keeping the insolence of the nobility in check. Meanwhile the podestà still subsists; but he is no longer equal to the task of maintaining an equilibrium of forces. He sinks more and more into a judge, loses more and more the character of dictator. His ancient place is occupied by the *captain of the people*, acting as head of the ascendant Guelphs or Ghibellines who undertakes the responsibility of proscriptions, decides on questions of policy, forms alliances, declares war and is often little better than an autocrat.

AGE OF THE DESPOTS

After the death of Frederick II. Italian affairs were managed by Manfred and by Charles of Anjou, the supreme captains of the parties, under whose orders acted the captains of the people in each city. The contest being carried on by warfare, it followed that the captains in the cities were chosen for their military skill, and warrior dynasties arose, in many cases descended from the old nobility absorbed into the bourgeoisie. Thus the Della Scala dynasty arose in Verona, and the Carraresi in Padua. The Estensi made themselves lords of Ferrara; the Torriani headed the Guelphs of Milan. At Ravenna we find the Polenta family,

at Rimini the Malatestas, at Parma the Rossi, at Piacenza the Scotti, at Faenza the Manfredi. In Tuscany, where the Guelph party was very strongly organized, and the commercial constitution of Florence kept the nobility in check, the communes remained as yet free from hereditary masters. Yet generals from time to time arose, the Conte Ugolino della Gherardesca at Pisa, Uguccione della Faggiuola at Lucca, the Conte Guido da Montefeltro at Florence, who threatened the liberties of Tuscan cities with military despotism.

After the commencement of the 14th century, the civil wars decreased in fury, and at the same time it was perceived that their effect had been to confirm tyrants in their grasp upon free cities. Growing up out of the captain of the people or signore of the commune, the tyrant annihilated both parties for his own profit and for the peace of the state. In him, for the first time, the city attained self-consciousness; the blindly working forces of previous revolutions were combined in the will of a ruler. The tyrant's general policy was to favour the multitude at the expense of his own caste. He won favour by these means, and completed the levelling down of classes, which had been proceeding ever since the emergence of the communes.

Decline of Civil War.—In 1309, Robert, grandson of Charles, the first Angevin sovereign, succeeded to the throne of Naples, and became the leader of the Guelphs in Italy. In the next year Henry VII. of Luxembourg crossed the Alps soon after his election to the empire, and raised the hopes of the Ghibellines. Italy had entered on a new phase of her existence, and Dante's *De monarchia* represented a dream of the past which could not be realized. Henry established imperial vicars in the Lombard towns, confirming the tyrants, but gaining nothing for the empire in exchange for the titles he conferred. After receiving the crown in Rome, he died at Buonconvento, a little walled town south of Siena, in 1313. The profits of his inroad were reaped by despots. From this epoch dates the supremacy of the Visconti of Milan. In Tuscany Castruccio Castracane, Uguccione's successor at Lucca, became formidable. In 1325 he defeated the Florentines at Alto Pasio, and carried home their *carroccio* as a trophy of his victory over the Guelphs. Louis the Bavarian, the next emperor, made a similar incursion in the year 1327, with even greater loss of imperial prestige. Equally contemptible in its political results and void of historical interest was the brief visit of John of Bohemia, son of Henry VII., whom the Ghibellines next invited to assume their leadership. He sold a few privileges, conferred a few titles, and recrossed the Alps in 1333. In spite of repeated efforts on the part of the Ghibellines, the imperialists gained no permanent advantage. The Italians were tired of fighting, and each city accepted a master to quench party strife, encourage trade, and make the handicraftsmen comfortable. Even the Florentines in 1342 submitted for a few months to the despotism of the duke of Athens, and had he not mismanaged matters, he might have held the city in his grasp. Italy was settling down and turning her attention to home comforts, arts and literature. Boccaccio, the contented bourgeois, succeeded to Dante, the fierce aristocrat.

The most marked proof of the change which came over Italy towards the middle of the 14th century is furnished by the companies of adventure. The burghers no longer fought themselves, but played the game of warfare by the aid of mercenaries. Ecclesiastical overlords, prosperous republics, with plenty of money to spend but no leisure or inclination for camp-life; cautious tyrants courting popularity by exchanging conscription for taxation—all combined to favour the new system. Mercenary troops, originally foreign adventurers, soon appeared under their own captains, who hired them out to the highest bidder, or marched them on marauding expeditions up and down the less protected districts. As the companies grew in size and improved their discipline, it was seen by the Italian nobles that this kind of service offered a good career for men of spirit, who had learned the use of arms. To leave so powerful and profitable a calling in the hands of foreigners seemed both dangerous and uneconomical. Therefore, after the middle of the century, this profession fell into the hands of natives. The first Italian who formed an ex-

clusively Italian company was Alberico da Barbiano, a nobleman of Romagna, and founder of the Milanese house of Belgiojoso. In his school the great condottieri (*q.v.*), Braccio da Montone and Sforza Attendolo were formed; and henceforth the battles of Italy were fought by Italian generals commanding native troops. But the new companies of adventure were in no sense patriotic. They sold themselves for money, irrespective of the cause which they upheld; and, while changing masters, they had no care for any interests but their own. In the hands of able captains, like Francesco Sforza or Piccinino, these mercenary troops became moving despotisms, draining the country of its wealth, and always eager to fasten and found tyrannies upon the provinces they had been summoned to defend. Battles became all but bloodless; diplomacy and tactics superseded feats of arms and hard blows in pitched fields. In this way the Italians lost their military vigour, and the whole political spirit of the race was demoralized. The purely selfish bond between condottieri and their employers, whether princes or republics, involved intrigues and treachery which ended by making statecraft in Italy synonymous with perfidy.

It must further be noticed that the rise of mercenaries was synchronous with a change in the nature of Italian despotism. The tyrants, as we have already seen, established themselves as captains of the people, vicars of the empire, vicars for the Church, leaders of the Guelph and Ghibelline parties. They were accepted by a population eager for repose, who had merged old class distinctions in the conflicts of preceding centuries. As their tenure of power grew firmer, they advanced dynastic claims, assumed titles, and took the style of petty sovereigns. Their government became paternal; and, though there was no limit to their cruelty when stung by terror, they used the purse rather than the sword. Thus was elaborated the type of despot which attained completeness in Gian Galeazzo Visconti and Lorenzo de' Medici, who substituted cunning and corruption for violence. The lesser people tolerated him because he extended the power of their city and made it beautiful with public buildings. The bourgeoisie, protected in their trade, found it convenient to support him. The nobles, turned into courtiers, placemen, diplomatists and men of affairs, ended by preferring his authority to the alternative of democratic institutions. A lethargy of well-being, broken only by the pinch of taxation for war costs, or by occasional outbursts of cruelty, descended on the population of cities which had boasted of their freedom. Only Florence and Venice, at the close of the period upon which we are now entering, maintained their republican independence. And Venice was ruled by a close oligarchy; Florence was passing from the hands of her oligarchs into the power of the Medicean merchants.

Between the year 1305, when Clement V. settled at Avignon, and the year 1447, when Nicholas V. re-established the papacy upon a solid basis at Rome, the Italians approximated more nearly to self-government than at any other epoch of their history. At the end of this century and a half, five principal powers divided the peninsula; and their confederated action during the next 45 years (1447-92) secured for Italy a season of peace and brilliant prosperity. These five powers were the kingdom of Naples, the duchy of Milan, the republic of Florence, the republic of Venice and the papacy.

The Two Sicilies.—After the death of Joanna II. of Naples in 1435, who had had no children, the kingdom was fought for between René of Anjou and Alfonso, surnamed the Magnanimous, king of Sicily, both of whom had been adopted by the late queen. During the war of succession which ensued, Alfonso was taken prisoner by the Genoese fleet in Aug. 1435, and was sent a prisoner to Filippo Maria at Milan, who supported René. Here he proved so incontestably the advantage which might ensue to the Visconti from his alliance, if he held the *regno*, that he obtained his release and recognition as king. Alfonso now reigned alone and undisturbed in Lower Italy, combining for the first time since the year 1282 the crowns of Sicily and Naples. When he died in 1458 he bequeathed Naples, which he had seized by conquest, to his natural son Ferdinand, while Sicily and Aragon passed together to his brother John, and so on to Ferdinand and the Catholic.

The 23 years of Alfonso's reign were the most prosperous and splendid period of south Italian history. He had become an Italian in taste and sympathy, entering with enthusiasm into the humanistic ardour of the earlier Renaissance, encouraging men of letters at his court, administering his kingdom on the principles of an enlightened despotism, and lending his authority to establish that equilibrium in the peninsula upon which the politicians of his age fully believed that Italian independence might be based.

Milan.—Milan was ruled by the Visconti, and when in 1349, after the murder of Luchino, his brother John, archbishop of Milan, assumed the lordship of the city, he extended the power of the Visconti over Genoa and other parts of north Italy. He died in 1354, and his heritage was divided between three members of his house, Matteo, Bernabò and Galeazzo. In the next year Matteo was assassinated by order of his brothers, who made an equal partition of their subject cities—Bernabò residing in Milan, Galeazzo in Pavia. Galeazzo married his daughter Violante to the English duke of Clarence, and his son Gian Galeazzo to a daughter of King John of France. When he died in 1378, this son murdered his uncle Bernabò, and thus became the most formidable of Italian despots. Immured in his castle at Pavia, accumulating wealth by systematic taxation and methodical economy, he organized mercenary troops and threatened the whole of Italy with conquest. Gian Galeazzo, partly by force and partly by intrigue, pushed his dominion to the very verge of Venice, and, having subjected Lombardy to his sway, proceeded to attack Tuscany, when the plague suddenly cut short his career in 1402. Seven years before his death Gian Galeazzo bought the title of duke of Milan and count of Pavia from the emperor Wenceslaus, but no sooner was he dead than the essential weakness of an artificial state became apparent. The Visconti's own generals, Facino Cane, Pandolfo Malatesta, Jacopo dal Verme, Gabrino Fondulo, Ottobon Terzo, seized several Lombard cities. In others the petty tyrants whom the Visconti had uprooted reappeared. The Estensi recovered their grasp upon Ferrara and the Gonzaga upon Mantua. Venice strengthened herself between the Adriatic and the Alps. Florence reassumed her Tuscan hegemony. Meanwhile Gian Galeazzo had left two sons, Giovanni Maria and Filippo Maria. Giovanni, a monster of cruelty and lust, was assassinated by some Milanese nobles in 1412; and now Filippo set about rebuilding his father's duchy. Herein he was aided by the troops of Facino Cane, who, dying opportunely at this period, left considerable wealth, a well-trained band of mercenaries, and a widow, Beatrice di Tenda. Filippo married and then beheaded Beatrice after a mock trial for adultery. He subsequently spent a long career in the attempt to carry out his schemes of Italian conquest. Venice and Florence offered a determined resistance; nor was Filippo equal in ability to his father. In the course of his wars with Florence and Venice, the greatest generals of this age were formed—Francesco Carmagnola, who was beheaded at Venice in 1432; Niccolò Piccinino and Francesco Sforza. Sforza received the hand of Filippo's natural daughter, Bianca, and when the Visconti dynasty ended by the duke's death in 1447, he pretended to espouse the cause of the Milanese republic, which was then re-established; but he played his cards so subtly as to make himself, by the help of Cosimo de' Medici in Florence, duke *de facto* if not *de iure*. Once seated in the duchy of Milan, he displayed rare qualities as a ruler; for he not only entered into the spirit of the age, which required humanity and culture from a despot, but he also knew how to curb his desire for territory. The conception of confederated Italy found in him a vigorous supporter.

Florence.—After the expulsion of the duke of Athens in 1343, and the great plague of 1348, the Florentine proletariat rose up against the merchant princes, and in 1378, the Ciompi rebellion placed the city for a few years in the hands of the Lesser Arts. The revolution was but temporary, and the necessities of war and foreign affairs soon placed Florence in the power of an oligarchy headed by the great Albizzi family. They fought the battles of the republic with success against the Visconti, and widely extended the Florentine domain over the Tuscan cities. Pisa was then enslaved, and Florence gained access to the sea. However, throughout this period a powerful opposition was gathering

strength. It was led by the Medici, who sided with the common people, and increased their political importance by the accumulation and wise employment of vast commercial wealth. In 1433 the Albizzi and the Medici came to open strife. Cosimo de' Medici was exiled to Venice. In the next year he returned, and by a system of corruption and popularity-hunting, combined with the patronage of arts and letters, established himself as the real but unacknowledged dictator of the commonwealth. He supported Francesco Sforza in Milan, foreseeing that the dynastic future of his own family and the pacification of Italy might be secured by a balance of power in which Florence should rank on equal terms with Milan and Naples.

Venice.—The republic of Venice differed essentially from any other state in Italy. The constitution of the commonwealth had slowly matured itself through a series of revolutions. During the earlier days of the republic the doge had been a prince elected by the people, and answerable only to the popular assemblies. The several steps whereby the members of the grand council, formed in 1172, succeeded in eliminating the people from a share in the government, and reducing the doge to the position of their ornamental representative, cannot here be described. In 1297 an act was passed confining the grand council to a fixed number of privileged families, in whom the government was henceforth vested by hereditary right. The establishment in 1311 of the Council of Ten completed that famous constitution, which endured till the extinction of the republic in 1797. Meanwhile, throughout the middle ages, it had been the policy of Venice to confine her energies to commerce in the East. The first entry of any moment made by the Venetians into strictly Italian affairs was in 1336, when the republics of Florence and St. Mark allied themselves against Mastino della Scala, and Venice took possession of Treviso. After this, for 30 years, between 1352 and 1381, Venice and Genoa contested the supremacy of the Mediterranean. They fought their duel out upon the Bosphorus, off Sardinia, and in the Morea, with various success. From the first great encounter, in 1355, Venice retired well-nigh exhausted, and Genoa was so crippled that she placed herself under the protection of the Visconti. The second and decisive battle was fought upon the Adriatic. The Genoese fleet under Luciano Doria defeated the Venetians off Pola in 1379, and seized Chioggia. Thus the Venetians found themselves blockaded in their own lagoons. Meanwhile a fleet was raised for their relief by Carlo Zeno in the Levant, and the admiral Vettor Pisani, who had been imprisoned after the defeat at Pola, was released to lead their forlorn hope from the city side. The Genoese in their turn were now blockaded in Chioggia, and forced by famine to surrender. The losses of men and money which the war of Chioggia entailed signed her naval ruin. During this second struggle with Genoa, the Venetians had been also at war with the Carraresi of Padua and the Scaligers of Verona. In 1406, after the extinction of these princely houses, they added Verona, Vicenza and Padua to their territories. Their career of conquest, and their new policy of directing Italian affairs were confirmed by the long dogeship of Francesco Foscari (1423-57). When Constantinople fell in 1453, the old ties between Venice and the Eastern empire were broken, and she now entered on a wholly new phase of her history. Ranking as one of the five Italian powers, she was also destined to defend Western Christendom against the encroachments of the Turk in Europe. (*See VENICE: History.*)

The Papacy.—By their settlement in Avignon, the popes relinquished their protectorate of Italian liberties, and lost their position as Italian potentates. Rienzi's revolution in Rome (1347-54), his establishment of a republic, and the rise of dynastic families in the cities of the Church, claiming the title of papal vicars, but acting in their own interests, weakened the authority of the Holy See. Although Cardinal Albornoz conquered Romagna and the March in 1364, the legates who resided in those districts were not long able to hold them against the local despots. At last Gregory XI. returned to Rome, and Urban VI., elected in 1378, put a final end to the Avignonian exile. But the Great Schism, which now distracted Western Christendom, so enfeebled the papacy, and kept the Roman pontiffs so engaged in ecclesias-

tical disputes, that they had neither power nor leisure to occupy themselves with their temporal affairs. The threatening presence of the two princely houses of Orsini and Colonna, alike dangerous as friends or foes, rendered Rome an unsafe residence. Even when the schism was nominally terminated in 1415 by the council of Constance, the next two popes held but a precarious grasp upon their Italian domains. At the same time, the growing conviction that a federation was necessary proved advantageous to the popes as sovereigns. They gradually assumed the style of despots and made use of the humanistic movement, then at its height, to place themselves in a new relation to Italy. The election of the distinguished humanist Thomas of Sarzana as Nicholas V. in 1447, opened a period of temporal splendour, which ended with the establishment of the popes as sovereigns. Soon after assuming the tiara, he found himself without a rival in the Church; for the schism ended by Felix V.'s resignation in 1449. Nicholas began to rebuild and to fortify Rome, determining to render it once more a capital worthy of its high place in Europe.

Confederated Italy.—Italy was now for a brief space independent. The humanistic movement had created a common culture, a common language and sense of common nationality. All political institutions tended towards despotism. The Medici became yearly more indispensable to Florence, the Bentivoglio more autocratic in Bologna, the Baglioni in Perugia; and even Siena was ruled by the Petrucci. But this despotism was of a mild type. The princes were Italians; they shared the common enthusiasms of the nation for art, learning, literature and science; they studied how to mask their tyranny with arts agreeable to the multitude. When Italy had reached this point, Constantinople was taken by the Turks. On all sides it was felt that the Italian alliance must be tightened; and one of the last, best acts of Nicholas V.'s pontificate was the appeal in 1453 to the five great powers in federation. As regards their common opposition to the Turk, this appeal led to nothing; but it marked the growth of a new Italian consciousness.

Having become despots, the popes sought to establish their relatives in principalities. The word nepotism acquired new significance in the reigns of Sixtus IV. and Innocent VIII. But though the country was convulsed by no great struggle, the following years were marked by appalling increase of political crime; e.g., the revolt of the barons against Ferdinand I. of Naples (1464), the murder of Galeazzo Maria Sforza at Milan (1476), and the plot of the Pazzi to destroy the Medici (1478). After Cosimo de' Medici's death in 1464, the leadership of the Florentine republic passed to his son Piero, who left it in 1469 to his sons Lorenzo and Giuliano. These youths assumed the style of princes, and it was against their lives that the Pazzi, with the sanction of Sixtus IV., made assault. Giuliano was murdered, but Lorenzo escaped to tighten his grasp upon the city, which now loved him and was proud of him. During the following 14 years he made himself absolute master of Florence. Apprehending the importance of Italian federation, Lorenzo, by his personal tact and prudence, secured peace and a common intelligence between the five powers. His own family was fortified by the marriage of his daughter to a son of Innocent VIII., which procured his son Giovanni's elevation to the cardinalate, and involved two Medicean papacies and the future dependence of Florence upon Rome.

AGE OF INVASIONS

The year 1492 opened a new age for Italy. In this year Lorenzo died, and was succeeded by his son Piero; France passed beneath the personal control of Charles VIII.; the fall of Granada freed Spain from her embarrassments, Columbus discovered America, destroying the commercial supremacy of Venice; last, but not least, Rodrigo Borgia assumed the tiara as Alexander VI. In this year Italy was once more drawn into the vortex of European affairs. After Galeazzo Maria's assassination, his crown passed to a boy, Gian Galeazzo, who was in due course married to a granddaughter of Ferdinand I. of Naples. But the government of Milan remained in the hands of this youth's uncle, Lodovico, surnamed Il Moro, who resolved to become duke of Milan. The king of Naples was his natural enemy and he suspected that

Piero de' Medici might abandon his alliance. Feeling himself alone, with no right to the title he was bent on seizing, he had recourse to Charles VIII. of France, whom he urged to make good his claim to the kingdom of Naples, which rested on the will of King René of Anjou. Charles finally agreed to invade Italy. He crossed the Alps in 1495, passed through Lombardy, entered Tuscany, freed Pisa from the yoke of Florence, witnessed the expulsion of the Medici, marched to Naples and was crowned there—all this without striking a blow. Meanwhile Lodovico procured his nephew's death, and raised a league against the French in Lombardy. Charles hurried back from Naples, and narrowly escaped destruction at Fornovo in the passes of the Apennines, returning to France in 1495. Little was left him of his recent acquisitions; but he had convulsed Italy by this invasion, destroyed her equilibrium, exposed her military weakness and political disunion, and revealed her wealth to greedy and more powerful nations.

The princes of the house of Aragon, now represented by Frederick, a son of Ferdinand I., returned to Naples, and Florence made herself a republic. At this crisis she was ruled by the monk Girolamo Savonarola, who inspired the people with a thirst for freedom, preached the necessity of reformation, and placed himself in direct antagonism to Rome. After a short but eventful career, the influence of which was long effective, he lost his hold upon the citizens. Alexander VI. procured a mock trial, and his enemies had him put to death in 1498. In this year Louis XII. succeeded Charles VIII. upon the throne of France. As duke of Orleans he had certain claims to Milan through his grandmother Valentina, daughter of Gian Galeazzo, the first duke, and in 1499 Louis entered and subdued the Milanese. Lodovico escaped to Germany, returned the next year, was betrayed by his Swiss mercenaries and sent to die at Loches in France. In 1500 Louis concluded a treaty at Granada with Ferdinand the Catholic, whereby the French and Spanish kings were to divide the spoil. The conquest was easy; but, when it came to a partition, Ferdinand played his ally false. He made himself supreme over the two Sicilies, which he now reunited under a single crown. Three years later Louis signed the treaty of Blois (1504), whereby he invited the emperor Maximilian to aid him in the subjugation of Venice.

The stage was now prepared for the ruin of Italy. Spain, France, Germany, with their Swiss auxiliaries, had been summoned upon various pretexts to seize her provinces. Then, too late, patriots like Machiavelli perceived the suicidal self-indulgence of the past, which, by substituting mercenary troops for national militias, left the Italians at the absolute discretion of their neighbours. The game was in the hands of French, Spanish and German invaders, and no scheme for combination against common foes arose in the peninsula. Each petty potentate strove for his own private advantage in the confusion; and at this epoch the chief gains accrued to the papacy. Aided by his terrible son, Cesare Borgia, Alexander VI. chastised the Roman nobles, subdued Romagna and the March, threatened Tuscany, and seemed to be upon the point of creating a Central Italian state in favour of his progeny, when he died suddenly in 1503 while Cesare was ill. His conquests reverted to the Holy See. Julius II. continued Alexander's policy, but no longer in the interest of his own relatives. It became the nobler ambition of Julius to aggrandize the Church, and to reassume the protectorate of the Italian people. With this object, he secured Emilia, carried his victorious arms against Ferrara, and curbed the tyranny of the Baglioni in Perugia. Quarrelling with the Venetians in 1508, he combined the forces of all Europe by the league of Cambrai against them; and, when he had succeeded in his first purpose of humbling them, he turned round in 1510, uttered his famous resolve to expel the barbarians from Italy, and pitted the Spaniards against the French. It was with the Swiss that he hoped to effect this revolution; but the Swiss, formed for mercenary warfare, proved a perilous instrument in the hands of those who used them, and were hardly less injurious to their friends than to their foes. In 1512 the battle of Ravenna between the French troops and the allies of Julius—Spaniards, Venetians and Swiss—was fought. Gaston de

Foix bought a doubtful victory dearly with his death; and the allies immediately afterwards expelled the French from Lombardy. Julius II. had only exchanged one set of foreign masters for another. As a consequence of the battle of Ravenna, the Medici returned in 1512 to Florence.

When Leo X. was elected in 1513, Rome and Florence rejoiced; but Italy had no repose. Louis XII. had lost the game, and the Spaniards were triumphant. By the victory of Marignano in 1515 Francis I., having now succeeded to the throne of France, regained the Milanese and broke the power of the Swiss, who held it for Massimiliano Sforza, the titular duke. Leo for a while relied on Francis; for the vast power of Charles V., who succeeded to the empire in 1519, as in 1516 he had succeeded to the crowns of Spain and Lower Italy, threatened the whole of Europe. Leo, however, in 1521, changed sides, allied himself to Charles, and died after hearing that the imperial troops had again expelled the French from Milan. At the decisive battle of Pavia in 1525, Francis was taken prisoner, and Italy lay open to the Spanish armies. Meanwhile Leo X. had been followed by Adrian VI., and Adrian by Clement VII. of the house of Medici. The year 1527 was signalized by the famous sack of Rome. An army of mixed German and Spanish troops, pretending to act for the emperor, but which may rather be regarded as a vast marauding party, entered Italy under their leader Frundsberg. After his death Rome was taken by assault. The Constable de Bourbon, who commanded the army, was killed in the first onslaught; Clement was imprisoned in the castle of St. Angelo; Rome was abandoned to the rage of 30,000 ruffians. As an immediate result of this disaster, Florence shook off the Medici and re-established the republic. But Clement, having made peace with the emperor, turned the remnants of the army which had sacked Rome against his native city. After a desperate resistance, Florence fell in 1530. Alessandro de' Medici was placed there and, on his murder in 1537, Cosimo de' Medici, of the younger branch of the ruling house, was made duke, and bequeathed to his descendants the grand-duchy of Tuscany.

SPANISH-AUSTRIAN ASCENDANCY

It was high time, after the sack of Rome in 1527, that Charles V. should undertake Italian affairs. By the treaty of Barcelona in 1529 the pope and emperor made terms. By that of Cambrai in the same year France relinquished Italy to Spain. Charles then entered the port of Genoa, and on Nov. 5, met Clement VII. at Bologna. He there received the imperial crown, and summoned the Italian princes for a settlement of all disputed claims. Francesco Sforza, the last and childless heir of the ducal house, was left in Milan till his death, which happened in 1535. The republic of Venice was respected in her liberties and Lombard territories. The Este family received a confirmation of their duchy of Modena and Reggio, and were invested in their fief of Ferrara by the pope. The marquise of Mantua was made a duchy; and Florence was secured, as we have seen, to the Medici. The great gainer by this settlement was the papacy, which held the most substantial Italian state, together with a prestige that raised it far above all rivalry. The rest of Italy became but a dependence upon Spain. Charles V., it must be remembered, achieved his conquest and confirmed his authority far less as emperor than as king of Spain. A Spanish viceroy in Milan and another in Naples, supported by Rome and by the minor princes who followed the policy dictated to them from Madrid, were sufficient to preserve the whole peninsula in a state of somnolent inglorious servitude. From 1530 until 1796, that is, for a period of nearly three centuries, the Italians had no history of their own. Italy only too often became the theatre of desolating and distracting wars. But these wars were fought for the most part by alien armies; the points at issue were decided beyond the Alps; the gains accrued to foreign royal families. Italy, intellectually first among the peoples, was now politically and practically last; and nothing to her historian is more heartrending than to watch the gradual extinction of her spirit in this age of slavery.

In 1534 Alessandro Farnese, who owed his elevation to his sister Giulia, one of Alexander VI.'s mistresses, took the tiara

with the title of Paul III. He conferred the duchy of Parma on his family, and his descendants held it until 1731. Paul III.'s pontificate was further marked by important changes in the Church. In 1540 he approved of Loyola's foundation, and secured the powerful militia of the Jesuit order. The Inquisition was established with almost unlimited powers in Italy, and the press was placed under its jurisdiction. Henceforth it was impossible to publish or to utter a word which might offend the despots of Church or State.

In 1556, Philip II., by the abdication of his father, Charles V., became king of Spain. He already ruled the Two Sicilies and the duchy of Milan. In the next year Ferdinand, brother of Charles, was elected emperor. Gian Pietro Caraffa, who was made pope in 1555 with the name of Paul IV., endeavoured to revive the ancient papal policy of leaning upon France. He encouraged the duke of Guise to undertake the conquest of Naples, as Charles of Anjou had been summoned by his predecessors. But such schemes only led to a languid, lingering Italian campaign, which was settled by Philip's victories over the French at St. Quentin and Gravelines. The peace of Câteau Cambrésis, signed in 1559, left the Spanish monarch undisputed lord of Italy. Of free commonwealths there now survived only Venice, which, together with Spain, achieved for Europe the victory of Lepanto in 1573; Genoa, which, after the ineffectual Fieschi revolution in 1547, abode beneath the rule of the great Doria family, and held a feeble sway in Corsica; and the two insignificant republics of Lucca and San Marino.

Rise of Savoy.—The future hope of Italy, however, was growing in a remote and hitherto neglected corner. Emmanuel Philibert, duke of Savoy, represented the oldest and not the least illustrious reigning house in Europe, and his descendants were destined to achieve the unity and independence of Italy (*see SAVOY, HOUSE OF*).

When Emmanuel Philibert succeeded to his father Charles III. in 1553, he was a duke without a duchy. But the princes of the house of Savoy were a race of warriors; and what Emmanuel Philibert lost as sovereign he regained as captain of adventure in the service of his cousin Philip II. The treaty of Câteau Cambrésis in 1559, and the evacuation of the Piedmontese cities held by French and Spanish troops in 1574, restored his state. By removing the capital from Chambéry to Turin, he completed the transformation of the dukes of Savoy from Burgundian into Italian sovereigns. Emmanuel Philibert was succeeded by his son Charles Emmanuel I., who married Catherine, a daughter of Philip II. He seized the first opportunity of annexing Saluzzo, which had been lost to Savoy in the last two reigns, attacked Geneva and threatened Provence. Henry IV. of France forced him in 1601 to relinquish Bresse and his Burgundian possessions. In return he was allowed to keep Saluzzo. Charles Emmanuel then attempted the acquisition of Montferrat, but after several campaigns he only secured a few places on the borders of that province.

The Gonzaga, and several other ancient ducal families, died out about this time. The legitimate line of the Estensi ended in 1597 by the death of Alfonso II., the last duke of Ferrara. He left his domains to a natural relative, Cesare d'Este. Urban VIII., however, put in a claim to Ferrara, which, it will be remembered, had been recognized a papal fief in 1530. Cesare d'Este had to content himself with Modena and Reggio, where his descendants reigned as dukes till 1794. Under the same pontiff, the Holy See absorbed the duchy of Urbino on the death of Francesco Maria II., the last representative of Montefeltro and Della Rovere. The popes were now masters of a territory embracing a large part of Countess Matilda's legacy, in addition to Pippin's donation, and the patrimony of St. Peter. Urban's predecessor, Paul V., advanced so far as to extend his spiritual jurisdiction over Venice, which, up to the date of his election (1605), had offered the single instance in Italy of a national church. The republic managed the tithes, and the clergy acknowledged no chief above their own patriarch. Paul V. forced the Venetians to admit his ecclesiastical supremacy; but they refused to readmit the Jesuits, who had been expelled in 1606.

Venice rapidly declined throughout the 17th century. The loss of trade consequent upon the discovery of America and the sea-route to the Indies, had dried up her chief source of wealth. Prolonged warfare with the Ottomans, who forced her to abandon Candia in 1669, still further crippled her resources. Yet she kept the Adriatic free of pirates, notably by suppressing the sea-robbers called *Uscocchi* (1601–17), maintained herself in the Ionian islands, and in 1684 Francesco Morosini, upon whose tomb we still may read the title *Peloponnesiacus*, wrested the whole of the Morea from the Turks. But after his death in 1715 the republic relaxed her hold upon his conquests. Though the signory still made a brave show upon occasions of parade, it was clear that the State was relapsing into complete decay. The Spanish monarchy at the same epoch dwindled with apparently less reason. The revolt of Masaniello in Naples (1647), followed by rebellions at Palermo and Messina, which placed Sicily for a while in the hands of Louis XIV. (1676–78) were symptoms of progressive anarchy. The population, ground down by preposterous taxes and ill-governed, rose in blind exasperation against their oppressors. But the destinies of Italy were decided in the cabinets and on the battlefields of northern Europe, and the Italians themselves had no say in these events.

Italy, handled and rehandled, settled and resettled, during the dynastic wars of the Spanish, Polish and Austrian successions, changed masters without caring or knowing what befell the principalis in any one of the disputes. The people came to be partitioned and exchanged without the assertion or negation of a single principle affecting their interests or rousing their emotions.

In 1700 Charles II. died, and with him ended the Austrian family in Spain. Louis XIV. claimed the throne for Philip, duke of Anjou. Charles, archduke of Austria, opposed him. The dispute was fought out in Flanders; but Lombardy felt the shock, as usual, of the French and Austrian dynasties. The French armies were more than once defeated by Prince Eugene of Savoy, who drove them out of Italy in 1707. Therefore, in the peace of Utrecht (1713), the services of the house of Savoy had to be duly recognized. Victor Amadeus II. received Sicily with the title of king. Montferrat and Alessandria were added to his northern provinces, and his state was recognized as independent. Charles of Austria, now emperor, took Milan, Mantua, Naples and Sardinia for his portion of the Italian spoil. Philip founded the Bourbon line of Spanish kings, renouncing in Italy all that his Habsburg predecessors had gained. Discontented with this diminution of the Spanish heritage, Philip V. married Elisabetta Farnese, heiress to the last duke of Parma, in 1714. He hoped to secure this duchy for his son, Don Carlos; and Elisabetta further brought with her a claim to the grand-duchy of Tuscany, which would soon become vacant by the death of Gian Gastone de' Medici. After this marriage Philip broke the peace of Europe by invading Sardinia. The Quadruple Alliance was formed, and the new king of Sicily was punished for his supposed adherence to Philip V. by the forced exchange of Sicily for the island of Sardinia. It was thus that in 1720 the house of Savoy assumed the regal title which it bore until the creation of the Italian kingdom in the next century. Though a despot, as all monarchs were obliged to be at that date, Victor Amadeus II. reigned with prudence, probity and zeal for the welfare of his subjects. He took public education out of the hands of the Jesuits, which, for the future development of manliness in his dominions, was a measure of incalculable value. In 1730 Victor Amadeus abdicated in favour of his son Charles Emmanuel III. Repenting of this step, he subsequently attempted to regain Turin, but was imprisoned in the castle of Rivoli, where he ended his days in 1732.

Austrian Ascendancy.—By the terms of the Treaty of Vienna of 1738, which closed the war of Polish succession, Don Carlos, the Spanish Bourbon, who had been proclaimed duke of Parma, on the extinction of the Farnese line in 1731, was now transferred to the Two Sicilies, while Francis of Lorraine, the husband of Maria Theresa, took Tuscany, where the Medici had come to an end with the death of Gian Gastone in 1737, and Parma. Milan and Mantua remained in the hands of the Austrians, while Charles Emmanuel acquired Tortona and Novara.

When the emperor Charles VI., father of Maria Theresa, died in 1740, the three branches of the Bourbon house, ruling in France, Spain and the Sicilies, joined with Prussia, Bavaria and the kingdom of Sardinia to despoil Maria Theresa of her heritage. Lombardy was made the seat of war, and here the king of Sardinia acted as in some sense the arbiter of the situation. After war broke out, he changed sides and supported the Habsburg-Lorraine party. At first, in 1745, the Sardinians were defeated by the French and Spanish troops. But Francis of Lorraine, elected emperor in that year, sent an army to the king's support, which in 1746 obtained a signal victory over the Bourbons at Piacenza. Charles Emmanuel now threatened Genoa. The Austrian soldiers already held the town. But the citizens expelled them, and the republic kept her independence. In 1748 the Treaty of Aix-la-Chapelle, which put an end to the War of the Austrian Succession, once more redivided Italy. Parma, Piacenza and Guastalla were formed into a duchy for Don Philip, brother of Charles III. of the Two Sicilies, and son of Philip V. of Spain. The duchy of Modena was placed under the protection of the French. So was Genoa, which in 1755, after Paoli's insurrection against the misgovernment of the republic, ceded her old domain of Corsica to France.

From the date of this settlement until 1792, Italy enjoyed a period of repose and internal amelioration under her numerous paternal despots. The Austrian government in Lombardy under Maria Theresa was characterized by improved agriculture, regular administration, order, reformed taxation and increased education. The nobles and the clergy were rich and influential, but kept in order by the civil power. There was no feeling of nationality, but the people were prosperous and enjoyed profound peace. On the death of Maria Theresa in 1780, the emperor Joseph II. instituted much wider reforms. Feudal privileges were done away with, clerical influence diminished and many monasteries and convents suppressed, the criminal law rendered more humane and torture abolished largely as a result of G. Beccaria's famous pamphlet *Dei delitti e delle pene*. On the whole the Austrian rule in pre-revolutionary days was beneficial and far from oppressive, and helped Lombardy to recover from the ill-effects of the Spanish domination. It did little for the moral education of the people, but the same criticism applies more or less to all the European governments of the day. The emperor Francis I. ruled the grand-duchy of Tuscany by lieutenants until his death in 1765, when it was given, as an independent state, to his second son, Peter Leopold. The reign of this grand duke was long recalled as a period of internal prosperity, wise legislation and important public enterprise. In 1790 he succeeded to the empire, and left Tuscany to his son Ferdinand. The kingdom of Sardinia was administered upon similar principles; Charles Emmanuel made his will law, and erased the remnants of free institutions from his state. At the same time he wisely followed his father's policy on education and the Church. This is perhaps the best that can be said of a king who incarnated the stolid absolutism of the period. From this date, however, we are able to trace the revival of independent thought among the Italians. The European ferment of ideas which preceded the French revolution expressed itself in men like Alfieri, the fierce denouncer of tyrants, Beccaria, the philosopher of criminal jurisprudence, Volta, the physicist, and numerous political economists of Tuscany. The papacy, during this period, had to reconsider the question of the Jesuits, who made themselves universally odious, not only in Italy, but also in France and Spain. In the pontificate of Clement XIII. they ruled the Vatican, and almost succeeded in embroiling the pope with the concerted Bourbon potentates of Europe. His successor, Clement XIV., suppressed the order altogether by a brief of 1773.

(J. A. S.; L. V.)

THE NAPOLEONIC PERIOD, 1796-1814

At the end of the 18th century the Austrian Habsburgs possessed the duchies of Milan (including Mantua) and Tuscany; while through a marriage alliance with the house of Este of Modena it dominated that duchy and also had a few fiefs in Piedmont and in Genoese territory. By marrying her daughter, Maria Ame-

lia, to the young duke of Parma, and another daughter, Maria Carolina, to Ferdinand of Naples, Maria Theresa consolidated Habsburg influence in the north and south of the peninsula. The Spanish Bourbons held Naples and Sicily, as well as the duchy of Parma. Of the nominally independent states the chief were the kingdom of Sardinia, ruled over by the house of Savoy, and comprising Piedmont, the isle of Sardinia and nominally Savoy and Nice, though the two provinces last named had virtually been lost to the monarchy since the campaign of 1793. The papacy exercised the temporal power over extensive dominions in central Italy. The republics of Venice and Genoa were in a state of decadence. The small states, Lucca and San Marino, completed the map of Italy. The worst governed part of the peninsula was the south, where feudalism lay heavily on the cultivators and corruption pervaded all ranks.

The campaign of 1796 (*see NAPOLEONIC CAMPAIGNS*) led to the awakening of the Italian people. Democratic propaganda, inspired by France, had already resulted in numerous clubs and secret societies, and every throne in Italy was insecure. The grand-duke of Tuscany recognized the French republic early in 1795. Napoleon's campaign of 1796 detached Sardinia from alliance with Austria and England. The response of a section of the Italians to the French propaganda helped his progress. Ferdinand of Naples sought for an armistice, the central duchies were easily overrun, and, early in 1797, Pope Pius VI. signed terms of peace with Bonaparte at Tolentino, practically ceding the northern part of his states. The districts of Reggio, Modena and Bologna had declared for a democratic policy, and an assembly was formed at Modena which abolished feudal dues and customs, declared for manhood suffrage and established the Cispadane republic (Oct. 1796).

The Cisalpine Republic.—While the French directory saw in the Milanese little more than a district which might be plundered and bargained for, Bonaparte, though by no means remiss in the exaction of gold and of artistic treasures, was laying the foundation of a friendly republic.

The Transpadane republic, or, as it was soon called, the Cisalpine republic, began its organized life on July 9, 1797, with a brilliant festival at Milan. The constitution was modelled on that of the French directory, but the French republic, through its general, Bonaparte, nominated and appointed the first deputies and administrators. In the same month it was joined by the Cispadane republic; and the terms of the Treaty of Campo Formio (Oct. 17, 1797), awarded to this now considerable state the Venetian territories west of the river Adige. A month later Bonaparte absorbed the Swiss district of the Valtellina (*q.v.*) in the Cisalpine republic.

Early in the year 1798, Venice with its mainland territories east of the Adige, inclusive of Istria and Dalmatia, went to the Habsburgs, while the Venetian isles of the Adriatic (the Ionian isles) and the Venetian fleet went to strengthen France. In June 1797, Genoa had also been compelled to undergo at Bonaparte's hands a remodelling on the lines already followed at Milan. The new Genoese republic, French in all but name, was renamed the Ligurian republic.

Occupation of Rome and Naples.—Before Napoleon set sail for Egypt, the French had taken possession of Rome. Joseph Bonaparte, then French envoy to the Vatican, encouraged democratic manifestations; and one of them, at the close of 1797, led to a scuffle in which a French general, Duphot, was killed. The French directory at once ordered its general, Berthier, to march on Rome; the Roman democrats proclaimed a republic on Feb. 15, 1798, and on their invitation Berthier and his troops marched in. The pope, Pius VI., was forthwith removed to Siena and a year later to Valence in the south of France, where he died. Thus fell the temporal power. The "liberators" of Rome thereupon proceeded to plunder the city.

These events brought revolution to the gates of the kingdom of Naples, the worst-governed part of Italy. A British fleet under Nelson, sent into the Mediterranean in May 1798, encouraged the Neapolitan court to a rupture with France. The Neapolitan troops at first occupied Rome, but they were soon scattered in flight; and the French troops, under Gen. Championnet, after crushing the stubborn resistance of the Neapolitan lazzaroni,

forced their way into Naples and proclaimed the Parthenopæan republic (Jan. 23, 1799). Much good work was done by the Neapolitan republicans during their brief tenure of power, but it soon came to an end owing to the course of events which favoured a reaction against France. At the close of 1798 the French directorate virtually compelled the young king of Sardinia, Charles Emmanuel IV., to abdicate at Turin. He retired to the island of Sardinia, while the French despoiled Piedmont, thereby adding fuel to the resentment rapidly growing against them in every part of Europe.

Treaty of Lunéville.—In the war of the Second Coalition the French armies in Italy were everywhere defeated by the Austro-Russian army, under Suvorov, and forced to evacuate Naples and central Italy. In many parts the peasants and townfolk, enraged by the licence of the French troops, rose up in arms against them. The republics set up by the French at Naples, Rome and Milan, collapsed as soon as their forces retired; and a reaction in favour of clerical and Austrian influence set in with great violence. Even in the north the Austro-Russians drove the French before them, until only Genoa held out, defended by Masséna. Everywhere the old order of things was restored. The aged pope, Pius VI., died at Valence (Aug. 29, 1799), and on March 24, 1800, the conclave, assembled at Venice, elected Pius VII.

Such was the position of affairs when Bonaparte returned from Egypt and landed at Fréjus. The contrast presented by his triumphs to the reverses sustained by the armies of the French directory, was fatal to that body. After the *coup d'état* of Brumaire (Nov. 1799) he, as First Consul, began to organize an expedition against the Austrians (Russia having now retired from the coalition), in northern Italy. The campaign culminating at Marengo was the result. By that triumph, Bonaparte consolidated his own position in France and again laid Italy at his feet. The emperor Francis was forced to sue for peace which was finally concluded at Lunéville on Feb. 9, 1801. The Cisalpine and Ligurian republics (reconstituted soon after Marengo) were recognized by Austria on condition that they were independent of France. The rule of Pius VII. over the Papal States was admitted; and Italian affairs were arranged much as they were at Campo Formio: Modena and Tuscany now reverted to French control, their former rulers being promised compensation in Germany. Naples, easily worsted by the French, under Miollis, left the British alliance, and made peace by the treaty of Florence (March, 1801), agreeing to withdraw her troops from the Papal States, to cede Piombino and the Presidii (in Tuscany) to France, and to close her ports to British ships and commerce. King Ferdinand also had to accept a French garrison at Taranto and other points in the south.

REORGANIZATION OF ITALY

Bonaparte procured the cession to France of Parma; while the duke of Parma (husband of an infanta of Spain) was promoted by him to the duchy of Tuscany, now renamed the kingdom of Etruria; and on Sept. 21, 1802, Piedmont was incorporated in the French republic. Besides copying the Roman habit of planting military colonies, the First Consul imitated the old conquerors of the world by extending and completing the road system of his outlying districts, especially at those important passes, the Mont Cenis and Simplon; and public works in various parts of Piedmont, and the Cisalpine and Ligurian republics, attested to his foresight and wisdom. The universities of Pavia and Bologna were reopened and made great progress in this time of peace and growing prosperity. Somewhat later the construction of the Pavia canal was begun in order to connect Lake Como with the Adriatic for barge-traffic.

Bonaparte, now First Consul for life, felt strong enough to impose his will on the Cisalpine republic, and on the pretext of consolidating it, he invited 450 of its leading men to come to Lyons to a *consulta*. In reality he and his agents had already provided for the passing of proposals which were agreeable to him. It remained to find a chief. Talleyrand and French agents set to work on behalf of their master, with the result that he was elected president for ten years. He accepted that office with the Lombard count, Melzi, as vice-president. The constitution com-

prised a *consulta* charged with executive duties, a legislative body of 150 members and a court charged with the maintenance of the fundamental laws. In practice, the whole constitution was as autocratic as that of France after the changes brought about by Bonaparte in Aug. 1802. The Cisalpine now took the name of the Italian republic, and the Ligurian republic and that of Lucca remodelled their constitutions in a similar fashion.

The Kingdom of Italy.—The complete disregard shown by Napoleon for one of the chief conditions of the Treaty of Lunéville (Feb. 1801)—that stipulating for the independence of the Ligurian and Cisalpine republics—became more and more apparent every year. Finally, after the proclamation of the French empire (May 18, 1804) Napoleon decided to accept the crown of Italy which Melzi, Marescalchi, Serbelloni and others begged him to assume. Accordingly, on May 26, 1805, in the cathedral at Milan, he crowned himself with the iron crown of the old Lombard kings, using the traditional formula, "God gave it me: let him beware who touches it." On June 7 he appointed his step-son, Eugène Beauharnais, to be viceroy. Eugène soon found that his chief duty was to enforce the will of Napoleon. The republic of Lucca, along with Piombino, was awarded as a principality by the emperor to Elisa Bonaparte and her husband, Felice Baciocchi. In June 1805, the French emperor, at the supposed request of the doge of Genoa, declared the Ligurian republic to be an integral part of the French empire. As a result of this defiance to the sovereigns of Russia and Austria, the Third Coalition was formed between Great Britain, Russia and Austria, Naples soon joining its ranks.

Napoleon's victories forced Austria to make peace by the treaty of Pressburg, ceding to the kingdom of Italy her part of Venetia along with the provinces of Istria and Dalmatia. Napoleon next sent Joseph Bonaparte and Masséna southwards with a strong column, and compelled the Anglo-Russian forces to evacuate Naples. The Bourbon court sailed away to Palermo, where it remained for eight years under the protection afforded by the British. On Feb. 15, 1806, Joseph Bonaparte entered Naples in triumph, his troops capturing there 200 pieces of cannon. Gaeta, however, held out stoutly against the French. Sir Sidney Smith with a British squadron captured Capri (Feb. 1806) and the peasants of the Abruzzi and Calabria soon began to give trouble. Worst of all was the arrival of a small British force in Calabria under Sir John Stuart, which defeated the French with heavy loss near the village of Maida (July 4). Calabria rose in revolt, and the peasants dealt out savage reprisals to the French troops. On July 18, however, Gaeta surrendered to Masséna, who crushed the Bourbon rising in Calabria with great barbarity, and compelled the British force to re-embark for Sicily. Under Joseph, who had been duly proclaimed king of Naples on March 30, 1806, great progress was made in abolishing feudal laws and customs, in reforming the judicial procedure and criminal laws on the model of the *Code Napoléon*, and in attempting elementary education.

The peace of Tilsit (July 7, 1807) enabled Napoleon to press on his projects for securing the command of the Mediterranean. He failed to capture Sicily; Capri, however, fell to the French on Oct. 18, 1808, shortly after the arrival at Naples of the new king, Joachim Murat, Joseph Bonaparte being transferred from Naples to Madrid. Joseph left Naples on May 23, 1808; but it was not until Sept. 6 that Murat made his entry. A fortnight later his consort Caroline, Napoleon's sister, arrived, and soon showed a vigour and restlessness of spirit which frequently clashed with the dictates of her brother, the emperor, and the showy, unsteady policy of her husband. Early in 1808 Elisa Bonaparte and her husband, Baciocchi, rulers of Lucca and Piombino, became the heads of the administration in Tuscany, Elisa showing decided governing capacity.

Napoleon and the Papacy.—For some time past the relations between Napoleon and the pope, Pius VII., had been severely strained, chiefly because the emperor insisted on controlling the Church, both in France and in the kingdom of Italy, but also because the pontiff refused to grant the divorce between Jerome Bonaparte and the former Miss Patterson on which Napoleon early in the year 1806 laid so much stress. His desire further to

extend the continental system, that great engine of commercial war by which he hoped to assure the ruin of England, prompted the annexation of Tuscany and his intervention in the affairs of the Papal States, and in Feb. 1808 a French column under Miollis occupied Rome and deposed the papal authorities. Against this violence Pius VII. protested in vain. Napoleon, on April 2, annexed to the kingdom of Italy the papal provinces of Ancona, Urbino, Macerata and Camerino. After the occupation of Vienna the conqueror dated from that capital on May 17, 1809, a decree virtually annexing Rome and the *Patrimonium Petri* to the French empire. In reply the pope prepared a bull of excommunication against those who should infringe the prerogatives of the Holy See in this matter. Thereupon the French general, Miollis, who still occupied Rome, caused the pope to be arrested and carried him away northwards into Tuscany, thence to Savona; finally he was taken, by Napoleon's orders, to Fontainebleau. Thus, a second time, fell the temporal power of the papacy. By an imperial decree of Feb. 17, 1810, Rome and the neighbouring districts, including Spoleto, became part of the French empire; the *Code Napoléon* was introduced, public works were set on foot and great advance was made in the material sphere. Napoleon intended to make the city the second capital of the empire. Nevertheless the harshness with which the emperor treated the Roman clergy and suppressed the monasteries caused deep resentment to the orthodox.

COLLAPSE OF NAPOLEON'S RULE

In civil administration, law, judicial procedure, education and public works, Italy under Napoleon experienced great benefits, the results of which never wholly disappeared. On the other hand, she suffered from the rigorous measures of the continental system, which seriously crippled trade, while the drain of men to supply his armies in Germany, Spain and Russia was also a serious loss. A powerful Italian corps marched under Eugène Beauharnais to Moscow, and distinguished itself at Malo-Jaroslavetz, as also during the horrors of the retreat in the closing weeks of 1812. It is said that out of 27,000 Italians who entered Russia with Eugène, only 333 saw their country again.

The uncertainty caused by Murat's policy in 1813-14 had no small share in precipitating the downfall of Napoleon's power in Italy. After the battle of Leipzig (Oct. 16-19, 1813), Beauharnais' power crumbled away under the assaults of the now victorious Austrians, and was fatally compromised by the defection of Murat and the dissensions among the Italians. Very many of them, distrusting both of these kings, sought to act independently in favour of an Italian republic. Lord William Bentinck with an Anglo-Sicilian force landed at Leghorn on March 8, 1814, and issued a proclamation to the Italians bidding them rise against Napoleon in the interests of their own freedom. A little later he gained possession of Genoa. On April 16, 1814, Beauharnais signed an armistice with the Austrians who, under Gen. Bellegarde, entered Milan without resistance; and this event preluded the restoration of the old political order.

The arrangements made by the allies in accordance with the treaty of Paris (June 12, 1814) and the Final Act of the congress of Vienna (June 9, 1815), imposed on Italy boundaries which, roughly speaking, corresponded to those of the pre-Napoleonic era. To the kingdom of Sardinia, now reconstituted under Victor Emmanuel I., France ceded its old provinces, Savoy and Nice; and the allies insisted on the addition to that monarchy of the territories of the former republic of Genoa in order to strengthen it as a buffer state between France and the smaller states of central Italy. Austria recovered the Milanese, and all the possessions of the old Venetian republic on the mainland, including Istria and Dalmatia. The Ionian islands, formerly belonging to Venice, were, by a treaty signed at Paris on Nov. 5, 1815, placed under the protection of Great Britain. By an instrument signed on April 24, 1815, the Austrian territories in north Italy were erected into the kingdom of Lombardo-Venetia, which, though an integral part of the Austrian empire, was to enjoy a separate administration. Francis IV., son of the archduke Ferdinand of Austria and Maria Beatrice, daughter of Ercole Rinaldo, the last of the Estensi, was reinstated as duke of Modena. Parma and Piacenza

were assigned to Marie-Louise, daughter of the Austrian emperor and wife of Napoleon, on behalf of her son, the little Napoleon, but by subsequent arrangements (1816-17) the duchy was to revert at her death to the Bourbons of Parma, then reigning at Lucca. Tuscany was restored to the grand-duke Ferdinand III. of Habsburg-Lorraine. The duchy of Lucca was given to Marie-Louise of Bourbon-Parma, who, at the death of Marie-Louise of Austria, would return to Parma, when Lucca would be handed over to Tuscany. The pope, Pius VII., returned to Rome in May, 1814, and was recognized by the congress of Vienna as the sovereign of all the former possessions of the Holy See. Ferdinand IV. of Naples, not long after the death of his consort, Maria Carolina, in Austria, returned from Sicily. He received back his dominions in their entirety, with the new title of Ferdinand I. of the Two Sicilies. The rash attempt of Murat in the autumn of 1815, which led to his death at Pizzo di Calabria, enabled the Bourbon dynasty to crush malcontents with all the greater severity. The reaction, which was dull and heavy in the dominions of the pope and of Victor Emmanuel, systematically harsh in the Austrian states of the north, and comparatively mild in Tuscany, excited the greatest loathing in southern Italy and Sicily, because there it was directed by a dynasty which had aroused feelings of hatred mingled with contempt.

There were special reasons why Sicily should harbour these feelings against the Bourbons. During eight years (1806-14) the chief places of the island had been garrisoned by British troops. Lord William Bentinck exercised a restraining influence on Ferdinand and Maria Carolina, and in 1812 a constitution modelled largely on that of England was passed by the estates. After the retirement of the British troops in 1814 the constitution lapsed, and the royal authority became once more absolute. But the memory of the benefits conferred by "the English constitution" remained and proved one of the influences which spurred on the Sicilians and the democrats of Naples to the efforts which they put forth in 1821, 1848 and 1860.

This result of British intervention was in some respects similar to that exerted by Napoleon on the Italians of the mainland. The general reactions after 1815 could not blot out from the minds of the Italians the recollections of the benefits derived from the just laws, vigorous administration and enlightened aims of the great emperor. The hard but salutary training which they had undergone at his hands had taught them that they were the equals of the northern races both in the council chamber and on the field of battle. It had further revealed to them that they were in all essentials a nation.

(X.)

THE RISORGIMENTO

As the result of the Vienna treaties, Austria came to be the predominant power in Italy—Lombardy and Venetia she ruled directly, the duchies through Austrian princes, and the other states by indirect influence and alliances. Victor Emmanuel I. of Sardinia was more independent than the other Italian rulers and his dynasty was popular, but he was determined to restore the antiquated laws, institutions and conditions preceding the French revolution and to introduce the most bigoted reaction. In the Lombardo-Veneto, the Austrian administration was honest and efficient, but politically oppressive. Duke Francis of Modena was a reactionary tyrant; in Parma there was little oppression under Marie-Louise, and in Tuscany the rule of Ferdinand was mild, but demoralizing. The papal government was an incompetent theocracy with a corrupt administration and a police which, although barbarously tyrannical, was unable to cope with the anarchy and brigandage prevalent in some provinces. In Naples King Ferdinand retained some of the institutions and officials of Murat's régime, but a degrading bigotry became the basis of government and social life, while in Sicily, converted into a Neapolitan province and deprived of its constitution, Bourbon rule was particularly unpopular.

The newly-restored governments might easily have achieved popularity among peoples worn out by the terrible drain of men and money caused by the Napoleonic wars. But in their terror of revolution they failed to realize that the past régime had

wafted a breath of new life into Italy, and that the new-born idea of Italian unity was a force to be reckoned with. The masses were still politically indifferent, but in the upper classes there was a sense of despair at Italy's degradation and an incipient hatred of foreign rule, which found expression in the secret societies, particularly the Carbonari (*q.v.*). In 1820 a Carbonarist mutiny broke out in the Neapolitan army to the cry of "God, the king and the constitution." The king, in a panic, granted the constitution, which he swore to respect (July, 1820), but immediately after he repaired to the congress of Laibach (*see* LAIBACH, CONGRESS OF) and applied for military assistance with which to crush the revolution. Austria was entrusted with the task, and an Austrian army defeated the Neapolitan Liberals under Gen. Pepe at Rieti (March 7, 1821), and restored Ferdinand's autocracy. The same year a Carbonarist mutiny broke out in Piedmont. Prince Charles Albert, the heir presumptive, felt a certain interest in Liberal ideas and was above all anti-Austrian, and when on the abdication of Victor Emmanuel and in the absence of the new king, Charles Felix, he was appointed regent, he granted the constitution; but Charles Felix returned, abrogated the constitution and crushed the revolution with Austrian assistance. He exiled Charles Albert, but resented Austria's attempt to have him excluded from the succession.

There had been some mild plotting against Austria in Lombardy, in consequence of which Count F. Confalonieri, the poet Silvio Pellico, and others, were imprisoned in the Spielberg for many years; the sufferings and heroism of the prisoners and Pellico's famous account of his imprisonment (*Le mie prigioni*) enlisted wide sympathy for the Italian cause throughout Europe.

The July revolution in Paris aroused great hopes among the Italian patriots, and in Feb. 1831 the Romagna and the March rose in revolt against the papal authorities who were expelled without difficulty; Louis Napoleon, afterwards emperor of the French, was among the insurgents. Similar risings broke out at Parma and Modena, but Austrian intervention restored papal and ducal rule, and Austrian forces remained for some years in occupation of Ferrara, while France occupied Ancona. The Powers addressed a memorandum to Pope Gregory XVI. recommending moderate reforms, but he paid no attention to it. Although the character of these agitations showed that the masses were still not yet ripe for a national movement, they proved the inability of the despotic governments to hold their own without foreign arms.

Mazzini and "Giovane Italia."—On April 27, 1831, Charles Albert succeeded Charles Felix as king of Sardinia. Immediately afterwards he received a letter from Giuseppe Mazzini exhorting him to put himself at the head of a movement for liberating and uniting Italy. Mazzini (*q.v.*) had formed an association among the Italian exiles at Marseille called the Giovane Italia (Young Italy) for the emancipation of Italy from foreign and domestic tyranny, and also from national faults of character. His great merit lies in his constant advocacy of the idea of Italian unity, and the Giovane Italia spread to all centres of Italian exiles. His attempt to raise a rebellion in Savoy only resulted in sentences of death or imprisonment on Liberal suspects, but the expedition of the Bandiera brothers to Calabria, organized by him, although unsuccessful, was significant as the first attempt by Italians from all parts of the country to promote revolution in the south. Side by side with the Mazzinian republican propaganda, the idea of regenerating Italy under Piedmontese auspices and the Savoy dynasty began to gain ground. Vincenzo Gioberti, who in 1843 published his treatise *Del primato morale e civile degli Italiani*, extolling the achievements and virtues of the Italians, advocated a federation of Italian States under the presidency of the pope. Cesare Balbo in his *Speranze d'Italia* (1844) also favoured a federation, but insisted on the expulsion of the Austrians from Italy. A third important publication was Massimo D'Azeglio's *Degli ultimi casi di Romagna*, exposing papal misgovernment.

On the death of Gregory XVI. in 1846, Cardinal Mastai Ferretti was elected pope as Pius IX. He was a kindly man of inferior intelligence, but the interest he evinced in Liberalism and the amnesty and administrative reforms which he granted aroused high hopes among the Italian patriots. Austria was much dis-

turbed by his attitude and immediately reoccupied Ferrara, to the great indignation of the pope. Charles Albert had little sympathy with revolution, and was dominated by religious fervour, but he hated Austria and the advent of an apparently anti-Austrian pope conciliated his two strongest feelings.

Charles Louis, duke of Lucca, in 1847 sold his duchy to Leopold II. of Tuscany (the successor of Ferdinand III. since 1824) to whom it would have reverted in any case at the death of the duchess of Parma. At the same time Leopold ceded Lunigiana to Parma and Modena in equal parts, an arrangement which provoked the indignation of the inhabitants of the district. In Sept. 1847 Leopold gave way to the popular agitation for a national guard, in spite of Metternich's threats, and allowed greater freedom of the press.

Ferdinand I. of the Two Sicilies had died in 1825, and was succeeded by Francis I. At the latter's death in 1830 Ferdinand II. succeeded, an ignorant bigot who concentrated the whole of the executive in his own hands. On Jan. 12, 1848 a revolution broke out at Palermo under the leadership of Ruggiero Settimo, and the insurgents demanded the constitution of 1812 or complete independence. Disturbances occurred at Naples also, and the king, who could not obtain Austrian help, granted a constitution (Jan. 28).

1848-1849

Revolutions of 1848.—The news from Naples strengthened the demand for a constitution in Piedmont. Count Camillo Cavour, then editor of a new and influential paper called *Il Risorgimento*, had advocated it strongly, and monster demonstrations were held every day. Although the king disliked the idea, he granted (March 4, 1848) the hastily drafted charter destined to be the constitution of the future Italian kingdom. It provided for a nominated senate and an elective chamber of deputies, the king retaining the right of veto; the press censorship was abolished, and freedom of meeting, of the press and of speech were guaranteed. Balbo was called upon to form the first constitutional ministry. Three days later the grand-duke of Tuscany promised similar liberties, and a charter was promulgated on the 17th.

A demonstration in favour of Pius IX. on Jan. 3 at Milan was dispersed with unnecessary severity, but the revolution which broke out on March 8 in Vienna itself, led to the granting of feeble concessions to Lombardy and Venetia. But it was too late, and the famous Five Days' revolution began. It was a popular outburst of pent-up hate, unprepared by leaders, although leaders such as Luciano Manara soon arose. Field-marshal Radetzky occupied the citadel and other points of vantage; the desperate struggle lasted until the 22nd, when the Austrians, having lost 5,000 killed and wounded, were forced to evacuate the city. The rest of Lombardy and Venetia now flew to arms, and the Austrian garrisons, except in the Quadrilateral (Verona, Peschiera, Mantua and Legnano) were expelled. In Venice the people, under the leadership of Daniele Manin, rose in arms and forced the Austrian authorities to withdraw on March 22, after which the republic was proclaimed. At Milan, where there was a division of opinion between the monarchists under Casati and the republicans under Cattaneo, a provisional administration was formed and the question of the form of government postponed for the moment. Provisional governments were set up in Parma and Modena, and in Rome Pius, after calling down God's blessing on Italy, promulgated a constitution on Feb. 11.

The War of 1848.—There were now three main political tendencies, *viz.*, the union of north Italy under Charles Albert and an alliance with the pope and Naples, a federation of the different States, and a united republic of all Italy. All parties, however, were agreed in favour of war against Austria. The news of the Five Days of Milan produced the wildest excitement in Turin, and on March 23 the king declared war against Austria. Charles Albert could dispose of 90,000 men, including some 30,000 from central Italy, but he took the field with only half his force, and his delays lost him his best chances, enabling Radetzky to receive reinforcements from Austria. The pope, unable to resist the popular demand for war, allowed his army to depart (March 23), with instructions to act in concert with Charles Albert. But in his

encyclical of April 20, he stated that, as head of the Church, he could not declare war, although he was unable to prevent his subjects from following the example of other Italians. Tuscany and Naples had both joined the Italian league. The Piedmontese defeated the enemy at Pastrengo (April 30), but did not profit by the victory, and in the meantime a dispute had broken out at Naples between the king and parliament, barricades were erected and street fighting ensued (May 15); on the 17th Ferdinand dissolved parliament and recalled the army. A force of Tuscan volunteers was attacked by a superior body of Austrians at Curtatone and Montanaro, and defeated after a gallant resistance on May 27; Charles Albert captured Peschiera on May 30, and defeated Radetzky at Goito. But the withdrawal of the Neapolitans seriously embarrassed the Italians, and the whole Austrian army now turned on Vicenza, which after a brave resistance surrendered on June 10. All Venetia except the capital was thus once more occupied by the Austrians. On July 23-25 (first battle of Custoza) the Piedmontese were defeated and forced to retire on Milan with Radetzky's superior force in pursuit. The king was the object of a hostile demonstration in Milan, and returned to Piedmont with the remnants of his army. On August 6 Radetzky again entered Milan, and three days later an armistice was concluded between Austria and Piedmont, the latter evacuating Lombardy and Venetia.

Meanwhile, on July 7, the Venetian assembly declared in favour of fusion with Piedmont, and Manin, who had been elected president, resigned his powers to the royal commissioners. Soon after Custoza, however, the Austrians blockaded the city. In Rome the pope's authority weakened day by day, and disorder increased. The Mamiani ministry having failed to achieve anything, Pius summoned Pellegrino Rossi, a learned jurist who had long been exiled in France, to form a cabinet. On Nov. 15 he was assassinated, and the terrified pope fled in disguise to Gaeta (Nov. 25); when parliament requested him to return he refused even to receive the deputation. On Feb. 5, 1849, a constituent assembly was summoned, and on the 9th it voted the downfall of the temporal power and proclaimed the republic. Mazzini hurried to Rome and was chosen head of the triumvirate. On the 18th Pius invited the armed intervention of France, Austria, Naples and Spain to restore his authority. In Tuscany the government drifted from the moderates to the extreme democrats, and in Oct. 1848, Leopold reluctantly consented to a democratic ministry led by Guerrazzi and Montanelli. He refused, however, to concede a constituent assembly, and left Florence. On Feb. 8, 1849, the republic was proclaimed, and on the 21st, at the pressing request of the pope and the king of Naples, Leopold went to Gaeta.

Ferdinand did not openly break his constitutional promises until Sicily was reconquered. He now prorogued parliament, enacted stringent measures against the Liberals, and retired to Gaeta, the haven of refuge for deposed despots.

Charles Albert was determined that so long as he had an army in being he could not abandon the Lombards and the Venetians, whom he had encouraged in their resistance, without one more effort, though he knew full well that he was staking all on a desperate chance. On March 12, 1849, he denounced the armistice. His forces amounted to 80,000 men, including a Lombard corps and other volunteers. But the discipline and morale of the army were shaken and its organization faulty, and after some preliminary fighting Radetzky won the decisive battle of Novara (March 23) which broke up the Piedmontese army. The king, who had sought death in vain all day, had to ask terms of Radetzky; these proving extremely onerous, he abdicated in favour of his son Victor Emmanuel II., and departed at once for Portugal, where he died in a monastery a few months later.

Re-establishment of Autocracy.—Novara set Austria free to reinstate the Italian despots. Ferdinand at once re-established autocracy in Naples; though the struggle in Sicily did not end until May, when Palermo, after a splendid resistance, capitulated. In Tuscany disorder continued, until on May 25, 1849, Austrian troops entered Florence, and on July 28 Leopold returned to his capital. While his restoration was welcomed by a part of the people, the fact that Leopold had come under Austrian protection ended by destroying all loyalty to the dynasty, and consequently

contributed not a little to Italian unity.

In Rome the triumvirate decided to defend the republic to the last; the defenders received a priceless addition to their strength in the person of Garibaldi, who in April, 1849, entered Rome with some 500 men. At this time France, as a counterpoise to Austrian intervention in other parts of Italy, decided to restore the pope. On April 25 Gen. Oudinot landed with 8,000 men at Civitavecchia, and on the 30th attempted to capture Rome by surprise, but was completely defeated by Garibaldi. The French republican Government, while pretending to treat with Mazzini, increased Oudinot's force to 35,000 men. At the same time, Austrian, Neapolitan and Spanish troops were converging on Rome. The Roman army (20,000 men) included, besides Garibaldi's red-shirted legionaries, volunteers from all parts of Italy, many of them wealthy young men of noble family. The Neapolitans were ignominiously beaten in May and retired to the frontier; but by the end of May, after desperate fighting, the French penetrated within the walls (June 29). Garibaldi quitted the city, followed by 4,000 of his men, and attempted to join the defenders of Venice. In spite of the fact that he was pursued by the armies of four Powers, he succeeded in reaching San Marino, whence, his force having melted away, he reached Piedmont and eventually America, to await a new call to fight for Italy.

After a heroic defence, conducted by Giuseppe Martinengo, Brescia was recaptured in April by the Austrians under Gen. Haynau, his atrocities earning him the name of "the Hyena of Brescia." In May they seized Bologna, and Ancona in June. Venice alone still held out; the assembly voted: "Venice resists the Austrians at all costs," and the citizens and soldiers, strengthened by the arrival of volunteers from all parts of Italy, showed the most splendid devotion in their hopeless task. By the end of May Venice was blockaded by land and sea, and on the 24th the city, reduced by famine, capitulated on favourable terms. Manin and a few others were excluded from the amnesty and went into exile.

The Italian cause had been crushed, but revolution and war had strengthened the feeling of unity, for Neapolitans had fought for Venice, Lombards for Rome, Piedmontese for all Italy. Piedmont was shown to possess the qualities necessary to constitute the nucleus of a great nation. It was now evident that the federal idea was impossible, for none of the princes except Victor Emmanuel could be trusted, and that unity and freedom could not be achieved under a republic, for nothing could be done without the Piedmontese army, which was royalist to the core. All reasonable men were thus convinced that the question of the ultimate form of the Italian government was secondary, and that the national efforts should be concentrated on the task of expelling the Austrians.

CAVOUR, AND "THE DECADE OF RESISTANCE"

The peace negotiations between Piedmont and Austria dragged on for several months, involving two changes of ministry, and D'Azeglio became premier. Through Anglo-French mediation Piedmont's war indemnity was reduced, and at last Austria agreed to amnesty all those compromised in the Lombard revolution save a very few; in August the peace terms were agreed upon. But it was not until the king's eloquent appeal from Moncalieri to his people's loyalty, and after a dissolution and the election of a new parliament, that the treaty was ratified (Jan. 9, 1850). The situation in Piedmont was far from promising. Legislation had to be entirely reformed, and the bill for abolishing the special jurisdiction for the clergy (*foro ecclesiastico*) and other mediaeval privileges aroused the bitter opposition of the Vatican as well as of the Piedmontese clericals. This same year (1850) Cavour, who had been in parliament for some time and had in his speech of March 7 struck the first note of encouragement after the gloom of Novara, became minister of agriculture, and in 1851 also assumed the portfolio of finance. A quarrel with D'Azeglio resulted in Cavour's resignation, but D'Azeglio was not equal to the situation, and he, too, resigned in Nov. 1852; whereupon the king appointed Cavour prime minister, a position which with short intervals he held until his death.

The Austrians in the period from 1849-59, known as the *decennio della resistenza* (decade of resistance), were made to feel that they were in a conquered country; for no self-respecting Lombard or Venetian would even speak to an Austrian. Austria, on the other hand, treated her Italian subjects with great severity. The Italian provinces were the most heavily taxed in the whole empire, and long terms of imprisonment and the bastinado, the latter even inflicted on women, were the penalties for the least expression of anti-Austrian opinion. The State trials at Mantua in connection with the discovery of a Mazzinian plot, conducted in the most shamelessly inquisitorial manner, resulted in five death sentences, including that of the priest Tazzoli, and many of imprisonment for long terms. On a charge of complicity an embargo was further laid on the property of many Lombard emigrants who had settled in Piedmont and become naturalized. The Piedmontese Government rightly regarded this measure as a violation of the peace treaty of 1850, and Cavour recalled the Piedmontese minister from Vienna.

Cavour's ideal for the present was the expulsion of Austria from Italy and the expansion of Piedmont into a North Italian kingdom; and although he did not yet think of Italian unity as a question of practical policy, he began to foresee it as a future possibility.

Realizing that by taking part in the Crimean War, Piedmont would gain for itself a military status and a place in the councils of the great Powers, and establish claims on Great Britain and France, Cavour negotiated a treaty of alliance (signed in Jan. 1855) and while Austria remained neutral, a well-equipped Piedmontese force of 15,000 men, under Gen. La Marmora, sailed for the Crimea. Everything turned out as Cavour had hoped. The Piedmontese troops distinguished themselves in the field, gaining the sympathies of the French and English; and at the subsequent congress of Paris (1856) where Cavour himself was Sardinian representative, the Italian question was discussed, and the intolerable oppression of the Italian peoples by Austria and the despots ventilated.

Austria at last attempted a more conciliatory policy towards her Italian subjects, but it was too late, and the immense majority of the people rejected these advances. The restored despots in the rest of Italy resumed their old methods of persecution, especially Ferdinand of Naples, whose treatment of political prisoners, including highly respectable men such as Silvio Spaventa, Luigi Settembrini and Carlo Poerio, called down upon him the fierce condemnation of W. E. Gladstone. The only exception was Leopold of Tuscany, but even his mildness failed to conciliate his people, owing to his dependence on Austria.

THE UNION OF ITALY

While Mazzini's influence declined, a new movement for the union of Italy under Victor Emmanuel gathered strength. The propaganda was organized by the Sicilian La Farina, by means of the *Società Nazionale*, and found many adherents, including not a few ex-republicans such as Manin, then an exile in Paris. Cavour gave secret encouragement to the movement, and ended by practically directing its activity through La Farina.

Napoleon III. and the War of 1859.—Both the king and his minister realized that Piedmont alone could not expel Austria from Italy without foreign assistance. Cavour now set himself to the task of isolating Austria and securing an alliance for her expulsion. The emperor Napoleon, almost alone amongst Frenchmen, had genuine Italian sympathies. But were he to intervene in Italy, the intervention would have to bring tangible advantages to France. Hence his hesitations and vacillations, which Cavour steadily worked to overcome. The attempt by the Mazzinian, Felice Orsini, to murder Napoleon (Jan. 14, 1858), although it failed, greatly impressed the emperor, as did Orsini's letter from prison exhorting him to intervene in Italy. Consequently negotiations with Cavour were resumed, and a meeting with him was arranged to take place at Plombières (July 20 and 21, 1858). There it was agreed that France should supply 200,000 men and Piedmont 100,000 for the expulsion of the Austrians from Italy, that Piedmont should be expanded into a kingdom of North Italy,

that central Italy should form a separate kingdom, on the throne of which the emperor perhaps would place one of his own relatives, and Naples another, possibly under Lucien Murat; the pope, while retaining only the "Patrimony of St. Peter" (the Roman province), would be president of the Italian confederation. In exchange for French assistance Piedmont would cede Savoy and perhaps Nice to France; and a marriage between Victor Emmanuel's daughter Clothilde and Napoleon's nephew Prince Bonaparte, to which the emperor attached great importance, although not made a definite condition, was also discussed.

On Jan. 1, 1859, Napoleon astounded the diplomatic world by remarking to Baron Hübner, the Austrian ambassador, that he regretted that relations between France and Austria were "not so good as they had been"; and at the opening of the Piedmontese parliament on the 10th Victor Emmanuel pronounced the memorable words that he could not be insensible to the cry of pain (*il grido di dolore*) which reached him from all parts of Italy. Yet after these warlike declarations and after the signing of a military convention at Turin, Napoleon suddenly adopted the Russian suggestion of a congress to settle Italian affairs. The scheme was strongly opposed by Cavour, and Napoleon then insisted on disarmament by both Sardinia and Austria. Cavour saw the necessity of acceding to this demand of disbanding the volunteers who had flocked to Piedmont from all parts of Italy when war seemed imminent, and of reducing the regular army to a peace footing. But in Austria, where the war party was in the ascendant, the reserves were called out on April 12, and on the 23rd, before Cavour's decision was known, an ultimatum was sent to Turin demanding disarmament within three days. Cavour was delighted at the turn affairs had taken, as Austria now appeared the aggressor. On the 29th Francis Joseph declared war, and the next day his troops crossed the Ticino, a move which was followed by a French declaration of war. The actions of Montebello (May 20), Palestro (May 31) and Melegnano (June 8) and the battles of Magenta (June 4) and Solferino (June 24) all went against the Austrians. Garibaldi's volunteers raised the standard of insurrection and held the field in the region of the Italian lakes. After Solferino the allies prepared to besiege the Quadrilateral, but Napoleon drew back, unwilling, for many reasons, to continue the campaign. He saw the defects of his own army organization, and feared intervention by Prussia; he did not wish to create a too powerful Italian state at the foot of the Alps; and lastly, the war was far from popular in France. Consequently, without consulting Victor Emmanuel, Napoleon asked Francis Joseph for an armistice, which was agreed to. The king was informed, and on the 8th an armistice was arranged at Villafranca until Aug. 15. But the king and Cavour were terribly upset by this move, which meant peace without Venetia; Cavour hurried to the king's headquarters at Monzambano, and in excited, almost disrespectful, language implored him not to agree to peace. On this occasion, however, Victor Emmanuel proved the greater statesman of the two; he saw that, great as was the sacrifice, he must be content with Lombardy for the present, lest all be lost. On the 11th the two emperors met at Villafranca, where they agreed that Lombardy should be ceded to Piedmont, Venetia retained by Austria, and Italy made into a confederation with the pope as president. Victor Emmanuel regretfully signed the peace preliminaries, adding, however, *pour ce qui me concerne* (which meant that he made no undertaking with regard to central Italy), and Cavour resigned office. (*See ITALIAN WARS.*)

The Lombard campaign had produced important effects throughout the rest of Italy. A bloodless revolution in Florence forced the grand duke to depart on April 27, 1859. A provisional government was formed, led by Ubaldo Peruzzi, and was strengthened on May 8 by the inclusion of Baron Bettino Ricasoli, a man of great force of character, who became the real head of the administration, and all through the ensuing critical period aimed unswervingly at Italian unity. The rulers of Parma and Modena and the papal authorities in the legations were likewise expelled, provisional governments being set up, and the dictatorship of Victor Emmanuel invoked. In July the marquis D'Azeglio arrived at Bologna as royal commissioner.

Napoleon was resolutely opposed to the Piedmontese annexations in central Italy. But here Cavour intervened, for he was determined to maintain the annexations, at all costs. Although he had resigned, he remained in office until Rattazzi could form a new ministry; and while officially recalling the royal commissioners according to the preliminaries at Villafranca, he privately encouraged them to remain and organize resistance to the return of the despots, if necessary by force (*see* CAVOUR). Farini, who was elected dictator of Parma and Modena, and Ricasoli, who had become supreme in Tuscany, were now the men who by their energy and determination achieved the annexation of central Italy to Piedmont, in spite of the strenuous opposition of the French emperor and the weakness of many Italian Liberals. In August Marco Minghetti succeeded in forming a military league and a customs union between Tuscany, Romagna and the duchies; and Gen. Manfredo Fanti was sent by the Turin Government to organize the army of the Central League, with Garibaldi under him.

The terms of the treaty of peace signed at Zürich on Nov. 10 were practically identical with those of the preliminaries of Villafranca. Napoleon realized now that it would be impossible, without running serious risks, to oppose the movement in favour of unity, and he thereupon raised the question of the cession of Nice and Savoy as the price of his consent to the union of the central provinces with the Italian kingdom. In Jan. 1866 the Rattazzi ministry fell, and Cavour was again summoned by the king to the head of affairs.

Cavour realized the necessity of the sacrifice of Nice and Savoy if central Italy was to be won. The negotiations were long drawn out; but at last, on March 24, the treaty was signed whereby the cession was agreed upon. The king having formally accepted the voluntary annexation of the duchies, Tuscany and Romagna, appointed the prince of Carignano viceroy with Ricasoli as governor-general (March 22), and was immediately afterwards excommunicated by the pope. On April 2, 1860, the new Italian parliament, including members from central Italy, assembled at Turin.

GARIBALDI

On his death in May 1859 Ferdinand of Naples was succeeded by his son Francis II. The son indicated no intention of changing his father's policy, and, in spite of Napoleon's advice, refused to grant a constitution or to enter into an alliance with Sardinia. The result was a revolutionary agitation in Sicily, stirred up by Rosalino Pilo and Francesco Crispi. An invitation had been sent Garibaldi to put himself at the head of the movement; at first he had refused, but reports of the progress of the insurrection soon determined him to risk all on a bold stroke, and on May 5, he embarked at Quarto, near Genoa, with Bixio, the Hungarian Türr and some 1,000 picked followers, on two steamers. The preparations for the expedition, openly made, were viewed by Cavour with mixed feelings. With its object he sympathized; yet he could not give official sanction to an armed attack on a friendly power, nor on the other hand could he forbid an action enthusiastically approved by public opinion. On the 11th Garibaldi landed at Marsala, without opposition, defeated the Neapolitan forces at Calatafimi on the 15th, and on the 27th entered Palermo in triumph, where he proclaimed himself, in King Victor Emmanuel's name, dictator of Sicily. By the end of July, after the hard-won victory of Milazzo, the whole island, with the exception of the citadel of Messina, was in his hands.

It was all-important that whatever victories Garibaldi might win should be won for the Italian kingdom, and, above all, that no ill-timed attack on the Papal States should provoke an intervention of the Powers. But Garibaldi, who wished to keep a free hand, refused to agree to the annexation of Sicily to Piedmont.

On Aug. 8, in spite of the protests and threats of most of the Powers, the Garibaldians began to cross the straits, and in a short time 20,000 of them were on the mainland. The Bourbonists offered no serious resistance, and on Sept. 6 King Francis and his family sailed for Gaeta; and the next day Garibaldi entered Naples alone in advance of the army and was enthusiastically welcomed. He proclaimed himself dictator of the kingdom.

His rapid success, meanwhile, inspired both the French emperor and the government of Turin with misgivings, and Cavour saw that the situation could only be saved by the armed participation of Piedmont in the liberation of south Italy. In the circumstances Cavour decided that Piedmont must anticipate Garibaldi, occupy Umbria and the Marches and place Italy between the red-shirts and Rome. His excuse was the pope's refusal to dismiss his foreign levies (Sept. 7). On Sept. 11 a Piedmontese army crossed the frontier; and, after defeating the papal troops under the French general Lamoricière at Castelfidardo, entered Neapolitan territory on Oct. 15. In the meanwhile the red-shirts had encountered a formidable obstacle to their advance in the Neapolitan army entrenched on the Volturno under the guns of Capua. On Sept. 19 the Garibaldians began their attack on this position with their usual impetuous valour; but it was not till Oct. 2 that they succeeded in carrying the position. On the 29th Victor Emmanuel and Garibaldi met, and on Nov. 7 they entered Naples together: Garibaldi resigned his authority into the king's hands and, refusing the titles and other honours offered to him (he had asked for the Neapolitan viceroyalty for life, which the king very wisely refused), retired to his island home of Caprera.

The Piedmontese under Cialdini had begun the siege of Gaeta on Nov. 5, and on Feb. 13 the fortress surrendered, Francis and his family having departed by sea for papal territory. The citadel of Messina capitulated on the 22nd, and Civitella del Tronto, the last stronghold of the Bourbon, on March 21. On Feb. 18 the first Italian parliament met at Turin, and Victor Emmanuel was proclaimed king of Italy.

The New Government.—There were, however, other serious problems calling for immediate attention. The country had to be built up and converted from an agglomeration of scattered mediaeval principalities into a unified modern nation. The first question which arose was that of brigandage in the south, which had indeed always existed in the Neapolitan kingdom, owing to the poverty of the population, but was now organized and encouraged for political purposes by King Francis's uncle, the count of Trapani, and Mons. de Mérode, a Belgian ecclesiastic who enjoyed immense influence at the Vatican. The task of suppressing the movement took four or five years. Politically, its sole outcome was to prove the impossibility of allowing the continuance of an independent Roman state in the heart of Italy. Another of the Government's difficulties was the question of what to do with Garibaldi's volunteers, which was discussed on April 18 in one of the most dramatic sittings of the Italian parliament, when Garibaldi denounced Cavour for his treatment of the volunteers and for the cession of Nice. On April 23 they were formally reconciled in the presence of the king, but the scene of April 18 hastened Cavour's end. In May the Roman question was discussed in parliament. Cavour had often declared that in the end the capital of Italy must be Rome, for it alone of all Italian cities had an unquestioned claim to moral supremacy, and his views of a free Church in a free State were well known. But it was not given him to see this problem solved, for his health was broken by the strain of the last few years, during which practically the whole administration of the country was concentrated in his hands. He died after a short illness on June 6, 1861.

Ricasoli became prime minister, Cavour having advised the king to that effect. The financial situation was far from brilliant; the budget of 1861 showed a deficit of 344,000,000 lire, while the service of the debt was 110,000,000; deficits were met by new loans issued on unfavourable terms. Considering the state of the country and the coming war for Venice, heavy expenditure was inevitable, but good management might have rendered the situation less dangerous. Ricasoli, honest and capable as he was, failed to win popularity, and was succeeded by Rattazzi.

In June, 1862, Garibaldi went to Sicily, where, after taking counsel with his former followers, he decided on an immediate raid on Rome, and in August he crossed over to Calabria with 1,000 men. His intentions in the main were still loyal, for he desired to capture Rome for the kingdom; and he did his best to avoid the regulars tardily sent against him. On Aug. 29, 1862, however, in an engagement with a force under Pallavicini at

Aspromonte, he was seriously wounded and taken prisoner. He was shut up in the fortress of Varignano, and after endless discussions as to whether he should be tried or not, the question was settled by an amnesty. The affair made the ministry so unpopular that it was forced to resign. Farini, who succeeded, retired almost at once on account of ill-health, and Minghetti became premier, with Visconti-Venosta as minister for foreign affairs.

Negotiations were resumed with Napoleon for the evacuation of Rome by the French troops, and the two governments concluded a convention on Sept. 15, 1864, whereby France agreed to withdraw her troops from Rome, Italy undertaking not to attack it nor permit others to do so, and to transfer the capital from Turin to some other city within six months. The convention was kept secret, but the last clause leaked out and caused the bitterest feeling among the people of Turin. Demonstrations were held which were repressed with unnecessary violence, and such a storm of disapproval arose that the king for the first time used his privilege of dismissing the ministry. Under La Marmora's administration the September convention was ratified, and the capital was transferred to Florence the following year.

Venice and the War of 1866.—Meanwhile, the Venetian question was becoming more and more acute. Every Italian felt the presence of the Austrians in the lagoons as a national humiliation, and it became clear that the foreigner could only be driven from the peninsula by another war. To wage this alone Italy was still too weak, and it was necessary to look round for an ally. Napoleon was sympathetic, but he dared not brave French public opinion by another war with Austria, nor did Italy desire an alliance which would only have been bought at the price of further cessions. There remained Prussia, which was completing her preparations for the final struggle with Austria for the hegemony of Germany; and Napoleon willingly lent his aid in negotiating a Prusso-Italian alliance. After a set-back due to the Gastein convention (Aug. 14, 1865) this was actually concluded on April 8, 1866.

The outbreak of war was postponed by further diplomatic complications. On June 12 Napoleon, whose policy throughout had been obscure and contradictory, signed a secret treaty with Austria, under which Venice was to be handed over to him, to be given to Italy in the event of her making a separate peace. La Marmora, however, who believed himself bound in honour to Prussia, refused to enter into a separate arrangement. On the 16th the Prussians began hostilities, and on the 20th Italy declared war. Victor Emmanuel took the supreme command of the Italian army, and La Marmora resigned the premiership (which was assumed by Ricasoli), to become chief of the staff. An indecisive battle was fought at Custoza on June 24; bad generalship, bad organization and the jealousy between La Marmora and Della Rocca were responsible for this failure which might have been afterwards retrieved, for the Italians had plenty of fresh troops besides Cialdini's army; but nothing was done, as both the king and La Marmora believed the situation to be much worse than it actually was. On July 3 the Prussians completely defeated the Austrians at Königgrätz, and on the 5th Austria ceded Venetia to Napoleon, accepting his mediation in favour of peace. The Italian fleet, commanded by the incompetent Persano, was defeated at Lissa by the Austrian fleet under the capable Tegethoff.

On the 22nd Prussia, without consulting Italy, made an armistice with Austria, while Italy obtained an eight days' truce on condition of evacuating the Trentino, which had almost entirely fallen into the hands of Garibaldi and his volunteers. An armistice was accordingly signed at Cormons on Aug. 12; Austria handed Venetia over to Gen. Leboeuf, representing Napoleon; and on Oct. 3 peace between Austria and Italy was concluded at Vienna. On the 19th Leboeuf handed Venetia over to the Venetian representatives, and at the plebiscite held on the 21st and 22nd, 647,246 votes were returned in favour of union with Italy, only 69 against it. When this result was announced to the king by a deputation from Venice he said: "This is the finest day of my life; Italy is made, but it is not complete." Rome was still wanting.

The Occupation of Rome.—Custoza and Lissa were not Italy's only misfortunes in 1866. There had been considerable dis-

content in Sicily, which culminated in serious riots in Palermo, in September; it was put down owing to the energy of the mayor of the city, Marquis A. di Rudini, and the arrival of reinforcements. The Ricasoli cabinet fell over the law against the religious houses, and was succeeded by that of Rattazzi, who, with the support of the Left, was apparently more fortunate. The French regular troops were withdrawn from Rome in Dec. 1866; but the pontifical forces were largely recruited in France and commanded by officers of the imperial army, and service under the pope was considered by the French war office as equivalent to service in France. This was a violation of the letter as well as of the spirit of the September convention, and Garibaldi advocated an invasion of Roman territory. He made open preparations for a raid, but on Sept. 23, 1867, Rattazzi had him arrested and confined to Caprera. In spite of the vigilance of the warships he escaped on Oct. 14 and landed in Tuscany, whence he attempted to march on Rome at the head of his ill-armed and ill-disciplined bands. Napoleon, under pressure of the Clerical Party, had sent another expedition to Rome (Oct. 26); Rattazzi resigned and was succeeded by Menabrea. On Nov. 3 a battle took place at Mentana between 4,000 or 5,000 red-shirts and a somewhat superior force of French and pontificals. The Garibaldians, mowed down by the new French *chassepôt* rifles, fought until their last cartridges were exhausted, and retreated the next day towards the Italian frontier, leaving 800 prisoners.

The affair of Mentana caused considerable excitement throughout Europe, and Rouher, the French premier, declared in the Chamber (Dec. 5, 1867) that France could never permit the Italians to occupy Rome. This attitude of France strengthened anti-French feeling in Italy, and Bismarck was not slow to make use of it with a view to preventing Italy from taking sides with France against Prussia in the coming inevitable struggle between the two Powers.

A scandal concerning the tobacco monopoly led to the fall of Menabrea, who was succeeded in Dec. 1869 by Giovanni Lanza, with Visconti-Venosta at the Foreign Office and Q. Sella as finance minister. The latter introduced a sounder financial policy, which was maintained until the fall of the Right in 1876. Mazzini, now openly hostile to the monarchy, was seized with a perfect monomania for insurrections, and promoted various small risings, the only effect of which was to show how completely his influence was gone.

In Dec. 1869, the XXI. oecumenical council began its sittings in Rome, and on July 18, 1870, proclaimed the infallibility of the pope (*see VATICAN COUNCIL*). Two days previously Napoleon had declared war on Prussia, and immediately afterwards he withdrew his troops from Civitavecchia. On Aug. 9 Italy made a declaration of neutrality, and three weeks later Visconti-Venosta informed the powers that Italy was about to occupy Rome. On Sept. 3 the news of Sedan reached Florence, and with the fall of Napoleon's empire, the September convention ceased to have any value. The Powers having engaged to abstain from intervention in Italian affairs, Victor Emmanuel addressed a letter to Pius IX. asking him in the name of religion and peace to accept Italian protection instead of the temporal power, to which the pope replied that he would only yield to force. Cardinal Antonelli would have come to terms, but the pope decided on making a sufficient show of resistance to prove that he was yielding to force. On the 20th the Italians, under Gen. Raffaele Cadorna, began the attack, and Gen. Mazé de la Roche's division having effected a breach in the Porta Pia, the pope ordered the garrison to cease fire, the Italians poured into the Eternal City, and the garrison laid down their arms; the next day, at the pope's request, the Leonine City on the right bank was also occupied. It had been intended to leave that quarter of Rome to the pope, but by the earnest wish of the inhabitants it too was included in the Italian kingdom. At the plebiscite there were 133,681 votes for union and 1,507 against it. Thus, after a struggle of more than half a century, in spite of apparently insuperable obstacles, the liberation and the unity of Italy were accomplished.

(L. V.)

1870-1902

The downfall of the temporal power was hailed throughout Italy

with great satisfaction. But in France, although the Government of National Defence had congratulated Italy, that of Thiers, which succeeded it, was less friendly. Bismarck, too, was annoyed with Italy on account of the Garibaldian expedition to assist the French and at Visconti-Venosta's plea for the integrity of French territory.

Church Settlement.—For a few weeks after the occupation of Rome relations between the Italian authorities and the Curia were marked by a conciliatory spirit. The Government laid before parliament a bill known as the Law of Papal Guarantees to regulate the position juridically. It embodied Cavour's idea of "a free Church in a free State" and various schemes previously presented, and was voted on March 21, 1871, by 185 votes to 106. The law recognized the person of the pope as sacred and intangible, and while providing for free discussions on religious matters, punished insults and outrages against the pope, according him the right to maintain the Swiss and Noble Guards, and granted him an annuity of 3,225,000 lire and the enjoyment of the Vatican and Lateran palaces and of the villa at Castel Gandolfo. The pope was given full freedom for the exercise of his spiritual ministry, while diplomats accredited to the Holy See and papal diplomats in Italy were placed on the same footing as those accredited to the Quirinal. All restrictions on the right of meeting of members of the clergy were abolished, and bishops were dispensed from swearing fealty to the king. The changed attitude of France stiffened the resistance of the papacy, and an encyclical of Pius IX. of May 15 repudiated the law of guarantees and summoned the Catholic princes to restore the temporal power. Consequently the law remained a unilateral measure, which Italy considered herself bound to respect and always respected while the papacy availed itself of those clauses which were of advantage to it.

Parliament and the Government offices were transferred to Rome in 1871. The growth of Clericalism in France engendered the belief that Italy might have to defend her newly-won unity against foreign aggression, and Gen. Ricotti, the minister of war, framed a bill for the improvement of the army. But with taxation screwed up to the extreme limit and a deficit of 212,500,000 lire, the financial situation was far from satisfactory. Sella had to bear the brunt of the unprecedented fight against bankruptcy which Italy had been waging since 1861. In the face of grave difficulties and violent popular opposition, he had succeeded in getting the grist tax on cereals (*tassa sul macinato*) voted and applied, and brought its net revenue from 25,000,000 lire to over 80,000,000. He undoubtedly saved the situation by that measure for the time being, but while in 1871 he had succeeded by rigid economies in reducing the deficit to less than 50,000,000 lire, in 1872 it had again risen to 200,000,000. He therefore proposed to make over the Treasury service to the state banks, to increase the forced currency, to increase certain taxes, and to provide for the conversion of sundry internal loans into consolidated stock at a lower rate of interest. After a long and bitter struggle he was able to carry out his programme by March 1872, thereby meeting the pressing needs of the moment and laying the foundations of a definitely balanced budget.

On April 29, 1873, the Lanza-Sella cabinet was beaten in the Chamber, but was induced to remain in office until after the debate on the extension to Rome of the law of 1866 on the religious orders, a measure carried in May. While leaving the general houses of the confraternities intact, the law abolished the legal personality of the religious orders, placed the schools and hospitals under civil administration and the churches under the secular clergy, and provided pensions for monks and nuns. The pope enjoined on the suppressed orders to reconstitute themselves under the ordinary Italian law of association. A few days after the passage of the bill Rattazzi died (June 5, 1873), and on June 23 the Lanza cabinet was defeated by a coalition of the Left under Depretis and a part of the Right under Minghetti and by Tuscan deputies led by Correnti.

Minghetti.—Minghetti now became prime minister, with Visconti-Venosta as minister of foreign affairs. In essential points the work of the preceding administration was continued. Minghetti gradually overcame the chronic deficit, and, owing to the normal

increase of revenue, ended his term of office with the announcement of a surplus of some 18,000,000 lire.

Outside the all-important domain of finance, the attention of Minghetti and his colleagues was principally absorbed by strife between Church and State, army reform and railway redemption.

Particularly noteworthy were the efforts of the cabinet to strengthen and consolidate national defence. Appalled by the weakness, or rather the non-existence, of the navy, Admiral Saint-Bon addressed himself earnestly to the task of recreating the fleet, which had never recovered from the effects of the disaster of Lissa. During his three years of office he laid the foundation upon which Brin was afterwards to build up a new Italian navy. Simultaneously Gen. Ricotti-Magnani's army reform scheme was adopted by parliament on June 7, 1875.

It was fortunate for Italy that during the whole period 1869-76 the direction of her foreign policy remained in the experienced hands of Visconti-Venosta. As foreign minister of a young State which had attained unity in defiance of the most formidable religious organization in the world and in opposition to the traditional policy of France, it could but be his aim to uphold the dignity of his country while convincing European diplomacy that United Italy was an element of order and progress, and that the spiritual independence of the Roman pontiff had suffered no diminution. Thiers had consistently opposed the emperor Napoleon's pro-Italian policy. He frankly regretted the constitution of powerful homogeneous states upon the borders of France. Personal pique accentuated this feeling towards Italy and had decreased whatever inclination he might otherwise have felt to oppose the French Clerical agitation for the restoration of the temporal power, and for French interference with the Italian Religious Orders bill. Consequently relations between France and Italy became severely strained. At this juncture the emperor of Austria invited Victor Emmanuel to visit the Vienna exhibition, and the Italian Government received confidential intimation that acceptance of the invitation to Vienna would be followed by a further invitation from Berlin. Perceiving the advantage of these visits, Visconti-Venosta and Minghetti advised their sovereign to accept both the Austrian and the subsequent German invitations. The Italian monarch was accorded in both capitals (Sept. 1873) a most cordial reception, although the contemporaneous publication of La Marmora's famous pamphlet, *More Light on the Events of 1866*, prevented intercourse between the Italian ministers and Bismarck from being entirely confidential. Visconti-Venosta and Minghetti, moreover, wisely resisted the chancellor's pressure to override the Law of Guarantees and to engage in an Italian *Kulturkampf*. Nevertheless the royal journey contributed notably to the establishment of cordial relations between Italy and the Central Powers. Meanwhile Thiers had given place to Marshal MacMahon, who effected a decided improvement in Franco-Italian relations. The foreign policy of Visconti-Venosta may be said to have reinforced the international position of Italy without sacrifice of dignity.

THE RISE OF THE LEFT

Depretis.—The fall of the Right on March 18, 1876, was an event destined profoundly, and in many respects adversely, to affect the course of Italian history. Except at rare and not auspicious intervals, the Right had held office from 1849 to 1876. For years the men of the Left had worked to inoculate the electorate with suspicion of Conservative methods and with hatred of the imposts which they nevertheless knew to be indispensable to sound finance. Moreover, the redemption of the railways by the State had been fiercely opposed by the Left, although its members were for the most part convinced of the utility of the operation. When, at the beginning of March 1876, these contracts were submitted to parliament, a group of Tuscan deputies, under Cesare Correnti, joined the opposition, and on March 18 took advantage of a chance motion to place the Minghetti cabinet in a minority. Depretis, successor of Rattazzi in the leadership of the Left, was entrusted by the king with the formation of a Liberal ministry. Besides the premiership, Depretis assumed the portfolio of finance; Nicotera, an ex-Garibaldian of somewhat tarnished reputation, but a man of energetic and conservative temperament, was placed at the ministry of the interior; public works were entrusted to Zanardelli, a

Radical doctrinaire of considerable juridical attainments. Great difficulty was experienced in finding a foreign minister willing to challenge comparison with Visconti-Venosta, and the choice fell upon Melegari, Italian minister at Berne and an old friend of Mazzini.

The new ministers had long since made monarchical professions of faith, but although their patriotism and loyalty were above suspicion, they were nevertheless considered to be tinged with an almost revolutionary hue. The king alone appeared to feel no misgivings. Danger lay rather in entrusting men schooled in political conspiracy and in unscrupulous parliamentary opposition with the government of a young state still beset by enemies at home and abroad. The programme of Depretis comprised extension of the franchise, strict enforcement of the rights of the State as against the Church, maintenance of the military and naval policy inaugurated by the Conservatives, acceptance of the railway redemption contracts, consolidation of the financial equilibrium, abolition of the forced currency, and, eventually, fiscal reform.

Nicotera, minister of the interior, found himself obliged to incur the wrath of his supporters by prohibiting Radical meetings likely to endanger public order, and by enunciating administrative principles which would have befitted an inveterate conservative. He instructed the prefects strictly to prevent infraction of the law against religious orders. At the same time the cabinet, as a whole, brought in a Clerical Abuses Bill, threatening with severe punishment priests guilty of disturbing the peace of families, of opposing the laws of the State, or of fomenting disorder. Depretis, for his part, was compelled to declare impracticable the immediate abolition of the grist tax, and to frame a bill for the increase of revenue, acts which caused the secession of many supporters. The first general election under the Left (Nov. 1876) had yielded the cabinet the overwhelming majority of 421 Ministerialists against 87 Conservatives, but the very size of the majority rendered it unmanageable. The Clerical Abuses Bill provoked dissensions: Nicotera was severely affected by revelations concerning his political past, and Zanardelli refused to sanction the construction of a railway in Calabria in which Nicotera was interested. Almost the only respect in which the Left could boast a decided improvement over the administration of the Right was the energy displayed by Nicotera in combating brigandage and the mafia (*q.v.*) in Calabria and Sicily. Successes achieved in those provinces failed, however, to save Nicotera from the wrath of the Chamber, and on Dec. 14, 1877, a cabinet crisis arose over a question concerning the secrecy of telegraphic correspondence. Depretis thereupon reconstructed his administration, excluding Nicotera, Melegari and Zanardelli, giving Crispi the Ministry of the Interior, entrusting Magliani with finance, and himself assuming the direction of foreign affairs.

Although the Left had for years advocated an Italo-Prussian alliance in opposition to the Francophil tendencies of the Right, Depretis and Melegari, both of whom were imbued with French Liberal doctrines, adopted towards the republic an attitude so deferential as to arouse suspicion in Vienna and Berlin, without, however, securing a more friendly attitude on the part of France. As a precaution against an eventual French attempt to restore the temporal power, orders were hurriedly given to complete the defences of Rome, but in other respects the Italian Government maintained its subservient attitude. In the hope of inducing the European Powers to "compensate" Italy for the increase of Austrian influence on the Adriatic, Crispi undertook in the autumn of 1877, with the approval of the king, and in spite of the half-disguised opposition of Depretis, a semi-official mission to Paris, Berlin, London and Vienna; but did not achieve any important success for Italian foreign policy.

Accession of Humbert I. and Leo. XIII.—The entry of Crispi into the Depretis cabinet (Dec. 1877) placed at the ministry of the interior a strong hand and sure eye at a moment when they were about to become imperatively necessary. Crispi was the only man of truly statesmanlike calibre in the ranks of the Left. Hardly had he assumed office when the unexpected death of Victor Emmanuel II. (Jan. 9, 1878) stirred national feeling to an unprecedented depth, and placed the continuity of monarchical institutions in Italy upon trial before Europe. His disappear-

ance snapped the chief link with the heroic period, and removed from the helm of state a ruler of large heart, great experience and civil courage, at a moment when elements of continuity were needed and vital problems of internal reorganization had still to be faced. Crispi adopted the measures necessary to ensure the tranquil accession of King Humbert with a quick energy which precluded any Radical or Republican demonstrations. Before the commotion caused by the death of Victor Emmanuel had passed away, the decease of Pius IX. (Feb. 7, 1878) placed further demands upon Crispi's sagacity and promptitude. Like Victor Emmanuel, Pius IX. had been bound up with the history of the Risorgimento, but, unlike him, had represented and embodied the anti-national, reactionary spirit. Notwithstanding the pontiff's bestowal of the apostolic benediction *in articulo mortis* upon Victor Emmanuel, the attitude of the Vatican had remained so inimical as to make it doubtful whether the conclave would be held in Rome. Crispi's energetic action and his outspoken communications to the Sacred College as to the consequences of holding the conclave abroad, induced the cardinals to hold it in Rome, the new pope, Cardinal Pecci, being elected on Feb. 20, 1878. The Italian Government assured the new pope protection during the settlement of his outstanding personal affairs, an assurance of which Leo. XIII. on the evening after his election, took full advantage. At the same time the duke of Aosta, commander of the Rome Army corps, ordered the troops to render royal honours to the pontiff should he officially appear in the capital. King Humbert addressed to the pope a letter of congratulation upon his election, and received a courteous reply. The Depretis-Crispi cabinet did not long survive the opening of the new reign. It was succeeded by that of Cairoli whose premiership was characterized by the enactment of highly dangerous financial measures, and was cut short by the attempt made upon the king's life during a royal visit to Naples in Nov. 1878, by Passanante. In spite of the courage and presence of mind of Cairoli, who received the dagger thrust intended for the king, public and parliamentary indignation found expression in a vote which compelled the ministry to resign.

Cairoli.—Though brief, Cairoli's term of office was momentous. Replying on April 9, 1878, to interpellations on the impending Congress of Berlin, the foreign minister, Count Corti, appeared free from apprehension lest Italy, isolated, might find herself face to face with a change of the balance of power in the Mediterranean, and declared that in the event of serious complications Italy would be "too much sought after rather than too much forgotten." The policy of Italy in the congress, he added, would be to support the interests of the young Balkan nations. Wrapped in this optimism, Count Corti proceeded, as first Italian delegate, to Berlin, where he had to sanction the Austrian occupation of Bosnia-Herzegovina. On July 8 the revelation of the Anglo-Ottoman treaty for the British occupation of Cyprus took the congress by surprise; and Corti returned from the German capital with "clean" but empty hands, a plight which found marked disfavour in Italian eyes, and stimulated anti-Austrian Irredentism. Ever since the war of 1866 secret revolutionary committees had been formed in the northern Italian provinces to prepare for the redemption of Trent and Trieste. For 12 years these committees had remained comparatively inactive, but in 1878 the presence of the ex-Garibaldian Cairoli at the head of the Government, and popular dissatisfaction at the spread of Austrian sway on the Adriatic, encouraged them to begin a series of noisy demonstrations. Nor could Austria ignore the Irredentist agitation, for the equivocal attitude of Cairoli and Zanardelli cast doubt upon the sincerity of their regret.

The fall of Cairoli, and the formation of a second Depretis cabinet in 1878, brought no substantial change in the attitude of the Government towards Irredentism, nor was the position improved by the return of Cairoli to power in the following July. In Bonghi's mordant phrase, the foreign policy of Italy during this period may be said to have been characterized by "enormous intellectual impotence counterbalanced by equal moral feebleness." Home affairs were scarcely better managed. Parliament had degenerated into a congeries of personal groups, whose

members were eager only to overturn cabinets in order to secure power for the leaders and official favours for themselves. Depretis, who had succeeded Cairoli in Dec. 1873, fell in July 1879, after a vote in which Cairoli and Nicotera joined the Conservative opposition. On July 12 Cairoli formed a new administration, only to resign on Nov. 24, and to reconstruct his cabinet with the help of Depretis. The administration of finance was as chaotic as the state of parliament. The 60,000,000 lire surplus announced by Seismit Doda proved to be a myth. Nevertheless Magliani, who succeeded Seismit Doda, had neither the perspicacity nor the courage to resist the abolition of the grist tax. While revenue was thus reduced no new taxes were imposed, although Depretis's scheme for building 5,000km. of new, and by no means wholly necessary, railways had been sanctioned. The unsatisfactory financial condition of the Florence, Rome and Naples municipalities necessitated State help, but the Chamber nevertheless proceeded with a light heart (Feb. 23, 1881) to sanction the issue of a foreign loan for 650,000,000 lire with a view to the abolition of the forced currency.

Tunisia.—Cairoli had declined the suggestions of Germany, Austria and Russia that Italy should seek compensation in Tunisia for the extension of Austrian sway in the Balkans, and neither he nor Count Corti had any inkling of the verbal arrangement made between Lord Salisbury and Waddington at the instance of Bismarck, that, when convenient, France should occupy Tunisia, an agreement afterwards confirmed in writing. Almost up to the moment of the French occupation of Tunisia the Italian Government believed that Great Britain, if only out of gratitude for the bearing of Italy in connection with the Dulcigno demonstration in the autumn of 1880, would prevent French acquisition of the Regency, and was ignorant of the assurance conveyed to France by Lord Granville that the Gladstone cabinet would respect the engagements of the Beaconsfield-Salisbury administration. The French Government in the meanwhile was preparing an expeditionary corps for the occupation of the Regency. In the spring of 1881, with the pretext of an attack by the Kroumir tribe on the Algerian border, the Regency was occupied, and on May 12 the bey signed the treaty of Bardo accepting French protection.

Italian indignation at the French *coup de main* was the deeper on account of the apparent duplicity of the Government of the republic, the French foreign minister, Barthélemy St. Hilaire, having on May 11 officially assured the Italian ambassador in Paris that France "had no thought of occupying Tunisia or any part of Tunisian territory, beyond some points of the Kroumir country." The whole Italian nation was filled with deep resentment at an event which was considered tantamount not only to the destruction of Italian aspirations to Tunisia, but to the ruin of the interests of the numerous Italian colony and to a constant menace against the security of the Sicilian and south Italian coasts. The conclusion of the treaty of Bardo on May 12 compelled Cairoli to sacrifice himself to popular indignation. Sella was called upon, but the dog-in-the-manger policy of Depretis, Cairoli, Nicotera and Baccarini, in conjunction with the intolerant attitude of some extreme Conservatives, proved fatal to his endeavours. Depretis then succeeded in recomposing the Cairoli cabinet without Cairoli, Mancini being placed at the Foreign Office. Public opinion was further irritated against France by the massacre of some Italian workmen at Marseille on the occasion of the return of the French expedition from Tunisia, and Depretis, in response to public feeling, found himself obliged to mobilize a part of the militia for military exercises; at the same time disorders occurred at Rome in connection with the transfer of the remains of Pius IX. from St. Peter's to the basilica of San Lorenzo.

THE TRIPLE ALLIANCE

A conviction was spreading that escape from the isolation of Italy lay in agreement with Austria and Germany. Depretis tardily recognized the need for such agreement, but he was opposed to any formal alliance, lest it might arouse French resentment, while the new Franco-Italian treaty was still uncompleted, and the foreign loan for the abolition of the forced currency had still to be floated. The Centre, a small group led by Sidney Son-

nino, a young politician of unusual fibre, believed that the only sound basis for Italian policy would be a close alliance with the Central Powers and a friendly understanding with Great Britain upon Mediterranean affairs. The principal Italian public men were divided in opinion on the subject of the alliance. Peruzzi, Lanza and Bonghi pleaded for equal friendship with all powers, and especially with France; Crispi, Minghetti, Cadorna and others favoured Germany and Austria. Austria and Germany, however, scarcely reciprocated these dispositions. The Irredentist agitation had left profound traces at Berlin as well as at Vienna, and had given rise to a distrust of Depretis which nothing had yet occurred to allay. Nor, in view of the comparative weakness of Italian armaments, could eagerness to find an ally be deemed conclusive proof of the value of Italian friendship. Mancini, foreign minister, limited his efforts to the maintenance of correct diplomatic relations with the Central Powers. Danger of foreign interference in the relations between Italy and the papacy had never been so great since the Italian occupation of Rome, as when, in the summer of 1881, the disorders during the transfer of the remains of Pius IX. had lent an unwonted ring of plausibility to the papal complaint concerning the "miserable" position of the Holy See. Bismarck at that moment was anxious to obtain from the Vatican the support of German Catholics, and might well have taken the initiative of making papal independence the subject of an international conference. Friendship and alliance with Catholic Austria and powerful Germany could alone lay this spectre. The political conditions of Europe favoured the realization of Italian desires, and it was tacitly understood between Bismarck and Austria that the latter should profit by Italian resentment against France to draw Italy into the orbit of the Austro-German alliance.

A visit of King Humbert and Queen Margherita to Vienna was then arranged and took place in due state, in Oct. 1881. The reception was marked by great cordiality, and both in Germany and Austria the visit was construed as a preliminary to the adhesion of Italy to the Austro-German alliance. Count Hatzfeldt, on behalf of the German Foreign Office, informed the Italian ambassador in Berlin that whatever was done at Vienna would be regarded as having been done in the German capital. Nor did nascent irritation in France prevent the conclusion of the Franco-Italian commercial treaty which was signed at Paris on Nov. 3.

The advent to power in France of Gambetta (Nov. 9, 1881) who was believed to favour a policy of *révanche* against Germany, and of more friendly relations with Italy, convinced Bismarck of the necessity of securing Italy's adhesion to the Austro-German alliance. As usual, when dealing with weaker nations, the German chancellor resorted to intimidation. He referred to Italy as a country tottering on the verge of revolution, and opened in the German semi-official press a campaign in favour of an international guarantee for the independence of the papacy. These manoeuvres produced their effect upon Italian public opinion. At the new year's reception of deputies King Humbert aroused enthusiasm by a significant remark that Italy intended to remain "mistress in her own house"; while Mancini, in a despatch to Count de Launay, Italian ambassador in Berlin, repudiated the supposition that closer relations between Italy and Germany could be made in any way contingent upon a modification of Italian freedom of action in regard to home affairs.

The sudden fall of Gambetta (Jan. 26, 1882) having removed the fear of immediate European complications, the cabinets of Berlin and Vienna again displayed diffidence towards Italy. But the bitterness aroused by the French action in Tunisia induced Mancini to open negotiations for an Italo-Austrian alliance. The first exchange of ideas between the two Governments proved fruitless. There were difficulties owing to Kalnóky's clerical views, and the polemics in the Italian press over the failure of the Austrian emperor to return King Humbert's visit, because the pope declared that he would not receive the emperor if he came to Rome on a visit to the Quirinal. Mancini was, on the other hand, unwilling to guarantee Austria's permanent possession of Trento and Trieste. Meanwhile (May 11, 1882) the Italian parliament adopted the new Army Bill, with a special credit of 127,500,000 lire for the creation of two new army corps, and increasing the ordinary

military estimates to 200,000,000 lire yearly. Garibaldi, since the French occupation of Tunis, had ardently worked for the increase of the army, and so had the satisfaction of seeing his desire realized before his death at Caprera on June 2, 1882. Before his death, and almost contemporaneously with the passing of the Army Bill, negotiations for the alliance were renewed. Encouraged from Berlin, Kalnóky agreed to the reciprocal territorial guarantee, but declined reciprocity in support of social interests. The treaty of triple alliance was signed on May 20, 1882, five days after the promulgation of the Franco-Italian commercial treaty in Paris. It pledged the contracting parties for a period of five years to join in resisting attack upon the territory of any one of them, within the limits of its own interests; if one of the contracting Powers were menaced by a single great Power and forced to declare war on it, the others would preserve a friendly neutrality, but if the menace came from two or more Powers the *casus foederis* would arise for all. Austria and Italy also undertook to maintain the *status quo* in the East, but if this should become impossible neither of the two Powers was to occupy territories permanently or temporarily without previous agreement and adequate compensation. Kalnóky desired that both the terms of the treaty and the fact of its conclusion should remain secret, but Bismarck and Mancini hastened to hint at its existence. A revival of Irredentism after the execution of an Italian subject of Austria named Oberdan, who was alleged to have intended to murder Francis Joseph, and the cordial references to France made by Depretis at Stradella (Oct. 8, 1882), prevented the French Government from suspecting the existence of the alliance. Suspicion was not aroused until March, 1883, when Mancini practically admitted the existence of the treaty. In Italy generally this revelation was hailed with satisfaction except by the Clericals, who were enraged at the blow thus struck at the restoration of the pope's temporal power, and by the Radicals, who feared both the inevitable breach with republican France and the reinforcement of the Italian constitutional parties by intimacy with strong monarchical states such as Germany and Austria.

Nevertheless, during its first period (1882-87), the triple alliance failed to ensure cordiality between the contracting Powers. Mancini exerted himself in a hundred ways to soothe French resentment. He not only refused to join Great Britain in the Egyptian expedition, but agreed to suspend Italian consular jurisdiction in Tunis; but his efforts were worse than futile. France remained cold, while Bismarck and Kalnóky, distrustful of the radicalism of Depretis and Mancini, assumed towards their ally an attitude almost hostile. Possibly Germany and Austria may have been influenced by the secret treaty signed between Austria, Germany and Russia on March 21, 1884, whereby Italy became in the eyes of the Central Powers a negligible quantity, and was treated accordingly. Meanwhile France provided Italy with fresh cause for uneasiness by abating her hostility to Germany. Italy in consequence drew nearer to Great Britain, and at the London conference on the Egyptian financial question sided with Great Britain against Austria and Germany. On Feb. 5, 1885, Massawa was occupied. The importance of this event was not appreciated at the time, and it aroused considerable opposition in the Chamber. On June 16 the cabinet obtained so small a majority that Depretis resigned. He was asked by the king to form a new ministry, which he did, but without Mancini who was replaced by Count Robilant. Robilant followed a firmly independent policy throughout the Bulgarian crisis of 1885-86. Italy, indeed, came out of the Eastern crisis with enhanced prestige and with her relations to Austria greatly improved. As, in the spring of 1886, the moment for the renewal of the triple alliance drew near, he profited by the development of the Bulgarian crisis and the threatened Franco-Russian understanding to secure from the Central Powers "something more" than the bare territorial guarantee of the original treaty. This "something more" consisted, at least in part, of the arrangement of an Anglo-Italian naval understanding providing for common action by the British and Italian fleets in the Mediterranean in case of war. A vote of the Italian Chamber on Feb. 4, 1887 in connection with the disaster to Italian troops at Dogali, in Abyssinia, brought about the resignation of the Depretis-

Robilant cabinet. The crisis dragged for three months, and before its definite solution by the formation of a Depretis-Crispi ministry, Robilant succeeded (March 17, 1887) in renewing the triple alliance on terms more favourable to Italy than those obtained in 1882. Not only did he secure concessions from Austria and Germany corresponding in some degree to the improved state of the Italian army and navy, but, in virtue of the Anglo-Italian understanding, assured the practical adhesion of Great Britain to the European policy of the Central Powers.

INTERNAL POLITICS

The period 1881-87 was marked by political and economic problems, and by the parliamentary phenomena known as *trasformismo*. On June 20, 1881, the Chamber adopted a Franchise Reform Bill, which increased the electorate from 600,000 to 2,000,000. On April 12, 1883, the forced currency was formally abolished by the resumption of Treasury payments in gold with funds obtained through a loan of £14,500,000 issued in London on May 5, 1882. On March 6, 1885, parliament finally sanctioned the conventions by which State railways were farmed out to three private companies—the Mediterranean, Adriatic and Sicilian. The conventions, concluded for a period of 60 years, but terminable by either party after 20 or 40 years, retained for the State the possession of the lines. Unfortunately, the calculation of probable railway revenue on which the conventions had been based, proved to be enormously exaggerated, and the Government's position remained so unsatisfactory as to render the resumption of the whole system by the State on the expiration of the first period of 20 years in 1905 inevitable.

Intimately bound up with the forced currency, the railway conventions and public works was the financial question in general. From 1876, when equilibrium between expenditure and revenue had first been attained, taxation yielded steady annual surpluses, in 1881 reaching the satisfactory level of 53,000,000 lire. The repeal of the grist tax on wheat, which took effect on Jan. 1, 1884, the increase of military and naval expenditure, the lack of firm financial administration, and the constant drain of not always necessary public works, opened a new and disastrous period of deficit. In their anxiety to remain in office Depretis and the finance minister, Magliani, never hesitated to mortgage the financial future of their country. No concession could be denied to deputies, or groups of deputies, whose support was indispensable to the life of the cabinet, nor, under such conditions, was it possible to place any effective check upon administrative abuses in which politicians or their electors were interested. Thus the deficit of 23,500,000 lire for the financial year 1885-86 rose to nearly 73,000,000 lire in 1887-88, and in 1888-89 attained the terrible level of 250,000,000 lire.

Nevertheless, in spite of many and serious shortcomings, the long series of Depretis administrations was marked by the adoption of some useful measures. The foundation of land tax reassessment was laid by the introduction of a new cadastral survey. The Agricultural Inquiry brought to light vast quantities of information valuable for future agrarian legislation. In 1885 a measure embodying the principle of employers' liability for accidents to workmen was enacted. An effort to encourage the development of the mercantile marine was made in the same year. Sanitation and public hygiene received a potent impulse from the cholera epidemic of 1884, many of the unhealthiest quarters in Naples and other cities being demolished and rebuilt. The movement was strongly supported by King Humbert, whose intrepidity in visiting the most dangerous spots at Busca and Naples while the epidemic was at its height, reassuring the panic-stricken inhabitants by his presence, excited the enthusiasm of his people and the admiration of Europe.

During the accomplishment of these and other reforms the condition of parliament underwent profound change. By degrees the administrations of the Left had ceased to rely solely upon the Liberal sections of the Chamber, and had carried their most important bills with the help of the Right. This process of transformation was not exclusively the work of Depretis, but had been initiated as early as 1873, when a portion of the Right under

Minghetti had, by joining the Left, overturned the Lanza-Sella cabinet. The practical annihilation of the old Right in the elections of 1876 opened a new parliamentary era. Reduced in number to less than 100, and radically changed in spirit and composition, the Right gave way, if not to despair, at least to a despondency unsuited to an opposition party. Gradually it lost its conservative character and approached the various cabinets of the Left. When, in course of time, the extended suffrage increased the Republican and Extreme Radical elements in the Chamber, and the Liberal "Pentarchy" (composed of Crispi, Cairoli, Nicotera, Zanardelli and Baccarini) assumed an attitude of bitter hostility to Depretis, the Right, obeying the impulse of Minghetti, rallied openly to Depretis, lending him aid without which his prolonged term of office would have been impossible. The result was parliamentary chaos, baptized *trasformismo*. Depretis thus established a parliamentary system destined largely to sterilize and vitiate the political life of Italy.

IMPERIAL AFFAIRS

Egypt and Abyssinia.—Contemporaneously with the vicissitudes of home and foreign policy under the Left there grew up in Italy a marked tendency towards colonial enterprise. On Nov. 15, 1869, an Italian shipper, Rubattino, had bought the bay of Assab from Beheran, sultan of Raheita, for 47,000 lire from funds furnished by the Government. The Egyptian Government raised some objections to the occupation, but in 1880 Assab was permanently occupied. On Sept. 20, 1881 Beheran formally accepted Italian protection, and in the following February an Anglo-Italian convention established the Italian title to Assab, and in July the Chamber adopted a bill constituting Assab an Italian crown colony.

Within four weeks of the adoption of this bill the bombardment of Alexandria by the British fleet (July 11, 1882) opened an era destined profoundly to affect the colonial position of Italy. The refusal of France to co-operate with Great Britain induced Lord Granville on July 27 to invite Italy to join in restoring order in Egypt; but Mancini and Depretis, in spite of the efforts of Crispi, then in London, declined the offer. Financial considerations, lack of proper transports for an expeditionary corps, fear of displeasing France, dislike of a "policy of adventure," misplaced deference towards the ambassadorial conference in Constantinople, and unwillingness to thwart the current of Italian sentiment in favour of the Egyptian "nationalists" were the chief motives of the Italian refusal.

The occupation of Massawa (Feb. 5, 1885) was carried out with the approval of Great Britain. Partly to satisfy public opinion, whose resentment had been aroused by the massacre of some Italian explorers in that part of Africa, partly in order to profit by the favourable disposition of the British Government, and partly in the hope of remedying the error committed in 1882 by refusal to co-operate with Great Britain in Egypt, the Italian Government in Jan. 1885 despatched an expedition to occupy Massawa and Beilul, subsequently extending their zone of occupation. The extension of the Italian zone excited the suspicions of John, negus of Abyssinia, whose apprehensions were assiduously fomented by Alula, ras of Tigré, and by French and Greek adventurers. Measures, apparently successful, were taken to reassure the negus, but shortly afterwards protection accorded by Italy to enemies of Ras Alula, induced the Abyssinians to enter upon hostilities. Ras Alula took prisoners and held as hostages the members of the Salimbeni expedition, whereupon Gen. Gené pushed forward a detachment to Saati. On Jan. 25, 1887, Ras Alula attacked Saati, but was repulsed with loss. On the following day, however, the Abyssinians, 20,000 strong, succeeded in surprising, near the village of Dogali, an Italian force of 524 officers and men under Col. De Cristoforis, and overwhelmed them. The Italians, after exhausting their ammunition, were destroyed where they stood. One man only escaped; 407 men and 23 officers were killed outright, and one officer and 81 men wounded. Dead and wounded alike were horribly mutilated by order of Alula.

In Italy the disaster of Dogali produced consternation, and caused the fall of the Depretis-Robilant cabinet. The Chamber sanctioned the despatch of reinforcements. Meanwhile Crispi

who, though averse from colonial adventure, desired to vindicate Italian honour, entered the Depretis cabinet as minister of the interior. In Nov. 1887, a strong expedition under Gen. di San Marzano raised the strength of the Massawa garrison to nearly 20,000 men. The British Government, desirous of preventing an Italo-Abyssinian conflict, which could but strengthen the position of the Mahdists, despatched Mr. (afterwards Sir) Gerald Portal from Massawa on Oct. 29 to mediate with the negus. The mission proved fruitless. On March 28, 1888, the negus descended from the Abyssinian high plateau in the direction of Saati, but, on April 3, sickness among his men compelled him to withdraw the Abyssinian army. He was killed on March 10, 1889, while in an expedition against the Mahdists. His death gave rise to an Abyssinian war of succession between Mangasha, natural son of John, and Menelek, king of Shoa and grandson of the Negus Sella-Selassie. Menelek, by means of Count Antonelli, resident in the Shoa country, requested Italy to execute a diversion in his favour by occupying Asmara. Antonelli obtained Menelek's signature to a treaty fixing the frontiers of the Italian colony and defining Italo-Abyssinian relations. The treaty, signed at Ucciali on May 2, 1889, arranged for regular intercourse between Italy and Abyssinia and conceded to Italy a portion of the high plateau, with the positions of Halai, Saganeiti and Asmara. The main point of the treaty, however, lay in clause 17:—

His Majesty the king of kings of Ethiopia *consents* to make use of the Government of His Majesty the king of Italy for the treatment of all questions concerning other Powers and Governments.

Upon this clause Italy founded her claim to a protectorate over Abyssinia. In Sept. 1889 the Treaty of Ucciali was ratified, Italy recognizing Menelek as emperor of Ethiopia, and Menelek recognizing the Italian colony. On Jan. 1, 1890, a royal decree conferred upon the colony the name of "Eritrea."

In the colony itself Gen. Baldissera, who had replaced Gen. Saletta, prepared himself to take the offensive against Mangasha and Ras Alula. The latter retreated, and Mangasha, seeing further resistance to be useless, submitted to Menelek, who conformed to article 17 of the Treaty of Ucciali by requesting Italy to represent Abyssinia at the Brussels anti-slavery conference, an act which strengthened Italian illusions as to Menelek's readiness to submit to their protectorate. But he afterwards protested against the Italian text of article 17 and to contend that the Amharic text contained no equivalent for the word "*consent*," but merely stipulated that Abyssinia "*might*" make use of Italy in her relations with foreign powers. On Oct. 28, 1890, Count Antonelli was despatched to settle the controversy, but found agreement impossible either with regard to the frontier or the protectorate. Meanwhile the marquis di Rudini, who had succeeded Crispi as the Italian premier, had authorized the abandonment of article 17, but was able to conclude two protocols with Great Britain (March and April, 1891) whereby the British government definitely recognized Abyssinia as within the Italian sphere of influence in return for an Italian recognition of British rights in the Upper Nile.

CRISPI

With the entry of Crispi into the Depretis cabinet as minister of the interior (April 4, 1887) an element of vigour which had long been lacking was introduced into the Government. Within four months the death of Depretis (July 29, 1887) opened for Crispi the way to the premiership. Besides assuming the presidency of the council of ministers and retaining the Ministry of the Interior, Crispi took over the portfolio of foreign affairs. One of the first questions with which he had to deal was that of conciliation between Italy and the Vatican. At the end of May the pope, in an allocution to the cardinals, had spoken of Italy in terms of unusual cordiality, and had expressed a wish for peace. Soon afterwards a pamphlet known to represent the pope's ideas, was published by Father Tosti, a close friend and confidant of the pope, and *persona grata* to the Italian Government, extolling the advantages of peace between Vatican and Quirinal. Reconciliation seemed within sight when suddenly Tosti's pamphlet was placed on the Index. On June 4, 1887, the official Vatican organ, the *Osservatore Romano*, published a letter written by Tosti to

the pope conditionally retracting the views expressed in the pamphlet. The letter had been written at the pope's request, on the understanding that it should not be published. The dream of conciliation was at an end, but the Tosti incident had served once more to illustrate the true position of the Vatican in Italy. It seemed clear that neither the influence of the regular clergy, of which the Society of Jesus is the most powerful embodiment, nor that of foreign clerical parties, which largely control the Peter's Pence fund, would ever permit renunciation of the papal claim to temporal power. Conciliation with Italy would expose the pope and his Italian *entourage* to suspicion of being unduly subject to Italian political influence—of being, in a word, more Italian than Catholic. In order to avoid this danger it was necessary to refuse all compromise, and, by perpetual reiteration of a claim incompatible with Italian territorial unity, to prove to the Church at large that the pope and the Curia were more Catholic than Italian. But such rigidity need not have been extended to the affairs of everyday contact between the Vatican and the Italian authorities, wherein, indeed, a tacit *modus vivendi* was easily attainable. The failure of the conciliation movement left profound irritation between Vatican and Quirinal.

The internal situation inherited by Crispi from Depretis was very unsatisfactory. Extravagant expenditure, and the over-speculation in building and in industrial ventures, had combined to produce a state of affairs calling for firm and radical treatment. Crispi, burdened by the premiership and by the two most important portfolios in the cabinet, was unable to exercise efficient control over all departments of State. Nevertheless his administration was by no means unfruitful. Zanardelli, minister of justice, secured in June 1888 the adoption of a new penal code, and municipal franchise was reformed by granting what was practically manhood suffrage with residential qualification. The management of finance was scarcely satisfactory, for Giolitti, who had succeeded Magliani and Perazzi at the Treasury, lacked the fibre needed to deal with the huge deficit of nearly 250,000,000 lire in 1888-89, the existence of which both Perazzi and he had recognized. The most successful feature of Crispi's term of office was his strict maintenance of order and the suppression of Radical and Irredentist agitation. So vigorous was his treatment of Irredentism that he dismissed without warning his colleague Seismit Doda, minister of finance, for having failed to protest against Irredentist speeches delivered in his presence at Udine. The general election of 1890 gave the cabinet an almost unwieldy majority, comprising four-fifths of the Chamber. But an angry outburst of Crispi's against the Right in a debate on a financial bill, precipitated a division and placed the cabinet in a minority (Jan. 31, 1891). The incident brought about the resignation of Crispi. A few days later he was succeeded in the premiership by the marquis di Rudini, leader of the Right, who formed a coalition cabinet with Nicotera and a part of the Left.

The sudden fall of Crispi wrought a great change in the character of Italian relations with foreign powers. His policy had been characterized by cordiality towards Austria and Germany, an understanding with Great Britain, in regard to Mediterranean questions and an apparent animosity towards France. Crispi entertained in reality no *a priori* animosity towards France, but was strongly convinced that Italy must emancipate herself from the position of political dependence on her powerful neighbour which had vitiated the foreign policy of the Left. His ostentatious visit to Bismarck at Friedrichsruh, and a subsequent speech at Turin, in which he eulogized the personality of Bismarck, aroused against him a hostility on the part of the French which he was never afterwards able to allay. In such circumstances the negotiations for the new commercial treaty could but fail. The chief advantage derived by Italy from Crispi's foreign policy was the increase of confidence in her Government on the part of her allies and of Great Britain. Both Bismarck and Great Britain made it clear that if Italy were attacked by France she would not stand alone. With the instinct of a true statesman, Crispi felt the pulse of the people, divined their need for prestige, and their preference for a Government heavy-handed rather than lax. How great had been Crispi's power was seen by contrast with the policy of the Rudini

cabinet which succeeded him in Feb. 1891. Crispi's so-called "megalomania" gave place to retrenchment in home affairs and to a deferential attitude towards all foreign powers. Although inclined to be friendly to France, Rudini did not intend to let the triple alliance lapse on its expiry in May 1892, and in fact, accepting proposals from Berlin, he renewed it in June 1891 for a period of 12 years. On the other hand he assured Russia in Oct. 1891 of the entirely defensive nature of Italian engagements under the triple alliance. At the same time he carried to a successful conclusion negotiations begun by Crispi for the renewal of commercial treaties with Austria and Germany, and concluded with Great Britain conventions for the delimitation of British and Italian spheres of influence in north-east Africa. In home affairs his administration was weak and vacillating, nor did the economies effected in naval and military expenditure and in other departments suffice to strengthen the position of the cabinet. He was defeated in the Chamber on May 5 and obliged to resign. Giolitti, a Piedmontese deputy, sometime Treasury minister in the Crispi cabinet, was entrusted with the formation of a ministry of the Left, which contrived to obtain six months' supply on account, and dissolved the Chamber.

GIOLITTI

The ensuing general election held in Nov. 1892 marked by unprecedented violence and abuse of official pressure upon the electorate, fitly ushered in what proved to be one of the most unfortunate periods of Italian history since the completion of national unity. Early in 1893 a scandal arose in connection with the management of State banks, especially of the Banca Romana, whose managing director, Tanlongo, had issued 62,500,000 lire of duplicate bank-notes. Giolitti scarcely improved matters by creating Tanlongo a member of the senate, and by denying in parliament the existence of any mismanagement. In consequence of an interpellation in the Chamber, Giolitti was compelled to arrest Tanlongo and other prominent persons, and to sanction an investigation by a parliamentary commission of seven members, into the conditions of the banks of issue. On Nov. 23 the report of the commission was read in the Chamber. It established that the two preceding cabinets had been aware of the irregularities committed by Tanlongo; that Tanlongo had heavily subsidized the press; that a number of deputies, including several ex-ministers, had received from him loans of a considerable amount; that Giolitti had deceived the Chamber about the banks of issue and was open to suspicion of having, after the arrest of Tanlongo, abstracted a number of documents from the latter's papers before placing the remainder in the hands of the judicial authorities. In spite of the gravity of the charges formulated against many prominent men, the report merely "deplored" and "disapproved" of their conduct, without proposing penal proceedings. The report, however, sealed the fate of the Giolitti cabinet, and on Nov. 24 it resigned amid general execration.

Giolitti also exhibited incompetence in the conduct of foreign and home affairs. On Aug. 16 and 18, 1893, a number of Italian workmen were massacred at Aigues-Mortes. The French authorities, under whose eyes the massacre was perpetrated, did nothing to prevent or repress it. This occurrence provoked anti-French demonstrations in many parts of Italy. The Italian foreign minister Brin, accepted as satisfactory the anodyne measures adopted by the French Government, and Giolitti removed the prefect of Rome for not having prevented an expression of popular anger. In the following December the French tribunal at Angoulême acquitted all the authors of the massacre. At home Giolitti displayed the same weakness. Symptoms of unrest in Sicily found him, as usual, unprepared and vacillating. The closing of the French market to Sicilian produce, the devastation wrought by the phylloxera and the decrease of the sulphur trade had combined to produce in Sicily a discontent of which Socialist agitators took advantage to organize the workmen and the peasants into groups known as *fasci*. Here and there the movement was based upon a bastard socialism, in other places it was made a means of municipal party warfare under the guidance of the local mafia, and in some districts it was simply popular effervescence against the local octrois

on bread and flour. As early as Jan. 1893 a conflict had occurred between the police and the populace, in which several persons were killed, an occurrence used by the agitators further to inflame the populace. Instead of maintaining a firm policy, Giolitti allowed the movement to spread until, towards the autumn of 1893, he became alarmed and drafted troops into the island. At the moment of his fall the movement assumed the aspect of an insurrection. The return of Crispi to power (Dec. 10)—a return imposed by public opinion as that of the only man capable of dealing with the desperate situation—marked the turning-point of the crisis. The *fasci* were suppressed, a state of siege was proclaimed, and the whole movement crushed in a few weeks. A simultaneous insurrection at Massa-Carrara was crushed with similar vigour. Crispi's methods aroused great outcry in the Radical press, but the severe sentences of the military courts were in time tempered by the royal prerogative of amnesty.

The financial situation further inspired serious misgivings. The State banks, already hampered by maladministration, were encumbered by huge quantities of real estate and the deficit amounted to over 150,000,000 lire. Drastic measures were required to limit expenditure and to provide new sources of revenue. Baron Sonnino, the finance minister, applied, and subsequently amended, a bill passed by the previous administration (Aug. 10, 1893) for the creation of a supreme State bank, the Bank of Italy, which was entrusted with the liquidation of the insolvent Banca Romana. The new law forbade the State banks to lend money on real estate, limited their powers of discounting bills and securities, and reduced the maximum of their paper currency. Forced currency was given to the existing notes of the banks of Italy, Naples and Sicily, while special State notes were issued to meet immediate currency needs. Various measures were prepared for increasing revenue and introducing economies, while the income-tax upon consols was increased from 13% to 20%. These proposals met with opposition so fierce as to cause a cabinet crisis, but Sonnino, who resigned office as minister of finance, returned to power as minister of the Treasury, promulgated some of his proposals by royal decree, and in spite of vehement opposition secured the ratification by the Chamber. When the Crispi cabinet fell in March 1896, Sonnino had the satisfaction of seeing revenue increased by 85,000,000 lire, outgo fall by 90,000,000 lire, the gold premium reduced from 16 to 5%, consolidated stock at 95 instead of 72, and, notwithstanding the expenditure necessitated by the Abyssinian war, financial equilibrium practically restored.

While engaged in restoring order and in supporting Sonnino's courageous struggle against bankruptcy, Crispi became the object of fierce attacks from the Radicals, Socialists and anarchists. A series of anarchist outrages led the government to frame and parliament to adopt (July 11) a Public Safety Bill for the prevention of anarchist propaganda and crime. At the end of July the trial of the persons implicated in the Banca Romana scandal led to a series of charges against Crispi by Giolitti, and the Radical leader, Cavallotti, but they proved devoid of serious foundation, and Giolitti fled to Berlin to avoid arrest for libel. At the general election of May 1895, Crispi's Government obtained a majority of nearly 200 votes. Nevertheless public confidence in the efficacy of the parliamentary system and in the honesty of politicians was seriously diminished by these unsavoury occurrences, which, in combination with the acquittal of all the defendants in the Banca Romana trial, and the abandonment of the proceedings against Giolitti, reinforced to an alarming degree the propaganda of the revolutionary parties.

WAR IN AFRICA

Eritrea.—The foreign policy of the second Crispi administration was, as before, marked by a cordial interpretation of the triple alliance, and by close accord with Great Britain. Graver than any foreign question were the complications in Eritrea. Under the arrangement concluded in 1891 by Rudini, relations with Abyssinia had remained comparatively satisfactory. Towards the Sudan, however, the Mahdists, who had recovered from a defeat inflicted by an Italian force at Agordat in 1890, resumed operations in Dec. 1893. Col. Arimondi attacked and routed a Dervish force 10,000 strong on Dec. 21. The Italian troops,

mostly native levies, numbered only 2,200 men. Gen. Baratieri, the military governor, decided to execute a *coup de main* against the dervish base at Kassala. Concentrating a little army of 2,600 men, Baratieri surprised and captured Kassala on July 17, 1894, and garrisoned the place with native levies under Italian officers. Meanwhile Menelek, with the support of France and Russia, had completed his preparations for asserting his authority as independent ruler of Ethiopia. On May 11, 1893, he denounced the Treaty of Ucciali, but the Giolitti cabinet, absorbed by the bank scandals, paid no heed to his action, and Mangashà came to terms with Menelek. In Dec. 1894, a revolt broke out, but Major Toselli with a small force marched rapidly against the rebels under Bath-Agos, whom he routed and killed at Halai. Gen. Baratieri, crossing the Mareb, advanced to Adowa, but four days later was obliged to return northwards. Mangashà thereupon took the offensive and attempted to occupy the village of Koatit in Okulé-Kusai, but was forestalled and defeated by Baratieri on Jan. 13, 1895. Mangashà was obliged to abandon his camp to Baratieri, who also secured a quantity of correspondence establishing the complicity of Menelek and Mangashà in the revolt of Bath-Agos.

After obtaining the establishment of an apostolic prefecture in Eritrea under the charge of Italian Franciscans, Baratieri expelled from the colony the French Lazarist missionaries for their alleged complicity in the Bath-Agos insurrection, and in March 1895 undertook the conquest of Tigré. Adigrat, Makallè, Adowa and Axum, the holy city of Abyssinia, were occupied and garrisoned, and during the rainy season Baratieri returned to Italy, where he was received with unbounded enthusiasm. Early in September both Mangashà and Menelek showed signs of activity, and on Sept. 20 Makonnen, ras of Harrar, who had hitherto been regarded as a friend and quasi-ally by Italy, marched with 30,000 men to join the negus. On returning to Eritrea, Baratieri pushed forward columns under Major Toselli and Gen. Arimondi as far south as Amba Alagi. Mangashà fell back before the Italians, who obtained several minor successes; but on Dec. 6 Toselli's column, 2,000 strong, was almost annihilated by the Abyssinian vanguard of 40,000 men. Toselli and all but three officers and 300 men fell at their posts after a desperate resistance. Arimondi, collecting the survivors of the Toselli column, retreated to Makallè and Adigrat. At Makallè, however, he left a small garrison in the fort, which on Jan. 7, 1896, was invested by the Abyssinian army, and on Jan. 21 the garrison, under Major Galliano, who had heroically defended the position, were permitted to march out with the honours of war. Meanwhile Baratieri received reinforcements from Italy, but remained undecided as to the best plan of campaign. The Abyssinians were nearly 100,000 strong, mostly armed with rifles and well supplied with artillery, whereas the Italians, including camp followers, numbered less than 25,000 men.

Battle of Adowa.—Baratieri's futile tactics exasperated the home government, which on Feb. 22 despatched Gen. Baldissera, with strong reinforcements, to supersede him. Baratieri, anxious probably to obtain some success before the arrival of Baldissera, called a council of war (Feb. 29) and obtained the approval of the divisional commanders for a plan of attack. During the night the army advanced towards Adowa in three divisions, under Generals Dabormida, Arimondi and Albertone, each division being between 4,000 and 5,000 strong, and a brigade 5,300 strong under Gen. Ellena remaining in reserve. All the divisions, save that of Albertone, consisted chiefly of Italian troops. Owing to a mistake concerning the topography of the country, the various units were attacked separately by overwhelming forces, and the battle—or rather, series of distinct engagements—ended in a general rout. The Italians lost 4,600 white troops and nearly 3,000 native soldiers killed and wounded, while between 2,500 and 3,000 prisoners were taken by the Abyssinians, including Gen. Albertone. Generals Arimondi and Dabormida were killed and Gen. Ellena wounded. While the Abyssinians owned to a loss of over 3,000 men, it is certain that this figure must have been greatly exceeded, some writers placing it as high as 17,000. Baratieri reached Adi-Cajè before the débris of his army. Thence he despatched telegrams to Italy throwing blame for the defeat upon his troops, a proceeding which subsequent evidence proved to be as unjustifiable as it was

unsoldierlike. He was placed under court-martial and the sentence "deplored that in such difficult circumstances the command should have been given to a general so inferior to the exigencies of the situation."

In Italy the news of the defeat of Adowa caused deep discouragement and dismay. On March 5 the Crispi cabinet resigned before an outburst of indignation which the Opposition had assiduously fomented, and five days later a new cabinet was formed by Gen. Ricotti-Magnani, who, however, made over the premiership to the marquis di Rudini. The latter, though leader of the Right, had long been intriguing with Cavallotti, leader of the Extreme Left, to overthrow Crispi. The first act of the new cabinet was to confirm instructions given by its predecessor to Gen. Baldissera (who had succeeded Gen. Baratieri on March 2) to treat for peace with Menelek if he thought desirable. Baldissera opened negotiations with the negus through Major Salsa, and simultaneously reorganized the Italian forces. The negotiations having failed, he conducted successful operations against the dervishes and the Abyssinians, and despatched Major Nerazzini to the negus to arrange terms of peace. On Oct. 26 a provisional treaty was concluded at Addis Ababa annulling the Treaty of Ucciali; recognizing the complete independence of Ethiopia; postponing for one year the definitive delimitation of the Italo-Abyssinian boundary, but allowing the Italians meanwhile to hold the strong Mareb-Belesa-Muna line; and arranging for the release of the Italian prisoners after ratification of the treaty in exchange for an indemnity of which the amount was to be fixed by the Italian government. The treaty having been duly ratified, and an indemnity of 10,000,000 lire paid to Menelek, the Shoan prisoners were freed. Rudini, in order to satisfy the demands of his Radical supporters, was prepared to withdraw to Massawa, but the fall of his cabinet in June 1898, enabled Ferdinando Martini and Captain Ciccodicola, who had been appointed respectively civil governor of Eritrea and minister resident at Addis Ababa, to secure Seraè and Okulé-Kusai, and the Mareb-Belesa-Muna frontier. Eritrea remained approximately the same as before the revolt of Bath-Agos, except in regard to Kassala, which was transferred to the Anglo-Egyptian authorities on Dec. 25, 1897, in pursuance of a previous Anglo-Italian convention. Under Ferdinando Martini's able administration (1898-1906) the cost of the colony to Italy was reduced and its trade and agriculture vastly improved. (See also *ABYSSINIA: History*, and *ERITREA*.)

Fortunately, for Italy, the marquis Visconti-Venosta consented to assume the portfolio of foreign affairs, which had been resigned to Duke Caetani di Sermoneta, and again to place, after an interval of 20 years, his unrivalled experience at the service of his country. In Sept. 1896 he concluded with France a treaty with regard to Tunisia. During the Greco-Turkish war of 1897 Visconti-Venosta laboured to maintain the European concert, joined Great Britain in preserving Greece from the worst consequences of her folly, and lent moral and material aid in establishing an autonomous government in Crete.

Home Politics.—The home administration of the Rudini cabinet compared unfavourably with that of foreign affairs. Bound by a secret understanding with the Radical leader Cavallotti, Rudini was compelled to bow to Radical exigencies. He threw all the influence of the Government against Crispi, who was charged with complicity in embezzlements perpetrated by Favilla, managing director of the Bologna branch of the Bank of Naples. After being subjected to persecution for nearly two years, Crispi's character was substantially vindicated. Pressed by Cavallotti, Rudini in March 1897 dissolved the Chamber and conducted the general election in such a way as to crush by Government pressure the partisans of Crispi, and greatly to strengthen the (Socialist, Republican and Radical) revolutionary Parties. The effect was seen in May 1898, when, in consequence of a rise in the price of bread, disturbances occurred in southern Italy. At Faenza, Piacenza, Cremona, Pavia and Milan, where subversive associations were stronger, the movement assumed the complexion of a political revolt. During May 7-9 Milan remained practically in the hands of the mob. In view of these occurrences, Rudini authorized the proclamation of martial law at Milan, Florence,

Leghorn and Naples, delegating the suppression of disorder to special military commissioners. By these means order was restored, though not without considerable loss of life at Milan and elsewhere. As in 1894, excessively severe sentences were passed by the military tribunals, but successive royal amnesties obliterated these condemnations within three years.

The Rudini ministry underwent several metamorphoses, and fell for the fourth and last time on June 18, 1898, on account of public indignation at the result of Rudini's home policy as exemplified in the May riots. On June 29 Rudini was succeeded in the premiership by Gen. Luigi Pelloux. The Pelloux cabinet presented its predecessor's Public Safety Bill to parliament in Nov. 1898, but it was violently obstructed by the Socialists, Radicals and Republicans of the Extreme Left. In view of this obstruction, an effort was made to reform the standing orders of the Lower House, but parliamentary feeling ran so high that Gen. Pelloux thought it expedient to appeal to the country.

Accession of Victor Emmanuel III.—The general election of June 1900 largely increased the strength of the extreme parties, who in the new Chamber numbered nearly 100 out of a total of 508. Gen. Pelloux therefore resigned, and on June 24 a moderate Liberal cabinet was formed by the aged Saracco, president of the senate. Within five weeks of its formation King Humbert was shot by an anarchist assassin named Bresci, at Monza (July 29, 1900). His death caused an outburst of profound sorrow and indignation. Though not a great monarch, King Humbert had, by his unfailing generosity and personal courage, won the esteem and affection of his people. More than 2,500,000 lire of his civil list was yearly given for charitable purposes. Humbert was succeeded by his only son, Victor Emmanuel III. (b. Nov. 11, 1869), a liberal-minded and well-educated prince.

Foreign Affairs.—Admiral Canevaro, who had gained distinction as commander of the international forces in Crete (1896-98), assumed the direction of foreign affairs in the first period of the Pelloux administration. His diplomacy, though energetic, lacked steadiness. Soon after taking office, he completed the negotiations begun by the Rudini administration for a new commercial treaty with France (Oct. 1898), after a breach which had lasted for more than ten years. By the despatch of a squadron to South America he obtained satisfaction for injuries inflicted 13 years previously upon an Italian subject by the United States of Colombia. Supported by Great Britain and Germany, he succeeded in preventing the invitation of a papal delegate to the Hague Peace Conference. Shortly afterwards his term of office was brought to a close by the failure of an attempt to secure for Italy a coaling station at Sanmun and a sphere of influence in China. Under his successor, the Marquis Visconti-Venosta, an Italian expedition, 2,000 strong, was despatched to China to aid in repressing the Chinese outbreak and in protecting Italian interests in the Far East (July 1900). With characteristic foresight, Visconti-Venosta promoted an exchange of views between Italy and France on the Tripolitan hinterland. Similarly, he exchanged notes with Austria with a view to the prevention of any misunderstanding of Italian and Austrian interests in Albania. Upon the fall of the Saracco cabinet (Feb. 9, 1901) Visconti-Venosta was succeeded at the Foreign Office by Prinetti. The outset of his administration was marked by Franco-Italian fêtes at Toulon (April 10-14, 1901), and by the despatch of three Italian warships to Prevesa to obtain satisfaction for damage done to Italian subjects by Turkish officials.

The Saracco administration was overthrown in Feb. 1901 in consequence of its vacillating conduct towards a dock strike at Genoa. It was succeeded by a Zanardelli cabinet, in which the portfolio of the Interior was allotted to Giolitti. Composed mainly of elements drawn from the Left, and dependent for a majority upon the support of the subversive groups of the Extreme Left, the formation of this cabinet gave the signal for a vast working-class movement, during which the Socialist Party sought to extend its political influence by means of strikes and the organization of labour leagues among agricultural labourers and artisans. During the first six months of 1901 the strikes numbered 600, and involved more than 1,000,000 workmen. (X.)

1902-1914

Industrial Unrest, 1902-07.—The strikes and other economic agitations at this time may be divided roughly into three groups: strikes in industrial centres for higher wages, shorter hours and better labour conditions generally; strikes of agricultural labourers in northern Italy for better contracts with the landlords; disturbances among the south Italian peasantry due to low wages, unemployment (particularly in Apulia), and the claims of the labourers to public land occupied illegally by the landlords, combined with local feuds and the struggle for power of the various influential families. The prime cause in most cases was the unsatisfactory economic condition of the working classes. Unfortunately these genuine grievances were taken advantage of by the Socialists for their own purposes, and strikes and disorders, in which the dregs of the population took part, were sometimes promoted without cause, and conciliation impeded by outsiders who acted from motives of personal ambition or profit. The most serious movement at this time was that of the railway servants. On Jan. 4, 1902, the employees of the Mediterranean railway advanced demands for greater fixity of tenure, more regular promotion and the recognition of their union by the companies. By the beginning of February the Government was faced by the possibility of a strike which would paralyse the whole economic life of the country. Then the Turin gas men struck, and a general sympathetic strike broke out in that city, resulting in scenes of violence lasting two days. The Government called out all the railwaymen who were army reservists, but continued to keep them at their railway work. At the same time it mediated between the companies and the employees, and in June a settlement was formally concluded.

The Socialist Party, which had grown powerful under a series of weak-kneed administrations, now began to show signs of division; the revolutionary wing, led by Enrico Ferri, the Mantuan deputy, advocating a policy of uncompromising class warfare, the *reformisti*, or moderate Socialists, led by Filippo Turati, deputy for Milan, adopting a more conciliatory attitude. Later another extreme wing was formed, constituted by the *sindicalisti*, who were opposed to all legislative parliamentary action and favoured only direct revolutionary propaganda. Strikes broke out in the district of Copparo, in the Polesine, and in Apulia, and later among the Genoa dockers, the Florence iron-workers and the Como textile workers.

In Sept. 1904 a very serious situation arose. There were disturbances at Buggeru in Sardinia, at Castelluzzo in Sicily, and at Sestri Ponente, all of them accompanied by loss of life. The Monza labour exchange then took the initiative of proclaiming a general strike throughout Italy (Sept. 15) as a protest against the Government for daring to maintain order. The strike spread to nearly all the industrial centres. At Milan it was more serious, as the movement was controlled by the extremists under Arturo Labriola; the strikers committed many acts of savage violence, especially against those workmen who refused to strike, and much property was wilfully destroyed. Riots broke out also in Genoa, Venice, Naples, Florence, Rome and Bologna. The deputies of the Extreme Left demanded an immediate convocation of parliament in order that they might present a bill forbidding the troops and police to use their arms in all conflicts between capital and labour, whatever the provocation might be. This movement caused a feeling of reaction against Socialism; for, however much sympathy there might be with the genuine grievances of the working classes, the September strikes were of a frankly revolutionary character.

Early in 1905 there was a fresh agitation among the railway servants, who were dissatisfied with the clauses concerning the personnel in the bill for the purchase of the lines by the State. They initiated a system of obstruction which hampered and delayed the traffic without altogether suspending it. On April 17 a general railway strike was ordered by the union, but owing to the action of the authorities, who for once showed energy, the traffic was carried on. The extreme parties now began to direct especial attention to propaganda in the army, with a view to destroying its cohesion and thus paralysing the action of the Government. Fortunately, however, this policy was not successful. No mutinies

occurred, except a few trifling disturbances among reservists unexpectedly called back to the colours.

In June and July, 1907, there were again disturbances among the agricultural labourers of Ferrara and Rovigo, and a widespread strike organized by the *leghe* throughout those provinces caused very serious losses to all concerned. The *leghisti*, moreover, were guilty of much criminal violence; they committed one murder and established a veritable reign of terror, boycotting, beating and wounding numbers of peaceful labourers who would not join the unions, and brutally maltreating isolated policemen and soldiers. The authorities, however, by arresting a number of the more prominent leaders, succeeded in restoring order. Almost immediately afterwards another agitation broke out in various towns under the guise of anti-clericalism, in consequence of scandals, real or alleged, in certain convent schools. Unoffending priests were attacked, and even Cardinal Merry del Val was assaulted at Marino. The Socialists and the freemasons were largely responsible for the disorders.

In Oct. 1907 there was again a general strike at Milan and other cities which was rendered more serious on account of the action of the railway servants; traffic was disorganized over a large part of northern Italy, until the Government, being now owner of the railways, dismissed the ringleaders from the service. In the spring of 1908 there were serious agrarian strikes in the province of Parma, and although they ended in June with the defeat of the strikers, a vast amount of damage had been done. The failure of the strike caused the Socialists to quarrel among themselves and to accuse each other, not without reason, of dishonesty in the management of party funds. The spirit of indiscipline had begun to reach the lower classes of state employees, especially the school teachers and the postal and telegraph clerks. Fortunately, however, the Government nipped the agitation in the bud by dismissing the ringleader, Dr. Campanozzi, while attempting to redress some of the genuine grievances.

Internal Politics, 1902-09.—In parliamentary politics the most notable event in 1902 was the presentation of a divorce bill by Zanardelli's Government; this was done not because there was any real demand for it, but to please the doctrinaire anti-clericals and freemasons. But the agitation against the measure was so strong that the ministry decided to drop the bill. The financial situation continued satisfactory; a new loan at 3½% was voted by the Chamber in April 1902, and by June the whole of it had been placed in Italy. In October the rate of exchange was at par, the premium on gold had disappeared, and by the end of the year the budget showed a surplus of sixteen millions.

In Oct. 1903 Zanardelli, the premier, resigned on account of his health, and the king entrusted the formation of the cabinet to Giolitti. The new administration included Tittoni, the prefect of Naples, as foreign minister, and Luigi Luzzatti, the eminent financier, at the Treasury. Almost immediately after his appointment Tittoni accompanied the king and queen of Italy on a state visit to France and then to England, where various international questions were discussed, and the cordial reception which the royal pair met with in London and at Windsor served to dispel the small cloud which had arisen in the relations of the two countries on account of the Tripoli agreements and the language question in Malta. The weakness of the Government in dealing with the strike riots caused a feeling of profound dissatisfaction, and the so-called "experiment of liberty," conducted with the object of conciliating the extreme parties, proved a failure. In Oct. 1904, after the September strikes, the Chamber was dissolved, and at the general elections in November a ministerial majority was returned, while the deputies of the Extreme Left (Socialists, Republicans and Radicals) were reduced from 107 to 94, and a few mild Clericals elected. In spite of its majority, the Giolitti cabinet, realizing that it had lost its hold over the country, resigned in March 1905.

A cabinet was formed by Fortis, Tittoni remaining as foreign minister. A colourless administration, its most important measure was the bill for the purchase of the railways, which was voted in June 1905. Dissatisfaction caused by the *modus vivendi* with Spain, which would have wrought much injury to the Italian wine-

growers, led to demonstrations and riots, and a hostile vote in the Chamber (Dec. 17, 1905) compelled Fortis to reconstruct the ministry, the marquis di San Giuliano accepting the portfolio of foreign affairs. Even this cabinet was still-born, and a hostile vote in the Chamber on Jan. 30, 1906 brought about its fall.

Now at last, after waiting so long, Sonnino's hour had struck, and he became premier for the first time. This result was most satisfactory to all the best elements in the country, and great hopes were entertained that the advent of a rigid and honest statesman would usher in a new era of Italian parliamentary life. Unfortunately the composition of the new cabinet proved disappointing; for while such men as Guicciardini, the minister for foreign affairs, and Luzzatti, at the Treasury, commanded general approval, the choice of Sacchi as minister of justice and of Pantano as minister of agriculture and trade, both of them militant Radicals, savoured of an unholy compact between the premier and his erstwhile bitter enemies. For this combination Sonnino himself was not altogether to blame; having lost many of his most faithful followers, who, weary of waiting for office, had gone over to the enemy, he had been forced to seek support elsewhere, and thus secure at least the neutrality of the Extreme Left. The new premier's first act was to suppress all subsidies to journalists, and although this resulted in bitter attacks against him in the columns of the "reptile press" it commanded the approval of all right-thinking men. The Socialist motion in the Chamber for the immediate discussion of a bill to prevent "the massacres of the proletariat" having been rejected by an enormous majority, the 28 Socialist deputies resigned their seats; on presenting themselves for re-election their number was reduced to 25. A few days later the ministry, having received an adverse vote on a question of procedure, sent in its resignation (May 17), and Giolitti returned to power.

The change of government brought Tittoni back to the Foreign Office. The new ministry began auspiciously with the conversion of the public debt from 4% to 3½%, to be eventually reduced to 3¼%. This operation had been prepared by Luzzatti under Sonnino's leadership, and although carried out by Maiorana it was Luzzatti who deservedly reaped the honour and glory. The surplus for the year amounted to 65,000,000 lire. In November Pietro Bertolini became minister of public works; his acceptance of office under Giolitti marked a further step in the *dégringolade* of Sonnino's party, to which Bertolini had belonged. Gen. Viganò was succeeded in December by Senator Casana, the first civilian to become minister of war in Italy; the experiment of a civilian "War Lord" was not a complete success, and in April 1909 Casana retired and was succeeded by Gen. Spingardi.

Meanwhile the relations between Church and State began to show signs of change. The chief supporters of the claims of the papacy to temporal power were the clericals of France and Austria, but in the former country they had lost influence. With the rebellion of her "Eldest Daughter," the Church of Rome began to realize the folly of placing every Italian in the dilemma of being either a good Italian or a good Catholic, when the majority wished to be both. Outside Rome, relations between the clergy and the authorities were already quite cordial. In July 1903 Leo XIII. died, and Cardinal Sarto became pope under the style of Pius X. The new pope was distinctly less insistent in his claims to temporal power. At the elections for the local bodies the Catholics had already been permitted to vote, and the encyclical of June 11, 1905, practically abolished the *non expedit*. In September of that year a number of religious institutions in the Near East, formerly under the protectorate of the French Government, in view of the rupture between Church and State in France now asked to be placed under Italian protection, which was granted in Jan. 1907. Giolitti wished to conciliate the Vatican by facilitating religious education, which was desired by the majority of parents, but without offending the freemasons and other anti-clericals too much. Consequently the minister of education, Rava, elaborated a scheme based on compromise which, it was hoped, would please everyone; but in practice it did not work satisfactorily. At the general elections of March 1909, over a score of Clerical deputies were returned, men of a very mild tone who did not trouble

about the temporal power and were supporters of the monarchy and anti-Socialists; where no Clerical candidate was in the field the Catholic voters plumped for the constitutional candidate against all representatives of the Extreme Left. At 5 A.M. on Dec. 28, 1908, an earthquake of appalling severity shook the whole of southern Calabria and the eastern part of Sicily, completely destroying the cities of Reggio and Messina, the smaller towns of Canitello, Scilla, Villa San Giovanni, Bagnara, Palmi, Melito, Porto Salvo and Santa Eufemia, as well as a large number of villages. At Messina the horror of the situation was heightened by a tidal wave; the number of persons killed was approximately 150,000, while the injured were beyond calculation.

Foreign Affairs, 1902-09.—In the field of foreign affairs Franco-Italian friendship was officially cemented by the visit of King Victor Emmanuel and Queen Elena in Oct. 1903 to Paris, where they received a very cordial welcome. The visit was returned in April 1904 when M. Loubet, the French president, came to Rome; this action was strongly resented by the pope, who, like his predecessor since 1870, objected to the presence of foreign Catholic rulers in Rome, and led to the final rupture between France and the Vatican. The Franco-Italian understanding had the effect of raising Italy's credit, and also served to clear up the situation in Tripolitania, which was recognized as coming within the Italian "sphere of influence."

The triple alliance was maintained and renewed in June 1902 for 12 years, but public opinion was no longer so favourably disposed towards it. Austria's petty persecutions of her Italian subjects in the *irredente* provinces, her support of the anti-Italian Slav elements on the Adriatic littoral, her active propaganda incompatible with Italian interests in the Balkans, and the anti-Italian war talk of Austrian military circles, imperilled the relations of the two allies. One of the causes of ill-feeling was the university question; the Austrian Government had persistently refused to create an Italian university for its Italian subjects. An attempt at compromise resulted in the institution of the Italian law faculty at Innsbruck, but this aroused the violent hostility of the German students and populace, who indulged in an unprovoked attack on the Italians, in Oct. 1902. Further acts of violence were committed by the Germans in 1903, which led to anti-Austrian demonstrations in Italy. Anti-Italian demonstrations occurred periodically also at Vienna and in Dalmatia. But the most serious point at issue was the Balkan question. Italian public opinion could not view without serious misgivings the active political propaganda which Austria was conducting in Albania. The two Governments frequently discussed the situation, but although they had agreed to a self-denying ordinance whereby each bound itself not to occupy any part of Albanian territory, Austria's declarations and promises were hardly borne out by the activity of her agents in the Balkans. Italy, therefore, instituted a counter-propaganda by means of schools and commercial agencies. The Macedonian troubles of 1903 again brought Austria and Italy into conflict. Acceptance by the Powers of the Mürzsteg reform programme and appointment of Austrian and Russian financial agents in Macedonia was an advantage for Austria and a set-back for Italy; but the latter scored a success in the appointment of Gen. De Giorgis as commander of the international Macedonian gendarmerie.

In Oct. 1908 came the bombshell of the Austrian annexation of Bosnia. The news caused the most widespread sensation, and public opinion in Italy was greatly agitated; Tittoni, however, in a speech at Carate Brianza (Oct. 6) declared that "Italy might await events with serenity, and that these could find her neither unprepared nor isolated," and his words were taken to mean that Italy would receive compensation to restore the balance of power upset in Austria's favour. When it was found that there was to be no direct compensation for Italy, a storm of indignation was aroused against Austria, and also against Tittoni.

With the abandonment by Austria of her military posts in the sandjak of Novipazar (Oct. 29) the danger of a "pacific penetration" of Macedonia became more remote. Austria also renounced her right to police the Montenegrin coast and to prevent Montenegro from having warships of its own in a note presented to the

Italian Foreign Office on April 12, 1909. Italy had developed some important commercial interests in Montenegro, and anything which strengthened the position of that principality was a guarantee against further Austrian encroachments. The harbour works of the Montenegrin port of Antivari, commenced in March 1905 and completed early in 1909, were an Italian concern. But the whole episode was a warning to Italy, and the result was a national movement for security. Credits for the army and navy were voted almost without a dissentient voice; new battleships were laid down, the strength of the army was increased, and the defences of the exposed eastern border were strengthened.

Sonnino and Luzzatti.—On Dec. 2, 1909, the cabinet was defeated on a point of procedure, but really by Sonnino's attacks on its Shipping Subsidies Bill, and resigned. Baron Sonnino was consequently called upon to form a cabinet, which comprised Guicciardini (foreign minister), Salandra (Treasury), and Luzzatti (agriculture). But although it enjoyed wide popular support, the cabinet had no stable majority in the Chamber, and was defeated over a new shipping bill on March 21, 1910, and resigned. Luzzatti now formed a cabinet, with the marquis di San Giuliano at the Foreign Office, Tedesco, Facta, Credaro and Sacchi in other departments. The cabinet only held office on sufferance until Giolitti saw fit to return to power, and it showed great feebleness in dealing with the agrarian strikes of the Romagna, and other internal troubles. On Dec. 21, 1910, there was a division over the extension of the franchise bill, and although the cabinet secured a majority, the Radical ministers, Credaro and Sacchi, resigned. The whole cabinet followed suit on March 18, 1911, and Giolitti was again sent for.

The Turkish War.—During the previous few years relations with Turkey had become strained owing to the restrictions placed by the Porte on Italian enterprise in Tripoli, the only part of North Africa where Italian expansion was still possible. At the same time the policy of Germany aroused the suspicion that she was contemplating action in that province. The Nationalist movement, created at the Florence congress of 1910, and directed towards awakening the country to the necessity of a more vigorous foreign policy, advocated the occupation of Tripoli. The strength of the movement was such that Giolitti himself, anxious as he was to avoid foreign complications, could not afford to disregard it.

After a series of diplomatic incidents, an ultimatum was presented to Turkey on Sept. 28, 1911, and no satisfactory answer being obtained, war was declared on the 29th. Except for the Socialists, public opinion strongly supported the Government. On Nov. 5 Italian sovereignty was extended to Tripolitania and Cyrenaica. The foreign Powers were unfriendly to Italy's African policy, and while Austria placed a veto on the extension of the campaign to the Balkans, a serious diplomatic incident arose with France over the searching by Italian cruisers of the French steamers "Carthage" and "Manouba," suspected of carrying contraband. On Oct. 15, 1912, the peace preliminaries were signed at Ouchy, and the treaty on the 18th, the sultan retaining only spiritual authority over the inhabitants of the annexed territories, while Italy was to remain in occupation of Rhodes and the Dodecanese until Turkey had withdrawn all her troops from Libya and fulfilled her other treaty undertakings.

Giolitti's proposals for the extension of the franchise (raising the electorate from three to eight million voters), payment of members, and a Government monopoly of life insurance, although not wanted by any strong section of public opinion, were voted without much opposition, as parliament did not wish to embarrass the cabinet during the war. At the Socialist congress of Reggio Emilia (June 1912) a group of leaders, including Leonida Bissolati and Ivanoe Bonomi, who approved of the Government's African policy, were expelled from the party and formed a new group called the Reformist Socialists, prepared to collaborate with the constitutional parties. The majority styled itself thenceforth the "Official" Socialist Party. In the field of labour there were strikes at the Fiat works in Turin, and among the agricultural workers of Ferrara and a general strike at Milan in the summer of 1913.

At the elections of Oct. 26–Nov. 2, 1913, under the extended

franchise, the Socialist group was increased to 79. For the first time a Catholic Party presented itself to the polls, the pope having withdrawn the *non expedit*, and 33 Catholics were returned, while a number of Liberals and Democrats owed their success to Catholic support. Giolitti's position was somewhat shaken, owing to disagreement among his own followers over the question of Catholic support, and the threatened railway strike. On March 10, 1914, he resigned and was succeeded by Antonio Salandra, a Right-wing Liberal of high standing. San Giuliano remained at the Foreign Office, but Spingardi was succeeded as war minister by Gen. Grandi. The revolutionary *Sindacato ferroviari* demanded a general increase of wages, but, owing to financial difficulties, the Government could offer an increase only to the lowest categories; the *Sindacato* threatened a strike, but eventually gave way.

On the national festival of the Statuto (June 7, 1914) riots broke out at Ancona because the authorities had forbidden the holding of an anti-militarist meeting. A general strike ensued in the town and the trouble spread to other parts of the March, to Romagna, and most of the larger cities. The movement was of a mainly revolutionary character; its leader was the anarchist Enrico Malatesta, and Benito Mussolini (*q.v.*), editor of the *Avanti*, played a prominent part in it. For a week many towns were under mob rule, until a popular reaction led by the Nationalists cleared the streets of the seditious elements and the troops and police restored order.

THE WORLD WAR

The Austrian ultimatum was presented to Serbia on July 23, 1914. Italy co-operated with Great Britain in trying to avert a catastrophe, and public opinion, although realizing that if a *casus foederis* under the terms of the triple alliance were to arise, Italy would be bound to stand by her allies, was hostile to the idea of siding with Austria. General relief was caused by Italy's declaration of neutrality on Aug. 3 which was based on (1) Austria's failure to co-operate with Italy before taking action, (2) the fact that Italy had not been given time to act in favour of peace, or to make adequate military preparations and (3) the fact that Italy was not bound by the terms of the alliance to take part in an aggressive policy. It was afterwards announced that no *casus foederis* could arise for Italy in a conflict in which Great Britain was involved.¹

The question now was whether Italy should remain neutral to the end of the war. The Triplicists, although fairly numerous in Conservative and diplomatic circles, and in a part of the army, hardly went so far as to advocate intervention on the side of the Central Powers, for the invasion of Belgium had created a very unfavourable impression, but they advocated neutrality. The Catholics were neutralists from dislike of "atheist" France and Orthodox Russia and from sympathy with Catholic Austria. The "Official" Socialists were neutralists because they opposed all war except class-war. The Nationalists, Irredentists and some Liberals, realizing that this was the last chance for completing Italian unity and affirming Italy's position as a Great Power, favoured intervention, while the Democrats, Freemasons, Republicans and Reformist Socialists were interventionists from sympathy with France. Mussolini's little group of Syndicalists desired intervention, partly for the same reason as the Nationalists, but also in the hope that war would promote social changes. Mussolini resigned the editorship of the *Avanti* and founded a new paper, *Il Popolo d'Italia*, which supported intervention.

On Oct. 16, 1914, the marquis di San Giuliano died, and the prime minister temporarily took over the Foreign Office. On Oct. 31 the Treasury minister, Rubini, resigned on a question concerning the supply of funds for the army, and the cabinet followed suit. But Salandra himself reconstructed it by Nov. 5, and selected Sonnino as foreign minister. Owing to the troubles in Albania, the departure of Prince William of Wied and the Greek invasion of the southern districts, Italy occupied the islet of Saseno on Oct. 31, and on Dec. 26 the town and harbour of Valona. 1915 began with a serious earthquake in the Abruzzi (Jan. 13), which caused the death of 30,000 people.

¹The treaty of 1882 stated that "the treaty was not in any case directed against England."

The Treaty of London.—Meanwhile the interventionist tendency grew stronger. Both Salandra and Sonnino were determined not to let the war end without trying to acquire at least a part of the Italian districts of Austria, and to secure a rectification of the frontiers of 1866 which left Italy open to invasion. In Dec. 1914 Italy had reminded Austria that the invasion of Serbia, by tending to destroy the balance of power in the Balkans, gave Italy a right to compensation under the terms of Article 7 of the alliance as renewed in 1887. Sonnino demanded all the Trentino, the Isonzo valley, some of the Dalmatian islands, a free hand in Albania and the formation of Trieste and north-western Istria into an independent state, Italy in return to remain neutral to the end of the war. As Austria continued to give evasive replies, Italy opened negotiations with the Entente. On April 26, 1915, the Treaty of London was concluded between Italy, Britain, France and Russia, to be completed by naval and military conventions. Italy undertook to intervene, and was promised the Trentino and the Upper Adige valley to the Brenner pass, Trieste, Gorizia-Gradisca, Istria and the Quarnero islands of Cherso and Lussin, Dalmatia to Cape Planka, Valona, full possession of Rhodes and the Dodecanese, and in Asia Minor a zone of influence and eventually a share in its partition. If an independent Albania were created, it would be under Italian control, while Italy would not oppose the cession of the northern and southern districts to Serbia and Greece if the other signatories so desired.

The poet D'Annunzio by his fiery speeches, and Mussolini by his articles, largely influenced public opinion in favour of intervention. On May 3, 1915, Italy denounced the alliance with Austria, but Prince von Bülow made a last effort to secure Italian neutrality through Giolitti, who, although informed by Salandra of Italy's engagements with the Entente, continued his neutralist activities. Salandra, knowing that if Giolitti declared his opposition, the cabinet must fall, resigned on May 13. But at once huge popular demonstrations in favour of Salandra and intervention were held all over Italy, and the king refused Salandra's resignation; Austria's final offer, no improvement on the last, was rejected.

UNITY WITH THE ALLIES

Italy Enters the War.—On May 20, 1915, the Chamber and the Senate granted the Government full powers. On the 23rd the general mobilization was ordered, and on the 24th war against Austria was declared, while diplomatic relations with Germany were broken off. Owing to the persecution of Italian subjects in Turkey and Turkish assistance to the rebels in Libya, war was declared against the Porte on Aug. 21, and against Bulgaria in September. On Dec. 1 Sonnino adhered to the London Agreement, undertaking not to conclude a separate peace. An expeditionary force was sent to Albania, where it saved the remnants of the Serbian army driven from its own country.

The initial successes of the Italian offensive were satisfactory, but did not lead to definite results. The subsequent defeats sustained in the Trentino and on the Asiago plateau (May 1916) shook the cabinet's position, and on June 10 Salandra resigned. Paolo Boselli, the veteran statesman, respected by all parties, formed a cabinet in which all shades of opinion, except the Socialists and Neutralists, were represented. Sonnino remained at the Foreign Office, while Orlando was transferred from the Ministry of Justice to that of the Interior.

On Aug. 4, 1916, after 11 days' desperate fighting, Gen. Cadorna's forces captured Gorizia. On Aug. 27 Italy declared war on Germany, owing to the assistance she had afforded to Austria and the seizure of Italian property by the Imperial Government. In April 1917, the British, Italian and French premiers concluded a convention at St. Jean de Maurienne whereby it was agreed that in a future partition of Anatolia the Smyrna area was to be assigned to Italy.

During the operations of 1916 and 1917 the Italians achieved some important successes, and above all pinned down Austria's best troops, preventing her from sending reinforcements to the West. But the protracted struggle, the fearful losses, the collapse of Russia, and the grave privations at home had accentuated the feeling of depression in Italy, to which enemy and neutralist prop-

aganda contributed. The Socialists fomented the discontent. Claudio Treves's phrase, "next winter not a man in the trenches," the German peace offensive, the pope's allusion to "the useless carnage" and the defeatist campaign of the Giolittians began to affect public opinion and the war-weary troops. There were revolutionary riots in Turin (Aug. 1917) and signs of a diminished military spirit among certain units at the front. Cadorna had repeatedly warned the Government, and particularly the minister of the interior, Orlando, but no attention was paid to him. This state of affairs and certain military errors of Generals Cadorna, Capello, Badoglio and others resulted in the disaster of Caporetto (*q.v.*) (Oct. 23, 1917).

In spite of this serious defeat, by Nov. 22 the army had reconstituted its front on the Asiago-Grappa-Piave line, and the enemy's advance was definitely held up. British and French forces hurried to assist Italy, but did not come into action till December. Cadorna was relieved of his command and succeeded by Gen. Diaz. The Boselli cabinet resigned (Oct. 26) and on the 30th, Orlando succeeded as premier, while Sonnino remained at the Foreign Office and Nitti became Treasury minister. The army was rapidly reorganized and the losses in material made good through the enterprise of the Italian manufacturers and the technical genius of Gen. Dallolio, minister of munitions.

On Jan. 8, 1918, President Wilson published his famous Fourteen Points (*q.v.*). Those referring to Italy—"the rectification of the Italian frontiers on clearly recognized national lines," and "autonomy" for the peoples of Austria-Hungary—were of a nature to raise anxiety as to his intentions. From April 8 to 10 the congress of nationalities oppressed by Austria met in Rome, and although organized by a private committee, its delegates were received by Orlando, to whom they presented the so-called "Pact of Rome." This should have been an earnest of mutual good-will between Italy and the Yugoslavs, but it had no binding force and compromised the solution of the territorial problems involved. Meanwhile the Yugoslavs were conducting a propaganda to induce Britain and France to rescind the objectionable clauses of the London Treaty, and even proposed that, should Italy remain obdurate, the Allies and America should cut off her supplies of food and fuel, a request which was rejected. The economic situation was becoming worse, and Italy suffered restrictions and privations greater than those of any other Allied country.

In June, 1918, the Austrians launched an offensive on the Asiago-Piave front, but were driven back with heavy losses. The Italian contingent in Macedonia, commanded by Gen. Mombelli, contributed materially to the victory in the Balkans (Sept. 15-29). On Oct. 24, Diaz delivered his attack on the Austrians from Asiago to the sea, and by Nov. 3 "what had been one of the most powerful armies in the world," as the victory communiqué stated, "was annihilated." Some 600,000 prisoners, 7,000 guns and immense quantities of material were captured. The same day at Villa Giusti near Padua the armistice between the Italian and Austro-Hungarian armies was signed. The armistice came into force on Nov. 4, followed a week later by that with Germany. The whole area within the armistice line was rapidly occupied, as well as certain points beyond it for the maintenance of order. Italy's losses had amounted to well over 600,000 killed and a million seriously wounded, including 220,000 permanently disabled.

THE POST-WAR PERIOD

The Peace Conference.—On Feb. 7, 1919, the Italian Government presented a memorandum to the Peace conference, embodying and justifying its territorial claims, which corresponded to those agreed upon in London, but Fiume was also mentioned, because on Oct. 31, 1918, the national council of that town had, in the name of the Italian majority, applied for annexation to Italy. Italian opinion was unanimous in desiring a satisfactory frontier and the protection of the *Italianità* of the Italian communities on the east coast of the Adriatic, but was divided on the details of the settlement. The Nationalists demanded the Treaty of London territories, plus Fiume. The *rinunciatari* were ready to give up Dalmatia, part of Istria and the Trieste hinterland, because they wanted to conciliate the Yugoslavs and disregarded

strategic necessities, but demanded Fiume. Bissolati, minister without portfolio, wished even to renounce the Alto Adige because of its German-speaking population. In the Italian Peace delegation too, opinion was divided; while Sonnino stuck to the Treaty of London and did not insist on Fiume, Orlando demanded the latter, but was prepared to compromise on Dalmatia. The Yugoslav counterclaims extended to the old Italo-Austrian frontier and even beyond it, and this attitude aroused much indignation in Italy, the more so as, until the very eve of Austria's collapse, the Croats and Slovenes had behaved as faithful subjects of the Dual Monarchy.

The Government had many internal difficulties to contend with. In Italy itself the Socialists and Communists, now that the war régime and the censorship were relaxed, took advantage of the general weariness of the people to foment revolutionary agitation, hoping to emulate their comrades in Russia. The financial situation was serious and the budget statement for 1917-18, presented on Nov. 2, 1918, showed a deficit of 6,271 millions. Bissolati, disagreeing with his colleagues over the Alto Adige and Dalmatia, resigned. On Jan. 1, 1919, the state of war was declared at an end throughout Italy, except in the Veneto. On the 3rd, President Wilson arrived in Rome and was received with frenzied enthusiasm as the man who had contributed the most to end the war, but the ministers who discussed politics with him suspected him of little sympathy with Italian aspirations.

TERRITORIAL REDIVISION

The Adriatic Question.—The ministerial crisis initiated by Bissolati's resignation came to a head on Jan. 18, and resulted in the resignation of Nitti (who wished to prepare the way for assuming the premiership himself) and of four other ministers. The Italian peace delegation to the Paris conference, which first met on that same day, was composed of Orlando, Sonnino, Salandra, Barzilai and the ambassador, Marquis Salvago-Raggi. On Feb. 17 the debate on the Adriatic question began, but led to no result. In the meanwhile frequent incidents between Italian and Yugoslav soldiers occurred on the frontier. On April 23, Wilson published his famous appeal to the Italian people over the heads of their Government, setting forth his reasons for opposing certain claims. The message caused wide-spread astonishment as a violation of the rules of diplomacy, while in Italy it aroused great indignation. Orlando started for Rome on the 24th to consult parliament and the country, and was received with enthusiastic demonstrations. In the Chamber his policy was approved by 382 votes to 40 and found adherents even in the Socialist camp.

D'Annunzio took up the Fiume-Dalmatia question with fiery eloquence, and the Nationalists urged the Government to annex both. Orlando failed to take advantage of the anxiety of Britain and France that Italy should sign the treaty with Germany, or of Wilson's desire that she should adhere to the League Covenant, to secure advantages for his country, and on May 5 he returned to Paris without having obtained any guarantees for Italy's claims. Discussion on the Adriatic question was resumed, and various proposals for its solution were advanced, including one suggested by M. Tardieu, on which agreement would have been possible, if President Wilson had not agreed to its rejection by Yugoslavia. Orlando returned to Rome in June, and on the 19th he was beaten in the Chamber and resigned. Nitti now formed a new cabinet, with Tittoni at the Foreign Office, Schanzer at the Treasury and Gen. Albricci as war minister. On June 28 the new peace delegation, presided over by Tittoni, left for Paris, and the same day the treaty with Germany was signed by Sonnino and the Marquis Imperiali.

The internal situation grew more serious. The bread subsidy involved a huge deficit in the budget, the doles to the unemployed encouraged idleness, and the regulations hampering trade rendered production ever more difficult. The workers received high wages, but were discontented because prices were rising, while both they and the war profiteers indulged in an orgy of extravagance. Ex-neutralists helped to foment discontent. In Jan. 1919 the Partito Popolare Italiano (Catholic) was formed; it had a more definite programme and a more complete organization than

the old Catholic group, and it developed rapidly under the guidance of its political secretary, the Sicilian priest, Don Luigi Sturzo. It advocated reforms of a Christian-Socialist character, including the expropriation of the landed estates for the benefit of the peasants, but with compensation to the landlords. A series of avowedly revolutionary strikes broke out in every trade, and even in the public services. A postal strike was threatened in Dec. 1918, fomented by the Socialist party, and only called off on the Government's promise of higher wages. During a Bolshevik demonstration on April 13, 1919, at Milan, a shot was fired at a patriotic *cortège*, which provoked a reaction in the crowd, and the offices of the Socialist paper *Avanti* were wrecked.

At the Peace conference, during the absence of the Italian delegation, Lloyd George and Clemenceau ignored the St. Jean de Maurienne agreement, and in accord with President Wilson decided to send Greek troops to Smyrna. Immediately after the Greek landing Italian troops occupied various points in south-west Anatolia. Italian forces co-operated with the British and the French in occupying other parts of Turkey, but the Italian view was that real peace could only be secured by a more conciliatory attitude towards the Turks. At the same time, in order to conciliate Greece, Tittoni concluded an arrangement with Venezelos in July 1919 for the delimitation of their respective spheres of military occupation, leaving the Greeks a free hand in Southern Albania.

D'Annunzio and Fiume.—Fresh troubles broke out at Fiume (*q.v.*), where on July 2-5, 1919, the antipathy of the French troops (mostly colonials) to the Italians and sympathy with the Croats, led to reprisals, in which some French and Annamite soldiers were killed or wounded. The Peace conference thereupon appointed an inter-Allied commission of inquiry, which proposed the dissolution of the Fiume national council, elections to be held under inter-Allied control, the disbanding of the Fiume volunteers, the reduction of the Italian garrison, and the importation of British or American police. These proposals were about to be carried out when on Sept. 12 D'Annunzio arrived at Fiume from Ronchi, at the head of some Italian troops, whom he had induced to follow him to save the town for Italy, and a number of volunteers. Most of the Italian troops and seamen in the town and port joined him, and he set up a government of his own. The Allied troops departed, and Nitti stigmatized the poet's conduct in the most violent terms, calling on the workmen and peasants of Italy to back him up against the *Patriotards*. But a large part of Italian opinion supported D'Annunzio, and volunteers flocked to his standard. Further and more serious general strikes and riots followed, but a reaction in public opinion was beginning to show itself, especially in the Fascist movement, under Benito Mussolini (*see* FASCISM). Nitti expressed the belief that the only remedy was to let the spirit of unrest wear itself out, regardless of the immediate danger to the country. The premier's treatment of the army caused much dissatisfaction. In his desire to restore the "Peace spirit," he failed to protect the officers from outrage and insult, and advised them to go about in mufti and disarm when off duty: while a decree of the minister of war granted an amnesty to deserters, thereby placing them on an equal footing with those who had done their duty in the war.

On Sept. 10, 1919 the Peace treaty with Austria was signed at St. Germain-en-Laye (*see* ST. GERMAIN, TREATY OF), whereby Italy definitely acquired the frontiers assigned to her by the Treaty of London on the north and north-east, plus the Sexten valley and Tarvis, but the Adriatic question remained unsolved. On Nov. 12, Tittoni resigned from the Foreign Office and the peace delegation, and was succeeded by the eminent jurist, Vittorio Scialoja.

Industrial and Political Unrest.—In spite of, or because of, the Government's restrictive measures, prices had more than doubled. The Government had made the wheat trade a state monopoly; while it requisitioned domestic wheat at a price below the cost of production, it had to buy foreign wheat at the market price. Thus wheat-growing was discouraged at home, and bread was sold below cost, thereby increasing the deficit by six

milliards. Transport was disorganized, and although the traffic was less, the staff, for demagogic reasons, had been increased from 154,000 to 180,000, and afterwards to 240,000; the railwaymen had become more and more idle and insubordinate.

By the electoral law of Sept. 1919 the proportional system, whereby the voter voted not for a candidate but for a list, was adopted to please the Socialists and the Popolari, who, as the only two mass parties, hoped to derive benefit from it. The Socialists demanded the abolition of capital and the institution of a Soviet republic, but the extremist group proposed abstention from the polls and an armed rising. The Popolari decided to present their own candidates instead of co-operating with other parties; an extreme wing promoted strikes and disorders and differed little from the Socialists. The constitutional groups were split up and without a programme or organization. The Government was discredited and unpopular. The elections were held on Nov. 16, 1919: 156 Socialists, 101 Popolari and 30 Combatants were returned, but none of the Fascist candidates. On the opening of parliament by the king on Dec. 1 the Socialist deputies withdrew from the Chamber, and as a protest against this insult a patriotic demonstration was held outside, in which some Socialist deputies were injured. A general strike was proclaimed in consequence, and at Mantua there were serious riots.

The Socialist successes at the election resulted in further disorders. On Jan. 13, 1920, the postal employees went on strike because their demands for higher wages were not instantly complied with; volunteers replaced the strikers, in spite of official discouragement, and this broke the back of the agitation. But on the 22nd the railwaymen struck, and although volunteers enabled the management to maintain a reduced service, on the 29th Nitti came forward with concessions and undertook not to punish a single striker, in spite of explicit provisions of the regulations. The strike ended in a triumph for the revolutionists. In the spring there was a strike at the Mazzonis cotton mills in Piedmont, where the Government legitimized the arbitrary seizure of the factories by the workmen, and the railwaymen in general refused to run trains conveying soldiers or police to places where there were disorders. Nitti, finding himself unable to conduct the government in the face of the growing opposition, had resigned on March 12, 1920, but as no one else was prepared to assume office in these difficult conditions, he reconstructed his cabinet with a few changes. On April 17, the Supreme Council met at San Remo to prepare the peace with Turkey. On May 12 the cabinet, having been defeated in the Chamber, resigned, but as no other combination proved possible, Nitti again reconstructed his cabinet. The prime minister's failure to solve the Adriatic problem and the indignation aroused by the arrest of the Dalmatians and Fiumani in Rome on account of an alleged plot, made his position untenable. On June 4 he enacted a decree reducing the bread subsidy, but yielding to the threats of the Socialists, he withdrew it five days later and resigned without waiting for a vote.

Giolitti now appeared the only man capable of forming a government, and this he achieved by June 16, with Count Sforza as minister of foreign affairs. The budget statement for 1920-21, presented on June 27, 1920, showed a deficit of 14 milliards.

Troubles now broke out in Albania. An Albanian government had been formed at Tirana and the Italian garrisons were greatly reduced; in the spring of 1920 Albanian bands began to disturb the Italian troops, and on June 5 they attacked and captured some of the outposts. An attack on Valona was repulsed, but on June 24, Giolitti, alarmed by a mutiny which had broken out as a result of anarchist propaganda at Ancona, and yielding to the Socialist demands, announced that Italy would withdraw her troops from Albania and negotiate with the Tirana Government. An agreement was arrived at on Aug. 3, and on Sept. 2 the last Italian troops departed, only the islet of Saseno being retained.

At the Spa conference (July 5-16, 1920) Italy succeeded in getting her share of the German indemnity raised to 10%, and that of the Austrian, Hungarian and Bulgarian indemnities to 25%. On Aug. 6 the Tittoni-Venezelos agreement was rescinded, and on the 10th the treaty with Turkey was signed at Sèvres;

by the terms of the tripartite agreement Italy obtained "economic priority" over a wide zone of Anatolia south and east of the Greek zone (Smyrna) and a concession for exploiting the Heraclea coal-fields. By a separate agreement with Greece,¹ Italy undertook to cede to the latter the Dodecanese minus Charki and Castellorizo, which together with Rhodes were to remain Italian for 15 years, and then, if Britain ceded Cyprus to Greece, a plebiscite was to decide the fate of those islands.

The Rapallo Conference.—Serious anti-Italian disorders occurred on July 11 at Spalato, where the Croat mob murdered the commander of the cruiser "Puglie" and wounded several officers and men; protest demonstrations were held at Trieste, and shots having been fired from one of the Yugoslav institutions, several of them were set on fire. At Fiume the national council resigned and D'Annunzio proclaimed the Reggenza del Carnaro, for which he drafted a curious, mystical, semi-mediaeval statute. The Yugoslavs felt that a direct understanding with Italy would be the best solution. A conference was held at Rapallo on Nov. 8, Italy being represented by Giolitti, Count Sforza, Bonomi, Gen. Badoglio and Admiral Acton; Yugoslavia by Vesnich, Trumbich, Kosta Stoyanovich and Col. Kalafatovich. On the 12th the treaty was signed. Italy waived her rights over Dalmatia, except for the town of Zara, and the following frontier was agreed upon: Mount Pec, Mount Yalovets, the watershed between the Isonzo and the Wurzen See and the Wocheiner Save, north-east slope of Mount Mezik, east slope of Mount Porzen, west slope of Mount Blegos, Zelse, Cabranska, east of Mount Trstenik, east of Griza, east of Mattuglie, frontier of the Fiume State on the Fiume-Castua road; the islands of Cherso, Lussin, Lagosta and Pelagosa were assigned to Italy, while both Powers recognized the independence of Fiume; the Italian-speaking inhabitants of the territories assigned to Yugoslavia were entitled to opt for Italian citizenship without having to leave the country, and full freedom of language, culture and religion were granted to Yugoslavs in Italian territory.

By a secret clause, which soon became public property, although Count Sforza denied its existence, Porto Baros, an integral part of the port of Fiume, was promised to Yugoslavia. D'Annunzio, however, refused to recognize the treaty, and on Dec. 23, as he refused to obey Gen. Cavaglia's summons to submit, military operations were commenced. There was some fighting, but on the 30th D'Annunzio accepted the conditions imposed. Fiume was to be placed under its own town council, with a local volunteer force assisted by Italian carabinieri, until after the elections for the constituent assembly. D'Annunzio left Fiume on Jan. 18, 1921. But the elections in the spring of that year led to disorders necessitating the maintenance of Italian troops. The evacuation of Dalmatia, divided for the purpose into three zones, began in the spring of 1921.

Industrial Disturbances.—Internal troubles reached their zenith in the autumn of 1920. There were industrial, agricultural and railway strikes in various parts of the country, and in September a very serious agitation broke out in the metal trades. These industries had earned large profits during the war and were paying high wages. But the cost of production was increasing, and there were signs of a coming slump, so that it was impossible to grant the still higher wages which the workmen demanded. The men of the Romeo works in Milan adopted obstructive tactics and sabotage, and the management retorted by a lock-out on Aug. 20. Thereupon the F.I.O.M. (*Federazione italiana operai metallurgici*) ordered all the metal workers in Milan to remain in permanence at the mills without working. The Federation of Mechanical Industries then extended the lock-out to the whole of Italy on the 31st, and the workmen, many of them armed, seized a number of factories in Lombardy, Piedmont and elsewhere. Encouraged by the passive attitude of the authorities, they kidnapped owners and managers and tried to force them to run the works exclusively for the workers; armed "Red Guards" were organized, revolutionary tribunals set up and persons approaching the factories were shot at. But the workmen found themselves incapable of

¹Denounced by Italy; Oct. 8, 1922, in consequence of Greece's inability to carry out her share of the arrangement.

running the factories unaided, and the occupation ended by becoming merely an occasion for orgies. At Turin a Nationalist student and a prison warder who happened to be passing near an "occupied" factory were brutally murdered by "Red Guards," and in many works the safes were broken open and the contents pocketed by the leaders.

On Sept. 19 Giolitti summoned the representatives of the owners and the workers to meet him in Rome, where a rise in wages and a form of workmen's control over industry, which the Government undertook to embody in a bill, was agreed upon. The factories were evacuated on the 27th and work was resumed on Oct. 4. As a practical attempt to establish Communism, the agitation had failed, but the "occupation" wrought serious injury to Italian credit at home and abroad.

THE FASCISTS

About this time agrarian troubles, provoked by Socialists and left-wing Popolari, had also broken out in various parts of Italy, notably in the Veneto, the provinces of Bergamo and Cremona, the Lazio, Tuscany and Sicily. The peasants demanded contracts which, if accepted, would have left the landlords without enough income to pay the taxes. The middle classes set themselves to organize resistance. The Agrarian Association of Bologna was particularly active, but it was the Fasci, now arising all over Italy, under Mussolini's leadership, which organized the national reaction. The first attempt at resistance at Bologna was on Sept. 20, when, as the result of a Communist attack on a patriotic procession, a kiosk where seditious papers were sold was destroyed. At a strike demonstration in the same city on Oct. 14, 1920, against the "white terror" in Hungary, the anarchist, Malatesta, incited the mob to violence, and a police inspector and a Guardia Regia were murdered. Small groups of Nationalists and Fascists thereupon paraded the streets; the tricolour flag appeared everywhere and the strike ceased.

The assumption of office by the Red municipal administrations offered occasion for fresh outbreaks of violence. In Bologna the Communist deputy, Bucco, secretary of the local chamber of labour, beginning to fear for his own safety, applied for police protection against the Fascists; he was spirited out of the city and after his departure a deficit of a quarter of a million was found in the accounts of the chamber of labour. On Nov. 21, 1920, the first meeting of the new Bologna town council was intended to be the occasion for an armed rising organized by the Communists. There were anti-Socialist demonstrations in the streets organized by the Nationalists and Fascists, supported by other citizens, but in the town hall, Giordani, a disabled ex-officer, was murdered and another member of the council, Colliva, seriously wounded by Communists. The Red leaders had to fly for their lives and the whole fabric of Bolshevik organization in Bologna collapsed. The town council was dissolved, while the Fascists wrecked or burned down various Socialist institutions. Throughout the Po valley the Fascists proceeded to break the tyranny of the "Red baronies"; the revolutionary *leghe* which had dominated labour in that area, were dispersed, and one Red town council after another resigned or was dissolved by the prefects, while ever-increasing masses of workers, industrial and agricultural, went over to Fascism and thus formed the basis of the Fascist labour movement.

During the last months the Maximalist Socialist party had begun to show signs of dissension. The Russian leaders demanded the absolute submission of the Italian party to the orders of Moscow and the expulsion of all Socialists tainted with the Reformist heresy. At the general congress of the party in Leghorn (Jan. 13-22) a resolution in favour of a middle tendency supported by Turati, Treves, Buozzi, Baldesi, D'Aragona and the G.C.L., who called themselves *Unitari* and were prepared to collaborate with bourgeois governments, was adopted. The Communists (represented by 18 deputies) thereupon broke away, formed a party of their own, and tried to affirm itself by a series of terrorist outrages. Bombs were thrown in Florence on Feb. 27, killing and wounding several persons, whereupon the Fascists retaliated by murdering Lavagnini, a notorious Communist railway organizer; the railwaymen and electricians went on strike and various affrays between

Communists and Fascists occurred, until the troops intervened and restored order. At Empoli a number of unarmed sailors were murdered by Communists, and the Fascists, summoned from various parts of the country, inflicted severe reprisals. Similar occurrences took place at Foiano della Chiana and other places.

On March 1, in spite of Socialist obstruction, the bill for the abolition of the bread subsidy was voted by a large majority. The bill in favour of syndicalist control over industry, presented by the premier in accordance with the agreement of the preceding September, encountered much opposition in parliament and was finally dropped.

On April 7, 1920, Giolitti, owing to the insecurity of the parliamentary situation, dissolved the Chamber, and on May 15 the elections were held. Out of 535 seats (27 had been added for the new provinces) the Liberals and Democrats of various shades secured 275, the Popolari rose from 101 to 107, the Socialists fell from 156 to 122 Unitari and 16 Communists; there were in addition four Germans for the Alto Adige and five Slavs for the Venezia Giulia. The Fascists were 35 and the Nationalists 10. The Socialists and Communists were now faced by a vigorous Fascist-Nationalist group supported by sympathizers belonging to other parties. On June 11 Parliament opened, and in the debate on the speech from the throne, the Nationalist, Federzoni (*q.v.*) delivered a strong attack on Count Sforza's foreign policy. On June 26 the cabinet secured only a small majority on a vote of confidence on foreign policy and Giolitti resigned.

Bonomi formed an administration comprising members of many parties, but the Popolari were predominant and Don Sturzo ruled the cabinet with a rod of iron. A bill, demanded by the Popolari and Socialists, for the expropriation of land alleged to be inadequately cultivated, was introduced, but aroused violent opposition and never became law. Bonomi had the merit of deciding that the celebration of the ceremony for the Unknown Soldier should at last be held; it took place on Nov. 4, 1921. Two days later the Fascist congress was opened in Rome, and Fascism was definitely constituted into a political party. On the 10th the Communists and Socialists proclaimed a general strike as a protest against the presence of the Fascists in Rome; disorders ensued, in which five persons were killed and several wounded. The debate in the Chamber on the eligibility of the deserter Misiano, who had been returned for Turin and Naples, led to violent scenes, until on Dec. 20 his election was annulled. During this same month the Banco di Sconto failed, and the Government was severely blamed for not having prevented the collapse of so important an institution, whose actual condition was by no means hopeless; as was proved at the subsequent legal proceedings before the Senate, the failure caused serious prejudice to the general financial and economic situation of the country.

The Bonomi cabinet was now attacked on all sides, and when on Feb. 2, 1922, the Democrats, 16 of whom were in the Government, went over to the Opposition, Bonomi resigned. It was not until the 25th that a new Cabinet was formed by Luigi Facta. He was a thoroughly honest man, and his acceptance of office in these circumstances was proof of his patriotism, but he was not a first-class statesman. He selected Schanzer for the Foreign Office, while the other ministers were of respectable mediocrity.

In 1922 the reconquest of Tripolitania was commenced with the reoccupation of the port of Misurata at the end of January. After a series of operations lasting through 1922 and 1923 the whole colony was reoccupied. The governor in this period was Count Giuseppe Volpi, afterwards finance minister.

The Genoa economic conference was inaugurated on April 10. Facta presided with dignity, but the hardest work was accomplished by Schanzer, who often succeeded in composing differences between the British and the French and between the French and the Germans and Russians.

Further industrial troubles followed. At Naples a conflict had opened between the Red dockers' union, which wished to retain its labour monopoly, and the new Fascist dockers' union. The Red union proclaimed a strike in all the Italian ports on March 18. In spite of the Government's tendency to support the Reds, the Fascists eventually succeeded in breaking the Red

monopoly and restoring order and freedom of labour in the ports. On May 24 the funeral procession escorting the body of the war hero Enrico Toti to the cemetery in Rome was fired on by Communists in the San Lorenzo quarter. Two persons were killed and several wounded. The next day the Committee of Proletarian Defence and the Alleanza del Lavoro, a newly formed coalition of the Communist, Socialist and Republican parties and the G.C.L., ordered a general strike in Rome.

Rumours of a new cabinet crisis followed and the Socialists were divided on the question of collaborating with a bourgeois government. On July 12, 1922, Peano, the Treasury minister, issued his financial statement for 1921-22, which showed a deficit of 4,500 million lire, while experts estimated it at 6,500 million. Public opinion was seriously alarmed, but the deputies were too busy over lobby intrigue in view of the expected crisis to worry about finance. There were disorders at Cremona, provoked by the left wing Popolari led by Miglioli and the Socialists; the Fascists mobilized and wrecked several Socialist institutions and Miglioli's own law offices. The Democrats in the Chamber seized the occasion to contract an alliance with the Popolari, and on July 19 Facta was outvoted and resigned. But it proved impossible to form a new cabinet, and after various unsuccessful attempts, the old cabinet was reconstructed, with Senator Taddei, prefect of Turin, as minister of the Interior.

THE FASCIST COUP-D'ÉTAT

The General Strike.—On Aug. 1, 1922, a general strike in all Italy was called by the Alleanza del Lavoro proclaimed by Turati a "legalist" strike, because its professed object was to affirm the authority of the State against the Fascists. Work was suspended in many factories and a part of the railwaymen struck; but the Fascists and Nationalists ordered a general mobilization, and the Fascist directorate issued a manifesto calling on the public servants and the workers "to shake off the yoke of the politicians by whom they were led," and giving the Government 48 hours within which to prove that it possessed authority over its own employees and those who were attempting to destroy the nation. "On the expiry of this delay Fascism will assume full freedom to supplant the State." Serious conflicts between Fascists and Communists occurred at Milan, Ancona and other places, but the strike rapidly collapsed, and by the 5th all disturbances were over. During the strike agitation the Fascists delivered an attack on the Communist-Socialist municipality of Milan, which had for years ruled the city, bringing it to the verge of ruin and indulging in the most scandalous graft; the deficit was 375,000,000 lire, with bills for 101,000,000 lire overdue, and the richest city in Italy could obtain no credit anywhere. The Fascists and other citizens took the places of the strikers; on Aug. 3 the Fascists succeeded in getting into the town hall, and for the first time since 1914 the tricolour was raised on Palazzo Marino amid scenes of great popular enthusiasm. The Fascists withdrew on the 4th and handed over the building to the prefect's commissioner. On the 27th, after the disastrous results of the inquiry into its financial administration, the council was dissolved.

At Genoa the Fascists led a similar and equally successful operation against the port consortium, which was largely under the influence of the Red dockers' union, and extended their action against a number of Socialist, Communist and Popolare town councils and institutions, and also against the governor of Trento, Credaro, accused of being under the influence of the anti-Italian Pan-German elements of Bolzano. All these actions were of course illegal, but public opinion approved of them because it considered that the Fascists were doing what the Government should have done before.

Facta's position was daily weakening, and indeed the whole machinery of government was obviously breaking down. At the Socialist congress held on Oct. 3 the party split into two groups, the *Unitari* or collaborationists and the uncompromising *Massimalisti*; as a result of this split the G.C.L. broke off its alliance with the Socialist party and declared itself a non-political body, but many of its adherents had already gone over to Fascism. The Partito Popolare was also divided by conflicting tendencies, and

the pope enjoined on the bishops and clergy to abstain from partisan political activity. The moment was now ripe for a bold Fascist move.

Although many Liberals approved of the Fascist programme, the Fascists themselves were convinced that it could not be carried out under normal parliamentary conditions. At a Fascist gathering at Udine on Sept. 29 Mussolini made an important declaration in favour of the monarchy, thereby securing the support of many non-Fascists. His hints at a revolution, however, were still regarded as figures of speech, but he was now entrusted by the party directorate with a mandate to conduct a political and even military action to bring Fascism into power. On Oct. 24 another Fascist congress was held at Naples, where 40,000 Fascists in military formation paraded the streets. In his speech at the San Carlo theatre Mussolini said that "what we have in view is the introduction into the Liberal State, which has fulfilled its functions . . . of all the forces of the new generation which has emerged from the war and the victory." In another speech he declared that "either the Government will be given to us or we shall seize it by marching on Rome."

March on Rome.—That same evening the Fascist Quadrumvirate was formed, composed of Michele Bianchi, general secretary of the party, Italo Balbo, commander of the armed *squadre*, Gen. De Bono, who had organized them, and the deputy C. M. De Vecchi, while Dino Grandi, an authority on labour problems, was entrusted with the political functions of the enterprise. The congress broke up and on the 27th Facta resigned. In the meanwhile the general mobilization of the Fascists had been ordered, and they proceeded to concentrate on Rome in four columns. Both the Fascist leaders and the Army officers were anxious to avoid any conflict between the *squadre* and the troops, and the news that martial law had been proclaimed caused deep consternation. Facta had indeed drafted and issued the decree, but the king refused to sign it as it would have meant civil war, and it was immediately withdrawn. After an unsuccessful attempt by Salandra to form a cabinet owing to Mussolini's declaration that an administration of the old parliamentary type was now impossible, the king, on Salandra's advice, sent for Mussolini. The Fascist columns began to enter Rome on the morning of Oct. 30, 1922, and the city was peacefully occupied; the only regrettable incidents were the murder of a Fascist at Valmontone by Communists, and the murder of some Communists by Fascists in the San Lorenzo quarter of Rome. Mussolini reached Rome from Milan the same day, and at once presented himself to the king, with his cabinet list already prepared, which the king at once accepted. As the presence of the *squadre* in Rome was no longer necessary, and might lead to trouble, Mussolini ordered them to depart; this they began to do on Oct. 31, after paying a tribute of honour to the tomb of the Unknown Soldier and homage to the king. By Nov. 2 all had left the capital.

The Fascist Government.—The new cabinet was composed as follows: Mussolini, premier and minister of foreign affairs and the interior; Gen. Diaz (war); Admiral Thaon di Revel (marine); Prof. Alberto de Stefani (finance); Prof. Tangorra (treasury); duke of Cesarò (post office); Federzoni (colonies); Prof. Gentile (education); De Capitani (agriculture); Carnazza (public works); Count Teofilo Rossi (industry); Cavazzoni (labour); De Vecchi (under-secretary for pensions). Although predominantly Fascist, the cabinet comprised members of all the chief groups except the anti-national parties; Rossi was a Giolittian, Cesarò a Social Democrat, Gentile¹ and De Capitani Liberals, Tangorra and Cavazzoni Popolari. Stringent orders for the cessation of all acts of violence were issued, and for the reinstatement of the town councils which had been forced by the Fascists to resign after Nov. 1. Occasional conflicts still occurred, but on the whole order was restored with surprising rapidity.

On Nov. 16 the premier informed the Chamber that he might have closed parliament and formed a purely Fascist cabinet, but that he preferred, at all events in the first phase, to form a coalition with all the national parties. He undertook to balance the budget, provide for the working classes, but not in accordance

¹Gentile afterwards became a Fascist.

with any extravagant theories, and conduct the foreign policy of Italy with firmness and dignity. He finally asked for full powers for a year to carry out the necessary reforms, and these were granted by 275 votes to 90. The Nationalists were now absorbed.

The most urgent problem before the new Government was finance. The estimated deficit for 1922-23 was 6,500 million lire and De Stefani at once proceeded to adopt drastic economies, reorganize taxation and encourage economic activity without hindrances to production. Tangorra having died on Dec. 21 De Stefani took charge of the Treasury as well. The Ministry of the Liberated Territories and several under-secretaryships were abolished, and by the decree of Jan. 23, 1923, the Government was enabled during one year to place on the retired list all officials who were too old or otherwise incapable of fulfilling their duties, and to revise all appointments made under special war legislation since May 1915. The Guardia Regia was disbanded. The Fascist and other armed *squadre* were also disbanded, and the *Milizia Volontaria per la Sicurezza nazionale* (see FASCISM), composed of *ex-squadristi* and officered by ex-army officers, was created in Jan. 1923 to assist in the maintenance of order. In the administration of justice the four courts of cassation were reduced to one, and many minor courts suppressed. The railway staff, which amounted to 225,000 when the Fascists came into power, was gradually reduced to 170,000.

A large number of abuses were eliminated; the eight hours' day, which had been reduced to five or six hours of real work, was restored; railway thefts and damage to property were brought down to trifling proportions; the free passes issued to the leaders of the revolutionary *sindacato ferroviari* and many other persons were withdrawn, discipline was re-established and bonuses for economy reintroduced. These reforms converted the railway deficit, which in 1921-22 amounted to 1,400 million lire, into a surplus of 176,000,000 lire for 1924-25. A similar transformation was effected in other services with similar results.

THE NEW NATIONALISM

Foreign Affairs.—Soon after coming into power Mussolini attended the opening of the Lausanne conference on the peace with Turkey, and there he first came into contact with his British and French colleagues. On Aug. 27, 1923, the Italian general, Tellini, president of the inter-Allied commission for the delimitation of the Graeco-Albanian frontier, and four of his staff were murdered by Epirote bands near Yannina on Greek territory, as a result of a violent campaign in the Greek press against Tellini, who was accused of unduly favouring the Albanian claims. On the 29th the Italian Government presented an ultimatum to Greece demanding immediate satisfaction and an indemnity of 50,000,000 lire. As the Greek Government rejected some of the conditions, and denied responsibility for the crime, an Italian fleet was sent to Corfu to occupy the island. The Greek commander having refused to lower the flag a few shots were fired on the fort, one of which killed or wounded a number of refugees who, unknown to the Italian admiral, were lodged in it. The island was then occupied. On Sept. 1 Greece appealed to the League of Nations Council, but as the Conference of Ambassadors had also been invested with the question, the Italian delegate to the League Council, Salandra, maintained that the conference alone was competent to deal with the matter, whereas the British delegate, Lord Robert (Viscount) Cecil, the Greek delegate, Politis, and the delegates of the small Powers insisted on the League's right to intervene. After arranging that an enquiry should be conducted by the four Great Powers, the Conference of Ambassadors finally decided that Greece should give full satisfaction, and pay the indemnity demanded. On the 13th the conference announced Greece's acceptance of its decision and Italy evacuated Corfu by the 27th.

The next important action of the Fascist Government in the field of foreign affairs was the settlement with Yugoslavia. As Mussolini had long recognized the difficulty of fully carrying out the Rapallo and Santa Margherita agreements, he had suggested, as early as Nov. 1922, to M. Ninichich, the advisability of a more complete agreement. The Santa Margherita convention

was ratified on Feb. 21, 1923, and Italy proceeded to evacuate the third Dalmatian zone; but the existence of the Fiume Free State was the chief obstacle to a real understanding. Negotiations with Yugoslavia were resumed, and on Jan. 27, 1924, the various agreements were signed in Rome. By the first of these the two Powers undertook to collaborate in maintaining the conditions established by the peace treaties and to assist each other politically and diplomatically in case of a conflict. By a second convention Italy recognized Yugoslavia's full sovereignty over Porto Baros and the Delta, while Yugoslavia recognized that of Italy over Fiume; a free customs zone was also established comprising Fiume and Castua (the latter ceded to Yugoslavia). Ratifications were exchanged on Feb. 22, and subsequently a series of commercial agreements was concluded at Nettuno.

Mussolini and Parliament.—In the summer of 1923 a bill was drafted dividing the country into 15 constituencies, each voter to vote for the party list which he preferred, the party securing relatively the largest number of votes to be entitled to two-thirds of the seats in the Chamber, while the remaining third was divided among the other parties on a proportional basis. The bill encountered much opposition among the Socialists and the Popolari, and also among some sections of the Liberals, but it was admittedly only a temporary and tentative measure, and it was voted by a large majority in the Chamber in July and by the Senate in Nov. 1923. At a cabinet Council on Dec. 31 the Government renounced the full powers granted to it by parliament a year previously, and on Jan. 25, 1924, parliament was dissolved. Mussolini stated that, while recognizing the value of the elective Chamber, it must not be accorded absolute predominance over the other organs of the State—the Crown, the Senate, the Executive—all of which have their allotted functions. He rejected the idea of electoral and political alliances with other parties, but decided to include in the Government electoral list men of all parties or no party who might be counted on to render services to the country. Salandra, Orlando, De Nicola and De Nava undertook to support the Government. The Duke of Cesari, minister of Posts and Telegraphs, disapproving of certain influential Fascists, resigned and presented an opposition list.

The Government candidates comprised 200 ex-combatants, and a number of eminent men. The Opposition competed for the 179 seats reserved for the minorities. The elections were held on April 6. In all 7,628,859 votes were recorded; of these 4,693,690 were for the Government, i.e., 65.25% of the recorded votes, not including those in favour of minority candidates who had declared themselves supporters of the Government; the Government thus would have been entitled to over two-thirds of the seats independently of the new law. Ex-premier Facta did not stand but was raised to the Senate soon afterwards.

CRISES AND STABILIZATION

The Matteotti Murder.—Parliament was opened by the king on May 24, 1924. After his overwhelming victory at the polls Mussolini held out the olive branch to the Opposition parties, and everything seemed to point to a return to normal political conditions; but on June 10 the Socialist deputy Giacomo Matteotti, secretary of the Unitario group, mysteriously disappeared, and a day or two later it was discovered that he had been kidnapped in a motor-car by Dumini, Volpi and other Fascists of shady antecedents and carried off to an unknown destination. The kidnappers, suspected of complicity in attacks on other anti-Fascist leaders, were caught at once, and four prominent Fascists—Marinelli, the administrative secretary of the party; Filippelli, editor of the *Corriere italiano*; Cesare Rossi, head of the official press bureau; and Naldi, the editor of the *Nuovo Paese*—were also arrested as accomplices. The body of Matteotti was discovered on June 13 buried in a lonely spot 20km. from Rome.

The affair created a sensation, and the Opposition deputies and press seized on it to indulge in the gravest accusations against all the leading Fascists. On June 15 the Opposition deputies withdrew from the Chamber, stating that they would not return until the Matteotti mystery, and the supposed complicity of the Government in the affair, had been cleared up. The Opposition by

this "withdrawal on to the Aventine"¹ hoped to render parliamentary business impossible and to exploit the consternation aroused by the crime to upset the Fascist Government. Among the persons more directly accused was Aldo Finzi, under-secretary for the Interior; he immediately resigned, and his resignation was accepted, but when he brought libel actions against his accusers they were unable to prove their case by evidence.

The Chamber was adjourned, and on the 16th Federzoni was transferred from the Colonial ministry to that of the Interior: he immediately cleared the department of the doubtful elements who had taken advantage of their connection with it for purposes of their own. On the 30th various cabinet changes were effected.

The Opposition saw in the Matteotti affair a chance of mobilizing a part of the nation against the Government, and secured the support of many who had adhered to Fascism only as long as they had believed it to be invincible, and were ready to abandon it the moment they thought that its days were numbered. Orlando, who had been elected on the Government list, and Giolitti, who had declared himself benevolently independent, joined the Opposition, professedly on constitutional grounds, but did not withdraw from the Chamber. The "Aventine" groups on June 27 confirmed their abstention from parliamentary activity, demanded the disbanding of the Milizia nazionale, and the repression of all acts of violence by Fascists (without mentioning those committed by non-Fascists); their unofficial leader was Giovanni Amendola. The conduct of the constitutional Opposition, in allying itself with the revolutionary Socialists and the Popolari extremists, was much criticized even in non-Fascist circles. The directorate of the ex-combatants' association also assumed an attitude of veiled hostility to the Government, and as this created a sharp division within its ranks the Government dissolved the directorate and placed a temporary board in charge.

The press campaign reached an unparalleled degree of violence, Don Sturzo's *Popolo* vying with the Socialist *Avanti* and Amendola's *Mondo*, and was a direct incitement to many acts of violence committed against Fascists. Mussolini therefore decided on July 8 to call into force the decree of July 12, 1923, drafted by the Duke of Cesarò, and the prefects were ordered to apply Art. 3 of the Communal and Provincial law, whereby in the interests of public order they were empowered to confiscate issues of papers containing seditious matter or incitements to violence. This measure was afterwards completed by the royal decree of March 4, 1926. Several Liberal and Democratic organs which systematically attacked the Government were acquired by pro-Fascists, including the *Corriere della Sera*, of Milan, the *Giornale d'Italia* of Rome, and the *Mattino* of Naples. Several Opposition papers continued to exist, including the Democratic *Mondo*, the *Voce Repubblicana*, the *Avanti*, etc. An important reform was carried out in the Milizia nazionale which, in accordance with the decree of Aug. 4, swore allegiance to the king on Oct. 28.

In the field of foreign affairs a treaty was concluded with Britain whereby the Transjuba territory was ceded to Italy. There had been a previous agreement to that effect, but the British Foreign Office had raised difficulties, claiming that the question should be settled together with that of the Dodecanese; the Italian Government persuaded Ramsay MacDonald that the two questions were wholly unconnected, and the treaty was signed on July 15, 1924, Italy securing a larger area than had been at first contemplated. Ratifications were exchanged on May 1, 1925.

The Government's position had been undoubtedly shaken by the Matteotti affair, but no evidence was produced implicating any of its members in it, and Mussolini parried the attack with consummate skill. The Fascist party, except for an insignificant number of defections, rallied round him solidly, and after the first bewildering non-party opinion continued its support of him. The country tended to calm down, in spite of occasional regrettable incidents provoked by both sides, of which the most serious was the murder of the Fascist deputy Casalini by a Com-

munist on Sept. 12, 1924. The Chamber opened on Nov. 12, Orlando and the Communists being present, while later Giolitti's attack on the Government for its unconstitutional methods caused some surprise as coming from a statesman who while in office had proved a past-master in the art of violating the Constitution. On Dec. 20 the premier presented a bill to parliament providing for the re-establishment of the old one-member constituency system, eventually passed by 307 votes to 33, and approved by the Senate on Feb. 10, 1925. This measure divided the "Aventine," as the Democrats and Liberals were in favour of it, while the Socialists and Popolari were proportionalists. In his speech in the Chamber on Jan. 3, 1925, Mussolini reaffirmed the uncompromising policy of Fascism, rejecting all alliances, and stated that the government was determined to *Fascistizzare* the State, and that if the Opposition did not abstain from factious violence severe repressive measures would be resorted to. These declarations induced Salandra to withdraw his support, although, like Orlando and Giolitti, he did not retire on to the "Aventine"; a part of his group (the Liberal Right) broke away and formed the pro-Fascist National Liberals. In March Roberto Farinacci was appointed general secretary of the Fascist Party, which he proceeded to reorganize, giving it a rigidly intransigent character. His speeches and articles represented the extremist attitude of Fascism.

The bill presented by the minister of war, Gen. Di Giorgio, for reorganizing the army, encountered much opposition in military circles and in the Senate. Gen. Di Giorgio therefore resigned, and Mussolini himself took charge of the War Ministry *ad interim*, with Gen. Cavallero as under-secretary; Gen. Badoglio was appointed chief of the staff and entrusted with the co-ordination of the army, navy and air force. On May 5 Admiral Thaon di Revel resigned, and Mussolini took over the Ministry of Marine and the newly created Air Ministry as well, with Admiral Sirianni and Gen. Bonzani as under-secretaries. This arrangement is regarded as leading the way to a future Ministry of National Defence. A great manifestation in honour of the king's jubilee was held on June 7, and it was generally recognized that the prestige of the monarchy had been greatly strengthened by the Fascist régime.

The decision of the Senate judicial committee, rendered on June 12, 1925, on Donati's charges against Gen. De Bono, acquitted the latter of guilt in connection with the Matteotti affair and of the other more serious accusations, only certain minor counts being declared not proven. In consequence of the success of the Fascist list at the Palermo municipal election, on May 2, 1925, Orlando resigned his seat. His withdrawal from politics made very little impression, as he had already to a very large extent lost his political influence. The findings of the prosecuting section of the Court of Appeal on the Matteotti case in Dec. 1925, while committing Dumini and four accomplices to trial for murder, excluded premeditation and exonerated members of the Government and officials from complicity. Cesare Rossi, Marinelli and Filippelli were consequently set free. The trial of the five accused men was ended on March 24, 1926, at Chieti. Dumini, Volpi and Poveromo were found guilty of non-premeditated unintentional homicide extenuated by the subnormal physical resistance of Matteotti and by other circumstances; Viola and Malacria were found not guilty. The sentence on Dumini, Volpi and Poveromo was 5 years 11 months and 20 days' penal servitude of which four years were remitted later under an amnesty and one year and nine months were already served in awaiting trial. They had therefore to serve only two months and 20 days' imprisonment.

Finance.—In the spring of 1925 financial difficulties had arisen resulting in the serious depreciation of the lira, which fell from a little over 100 to the £ to close on 150; this was partly due to the heavy excess of imports over exports in consequence of the bad harvest of 1924, but also to speculation initially promoted by certain members of the Opposition who hoped to break Fascism through a financial disaster and the consequent panic, due to the belief that the Government intended to reduce the currency to zero after the example of Germany. The premier felt that a bold Treasury policy was now necessary, requiring the services of a

¹An allusion to the withdrawal of the Roman *plebs* on to the Aventine hill as a protest against the aristocracy. Opposition deputies did not, as was often reported in the foreign press, actually meet on the the Aventine.

practical financier. De Stefani's great task in reorganizing the fiscal system and balancing the budget was accomplished; for 1924-25 a surplus of 209 millions was announced, which eventually rose to 417 millions. In July he resigned and was replaced by Count Giuseppe Volpi, governor of Tripoli, and formerly a business man of wide experience. After enacting new regulations, which effectively restrained illicit speculation and improved the currency (the lira rose to 120 to the £) he undertook the settlement of the war debt to the U.S., which was weighing heavily on Italian finance. On Nov. 14 an agreement was concluded at Washington whereby Italy's debt, originally \$2,148,000,000, was reduced to \$2,042,000,000 to be spread over 62 years, which, calculating the interest at 5%, reduces the actual value of the debt to \$360,000,000 (a reduction of 82%). The agreement was ratified by the U.S. Senate on April 21. A loan floated by the American banks for \$100,000,000 to help the Government to stabilize the exchange was subscribed several times over, while other loans for public works and the railways were also successfully floated in New York. On Jan. 27, 1926, Volpi signed with Churchill, the British chancellor of the Exchequer, an agreement in settlement of the Italian war debt of £610,000,000, whereby Italy contracted to pay an annual sum of £4,500,000, slightly reduced at first, over a period of 62 years. The first payment of £2,000,000 was made in March 1926.

In order to bring southern Italy up to the standard of the more progressive north a series of measures were enacted for co-ordinating agricultural land reclamation, drainage, the building of roads and railways, etc., for which adequate funds were provided and a suitable civil service organization created. The wheat crop of 1925 had beaten all records, amounting to 65,000,000 quintals (the pre-war average was 49,000,000), but Mussolini was determined to spare no efforts to increase the output; all forms of encouragement to producers were adopted and various agricultural measures enacted, constituting what was known as "the battle for wheat."

POLITICAL ENTRENCHMENT

Fascist Legislation.—Of the political Fascist measures the following were the most important:—

In order to eliminate the influence of freemasonry in the administrative and political life of the country often inspired by foreign interests, a law was enacted in Dec. 1925 whereby all associations were obliged to communicate their statutes and their membership lists to the authorities, and, should secret societies continue nevertheless to exist, civil servants were forbidden to belong to them on pain of dismissal.

The law of Jan. 31, 1926, provided that Italians living abroad who committed acts calculated to promote sedition in Italy or injure Italian interests should be deprived of Italian citizenship, and in the graver cases even of their property.

By the law of Nov. 1925 the Government was empowered for one year to dismiss from the public service officials who committed overt acts against the State and existing institutions or attempted to prevent the enforcement of the laws or to frustrate its policy.

The unsatisfactory results of the system of municipal elections induced the Government to enact measures for placing the local administrations under the authority of a *Podestà* appointed by royal decree. The law of Oct. 28, 1925, provided for the appointment of a governor of Rome, assisted by an advisory council; that of Feb. 4, 1926, placed communes of less than 5,000 inhabitants under a *Podestà*, while that of Sept. 3, 1926, extended it to all communes.

The authority of the prefects was strengthened with a view to co-ordinating the various provincial services, while the advisory provincial economic councils were created (law of March 1926) to assist the prefects and the Government in all matters of an economic character. The law of Dec. 24, 1925, conferred greater power of parliamentary initiative on the prime minister and otherwise extended his authority; it also provided for the infliction of penalties for committing offences against him.

The most important measure was the law of April 3, 1926,

whereby the labour corporations were recognized and invested with the right of legally representing the various categories (employers, workers, employees, professional men, landlords, peasants, experts, etc.), and all labour conflicts were referred to the labour tribunals attached to courts of appeal; strikes and lock-outs were declared illegal, and persons promoting them or participating in them were liable to penalties.

Although most of the "Aventinians" continued to remain absent from the Chamber, the groups led by Salandra and Giolitti were present, together with Orlando's followers and the Communists. The unity of the Aventinians was gradually breaking up through internal dissensions and personal jealousy. The general internal situation continued to improve, although affrays between Fascists and anti-Fascists occurred from time to time. The most serious of these was the attack on Amendola (*q.v.*) near Montecatini, in the summer of 1925, and the outbreak in Florence on Oct. 3, when as the result of the murder of the Fascist provincial secretary Luporini by a leading freemason, the latter and two Communists were murdered by Fascists, and the shops and offices of several persons supposed to be freemasons were wrecked. In March 1926 Farinacci, who had been counsel for the defence of Dumini in the Matteotti trial, resigned from the secretaryship of the Fascist party, and was succeeded by Augusto Turati; on April 23 it decided to admit no new recruits to the party until 1927. The exclusion has been extended and is still (1928) in force.

The object of these various measures and of the general policy of the Government is to give stability and an essentially Fascist character to the State and its institutions. It is a policy similar to that of the men of the Risorgimento who succeeded in getting the then novel ideas of the unity and independence of Italy accepted by the mass of the people, who had until that time been indifferent or opposed to them.

Penal Laws.—A scheme for a new criminal code, containing many innovations, was drafted by Rocco, the minister of justice, and published on Aug. 22, 1927; the provisions of the law for the protection of the State were included in it; the penalties for the graver crimes of violence were made more severe, and penalties were established for sundry offences against morals, the practice and propaganda of birth control, etc. The draft was submitted to a committee of eminent jurists, with a view to presenting it, with their suggested amendments, to parliament. An important undertaking of the Fascist Government was the repression of ordinary crime, especially of the Mafia (*q.v.*) in Sicily, which for generations had terrorized the population of the island and had, to a large extent, enjoyed immunity owing to the impossibility of securing evidence. Mussolini entrusted the task to the prefect of Palermo, Mori, who accomplished it most successfully; numerous arrests were made, and at the three months' trial before the assizes of Termini Imerese, ending in Jan. 1928, witnesses at last gave evidence fearlessly and 147 mafiosi were condemned to severe sentences.

Representation and Organization.—In November 1927 the Fascist Grand Council drafted a new scheme for political representation, which after having been studied by the law officers of the State and the cabinet council, was submitted to parliament and became law in May 1928. In the new parliament the deputies numbered 400 instead of 535. Each of the 13 confederations and certain other recognized bodies of national importance have the right to be represented in a fixed proportion, and submit a list of their candidates for election, voted for by their own council, to the Fascist Grand Council. The latter is entitled to modify the list excluding certain names and adding others. The final list is then submitted to the electorate, which votes on it as a whole. If the list secures a majority of the votes all its members thereby become deputies. If it is rejected fresh elections will be held with competing lists, any association or organization of 5,000 voters having the right to present a list, each list including not more than three-quarters of the deputies to be elected. The lists are to be submitted to the vote; candidates securing the largest number of votes are elected; the seats reserved for minorities are distributed on a proportional basis. All male citizens over 21 years old, and those over 18 years in certain conditions are voters. The new system is

less of an election in the ordinary sense than a means to enable the citizens to express their approval or disapproval of the policy of the Government in general. It is regarded as a provisional measure, and a committee of senators and deputies will sit in permanence to follow its workings and from time to time propose such modifications as will appear desirable. The senate remains unchanged, and so also do the relations between the two chambers and between the latter, the executive and the Crown.

At a meeting of the Fascist Grand Council on Sept. 19, 1928, the powers and composition of that body were definitely laid down. Its chairman is the prime minister and its members are all the ministers and certain under-secretaries, the *Quadriviri* of the March on Rome, the presidents of the senate and the Chamber, the commander of the *Milizia nazionale*, the general secretary and certain other high officers of the Fascist party, the president of the special tribunal, the presidents of the confederation of workers' syndicates, of the agricultural confederation and of the industrial confederation, and of various other Governmental and semi-official organizations. The prime minister can summon other persons to be temporary members of the Grand Council for special purposes. The functions of the Grand Council are to ratify the lists of candidates to parliament according to article 5 of the new electoral law, to decide on the statutes, standing orders and policy of the Fascist party, and to appoint and revoke its chief officers. It is to be consulted on all matters affecting the Constitution, including the prerogatives of the Crown, the succession to the throne, the composition and functions of the senate and the Chamber, the prerogatives and powers of the prime minister, organization, relations between Church and State, and international treaties involving territorial changes. The Grand Council is further called upon to draft and keep up to date lists of persons to be submitted to the Crown, in case of a vacancy, for the succession to the premiership, and also a list of persons whom it deems suitable to fill other vacancies in the cabinet. This scheme finally welds the Fascist party and the State into a single unit, and also provides for the continuity of the régime. At the same session of the Grand Council it was decided that the first general election under the new electoral law should be held in April 1929.

A sensation was caused on Nov. 5, 1925, when it was announced that a plot had been discovered to murder Mussolini. The Socialist ex-deputy Zaniboni, was arrested in a room in a hotel commanding the Palazzo Chigi, armed with a rifle with which, as he confessed, he intended to shoot the premier. Gen. Capello (*q.v.*), ex-commander of the II. Army, an active freemason and a bitter opponent of the Government, was arrested for complicity in the attempt. Both were eventually condemned to 30 years' imprisonment. Mussolini was greeted with enthusiastic demonstrations in consequence of his escape. Another attempt on his life was made by the Hon. Violet Gibson, a demented Irishwoman, on April 7, 1926, on the eve of his departure for Tripoli. The premier was slightly wounded in the nose, but proceeded nevertheless on his journey to visit Italy's North African colony. Miss Gibson was sent back and arrived without further incident in England in May 1927.

SUPPRESSION OF INTERNAL DISORDER

Fascist Policy.—In the field of foreign affairs a treaty with Egypt was concluded, whereby the Jarabub oasis was ceded to Italy and the bay of Sollum was ceded to Egypt. The oasis is important both as the headquarters of the Senussi sect and because its possession enables Italy to prevent the contraband of arms from Egypt to the rebel tribes. Jarabub had been promised to Italy, but Lord Milner had informed Senator Scialoja in April 1920 that, as in the case of Transjuba, the agreement would only become effective after a general settlement of all the problems before the Peace conference, thus coupling the Jarabub question with that of the Dodecanese. As we have seen, this connection was rejected by Italy, and Britain had ended by accepting the Italian view, but with the concession of independence to Egypt in 1922 negotiations had had to be renewed with that country, and were concluded on Dec. 6, 1925.

The policy of the Fascist Government to enforce the teaching

of Italian in the schools of the Alto Adige, and otherwise to give an Italian character to this district inhabited by 180,000 to 200,000 Germans, aroused irritation in Germany, and the pan-German elements voiced by Held, the Bavarian premier, promoted an agitation against Italy, advocating a boycott of Italian goods, and accusing the Italian authorities of terrorizing the population. Mussolini on Feb. 6, 1926, delivered a vigorous speech in the Chamber denouncing this campaign and warning the German Government that unless it ceased Italy would not hesitate to adopt strong measures. This outburst caused widespread excitement abroad, but achieved its object, Stresemann replying in a very minor tone.

The year 1925 was proclaimed by Pope Pius XI. an *Anno Santo*, and over 1,000,000 pilgrims flocked to Rome from all parts of the world. The Italian Government and the Roman municipality collaborated with the Vatican in organizing the transport of the pilgrims and in making arrangements for their stay. Imposing ceremonies were held in St. Peter's and the other churches, undisturbed by any untoward incident. Suggestions were made from time to time for an official conciliation between the State and the Vatican, and although a solution was not reached till 1929, the question was now discussed in a far more friendly spirit than formerly, and the territorial aspirations of the Holy See were no longer stressed. In April 1928 a dispute arose in connection with a meeting in the Capitol of the *Centro nazionale*, a Catholic political organization which had adhered to Fascism; the pope reprimanded it for not having paid homage to him, and while admitting that Fascism had done much good to religion, denied that under the new régime the Church was enjoying a golden age. The Government made no reply, but shortly afterwards issued a decree dissolving the Catholic boy scouts, and providing that all such activities shall be concentrated in the Fascist *Balilla* organization. But, apart from this and other similar occasional misunderstandings, relations between the Church and the State have continued to improve, the Fascist Government attaching particular importance to conciliating the Vatican.

Two further unsuccessful attempts were made on Mussolini's life, one by the anarchist Lucetti in Rome on Sept. 11, 1926, and the other at Bologna on Oct. 31 by a youth named Zamboni; Lucetti was arrested and eventually condemned to 30 years' imprisonment, while Zamboni was lynched by the infuriated crowd. These new outrages aroused the greatest indignation throughout the country, and led to insistent demands for more rigorous measures against what was regarded as an attempt to destroy Fascist Italy. Reprisals against prominent anti-Fascist individuals and newspapers were carried out, and they all were immediately repressed; the Fascist Grand Council on Nov. 5 severely stigmatized them and proceeded to a rigorous revision of the party lists, expelling all members who were deemed unworthy. On the same day the prime minister announced a bill containing various provisions for the protection of the State, viz., the dissolution of the anti-national party organizations (Socialists, Communists and Republicans), the suppression of seditious newspapers, the application of the death penalty for attempts on the life of the king, the queen, the crown prince or the premier and for the graver forms of high treason, varying terms of imprisonment for lesser political crimes, the institution of the *confino* (relegation to a fixed place of residence) for persons of notoriously seditious activities, and for persons deriving their livelihood from usury, the illicit earnings of women, and other immoral sources, and the creation of a special tribunal of summary jurisdiction, presided over by a military judge, for trying graver political crimes. The bill, voted by the Chamber and the Senate, became law on Dec. 15. The Chamber on Nov. 9 voted that the "Aventinian" deputies who had refused to fulfil their parliamentary duties, should be deprived of their seats. There remained three small groups of opponents consisting of the followers of the ex-premiers—Salandra, Giolitti and Orlando—whose opposition, however, was very moderate. These various measures were professedly of a temporary nature, enacted to cover a period of transition from the old régime to the new Fascist State. In order to give greater unity to the conduct of the country's policy, Mussolini took over the Ministry of the Interior from Federzoni, who returned to the Colonial Ministry. On Dec. 8 the *Fascio littorio*

was declared an official emblem, thereby further identifying Fascism with the State.

During the last months of the year there had been considerable activity in the field of foreign affairs. On Sept. 30 a meeting between Mussolini and Sir Austen Chamberlain took place on a yacht off Leghorn, where the chief international problems were discussed. On Nov. 24 a treaty of commerce was concluded with Greece, and on the 27th a pact of friendship and security with Albania. This latter agreement aroused considerable agitation in Yugoslavia, where it was regarded as entrusting the protection of Albania to Italy alone, and led to violent attacks against Italy in the Yugoslav press and parliament. Subsequently (March 1927) Italy called the attention of other Powers to Yugoslavia's warlike preparations against Albania. There was also some friction with France on account of the French Government's alleged protection of the anti-Fascist organizations in France and of its support of Yugoslavia's anti-Italian policy. A treaty of conciliation and arbitration was concluded with Germany on Dec. 29, 1926.

On Nov. 6 a loan was issued for the conversion of the short-term Treasury bills into consolidated Government bonds. In Feb. 1927 the leaders of the old General Confederation of Labour declared their acceptance of the Fascist syndical régime. On April 23 the Charter of Labour was promulgated, constituting a new code of the rights and duties of employers and workers.

Two more treaties of conciliation and arbitration were concluded, with Chile (Feb. 24) and Hungary (April 5), while on March 8 Italy ratified the treaty assigning Bessarabia to Rumania; against this act Soviet Russia lodged a protest on the 19th. In China an Italian force was landed to co-operate with the British in the protection of Shanghai.

Since Mussolini's speech at Pesaro on Aug. 18, 1926, there had been a rapid revaluation in the lira from about 125 to the £ to 90. Although this improvement had many advantages, it produced certain temporary drawbacks, especially by the reduction of the profits of the export trade and a consequent increase of unemployment. Various measures were enacted for bringing down the cost of living, salaries, wages and rents, while taxes were reduced by over a milliard. But the decrease of prices was inevitably slow, and the possibility of further improvements in the currency made the business world chary of new investments. Foreign capital, however, had begun to flow into Italy, especially for hydro-electric development (1,000,000,000 lire from the U.S.A. alone), and a budget surplus for 1926-27 of 405 millions was announced. In the autumn of 1927 the Government decided that the time for the stabilization of the currency on a gold basis had arrived. The operation was carried out by an agreement between the Banca d'Italia, the Bank of England and the U.S. Federal Reserve Bank, concluded in London on Dec. 21. The Banca d'Italia, which is the sole bank of issue, secured a reserve in gold of equivalent currencies amounting to 57% of the paper circulation, and the Italian lira was declared convertible into gold at the rate of 92.46 to the £. (19 to the dollar). Stabilization had been made possible by sound finance, steady agricultural and industrial development, and the consequent confidence of the foreign financial world.

France and Yugoslavia.—Relations with Yugoslavia have undergone a series of vicissitudes. The treaty of friendship and cordial collaboration concluded on Jan. 27, 1924, for five years was followed by a commercial treaty, a consular convention and sundry other agreements in July-August of the same year concluded at Belgrade, which were duly ratified. On July 20, 1925, another series of agreements concerning the status of Italians in Dalmatia and of Yugoslavs in Fiume and other matters were signed at Nettuno. But the Yugoslav Government for a long time specifically refused to ratify them, a fact which tended to embitter relations between the two countries which the 1924 treaties had apparently placed on a more satisfactory basis. A pact of friendship and security with Albania was concluded on Nov. 27, 1926. Yugoslavia was jealous of Italian influence in Albania, where the President (in 1928, King) Ahmed Bey Zogu, who had come into power with Yugoslav help, was now friendlier to Italy than to Yugoslavia. Italy denounced to the other Powers Yugoslavia's military preparations on the Albanian frontier as a menace to that

country's integrity. Yugoslavia thereupon (Nov. 7, 1927) concluded a treaty of friendship with France; although the agreement had been previously initialled and did not in itself contain any dangerous clauses, the moment chosen for its conclusion was regarded in Italy as an unfriendly act and it was interpreted in Yugoslavia as a sort of *carte blanche* given to her by France for an anti-Italian policy, which was evidently not the intention of the French Government. Italy replied by concluding a treaty of alliance with Albania on Nov. 22, 1927. This treaty caused considerable irritation in Yugoslavia, but the French Government appears to have used its influence at Belgrade in a moderating sense, and Franco-Italian relations were improved subsequently by the public declarations of Briand and Mussolini, and by the suppression by the French Government of the *Corriere degli Italiani*, the bitterest of the seditious revolutionary papers published in France. The Yugoslav Government now made an effort to ratify the Nettuno conventions, but this aroused a violent outcry in certain extremist groups, especially in Croatia and Dalmatia, where a number of outrages against Italians were committed. The Belgrade Government repressed them with energy, with the result that the quarrel assumed the aspect of a Serbo-Croat conflict rather than an international one. The conventions were presented to the Skuptchina and voted, and ratifications exchanged on Aug. 13, 1928. Rioting followed in Dalmatia but since then Italo-Yugoslav relations have become more normal.

Other treaties of friendship, conciliation and arbitration have been concluded by Italy since the advent of the Fascist Government with the following countries: Switzerland (Sept. 20, 1924); Czechoslovakia (July 5, 1924); Siam (May 9, 1926); Spain (Aug. 7, 1926); Yemen (Sept. 2, 1926); Germany (Dec. 29, 1926); Chile (Feb. 24, 1927); Hungary (April 5, 1927); Lithuania (Sept. 17, 1927); Mexico (Oct. 16, 1927); Turkey (May 30, 1928); the United States (April 19, 1928); Abyssinia (Aug. 2, 1928); Greece (Sept. 23, 1928). The treaty with Switzerland is regarded as a model of such instruments. (L. V.)

THE VATICAN STATE

The execution of a political treaty with the Holy See on Feb. 11, 1929 ended the Roman Question. The recognition by Italy of the Papal Sovereignty evoked unexampled scenes of enthusiasm in Rome, and created a sense of deep satisfaction amongst the 300,000,000 Roman Catholics throughout the world.

Formal ratification of the treaty and its two accompanying instruments by the high contracting parties had to take place within four months of the affixing of the signature to the respective documents. (A summary of the political treaty will be found at the end of the article on the PAPACY.) It will be seen therefore that the Vatican City is constituted a tiny state, with the status and immunities pertaining to independent civil sovereignty, and with certain public services placed at its disposal by the Italian government. This includes the railway station, and direct connection with other states by telegraphy, telephonic, wireless, broadcasting and postal services. The increase of papal territory is insignificant.

Marriage and Education.—The settlement of the Roman question was accompanied by concordat, which regulates the conditions of religion and of the Church in Italy.

It is stipulated that "The Italian State, wishing to restore dignity to matrimony, which is the basis of the family, in agreement with the Catholic tradition of its own people, recognizes matrimony as a sacrament regulated by canon law in its relation to civil law. Banns of marriage must appear in the parish church as well as in the town hall. Immediately after the celebration of marriage, the parish priest will explain to the married couple the civil consequences of marriage, reading the articles of the civil code concerning the rights and duties of the married."

"Cases concerning nullity of marriage and dissolution of marriages celebrated but not consummated are reserved to the ecclesiastical courts. Their sentences before becoming definitive must be brought before the Supreme Tribunal of the Segnatura, which will examine whether all the rules of canon law have been respected concerning the competence of the judge and whether the interested parties were represented before the court or judged in default."

The decision of the Supreme Tribunal of the Segnatura will be

sent to the court of appeal by the Italian State, which will enforce the sentences of the ecclesiastical authorities, ordering them to be noted in the municipal marriage registers. With regard to cases of separation, the Holy See consents to judgment being given by the Italian civil authorities.

Religious instruction will be compulsory, in the elementary schools and secondary schools, according to a programme to be established in agreement between the Holy See and Italy.

The clauses concerning Church marriages and religious instruction in the schools only apply to Roman Catholics. The marriages of non-Catholics will continue to be performed exclusively by the civil authorities, and children of non-Catholic parents are, at the request of the latter, exempted from Catholic teaching.

(The preamble to the treaty begins by re-affirming the principle contained in the first article of the constitution of the kingdom of Italy, by which the Holy Catholic Apostolic and Roman Religion is the only state religion in Italy.)

Some Implications of the Treaty.—Speculation was immediately rife after the signing of the treaty as to the question of Vatican citizenship, which at the most can only affect those who fulfil the requirements of domicile and papal service. Some writers at the time envisaged the possibility of a "double nationality." But the goodwill and mutual respect that the treaty brought to light as existing between the pope and Mussolini and their advisors, is a happy augury for the satisfactory solution of this and other problems of readjustment inherent in the historic reconciliation.

Proof of the practical goodwill of the Italian government was revealed a few days after the signing of the treaty. The Italian Government, foreseeing the travel needs that would arise when the pope ceased to be "the prisoner of the Vatican," arranged to present his holiness with a modern train similar in most respects to the royal train. (For the terms of the Financial Convention that was also signed between Italy and the Holy See on Feb. 11th, 1929, see PAPACY.)

(L. V.)

ITHACA (Ἰθάκη), vulgarly Thiaki (Θιάκη), next to Paxo the smallest of the seven Ionian islands, with an area of about 44 sq.m.; an eparchy of the nomos of Cephalonia in Greece whose population, with Cephalonia and Leucas, in 1920 was 64,215. It consists of two mountain masses, connected by a narrow isthmus of hills, W. of a wide inlet, the Gulf of Molo. The northern culminates in Anoi (2,650 ft.), the southern in Hagios Stephanos (Merovigli) (2,100 ft.). Vathy, the chief town and port of the island, lies at the northern foot of Mount Stephanos, its white-washed houses stretching for about a mile round the deep bay, to which it owes its name. As there is little arable land in Ithaca, the inhabitants are dependent on commerce for their grain supply; olive oil, wine and currants are the principal products. Goats are fed on the brushwood of the hills; and hares are exceptionally abundant. The island is divided into four districts: Vathy, Aeto (or Eagle's Cliff), Anoge (Anoi) or Upland, and Exoge (Exoi) or Outland.

The name has remained attached to the island from the earliest historical times with but little interruption of the tradition; though in Brompton's travels (12th century) and in the old Venetian maps we find it called Fale or Val de Compar, and at a later date it not infrequently appears as Little Cephalonia. This last name indicates the general character of Ithacan history in modern and in ancient times; for the fame of the island is almost solely due to the Homeric story of Odysseus, its king in the heroic age. In the *Odyssey* the island is incidentally described with picturesque topographical detail, the Homeric localities for which counterparts have been sought are Mount Neritos, Mount Neion, the harbour of Phorcys, the town and palace of Odysseus, the fountain of Arethusa, the cave of the Naiads, the stalls of the swineherd Eumaeus, the orchard of Laertes, the Raven Cliff Korax and the island Asteris, where the suitors lay in ambush for Telemachus. There are two schools of identification, one placing the town at Polis on the west coast in the northern half of the island (Leake, Gladstone, etc.), and the other at Aeto on the isthmus. The latter site, advocated by Sir William Gell, was supported by Dr. H. Schliemann, who carried on excavations in 1873 and 1878. But no amount of ingenuity can fully reconcile the descriptions in the *Odyssey* with the actual topography. Accordingly W. Dörpfeld has suggested that the Homeric Ithaca must be identified with Leucas (Santa Maura, *q.v.*). He deals ingeniously with the Homeric topography and suggests that the name may have been transferred as a result of migration and interprets the valuable and surprising results of his excavations in accordance with his theories of "Achaean" archaeology. Leucas fits Homeric descriptions better than Ithaca; but many scholars refuse to discuss the *Odyssey* as if it were a guide-book, or to look, in the author, for close familiarity with the Ionian islands.

ITHACA, a city of New York, U.S.A., at the southern end

of Cayuga Lake; the county seat of Tompkins county. It is served by the Lackawanna and the Lehigh Valley railways and by lake steamers. The population in 1925 was 18,948. The city spreads up from a level valley over heights to the south, east and west. It is surrounded by the romantic scenery of the Finger Lake region, and there are picturesque gorges, cascades and water-falls within the city limits. Cornell university (*q.v.*) occupies a beautiful campus of 1,500 acres. On the edge of the city is Buttermilk Falls State park; and the State parks embracing Taughannock Falls (215 ft. high) and Enfield Falls are respectively 9 m. N. and 7 m. S.W. Ithaca is a farming centre, a distribution point for coal from the Pennsylvania mines; and has various manufactures (including firearms, typewriters, adding machines, electric clocks) valued in 1925 at \$6,910,811. Ithaca was settled about 1789; named by Simeon De Witt in 1806; incorporated as a village in 1821; and chartered as a city in 1888. At Buttermilk Falls stood the principal village of the Tutelo Indians (Coreorgonel), destroyed by Sullivan's army in 1779.

ITINERARIUM, a term applied to the extant descriptions of the ancient Roman roads and routes of traffic, with the stations and distances (Lat. *iter*, road). Earlier than these, and therefore to be treated as an original source, are the silver cups found at Vicarello, on the lake of Bracciano (*q.v.*), which belong to the time of Trajan, and give the stations from Gades (Cadiz) to Rome overland through Spain, southern Gaul and Italy. There are a few inscriptions which give shorter stretches; but for the rest, we are dependent on the written itineraries. According to one view, all the sources we have are derived from a lost official map; one descendant of this is the *Antonine Itinerary*, a somewhat unskilful excerpt from it of the stations and distances along the various roads of the Roman empire; while from another map (also lost) are derived the *Ravenna Itinerary* and the *Tabula Peutingeriana*. Another view (Miller's) is that the maps arose out of the itineraries, which were kept at the main posting centres, and brought up to date from information given by travellers. Thus, he would hold, the *Antonine Itinerary* is made up from material collected from these itineraries and from travellers in various parts of the world. It belongs to the time of Diocletian, but is of private origin.

The *Tabula Peutingeriana* is a 12th century copy of Castorius' map of the world (4th century), which was intended to be rolled, and was also unofficial. From it is derived the *Ravenna Itinerary*.

The *Itinerarium Hierosolymitanum*, made by an unknown pilgrim in A.D. 333, records the stations and distances from Bordeaux overland to Jerusalem and back by Valona and Rome to Milan. The *Itinerarium Maritimum* (generally, but wrongly regarded as the second part of the *Itinerarium Antonini*) is independent.

See R. Miller, *Itineraria Romana* (Stuttgart, 1916); and for Roman Britain, T. Codrington, *Roman Roads in Britain*; O. G. S. Crawford in *Antiquity*, i. 195 (1927).

ITIUS PORTUS, the name given by Caesar to the chief harbour which he used when embarking for his second expedition to Britain in 54 B.C. It was certainly near Cape Grisnez (*Promuntorium Itium*), but the exact site has been disputed. Many have assumed that Caesar used the port for his first expedition, but the name does not appear at all in that connection and it is generally agreed that he first embarked at Boulogne, and the same view was widely held about the second. But T. Rice Holmes in the *Classical Review* (May 1909) gave strong reasons for preferring Wissant, 4 m. E. of Grisnez.

ITO, HIROBUMI, PRINCE (1841–1909), Japanese statesman, was born in 1841, being the son of Ito Jūzō, and (like his father) began life as a retainer of the lord of Choshu, one of the most powerful nobles of Japan. Choshu, in common with many of his fellow Daimyos, was bitterly opposed to the rule of the shōgun or tycoon, and when this rule resulted in the conclusion of the treaty with Commodore M. C. Perry in 1854, the smouldering discontent broke out into open hostility against both parties to the compact. In these views Ito cordially agreed with

his chieftain, and was sent on a secret mission to Yedo to report to his lord on the doings of the government. This visit caused Ito to turn his attention seriously to the study of the British and of other military systems. As a result he persuaded Choshu to remodel his army, and to exchange the bows and arrows of his men for guns and rifles.

But Ito felt that real knowledge of foreigners must be sought in Europe, and with the connivance of Choshu he and Inouye with three other young nobles, determined to risk their lives by committing the then capital offence of visiting a foreign country and went to London for a year to study English methods, but then events in Japan recalled them to their country. The treaties lately concluded by the shōgun with foreign powers conceded the right to navigate the strait of Shimonoseki, leading to the Inland Sea. On the northern shores of this strait lay the feudal state ruled over by Prince Choshu, who refused to recognize the clause opening the strait, and erected batteries on the shore, from which he opened fire on all ships which attempted to force the passage. The shōgun having declared himself unable to enforce the provision, the treaty powers determined to take the matter into their own hands.

Ito, who knew better than Prince Choshu the disproportion between the fighting powers of Europe and Japan, memorialized the cabinets, begging that hostilities should be suspended until he had used his influence with Choshu in the interests of peace. With this object Ito hurried back to Japan. But Choshu refused to give way, and suffered the consequences of his obstinacy in the destruction of his batteries and in the infliction of a heavy fine. Ito's part in these negotiations aroused the animosity of the more reactionary of his fellow-clansmen, who made repeated attempts to assassinate him. In 1868 Ito was made governor of Hiogo, and in 1869 vice-minister of finance. In 1871 he accompanied Iwakura on a mission to Europe, which, though diplomatically a failure, resulted in the enlistment of European advisers on military, naval and educational systems.

After his return to Japan Ito served in several cabinets as head of the bureau of engineering and mines, and in 1886 he became prime minister, a post which, when he resigned in 1901, he had held four times. In 1882 he was sent on a mission to Europe to study the various forms of constitutional government; on this occasion he attended the coronation of the tsar Alexander III. On his return to Japan he was entrusted with the drafting of a constitution. In 1890 he reaped the fruits of his labours, and nine years later he witnessed the abrogation of the old treaties, and the conclusion of conventions which placed Japan on terms of equality with the European states. In the work of reform in Japan Ito played a leading part. He was able to meet Li Hung-chang at the end of the Chinese and Japanese War (1895) as the representative of Japan, and the conclusion of the Anglo-Japanese Alliance in 1902 testified to his triumphant success in raising Japan to the first rank among civilized powers.

After the Russo-Japanese War (1905) Ito was appointed resident general in Korea, and increased Japanese influence in that country. He retired from this post in July 1909, and became president of the privy council in Japan. But on Oct. 26, when on a visit to Harbin, he was shot dead by a Korean assassin.

He is to be distinguished from Admiral Yuko Ito (b. 1843).

ITONAMAN, a small group of tribes of South American Indians, supposed on meagre evidence to constitute an independent linguistic stock. The stock gets its name from the Itonamas, the best known tribe of the group, which occupies a small area in north-eastern Bolivia along the Itonama river (a tributary of the Guapore) from its mouth up as far as the large lake of the same name in lat. 14° S. The Itonamas are a sedentary, agricultural folk, good canoeists and makers of excellent cotton textiles.

See A. D'Orbigny, *L'Homme Américain* (Paris, 1839); A. Landi, "Appunti sulle condizioni," etc. (*Arch. per Antropologia e Etnologia*, vol. xxxvi., pp. 219–228).

ITRI, a town of Campania, Italy, province of Rome, 4 m. by rail from Formia. Pop. (1921) 5,393. The town is 690 ft. above sea-level, in the mountains which the Via Appia traverses between Fondi and Formia. Interesting remains of the ancient road are preserved in Itri itself; and there are many remains of

ancient buildings near it. The place was once noted for brigandage.

ITUCALÉAN, a small group of tribes of South American Indians, supposed on very insufficient evidence to constitute an independent linguistic stock. The Itucalés, or Uarinas lived in north-eastern Peru on the Chambira river, a northern tributary of the Marañon between the Tigre and the Pastaza. Little or nothing is known of them.

See F. de Figueroa, *Relacion de las Misiones . . . en el País de los Maynas* (Col. de Libros y Documentos referentes a la Historia de America), vol. i. (Madrid, 1904).

ITURBIDE, AUGUSTIN DE (1783-1824), emperor of Mexico from May, 1822 to March, 1823, was born on Sept. 27, 1783, at Valladolid, now Morelia, in Mexico. He joined the provincial regiment of his native city in 1797. In 1810 Hidalgo offered him a flattering post in his revolutionary army, but he refused and joined the royalists. In Dec. 1813, Iturbide, now a colonel, and Gen. Llano defeated Morelos, the successor of Hidalgo, in the battle of Valladolid, thereby dealing a crushing blow to the revolt. In consideration of his services, the government placed him in command of the military district of Guanajuato and Michoacán, but in 1816 grave charges of extortion and violence led to his recall.

In 1820, when Ferdinand VII. of Spain was compelled to acknowledge once more the Constitution of 1812, Iturbide became associated with the conservatives in Mexico in a revolutionary movement. Iturbide issued Feb. 24, 1821, the famous *Plan de Iguala* for a Mexican empire. His plan conciliated all classes of society as Hidalgo's had never done. The military chieftains Santa Anna, Nicolás Bravo and Vicente Filisola supported him. In March 1821, Veracruz acknowledged his leadership, Valladolid was captured in May, and in June, Querétaro. In July the viceroy was withdrawn and on Aug. 24, 1821, Gen. Juan O'Donojú, the new representative of the king, seeing the futility of struggle, signed the treaty of Córdoba that gave Mexico her independence. In September Iturbide entered the City of Mexico; in Feb. 1822, the Spanish *Cortes* refused to sanction the treaty of Córdoba; and on May 19, Congress proclaimed Iturbide Augustín I. of Mexico. His régime proved arbitrary and extravagant, and in Dec. 1822, Santa Anna issued a *pronunciamiento* against him.

On March 19, 1823, Iturbide abdicated, and on May 11, sailed for Leghorn, Italy. Congress declared all matters appertaining to the election, coronation and administration of the late emperor null and void. In Dec. 1823, Iturbide moved to London; in Feb. 1824, he offered his services to the Mexican Congress; and on May 11, ignorant of a decree of death awaiting his reappearance in Mexico, sailed from England, landing near Soto la Marina on July 15. He was recognized, captured and shot, by order of the State of Tamaulipas, at Padilla, on July 19, 1824. In 1838 Congress ordered his remains removed to Mexico City where they lie in the cathedral with those of Hidalgo and other leaders.

See *Statement of Some of the Principal Events in the Public Life of Augustín de Iturbide*, written by himself (Eng. trans., 1824); also W. S. Robertson, *Rise of the Spanish-American Republics* (New York, 1918). (W. B. P.)

ITZA, an American-Indian people of Mayan stock, inhabiting the country around Lake Peten in northern Guatemala. Chichen-Itza, among the most wonderful of the ruined cities of Yucatan, was the capital of the Itzas. Thence, according to tradition they removed, on the breaking up of the Mayan kingdom in 1420, to an island in the lake and built another city. In 1697, the Spaniards destroyed the city and temples, and a library of sacred books, written in hieroglyphics on bark fibre.

ITZEHOE, a town in the Prussian province of Schleswig-Holstein, on the Stör, 32 m. N.W. of Hamburg and 15 m. N. of Glückstadt. Pop. (1925) 19,619. Itzehoe, the oldest town in Holstein, had as its nucleus a castle, built in 809. In 1201 the town was destroyed, but it was restored in 1224. Lübeck rights were granted to the new town in 1238, and to the old town in 1303. It passed to Prussia in 1867, with the duchy of Schleswig-Holstein. Ancient buildings include the church of St. Laurence (12th century), and a convent founded in 1256. Manufactures include

machinery, tobacco, fishing-nets, soap, cement and beer. Iron founding, shipbuilding and wool-spinning are carried on.

IUKA, the county seat of Tishomingo county, Mississippi, U.S.A., c. 25 m. S.E. of Corinth, N.E. corner of the State and 8 m. S. of the Tennessee river. Pop. (1910) 1,221; (1920) 1,306. In the American Civil War, a Confederate force under Gen. Sterling Price occupied the town on Sept. 14, 1862, driving out a small Union garrison; and on Sept. 19, a partial engagement took place between Price and a Federal column in which the Confederate losses were 700 and the Union 790. Price, whose line of retreat was threatened by superior forces under Gen. Grant, withdrew from Iuka on the morning of Sept. 20.

IULUS, in Roman legend: (a) the eldest son of Ascanius and grandson of Aeneas, founder of the Julian gens (*gens Iulia*), deprived of his kingdom of Latium by his younger brother Silvius (Dion. Halic. i. 70); (b) another name for Ascanius.

IUTURNA, previously Diuturna, "the lasting," Latin divinity, a personification of the never-failing springs. Her original home was on the river Numicius near Lavinium, where there was a spring called after her, supposed to possess healing qualities (whence the old Roman derivation from *iuvare*, "to help"). Her worship was early transferred to Rome, localized by the Lacus Iuturnae near the Temple of Vesta, at which Castor and Pollux, after announcing the victory of Lake Regillus, were said to have washed the sweat from their horses. At the end of the First Punic War, Lutatius Catullus erected a temple in her honour on the Campus Martius, subsequently restored by Augustus. Iuturna was associated with two festivals: the Iuturnalia on Jan. 11, probably a dedication festival of a temple built by Augustus, and celebrated by the college of the *fontani*, workmen employed in the construction and maintenance of aqueducts and fountains; and the Volcanalia on Aug. 23, at which sacrifice was offered to Volcanus, the nymphs and Iuturna, as protectors against outbreaks of fire. In Virgil, Iuturna appears as the sister of Turnus (probably owing to the partial similarity of the names), on whom Jupiter, to console her for the loss of her chastity, bestowed immortality and the control of all the lakes and rivers of Latium. For the statement that she was the wife of Janus and mother of Fontus (or Fons), the god of fountains, Arnobius (*Adv. gentes* iii. 29) is alone responsible.

IVAN VI. (1740-1764), emperor of Russia, was the son of Prince Antony Ulrich of Brunswick, and the princess Anna Leopoldovna of Mecklenburg, and great-nephew of the empress Anne, who adopted him and declared him her successor on Oct. 5, 1740, when he was only eight weeks old. On the death of Anne (Oct. 17) he was proclaimed emperor, and on the following day Biren, duke of Courland, was appointed regent. On the fall of Biren (Nov. 8, 1740), the regency passed to the baby tsar's mother, though the government was in the hands of the vice-chancellor, Andrei Osterman. A *coup d'état* placed the tsarevna Elizabeth on the throne (Dec. 6, 1741), and Ivan and his family were imprisoned in the fortress of Dünamünde (Dec. 13, 1742). In June 1744 they were transferred to Kholmogory on the White Sea, where Ivan, seeing nobody but his gaoler, remained for the next twelve years. He was then secretly transferred to the fortress of Schlüsselburg (1756), where even the commandant of the fortress was left in ignorance of his identity. In the few weeks' reign of Peter III. his condition was improved, but later instructions were given to chain him up. On the accession of Catherine orders were given that the prisoner was not to be delivered alive into any one's hands, even if his deliverers produced the empress's own sign-manual authorizing his release. By this time, twenty years of solitary confinement had disturbed Ivan's mental equilibrium, though he does not seem to have been actually insane. A sub-lieutenant of the garrison, Vasily Mirovich, learned his identity, and formed a plan for freeing and proclaiming him emperor. At midnight on July 5, 1764, Mirovich won over some of the garrison, arrested the commandant, Berednikov, and demanded the delivery of Ivan, who there and then was murdered by his gaolers in obedience to their instructions.

See R. Nisbet Bain, *The Pupils of Peter the Great* (London, 1897); M. Semevsky, *Ivan VI. Antonovich* (Rus.) (St. Petersburg, 1866); A. Brückner, *The Emperor Ivan VI. and his Family* (Rus.) (Moscow, 1874); V. A. Bilbasov, *Geschichte Catherine II.* (vol. ii., Berlin, 1891-93).

IVAN IV., called "the Terrible" (1530-1584), tsar of Muscovy, was the son of Vasily [Basil] III. Ivanovich, grand duke of Muscovy, by his second wife, Helena Glinska. Born on Aug. 25, 1530, he was proclaimed grand duke on the death of his father (1533), and took the government into his own hands in 1544, being then 14 years old. Ivan IV. had a neurotic strain in his character. His father died when he was three, his mother when he was only seven, and he grew up in a brutal and degrading environment where he learnt to hold human life and human dignity in contempt. He was maltreated by the leading boyars whom successive revolutions placed at the head of affairs, and he conceived an inextinguishable hatred of their whole order and a liking for the merchant class, their natural enemies. He threw to his dogs the last of his boyar tyrants, and announced his intention of assuming the title of tsar, a title which his father and grandfather had not dared to assume. On Jan. 16, 1547, he was crowned the first Russian tsar by the metropolitan of Moscow; on Feb. 3 in the same year he selected as his wife from among the virgins gathered from all parts of Russia for his inspection, Anastasia Zakharina-Koshkina, the scion of an ancient and noble family better known by its later name of Romanov.

Hitherto, by his own showing, the private life of the young tsar had been abominable, but in 1550 he summoned a *Zemsky Sobor* or national assembly, the first of its kind, to which he made public confession of the sins of his youth, and at the same time promised that the realm of Russia (for whose dilapidation he blamed the boyar regents) should henceforth be governed justly and mercifully. In 1551 the tsar submitted to a synod of prelates a hundred questions as to the best mode of remedying existing evils, for which reason the decrees of this synod are generally called *stoglav* or *centuria*. At this time Ivan deliberately broke with his disreputable past and surrounded himself with good men of lowly origin. The chief of these were Alexis Adashev and the monk Sylvester, men of obscure origin, and the best Muscovites of their day. The period of their administration coincides with the most glorious period of Ivan's reign—the period of the conquest of Kazan and Astrakhan.

In 1551 one of the factions of Kazan offered the whole khanate to the young tsar, and on Aug. 20, 1552 he began the siege with an army of 150,000 men and 50 guns. On Oct. 2 the fortress, which had been heroically defended, was taken by assault. The conquest of Kazan was the first territorial conquest from the Tatars, before whom Muscovy had humbled herself for generations; at Kazan Asia, in the name of Mohammed, had fought behind its last trench against Christian Europe marshalled beneath the banner of the tsar of Muscovy. For the first time the Volga became a Russian river. Nothing could now retard the natural advance of the young Russian state towards the east and the south-east. In 1554 Astrakhan fell almost without a blow. By 1560 all the Finnic and Tatar tribes between the Oka and the Kama had become Russian subjects. Ivan was also the first tsar who dared to attack the Crimea. In 1555 he sent Ivan Sheremetev against Perekop, and Sheremetev routed the Tatars in a great two days' battle at Sudbishenska. Some of Ivan's advisers, including both Sylvester and Adashev, now advised him to make an end of the Crimean khanate, as he had already made an end of the khanates of Kazan and Astrakhan. But Ivan recognized the difficulties involved. He coveted Livonia, which was comparatively near at hand and promised him a seaboard and direct communication with western Europe. Ivan IV. desired to raise Muscovy to the level of her neighbours. He proposed immigration into his tsardom of master-workmen and skilled artificers. But his neighbours combined to thwart him. Charles V. dispersed 123 skilled Germans whom Ivan's agent had collected and brought to Lübeck for shipment to a Baltic port. Therefore, when Sweden, Poland and Denmark were contesting the possession of Livonia, Ivan intervened in 1558. He captured Narva, Dorpat and a dozen smaller fortresses; then, in 1560, Livonia placed herself

beneath the protection of Poland, and King Sigismund II. warned Ivan off.

Ivan now entered upon the second and evil portion of his reign. As early as 1553 he had ceased to trust Sylvester and Adashev, owing to their backwardness in supporting the claims of his infant son to the throne while he himself lay at the point of death. On his recovery he overlooked their ambiguous conduct, and they continued to direct affairs for six years longer. Then the dispute about the Crimea arose, and Ivan began to distrust their intelligence as well as their loyalty. In 1560 both of them disappeared from the scene, Sylvester into a monastery at his own request, while Adashev died the same year, in honourable exile as a general in Livonia. The death of his wife Anastasia and his son Demetrius, and the desertion of his one bosom friend Prince Kurbsky, about the same time, seem to have infuriated Ivan against God and man. During the next ten years (1560-1570) terrible and horrible things happened in Muscovy. The tsar imagined that every man's hand was against him. On Dec. 3, 1564 he quitted Moscow with his whole family. On Jan. 3, 1565, he declared his intention to abdicate. The common people, whom he had always favoured at the expense of the boyars implored him to come back on his own terms. He consented to do so, but entrenched himself within a peculiar institution, the *oprichina* or "separate estate." Certain towns and districts all over Russia were separated from the rest of the realm, and their revenues were assigned to the maintenance of the tsar's new court and household, which was to consist of 1,000 carefully selected boyars and lower dignitaries, with their families and suites, in the midst of whom Ivan henceforth lived exclusively. The *duma*, or council, still attended to the administration; the old boyars still retained their ancient offices and dignities. But the tsar had cut himself off from all communication with them except on extraordinary occasions. The *oprichniki* trampled with impunity upon every one beyond the charmed circle. Their first victim was Philip, the saintly metropolitan of Moscow, who was strangled for condemning the *oprichina* as an unchristian institution, and refusing to bless the tsar (1569). Ivan had stopped at Tver, to murder St. Philip, while on his way to destroy the second wealthiest city in his tsardom—Great Novgorod. A delator of infamous character, one Peter, had accused the authorities of the city to the tsar of conspiracy; Ivan, without even confronting the Novgorodians with their accuser, proceeded at the end of 1569 to punish them. After ravaging the land he entered the city on Jan. 8, 1570, and for the next five weeks, day after day, massacred batches of every class of the population. Every monastery, church, manor-house, warehouse and farm within a circuit of 100 m. was plundered and left roofless, all goods were pillaged, all cattle destroyed. Not till Feb. 13 were the miserable remnants of the population permitted to rebuild their houses.

An intermittent and desultory war, with Sweden and Poland simultaneously, for the possession of Livonia and Estonia, went on from 1560 to 1582. Ivan's generals bore down their enemies by sheer numbers, capturing scores of fortresses and towns. But in the end the superior military efficiency of the Swedes and Poles invariably prevailed. Ivan had as his chief antagonist Stephen Báthory, one of the greatest captains of the age. The West was too strong for him. By the peace of Zapolie (Jan. 15, 1582) he surrendered Livonia with Polotsk to Báthory, and by the truce of Ilyusa he at the same time abandoned Ingria to the Swedes. The Baltic seaboard was lost to Muscovy for another century and a half. In his latter years Ivan cultivated friendly relations with England; he wished to marry Mary Hastings, one of Elizabeth's ladies, though his fifth wife, Martha Nagaya, was still alive. Towards the end of his life Ivan acquired Siberia, which was first subdued by the Cossack hetman Ermak or Yermak in 1581.

In November 1580 Ivan in a fit of ungovernable fury struck his eldest surviving son Ivan, whom he passionately loved, a blow which proved fatal. In an agony of remorse, he would now have abdicated, but the boyars absolutely refused his abdication. Three years later, on March 18, 1584, he died. During the last moments of his life he assumed the hood of the strictest order of

hermits, and died as the monk Jonah.

Ivan IV. possessed extraordinary political foresight. He anticipated the ideals of Peter the Great, but the resources for their realization were lacking. His brutal and vicious manners prepared the way for the horrors of "the Great Anarchy." Personally, Ivan was tall and well-made, with high shoulders and a broad chest. His face had a sinister, troubled expression, but an enigmatical smile played perpetually around his lips. He was the best educated and the hardest worked man of his age. His memory was astonishing, his energy indefatigable. As far as possible he saw to everything personally, and never sent away a petitioner of the lower orders.

IVAN V.¹ (1666-1696), tsar of Russia, was the son of Tsar Alexis Mikhailovich and his first consort Miloslavzkoya. Physically and mentally deficient, Ivan was the mere tool of the party in Muscovy who would have kept the children of the tsar Alexis, by his second consort Natalia Naruiskhina, from the throne. In 1682 the party of progress, headed by Artamon Matveyev and the tsaritsa Natalia, passed Ivan over and placed his half-brother, the vigorous and promising little tsarevich Peter, on the throne. On May 23, however, the Naruiskhin faction was overthrown by the *stryeltsi* (musketeers), secretly worked upon by Ivan's half-sister Sophia, and Ivan was associated as tsar with Peter. Three days later he was proclaimed "first tsar," in order still further to depress the Naruiskhins, and place the government in the hands of Sophia exclusively. In 1689 the name of Ivan was used as a pretext by Sophia in her attempt to oust Peter from the throne altogether. During the reign of his colleague Peter, Ivan V. took no part whatever in affairs, but devoted himself to religious exercises. On Jan. 9, 1684, he married Praskovia Saltyukova, who bore him five daughters, one of whom, Anne, ultimately became empress. He died on Jan. 29, 1696.

See R. Nisbet Bain, *The First Romanovs* (London, 1905); M. P. Pogodin, *The First Seventeen Years of the Life of Peter the Great* (Rus.) (Moscow, 1875).

IVAN III. (1440-1505), grand duke of Muscovy, son of Vasily (Basil) Vasilievich the Blind, grand duke of Moscow, and Maria Yaroslavovna, was born in 1440. He was co-regent with his father during the latter years of his life, and succeeded him in 1462. Ivan III.'s first enterprise was a war with the republic of Novgorod, which, alarmed at the growing dominance of Muscovy, had sought the protection of Casimir IV., king of Poland, an alliance regarded at Moscow as an act of apostasy from orthodoxy. Ivan took the field against Novgorod in 1470; during the summer of 1471, the Novgorodians sued for peace, which they obtained on engaging to abandon for ever the Polish alliance, ceding a considerable portion of their northern colonies, and paying a war indemnity of 15,500 roubles. Ivan sought continually a pretext for destroying Novgorod altogether; he found his opportunity in 1477. In that year the ambassadors of Novgorod addressed him in public audience as "Gosudar" (sovereign) instead of "Gospodin" ("Sir") as heretofore. Ivan seized upon this as a recognition of his sovereignty, and when the Novgorodians repudiated their ambassadors, he marched against them. Deserted by Casimir IV., and surrounded on every side by the Muscovite armies, which included a Tatar contingent, the republic recognized Ivan as autocrat, and surrendered (January 14, 1478) all her prerogatives and possessions (the latter including the whole of northern Russia from Lapland to the Urals) into his hands. Subsequent revolts (1479-1488) were punished by the removal

en masse of the richest and most ancient families of Novgorod to Moscow, Vyatka and other central Russian cities. Novgorod, as an independent state, ceased to exist. The rival republic of Pskov purchased the continuance of its political existence by assisting Ivan against its ancient enemy. The other principalities were virtually absorbed, by conquest, purchase or marriage contract—Yaroslavl in 1463, Rostov in 1474, Tver in 1485.

Ivan's refusal to share his conquests with his brothers, and his interference in their inherited principalities, involved him in several wars, from which, though the princes were assisted by Lithuania, he emerged victorious. Ivan's last will decreeing that the domains of all his kinsfolk, after their deaths, should pass directly to the reigning grand duke instead of reverting to the princes' heirs, destroyed these semi-independent princedoms. Ivan determined to annex part of Lithuania, now governed by his son-in-law Alexander, who was compelled in 1499 to take up arms against his father-in-law. The Lithuanians were routed at Vedrosha (July 14, 1500), and in 1503 Alexander purchased peace by ceding to Ivan, Chernigov, Starodub, Novgorod-Syever'sk and sixteen other towns.

In the reign of Ivan III. Muscovy rejected the Tatar yoke. In 1480 Ivan refused to pay the customary tribute to the grand Khan Ahmed. All through the autumn the Russian and Tatar hosts confronted each other on opposite sides of the Ugra, till Nov. 11, when Ahmed retired into the steppe. In the following year the grand khan, while preparing a second expedition against Moscow, was suddenly attacked, routed and slain by Ivak, the khan of the Nogai Tatars, whereupon the Golden Horde suddenly fell to pieces. In 1487 Ivan reduced the khanate of Kazan (one of the offshoots of the Horde) to the condition of a vassal-state, though in his later years it broke away from his suzerainty. With the other Mohammedan powers, the khan of the Crimea and the sultan of Turkey, Ivan's relations were pacific and even amicable. The Crimean khan, Mengli Girai, helped him against Lithuania, and facilitated the opening of diplomatic intercourse between Moscow and Constantinople, where the first Russian embassy appeared in 1495.

The character of the government of Muscovy under Ivan III. took on an autocratic form. This was due to the natural consequence of the hegemony of Moscow over the other Russian lands, and to the simultaneous growth of new and exotic principles falling upon a soil already prepared for them. After the fall of Constantinople, orthodox canonists were inclined to regard the Muscovite grand dukes as the successors of the Byzantine emperors. After the death of his first consort, Maria of Tver (1467), Ivan III. wedded the Catholic Zoe Paleologa (better known by her orthodox name of Sophia), daughter of Thomas, despot of the Morea, who claimed the throne of Constantinople as the nearest relative of the last Greek emperor. Through her influence the ceremonious etiquette of Constantinople with the imperial double-headed eagle was adopted by the court of Moscow. The old patriarchal systems of government vanished. The boyars were no longer consulted on affairs of state. The sovereign became sacrosanct, while the boyars were reduced to the level of slaves absolutely dependent on the will of the sovereign. The boyars naturally resented so insulting a revolution, and struggled against it, at first with some success. But Sophia prevailed in the end, and her son Vasily was ultimately crowned co-regent with his father (April 14, 1502). The first Russian "Law Book," or code, was compiled by the scribe Gusev in Ivan's reign. The grand duke invited many foreign masters and artificers to settle in Muscovy, the most noted of whom was the Italian Ridolfo di Fioravante, nicknamed Aristotle, who built the cathedrals of the Assumption (Uspenski) and of Saint Michael or the Holy Archangels in the Kremlin.

See P. Pierling, *Mariage d'un tsar au Vatican, Ivan III. et Sophie Paléologue* (Paris, 1891); E. I. Kashprovsky, *The Struggle of Ivan III. with Sigismund I.* (Rus.) (Nizhni, 1899); S. M. Solov'ev, *History of Russia* (Rus.), vol. v. (St. Petersburg, 1895).

IVAN I., called *Kalita*, or Money-Bag (d. 1341), grand duke of Vladimir, was first *sobiratel*, or "gatherer" of the scattered Russian lands, thereby laying the foundations of the future

¹Ivan V., if we count from the first grand duke of that name, as most Russian historians do; Ivan II., if, with the minority, we reckon from Ivan the Terrible as the first Russian tsar.

autocracy as a national institution. He adopted a policy of complete subserviency to the khan of the Golden Horde, who, in return for a liberal and punctual tribute, permitted him to aggrandize himself at the expense of the lesser grand dukes. Moscow and Tver were the first to fall. The latter Ivan received from the hand of the khan, after devastating it with a host of 50,000 Tatars (1327). When Alexander of Tver fled to Pskov, Ivan procured his banishment by the aid of the metropolitan, Theognost, who threatened Pskov with an interdict. In 1330 Ivan extended his influence over Rostov by the drastic methods of blackmail and hanging. But he threatened the republic of Great Novgorod in vain. In 1340 Ivan assisted the khan to ravage the domains of Prince Ivan of Smolensk, who had refused to pay the customary tribute to the Horde. Ivan's own domains remained free from Tatar incursions, and therefore attracted immigrants and their wealth from surrounding principalities. Ivan was a niggard, keeping an exact account of every village or piece of plate that his moneybags acquired, whence his nickname. During his reign the metropolitan see was transferred from Vladimir to Moscow, which gave Muscovy the pre-eminence over all the other Russian states. The Metropolitan Peter built the first stone cathedral of Moscow, and his successor, Theognost, followed suit with three more stone churches. Simultaneously Ivan substituted stone walls for the ancient wooden ones of the Kremlin, or citadel, which made Moscow a still safer place of refuge.

See S. M. Soloviev, *History of Russia* (Rus.), vol. iii. (St. Petersburg, 1895); Polezhaev, *The Principality of Moscow in the first half of the 14th Century* (Rus.) (St. Petersburg, 1878).

IVAN II. (1326–1359), grand duke of Vladimir, a younger son of Ivan Kalita, succeeded his elder brother Simeon as grand duke in 1353, despite the competition of Prince Constantine of Suzdal, the Khan Hanibek preferring to bestow the *yarluik*, or letter of investiture, upon Ivan rather than upon Constantine. At first the principalities of Suzdal, Ryazan and the republic of Novgorod refused to recognize him as grand duke, and waged war with him till 1354. The surrounding principalities paid little attention to Moscow, and Ivan was ruled to a great extent by the *tuisyatsky*, or chiliarch, Alexis Khvost, and, after his murder by the jealous boyars in 1357, by Bishop Alexis. Ivan, by his last will, divided his dominions among his children.

See Dmitry Ilovaisky, *History of Russia* (Rus.), vol. ii. (Moscow, 1876–94).

IVANOVO-VOZNESENSK, (1) a province of the Russian S.F.S.R., drained by the Volga and its tributary the Unzha. It lies in the *taiga* or pine forest area, and is thickly forested north of the Volga and east of the Unzha, but in the south-western district the forest remains in patches only. Rye and oats are the main crops, with potatoes, grasses, flax, wheat, barley and buckwheat in much smaller quantities. Sheep, cattle, horses and pigs are reared. A network of electric stations working on the abundant peat fuel of the district is planned, and the town of Ivanovo-Voznesensk is supplied from an electric plant at Teikovo, near Lake Rubsk, on the railway to Moscow via Aleksandrov.

(2) A town, the administrative centre of the province, linked by branch lines with the Moscow to Nizhni-Novgorod and the Moscow to Yaroslavl railways, and also to Kineshma on the Volga river. It has important cotton and linen factories, equipped with up-to-date machinery, and iron and chemical works connected with its textile industries. Its population is increasing rapidly and was 110,728 in 1926. Originally it consisted of two villages—Ivanovo, dating from the 16th century, and Voznesensk, of more recent date—united into a town in 1861. Its cathedral and the church of the Intercession of the Virgin were formerly associated with an important monastery founded in 1579 and abandoned in 1754.

IVARR BEINLAUSI (d. 873), son of Ragnar Lothbrok, the great Viking chieftain, is known in English and Continental annals as Inuaer, Ingwar or Hingwar. He was one of the Danish leaders in the Sheppey expedition of 855 and was perhaps present at the siege of York in 867. The chief incident in his life was his share in the martyrdom of St. Edmund in 870. He seems to have

been the leader of the Danes on that occasion, and by this act he probably gained the epithet "crudelissimus" by which he is usually described. It is probable that he is to be identified with Imhar, king of the Norsemen of all Ireland and Britain, who was active in Ireland between the years 852 and 873, the year of his death.

IVEAGH, EDWARD CECIL GUINNESS, 1ST EARL OF (1847–1927), was born on Nov. 10, 1847, the son of Sir Benjamin Guinness, first baronet. He was educated at Trinity college, Dublin, and after some experience of the business became chairman of the famous Guinness brewery. He retired from the management in 1889, marking his retirement by a gift of £250,000 for the housing of the poor in Dublin and in London. A little later he provided another £250,000 for the clearing of an insanitary area in Dublin and the erection of workmen's dwellings. His other great benefactions included £250,000 to the Lister Institute of Preventive Medicine in London for bacteriological research. Last of all he rescued Ken Wood, north of Hampstead Heath, for the benefit of Londoners by purchasing the remaining portion of the estate in 1925 and arranging that Ken Wood with its collection of pictures and the 76 acres on which it stood should become public property. From 1905 onwards when he purchased Elveden Hall, Suffolk, most of his time was spent in England, but he never lost touch with his native city, of which he was a constant benefactor, and he did not allow his Unionist principles to interfere with his civic patriotism. Guinness received a barony in 1891, a viscounty in 1905 and an earldom in 1919. He died in London on Oct. 7, 1927.

He was succeeded by his son, Rupert Viscount Elveden, M.P. (b. 1874), whose wife (née Lady Gwendolen Onslow) entered Parliament as member for Southend in 1927.

IVES, FREDERIC EUGENE (1856–), American inventor, was born on Feb. 17, 1856, on a farm in Litchfield, Connecticut. He was apprenticed as a printer on the *Litchfield Inquirer*, 1869. He diligently studied photography and it was in those early days he first dreamed of a quick and popular photo-mechanical process of illustration. So expert a photographer had he become at 19 that he was placed in charge of the Cornell university photographic laboratory. Here he developed a new "swell gelatine" line process by which beautiful illustrations were produced for the undergraduate periodical. At Cornell in 1878 Ives invented the first process called "half-tone." Although the results were identical with those of to-day, the process was different. The method now in universal use he invented in 1885–86 in Philadelphia, where, in Feb. 1881, he had begun the first commercial production of half-tone printing plates (by his first method). In 1881 Ives made the world's first set of trichromatic half-tone process printing plates. Among his other important inventions are the half-tone photogravure (anticipating rotogravure); the modern short-tube single-objective binocular microscope; the photochromoscope, a device for optically reproducing objects in both full modelling and perfect colour; also photographs and motion pictures in natural colours. Specimens of his early prints are preserved in the Smithsonian Institution. Frederic E. Ives is the father of Herbert E. Ives, the outstanding engineer in the development of television and the transmission of pictures by wire. (W. T. I.)

IVIZA, IBIZA or IVIÇA, an island in the Mediterranean sea, belonging to Spain, and forming part of the archipelago known as the Balearic islands (*q.v.*). Pop. (1920) 24,476; area 228 sq.m. Iviza lies 50 m. S.W. of Majorca and about 60 m. from Cape San Martin on the coast of Spain. Its greatest length from north-east to south-west is about 25 m. and its greatest breadth about 13 m. The hilly parts which culminate in the Pico de Atalayasa (1,560 ft.), are richly wooded. Oil, corn and fruits (of which the most important are the fig, prickly pear, almond and carob-bean) are the principal products; hemp and flax are also grown. Fruit, salt, charcoal, lead and stockings of native manufacture are exported. The imports are rice, flour, sugar, woollen goods and cotton. The capital of the island, and, indeed, the only town of much importance—for the population is remarkably scattered—is Iviza or La Ciudad (6,751), a fortified town on the south-east coast, possessing a good harbour, a 13th-century Gothic

collegiate church and an ancient castle. Iviza was the see of a bishop from 1782 to 1851.

South of Iviza lies the smaller and more irregular island of Formentera (pop., 1920, 2,508; area, 37 sq.m.). With Iviza it agrees both in general appearance and in the character of its products, but it is altogether destitute of streams. Goats and sheep are found in the mountains, and the coasts are greatly frequented by flamingoes. Iviza and Formentera are the principal islands of the lesser or western Balearic group, formerly known as the Pityusae or Pine islands.

IVO OF CHARTRES, SAINT (YVO, YVES) (c. 1040–1116), bishop of Chartres, was born of a noble family near Beauvais, and was educated in Paris and at Bec under Lanfranc. About 1080 he became prior of the canons of St. Quentin in Beauvais and ten years later bishop of Chartres in place of Geoffrey who had been deposed for simony. As bishop he incurred the hostility of Philip I. who wished to leave his wife and marry the Countess Bertrada of Anjou. In the Investiture struggle his policy was one of moderation. His importance as a canonist is apparent from his *Decretum* and his *Panormia*, both composed before 1096. His 288 letters throw much light on the political, religious and liturgical questions of his day. In addition to these works, which together with the sermons are printed in Migne's *Patrol. Lat.*, vols. 161 and 162, Ivo wrote an unprinted commentary on the Psalms and a collection of canons, *Tripartita*. His feast is celebrated on May 20.

See A. Sieber, *Bischof Ivo von Chartres* (Königsberg, 1895); F. Fournier, "Les Collections canoniques attribuées à Yves de Chartres" in *Bibliothèque de l'école des Chartres* (vols. 57 and 58, 1896) and "Yves de Chartres et le droit canonique" in *Rev. des questions historiques* (vol. 57, 1898), and F. P. Bliemelzrieder, *Zu den Schriften Ivo von Chartres* (1917).

IVORY, SIR JAMES (1765–1842), Scottish mathematician, was born in Dundee in 1765. In 1779 he entered the University of St. Andrews, distinguishing himself especially in mathematics. From 1804–16, he occupied a chair of mathematics at the Royal Military College, Marlow (now Sandhurst). He contributed many memoirs to the *Philosophical Transactions*, the most important being one in 1809 giving a theorem on the attraction due to a homogeneous ellipsoid, which is now known as Ivory's Theorem. Ivory received the Copley medal in 1814, was elected F.R.S. in 1815, and was connected with several other scientific societies. He died in London on Sept. 21, 1842.

IVORY, strictly speaking a term confined to the material represented by the tusk of the elephant, and for commercial purposes almost entirely to that of the male elephant. In Africa both the male and female elephant produce good-sized tusks; in the Indian variety the female is much less bountifully provided, and in Ceylon perhaps not more than 1% of either sex have any tusks at all. Ivory is in substance very dense, the pores close and compact and filled with a gelatinous solution which contributes to the beautiful polish which may be given to it and makes it easy to work. It may be placed between bone and horn; more fibrous than bone and therefore less easily torn or splintered. For a scientific definition it would be difficult to find a better one than that given by Sir Richard Owen. He says: "The name ivory is now restricted to that modification of dentine or tooth substance which in transverse sections or fractures shows lines of different colours, or striae, proceeding in the arc of a circle and forming by their decussations minute curvilinear lozenge-shaped spaces." These spaces are formed by an immense number of exceedingly minute tubes placed very close together, radiating outwards in all directions. It is to this arrangement of structure that ivory owes its fine grain and almost perfect elasticity, and the peculiar marking resembling the engine-turning on the case of a watch, by which many people are guided in distinguishing it from celluloid or other imitations. Elephants' tusks are the upper incisor teeth of the animal, which, starting in earliest youth from a semi-solid vascular pulp, grow during the whole of its existence, gathering phosphates and other earthy matters and becoming hardened as in the formation of teeth generally. The tusk is built up in layers, the inside layer being the last produced. A large proportion is embedded in the bone sockets of

the skull, and is hollow for some distance up in a conical form, the hollow becoming less and less as it is prolonged into a narrow channel which runs along as a thread or as it is sometimes called, nerve, towards the point of the tooth. The outer layer, or bark, is enamel of similar density to the central part. Besides the elephant's tooth or tusk we recognize as ivory, for commercial purposes, the teeth of the hippopotamus, walrus, narwhal, cachalot or sperm-whale and of some animals of the wild boar class, such as the wart-hog of South Africa. Practically, however, amongst these the hippo and walrus tusks are the only ones of importance for large work, though boars' tusks come to the sale-rooms in considerable quantities from India and Africa.

Sources of Ivory.—Generally speaking, the supply of ivory imported into Europe comes from Africa; some is Asiatic, but much that is shipped from India is really African, coming by way of Zanzibar and Mozambique to Bombay. A certain amount is furnished by the vast stores of remains of prehistoric animals still existing throughout Russia, principally in Siberia in the neighbourhood of the Lena and other rivers discharging into the Arctic ocean. The mammoth and mastodon seem at one time to have been common over the whole surface of the globe. In England tusks have been dug up—for instance at Dungeness—as long as 12 ft. and weighing 200 lb. The Siberian deposits have been worked now for nearly two centuries. The store appears to be as inexhaustible as a coalfield. Some think that a day may come when the spread of civilization may cause the utter disappearance of the elephant in Africa, and that it will be to these deposits that we may have to turn as the only source of animal ivory. Of late years in England the use of mammoth ivory has shown signs of decline. Little or none passed through the London sale-rooms after 1900. Before that, parcels of 10 to 20 tons were not uncommon. Not all of it is good; perhaps about half of what comes to England is so, the rest rotten; specimens, however, are found as perfect and in as fine condition as if recently killed, instead of having lain hidden and preserved for thousands of years in the icy ground. There is a considerable literature (see SHOOTING) on the subject of big-game hunting which includes that of the elephant, hippopotamus and smaller tusk-bearing animals. Elephants until comparatively recent times roamed over the whole of Africa from the northern deserts to the Cape of Good Hope. They are still abundant in Central Africa and Uganda, but civilization has gradually driven them farther and farther into the wilds and impenetrable forests of the interior.

The quality of ivory varies according to the districts whence it is obtained, the soft variety of the eastern parts of the continent being the most esteemed. When in perfect condition African ivory should be, if recently cut, of a warm, transparent, mellow tint, with as little as possible appearance of grain or mottling. Asiatic ivory is of a denser white, more open in texture and softer to work. But it is apt to turn yellow sooner, and is not so easy to polish. Unlike bone, ivory requires no preparation, but is fit for immediate working. That from the neighbourhood of Cameroon is very good, then ranks the ivory from Loango, Congo, Gabun and Ambriz; next the Gold Coast, Sierra Leone and Cape Coast Castle. That of French Sudan is nearly always "ringy," and some of the Ambriz variety also. We may call Zanzibar and Mozambique varieties soft; Angola and Ambriz all hard. Ambriz ivory was at one time much esteemed, but there is comparatively little now. Siam ivory is rarely if ever soft. Abyssinian has its soft side, but Egypt is practically the only place where both descriptions are largely distributed. A drawback to Abyssinian ivory is a prevalence of a rather thick bark. Egyptian is liable to be cracked, from the extreme variations of temperature; more so formerly than now, since better methods of packing and transit are used. Ivory is extremely sensitive to sudden extremes of temperature; for this reason billiard balls should be kept where the temperature is fairly equable.

The market terms by which descriptions of ivory are distinguished are liable to mislead. As is often the case they most generally refer to ports of shipment rather than to places of origin. For instance, "Malta" ivory is a well-understood term,

yet there are no ivory-producing animals in that island.

Tusks should be regular and tapering in shape, not very curved or twisted, for economy in cutting; the coat fine, thin, clear and transparent. The substance of ivory is so elastic and flexible that excellent riding-whips have been cut longitudinally from whole tusks. The size to which tusks grow and are brought to market depends on race rather than on size of elephants. The latter run largest in equatorial Africa. Asiatic bull elephant tusks seldom exceed 50 lb. in weight, though lengths of 9ft. and up to 150 lb. in weight are not entirely unknown. Record lengths for African tusks are the one presented to George V., when prince of Wales, on his marriage (1893), measuring 8ft. 7½in. and weighing 165 lb., and the pair of tusks which were brought to the Zanzibar market by natives in 1898, weighing together over 450 lb. One of the latter is now in the Natural History Museum at South Kensington; the other is in Messrs. Rodgers & Co.'s collection at Sheffield. For length the longest known are those belonging to Messrs. Rowland Ward, Piccadilly, which measure 11ft. and 11ft. 5in. respectively, with a combined weight of 293 lb. Osteodentine, resulting from the effects of injuries from spearheads or bullets, is sometimes found in tusks. This formation, resembling stalactites, grows with the tusk, the bullets or iron remaining embedded without trace of their entry.

Hard and Soft Ivory.—The most important commercial distinction of the qualities of ivory is that of the *hard* and *soft* varieties. The terms are difficult to define exactly. Generally speaking, hard or bright ivory is distinctly harder to cut with the saw or other tools. It is, as it were, glassy and transparent. Soft contains more moisture, stands differences of climate and temperature better and does not crack so easily. The expert is guided by the shape of the tooth, by the colour and quality of the bark or skin, and by the transparency when cut, or even before, as at the point of the tooth. Roughly, a line might be drawn almost centrally down the map of Africa, on the west of which the hard quality prevails, on the east the soft. In choosing ivory—for example for knife-handles—people rather like to see a pretty grain, strongly marked; but the finest quality in the hard variety, which is generally used for them, is the closest and freest from grain. The curved or canine teeth of the hippopotamus are valuable and come in considerable quantities to the European markets. Owen describes this variety as “an extremely dense, compact kind of dentine, partially defended on the outside by a thin layer of enamel as hard as porcelain; so hard as to strike fire with steel.” By reason of this hardness it is not at all liked by the turner and ivory workers, and before being touched by them the enamel has to be removed by acid, or sometimes by heating and sudden cooling when it can be scaled off. The texture is slightly curdled, mottled or damasked. Hippo ivory was at one time largely used for artificial teeth, but now mostly for umbrella and stick handles; whole (in their natural form) for fancy door-handles and the like. In the trade the term is not “riverhorse” but “seahorse” teeth. Walrus ivory is less dense and coarser than hippo, but of fine quality—what there is of it—for the oval centre which has more the character of coarse bone unfortunately extends a long way up. At one time a large supply came to the market, but of late years there has been an increasing scarcity, the animals having been almost exterminated by the ruthless persecution to which they have been subjected in their principal haunts in the northern seas. It is little esteemed now, though our ancestors thought highly of it. Comparatively large slabs are to be found in mediaeval sculpture of the 11th and 12th centuries, and the grips of most oriental swords, ancient and modern, are made from it. The ivory from the single tusk or horn of the narwhal is not of much commercial value except as an ornament or curiosity. Some horns attain a length of 8 to 10ft., 4in. thick at the base. It is dense in substance and of a fair colour, but owing to the central cavity there is little of it fit for anything larger than napkin-rings.

Ivory in Commerce.—Almost the whole of the importation of ivory to Europe was until recent years confined to London, the principal distributing mart of the world. But the opening up of the Congo trade placed the port of Antwerp in a position

which has equalled that of London. Other important markets are Liverpool and Hamburg; and Germany, France and Portugal have colonial possessions in Africa, from which it is imported. America is a considerable importer for its own requirements. Every pair of tusks that comes to the market represents a dead elephant, but not necessarily by any means a slain or even a recently killed one, as is popularly supposed. By far the greater proportion is the result of stores accumulated by natives, a good part coming from animals which have died a natural death. Not 20% is *live* ivory or recently killed; the remainder is known in the trade as *dead* ivory.

The British supplies of ivory have greatly fallen since the '90s. In 1827 the London market received 3,000 cwt.; in 1850, 8,000 cwt. In 1890 British imports increased to 14,349 cwt., but since then there has been decline to 10,911 cwt. in 1895; 9,889 cwt. in 1900; 5,095 cwt. in 1927. The price has greatly risen in consequence, the British imports of all grades of ivory in 1927 averaging as much as £66 per cwt.; while £154 was paid for East India billiard ball pieces. If we allow say 30 lb. per pair of tusks, each cwt. imported represents nearly four elephants, and we must expect supplies further to decline.

The leading London sales are held quarterly in Mincing lane, a very interesting and wonderful display of tusks and ivory of all kinds being laid out previously for inspection in the great warehouses known as the “Ivory Floor” in the London docks. The quarterly Liverpool sales follow the London ones, with a short interval.

Industrial Applications.—The important part which ivory plays in the industrial arts not only for decorative, but also for domestic applications is hardly sufficiently recognized. Nothing is wasted of this valuable product. Hundreds of sacks full of cuttings and shavings, and scraps returned by manufacturers after they have used what they require for their particular trade, come to the mart. The dust is used for polishing, and in the preparation of India ink, and even for food in the form of ivory jelly. The scraps come in for inlaying and for the numberless purposes in which ivory is used for small domestic and decorative objects. India, which has been called the backbone of the trade, takes enormous quantities of the rings left in the turning of billiard-balls, which serve as women's bangles, or for making small toys and models, and in other characteristic Indian work. Without endeavouring to enumerate all the applications, a glance may be cast at the most important of those which consume the largest quantity. Chief among these is the manufacture of billiard-balls, of cutlery handles, of piano-keys and of brushware

FIG. 1.—TYPES OF TUSKS

and toilet articles. Billiard-balls demand the highest quality of ivory; for the best balls the soft description is employed, though recently, through the competition of bonzoline and similar substitutes, the hard has been more used in order that the weight may be assimilated to that of the artificial kind. Therefore the most valuable tusks of all are those adapted for the billiard-ball trade. The term used is “scrivelloes,” and is applied to teeth proper for the purpose, weighing not over about 7 lb. The division of the tusk into smaller pieces for subsequent manufacture, in order to avoid waste, is a matter of importance.

The accompanying diagrams (figs. 1 and 2) show the method; the cuts are made radiating from an imaginary centre of the curve of the tusk. In after processes the various trades have their own particular methods for making the most of the material. In making a billiard-ball of the English size the first thing to be done is to rough out, from the cylindrical section, a sphere about $2\frac{1}{8}$ in. in diameter, which will eventually be $2\frac{1}{16}$ or sometimes for

FIG. 2.—TURNING BILLIARD-BALLS FROM IVORY BLOCKS

professional players a little larger. One hemisphere—as shown in the diagrams (fig. 2)—is first turned, and the resulting ring detached with a parting tool. The diameter is accurately taken and the subsequent removals taken off in other directions. The ball is then fixed in a wooden chuck, the half cylinder reversed, and the operation repeated for the other hemisphere. It is now left five years to season and then turned dead true. The rounder and straighter the tusk selected for ball-making the better. Evidently, if the tusk is oval and the ball the size of the least diameter, its sides which come nearer to the bark or rind will be coarser and of a different density from those portions further removed from this outer skin. The matching of billiard-balls is important, for extreme accuracy in weight is essential. It is usual to bleach them, as the purchaser—or at any rate the distributing intermediary—likes to have them of a dead white. But this is a mistake, for bleaching with chemicals takes out the gelatine to some extent, alters the quality and affects the density; it also makes them more liable to crack, and they are not nearly so nice-looking. On an average three balls of fine quality are got out of a tooth. The stock of more than one great manufacturer surpasses at times 30,000 in number.

The ivory for piano-keys is delivered to the trade in the shape of what are known as heads and tails, the former for the parts which come under the fingers, the latter for that running up between the black keys. The two are joined afterwards on the keyboard with extreme accuracy. Piano-keys are bleached, but organists for some reason or other prefer unbleached keys. The soft variety is mostly used for high-class work and preferably of the Egyptian type.

The great centres of the ivory industry for the ordinary objects of common domestic use are in Great Britain: for cutlery handles Sheffield; for billiard-balls and piano-keys London. For cutlery a large firm uses an average of some 20 tons of ivory annually, mostly of the hard variety. But for billiard-balls and piano-keys America is now a large producer, and a considerable quantity is made in France and Germany. Dieppe has long been famous for the numberless little ornaments and useful articles such as statuettes, crucifixes, little book-covers, paper-cutters, combs, serviette-rings and *articles de Paris* generally. And St. Claude in the Jura, and Geislingen in Württemberg, and Erbach in Hesse, Germany, are amongst the most important centres of the industry. India and China supply the multitude of toys, models, chess and draughtsmen, puzzles, work-box fittings and other curiosities.

Vegetable Ivory, Etc.—Some allusion may be made to vegetable ivory and artificial substitutes. The plants yielding the vegetable ivory of commerce represent two or more species of an anomalous genus of palms, and are known to botanists as *Phytelphas*. They are natives of tropical South America, occurring chiefly on the banks of the river Magdalena, Colombia, always found in damp localities, not only, however, on the lower coast region as in Darien, but also at a considerable elevation

above the sea. They are mostly found in separate groves, not mixed with other trees or shrubs. The plant is severally known as the "tagua" by the Indians on the banks of the Magdalena, as the "anta" on the coasts of Darien, and as the "pullipunta" and "homero" in Peru. It is stemless or short-stemmed, and crowned with from 12 to 20 very long pinnatifid leaves. The plants are dioecious, the males forming higher, more erect and robust trunks than the females. The male inflorescence is in the form of a simple, fleshy, cylindrical spadix covered with flowers; the female flowers are also in a single spadix, which, however, is shorter than in the male. The fruit consists of a conglomerated head composed of six or seven drupes, each containing from six to nine seeds, and the whole being enclosed in a walled woody covering forming altogether a globular head as large as that of a man. A single plant sometimes bears at the same time from six to eight of these large heads of fruit, each weighing from 20 to 25 lb. In its very young state the seed contains a clear insipid fluid, which travellers take advantage of to allay thirst. As it gets older this fluid becomes milky and of a sweet taste, and it gradually continues to change both in taste and consistence until it becomes so hard as to make it valuable as a substitute for animal ivory. In their young and fresh state the fruits are eaten with avidity by bears, hogs and other animals. The seeds, or nuts as they are usually called when fully ripe and hard, are used by the American Indians for making small ornamental articles and toys. They are imported into Britain in considerable quantities, frequently under the name of "Corozo" nuts, a name by which the fruits of some species of *Attalea* (another palm with hard ivory-like seeds) are known in Central America—their uses being chiefly for small articles of turnery.

Many artificial compounds have, from time to time, been tried as substitutes for ivory; amongst them potatoes treated with sulphuric acid. Celluloid is familiar to us nowadays. In the form of bonzoline, into which it is said to enter, it is used largely for billiard-balls; and a new French substitute—a casein made from milk, called galalith—has begun to be much used for piano-keys in the cheaper sorts of instrument. Odontolite is mammoth ivory, which through lapse of time and from surroundings becomes converted into a substance known as fossil or blue ivory, and is used occasionally in jewellery as turquoise, which it very much resembles. It results from the tusks of antediluvian mammoths buried in the earth for thousands of years, during which time under certain conditions the ivory becomes slowly penetrated with the metallic salts which give it the peculiar vivid blue colour of turquoise.

IVORY BILL or IVORY-BILLED WOODPECKER (*Campephilus principalis*), the largest North American woodpecker, reaches a length of 20 in. Formerly extending north to Illinois, Indiana and North Carolina, the ivory bill is now very rare everywhere and is almost confined to cypress swamps in a few isolated portions of Florida. The white beak and large size are diagnostic. The plumage is black, with the secondaries and shorter primaries white, and a pair of white stripes down the back. The long crest is scarlet in the male, black in the female. The call is "a sharp, penny trumpet-like yap-yap." The heads were used for ornaments by the Indians.

IVORY BLACK, a high grade carbonaceous black sometimes prepared by carbonizing ivory turnings and cuttings, but more often made by the calcination of bone, only the best grades of product being selected. It should have a deep black, velvety tint. It is largely composed of mineral matter, from 65 to 84% being calcium phosphate with some calcium carbonate. Ivory black is used by copper-plate printers in preparing their inks, and also to a decreasing extent as a decolourizing agent.

IVORY CARVING. The use of ivory as a material peculiarly adapted for sculpture and decoration has been universal in the history of civilization. In order to treat the subject adequately and give the relative importance of the art in different countries, the following division is made: (1) History, covering various periods and countries, (2) Chinese, (3) Japanese, (4) North American. For ivory carving technique see SCULPTURE: *Technique*.

TWO EGYPTIAN IVORIES

1. Whip handle in the form of a running horse, late 18th dynasty 1375-1350 B.C. Carnarvon collection

2. Figure of a gazelle, Thebes, late 18th dynasty. The base is painted to depict a desert crag with flowers. Carnarvon collection

HISTORY

It is probable that ivory carving has a long and continuous history, extending from the Palaeolithic period to the present day, but even so there are gaps and it is rather a question of a succession of groups than of an unbroken historical development. The question of the supply of the raw material perhaps partially accounts for the apparently barren periods, though it must also be remem-

FROM LAYARD, "THE MONUMENTS OF NINEVEH" (JOHN MURRAY)

IVORY CARVING. PANEL AND CARTOUCHE FROM EXCAVATIONS MADE BY LAYARD ABOUT 1840 ON THE SUPPOSED SITE OF NINEVEH

bered that we can only judge by the existing work and it may only be chance which has preserved these particular examples and not others. But there are historical grounds for these long periods of inactivity. In Europe the ivory carver was dependent on more or less remote countries for his material and it is easy to see that in the 7th and 8th centuries the Mohammedan conquests must have interfered to some extent with the traffic between Nubia (one of the great distributing centres) and Egypt, and so through Syria and Cyprus with Europe. By what route the vast quantities of tusks necessary to furnish the raw material for the huge output of the Carolingian and Gothic periods arrived in Europe it is difficult to say. Communication with the East was probably furnished by the navies of Cyprus but there appears to be no record of the port at which the ivories were landed. In western and northern Europe, chiefly during the Romanesque period, walrus tooth (or morse ivory) was largely used in place of elephant tusk, probably owing to the fact that it was more easily obtainable; more rarely whale's bone was employed. Ordinary bone was also used, notably in the Coptic period and again later, at the end of the 14th century, in northern Italy. Ivory uncoloured, as we generally see it now, does not seem to have appealed to the ancient or mediaeval imagination and the carvings were in most cases originally lavishly coloured and gilded and frequently enriched with jewels and pastes. At certain times, notably in the Carolingian period in Western Europe and in the Byzantine empire, ivory-carving reached an importance not perhaps warranted by its intrinsic merits. The very considerable influence exercised on Romanesque sculpture by Byzantine art was probably largely derived through carved ivories. Illuminated manuscripts were in their turn a fertile source of inspiration for carved ivories especially of the Byzantine and Carolingian periods. Textiles, too, furnish numerous prototypes for the Coptic bone-carvings and for the beasts and mythological monsters found on Byzantine and Mohammedan carvings. The connection between carved ivories and metalwork is frequently very close, as in the case of silver caskets of the Byzantine period at Anagni and Cracow.

After the 12th century with the widespread development of monumental sculpture ivory-carving ceases to have the same historical significance, though charming and extremely accomplished work was produced both during the Gothic and subsequent periods.

ANCIENT HISTORY

Carvings of the Palaeolithic Period.—Carvings in ivory, bone and horn are so numerous in certain periods of the stone age that one of these, the Aurignacian, has been called the ivory period. Most of the carvings have been found in southern France, in the Dordogne and Arriège districts, though a few come from the Riviera and Germany. The earlier examples usually take the

form of nude female figures, the aesthetic worth of which is usually almost negligible, but a small head of a girl found at Brassempouy (Landes) has real artistic value. The animal carvings belong almost entirely to the succeeding Magdalenian period; these are frequently of extraordinary merit. The material is usually reindeer horn or more rarely mammoth ivory; among the objects in the latter is a tusk in two parts carved in the round with reindeer, found at Montastruc, Bruniquel (now in the British Museum). In reindeer horn is a magnificent dagger handle from Laugerie Basse (now in the museum at St. Germain) with a figure of a kneeling reindeer, a fine example of the utilization of the natural form of the material. Though no hard and fast demarcation can be made, engraving is probably rather posterior to carving in the round. The engravings usually represent animals, often rendered in a masterly manner and combined to form scenes, but occasionally human figures are represented in a rudimentary and animal-like form.

Egyptian Ivories.—Ivory and bone were worked from a very early period in Egypt, the supply of the raw material being easily obtained from Ethiopia and possibly Asia Minor. A large number of combs, hairpins and other utensils dating from the Predynastic and Early Dynastic period have been found at Nagada and other sites, and a very fine handle carved with hunting and other scenes found at Gebel-el-arak is now in the Louvre. To the same period belong some at any rate of an extensive series of nude female figures, probably of amuletic significance, carved in varying degrees of crudity. A considerable number of ivory figures of men and women, some in embroidered robes, were found by Mr. Quibell at Hierakonpolis, many of which show considerable aesthetic feeling, but among the masterpieces of early Egyptian carving are two statuettes, both found at Abydos: one, a king belonging to the First Dynasty (now in the British Museum) wearing the crown of Upper Egypt and a richly embroidered robe; the second, now at Cairo, representing the King Khufu (Fourth Dynasty), the builder of the Great Pyramid. The later work, though frequently of very fine quality, is usually more purely decorative in intention, being largely used for handles, spoons, inlays for caskets and furniture. (See also EGYPT: *Ancient Art and Archaeology*.)

IVORY SCULPTURE. LEAF OF ROMAN DIPTYCH REPRESENTING A BACCHANTE.

inlaid with gold and lapis-lazuli, a method of decoration which is found elsewhere as for example at Mycenae and throughout the Aegean. Apparently contemporary with these are a series of fragments, chiefly heads, more purely indigenous in type. Both groups show an admixture of other influence and it has been plausibly suggested that the carvers were Phoenicians.

Aegean, Etruscan, Greek and Roman Ivories.—Among the earliest Aegean carvings that have any considerable aesthetic value are the small ivory figures of acrobats found in Crete at Knossos, now in the museum at Candia. These must be rated

tian carving are two statuettes, both found at Abydos: one, a king belonging to the First Dynasty (now in the British Museum) wearing the crown of Upper Egypt and a richly embroidered robe; the second, now at Cairo, representing the King Khufu (Fourth Dynasty), the builder of the Great Pyramid. The later work, though frequently of very fine quality, is usually more purely decorative in intention, being largely used for handles, spoons, inlays for caskets and furniture. (See also EGYPT: *Ancient Art and Archaeology*.)

Babylonian and Assyrian

Ivories.—Though only a few examples have been found up to the present there is every reason to believe that ivory was carved in Babylonia from a period at least as early as in Egypt. The later work of about the 9th to the 7th centuries B.C. is, however, represented in the British Museum by an unrivalled series of ivories from Nimrud many of which show strong Egyptian influence; these were frequently

beside the masterpieces of Minoan art and may be dated about the 16th century B.C. The celebrated figure of the snake goddess, now at Boston, has also been ascribed to the same period. A considerable number of ivories of very fine workmanship, now in the British Museum, which may be assigned to a date between the 14th and the 11th centuries have been found at Enkomi, in the island of Cyprus. They include a gaming box carved on the sides in low relief with hunting scenes, and two mirror handles with combats between human beings and monsters. Ivories similar in style and of about the same period have been found in Greece at Sparta and Mycenae (both groups being now in the museum at Athens). It has been suggested that one of the centres of production was perhaps Cyprus, but it is much more probable that they were made in Syria or possibly on the south coast of Asia Minor. In any case the main influence is Asiatic in derivation.

To a period between the 9th and the 6th centuries B.C. belong extensive groups of carvings which seem to derive from the same cultural source as the earlier ivories. These groups, which show close analogies of style both among themselves and with the Nimrud carvings, have been found on various sites—at Ephesus, Rhodes, Sparta and in Italy and Spain. The dominating style is Asiatic but in some cases there are traces of Egyptian influence. The ivories from Sparta, now in the Museum at Athens, were excavated in the sanctuary of Artemis Orthia and date mainly from the 8th and 7th centuries; they show traces of Ionic influence and were possibly worked locally. Among them are fibula-plaques carved in relief, figures of animals carved in the round, statuettes and a fine relief with a warship, this last inlaid with amber.

The carvings from Ephesus, now in the museum at Constantinople, were found in the temple of Artemis and date from about the same period. They consist chiefly of statuettes, the costume of which shows Asiatic (perhaps Hittite) influence, and some finely conceived animal figures.

The earliest ivories found in Etruscan tombs in Italy belong to about the same period and present many difficulties as to origin. Some of the finest examples were found in the Barberini Tomb at Praeneste south of Rome; these included a tazza on a high foot, and three arms and hands the use of which is not clear; all are decorated with bands of centaurs, griffins and animals in procession. It has been suggested, with considerable likelihood, that these are importations from Cyprus, probably of Phoenician workmanship, but even if they are native Etruscan imitations the motives are derived from an oriental source. Slightly later in date is a box found at Chiusi in northern Etruria, now in the Museo Archeologico at Florence.

It is remarkable that no ivories of importance belonging to the earlier classical period of Greek art have survived, though we know from documentary evidence that they existed. To the Graeco-Roman period should probably be assigned a very beautiful head found in the Roman theatre at Vienne (Isère) now in the Musée Archéologique of that town. A fine head of a goddess, together with fragments of arms in the Vatican, probably belongs to the same period, but it may serve to give an idea of the chryselephantine statuary of Greece known to us only from the descriptions of classical writers. A number of smaller ivories of the Roman period have survived, among them being a small figure of a tragic actor (in the Dutuit collection in Paris) and a statuette of a hunchback (in the British Museum), but they are mostly objects for domestic use.

IVORIES OF THE CHRISTIAN ERA

The ivory carvings of the earlier centuries of the Christian era show a close continuity in style with those of the preceding period, and much of the finest work, such as the well-known Symmachorum-Nicomachorum diptych in the Victoria and Albert and Cluny museums, may be called either late pagan or early Christian. The classification and provenance of ivories made between the 4th and the 7th centuries is one of the most difficult problems of Christian archaeology and to specify definitely the place of origin of individual examples is almost impossible. Intercourse

between the great centres of Mediterranean civilization was so close that very similar cultural conditions existed in cities so far apart as Antioch, Constantinople, Alexandria and Rome. This culture represents a fusion of the plastic and naturalistic ideals of classic art with the abstract and colouristic principles of the East. Christianity was oriental in conception and while for its own purposes it took over many of the artistic forms of Paganism it was largely influenced by the ideals of the Aramaic art of the countries adjacent to Palestine. A number of the earliest ivories with definitely Christian subjects are frequently associated with Antioch, though we have no one carving which can with certainty be ascribed to the school. Such celebrated carvings as the Brescia reliquary, a very fine pyxis at Berlin, and the diptych or book-cover with scenes from the New Testament in Milan cathedral, the first two of which may be assigned to the late 4th or early 5th centuries have been included in this group. The Milan book-cover has also been made the centre of a group of ivories which have recently been ascribed by several American scholars to Provence on the ground of their relationship with the Early Christian sarcophagi found in Southern France.

Other important carvings which have also been associated alternatively with Syria and with various western centres are the lovely reliefs of the Maries at the Sepulchre in the Trivulzio Collection at Milan and the Ascension of Munich. From the early centuries of the present era Alexandria was the seat of a flourishing school of bone carvers who produced small reliefs, probably for the decoration of articles of furniture, carved with figures taken from classical mythology, similar to those employed on contemporary woven fabrics. To the same centre should probably be ascribed the important reliefs with Bacchus, a warrior and other figures, now on the pulpit at Aix-la-Chapelle, and a number of diptychs which show strong traces of Hellenistic influence, such as the diptych of a Muse and a Poet at Monza. A very individualistic series of carvings, dating from the 6th century, closely connected with Alexandria in iconography, are the reliefs (mainly distributed between the museums at Milan and South Kensington) which may be associated with the celebrated ivory chair of St. Mark formerly at Grado.

Another ivory chair (now at Ravenna) usually, though for no very definite reason, called the throne of Maximianus, has been assigned alternatively to both Antioch and Alexandria. With these carvings may be grouped several book-covers and a number of other ivories. Another group, dating in the main from the 6th century, for which a Palestinian origin is usually claimed, though recently an American scholar has brought forward evidence connecting it with Alexandria, may be centred round a book-cover in the museum at Ravenna, formerly at Murano. This group includes panels scattered among various collections and a number of pyxides. Both in iconography and style this group is purely oriental in derivation.

The art of the capital itself was, we may assume, very eclectic, and though there is no definite evidence several ivories, including the supremely fine relief of St. Michael in the British Museum, have been assigned to Constantinople. It is also possible that most of the consular diptychs were produced there, though there is also evidence connecting them with Alexandria. A very large proportion of the ivory-carvings of this period were in the form of diptychs. In their simplest form these consisted of two leaves, the insides hollowed out and coated with wax on which a message could be scratched with the sharp end and effaced with the blunt end of a stylus. The unprepared ivory could also be used for receiving ink. Diptychs of an elaborate and purely ceremonial character, carved on the outside, were apparently used as presents to commemorate marriages or other family or official events; but the greater number that have been preserved are associated with consuls of Rome or Constantinople and were made for the purpose of notifying, to the emperor, or others, the sender's appointment to the consulate. These were more or less richly decorated according to the rank of the recipient, elaborate composite examples, such as the Barberini diptych in the Louvre, having been probably made for the Emperor.

These ceremonial diptychs date from the 4th or the beginning

EUROPEAN IVORIES, EARLY CHRISTIAN TO GOTHIC PERIOD

1. Gothic triptych, the Crucifixion and the Coronation of the Virgin. English, 14th century, now at the British Museum
2. Relief, the Adoration of the Magi. English, 12th century, now at South Kensington, England
3. Relief, the Descent from the Cross. Spanish, 11th century, now at South Kensington, England
4. The Holy Women coming to the tomb of Christ; a plaque in walrus Ivory, of the school of Cologne, second half of the 12th century. This was probably originally a book-cover. It was formerly in the Stroganoff Collection, Rome, and now belongs to Mr. George Blumenthal, New York
5. Early Christian pastoral throne, so-called chair of Maximianus, Archbishop (546-52), adorned with reliefs in ivory, at the Cathedral of Ravenna. Its origin has been assigned both to Antioch and to Alexandria. It was brought to Ravenna in 1001 as a present from the doge to the emperor Otto III.
6. The Marys at the Sepulchre, part of a diptych. 4th or 5th century, possibly of Syrian origin, now in the National Museum, Munich

MEDIAEVAL AND MODERN IVORIES

1. Statuette of Virgin and Child, by Giovanni Pisano. Sacristy of the Cathedral at Pisa (c. 1250-1320). 2. Mirror Case, "An Elopement" (sometimes called "Lancelot and Guinevere"), French, Gothic period, 14th century. 3. Statuette, "Death and the Maiden," German, 16th century. 4. Figure from "The Descent from the Cross," late 13th cen-

ture. In the Louvre. 5. Tankard, by Strauss, German Renaissance. 6. Statuette, Nessus and Deianira, ascribed to Mathias Rauchmiller (1645-1686) or Jacob Auer, German. 7. Crozier with scenes from the Gospels, English, late 11th or 12th century. 8. Relief, the Death of Cleopatra. 9. Madonna, by Eric Gill, contemporary

of the 5th century and between 60 and 70 are known to be in existence (in whole or in part); of these, about 50 are consular, the series ending with the year 541 when the office was abolished by Justinian. The diptychs in great part owe their preservation to the fact that at a later period they were frequently transformed into book-covers. Diptychs with Christian subjects are rare, though there is a fine 5th century example at South Kensington, with six of the miracles of Christ, which is allied in style with some of the earlier pagan examples. By the 5th century a liturgical use of diptychs seems to have been established in the church; names of those for whom prayers were asked were inscribed on the insides of the leaves and solemnly recited during the mass. With the end of the 6th century there is an almost complete blank for nearly two centuries in the history of ivory-carving in the eastern empire as well as in the west.

Byzantine Ivories.—The iconoclasts during the disputes of the 8th and early 9th centuries strove to substitute a secular and purely ornamental style for the religious and representational art of the monastic party and it is to this fact that we owe the group of caskets with subjects largely drawn from classical mythology or with zoöomorphic decoration. The dating of these caskets has been much discussed but it is probable that the earliest and finest, such as the casket from Veroli now at South Kensington, were produced during the iconoclastic period, though it seems likely that those of rougher workmanship are rather later in date while others again are apparently western imitations. Similar caskets with sacred subjects, usually the story of Adam and Eve, as for instance the example at Cleveland, appear from their style to date from the 11th or 12th century. The main period of Byzantine ivory-carving begins with the cessation of the iconoclastic disputes in 842 and it is probably to the period between the 10th century and the sack of Constantinople in 1204 that most of the surviving ivories belong, though it is not impossible that some should be ascribed to the succeeding centuries.

Ivory-carving occupies an exceptional place in Byzantine art of this period, there being practically no monumental sculpture in existence, but the difficulty of dating the ivories is greatly increased by this fact. Almost the only ivory the date of which can be fixed with any certainty by external evidence is the fine relief, in the Bibliothèque Nationale, Paris, of Christ crowning the Emperor Romanus and his wife Eudocia; this may be dated about 945, to which period should be assigned such a masterpiece as the Harbaville triptych in the Louvre. Only slightly later probably is the magnificent relief of the Virgin and Child now at Cleveland, formerly in the Stroganoff collection. An early group apparently is that in which the figures are sharply cut in high relief and show the same tightly curling hair as on the caskets. The finer carvings such as these show an austere beauty of conception and a refinement and careful precision of finish that is a legacy of the classical tradition, but the minor work suffers from a monotony of design and a carelessness of execution which become very tedious.

Mohammedan Ivories.—A group of ivories, the dating and origin of which are very uncertain, are the oliphants or horns. Some of the earliest of these perhaps go back to the iconoclastic period and some, for example the horn in the cathedral of St. Veit at Prague, which has representations of scenes in the Hippo-

drome, may have been made in Constantinople. But the greater number are carved with hunting scenes or zoöomorphic decoration, and while some of these are probably western copies, most of them are apparently of Syrian or Mesopotamian origin, the animals and monsters with which they are ornamented being similar to those common on Asiatic textiles. One of the finest of the horns with hunting scenes is in the minster at York.

Another series of ivories, the ornament of which is derived from oriental sources, is a group of caskets carved, as their inscriptions show, in the 10th century for the court of the caliphs of Cordova, one of the most important artistic centres in Europe at this period. The compositions of figures, animals and birds carved among foliage scrolls seem to derive from Mesopotamia. With the same country have been associated a rather later series of caskets painted with interlacing scrolls, foliage and figures of birds, animals and men; it is, however, more probable that they were produced in Sicily by Arab artists.

Carolingian and Romanesque Ivories.—Ivory-carving occupies an unusually important position in the history of the artistic revival during the 9th and 10th centuries under the Carolingian emperors; for monumental sculpture of the period is almost non-existent in Western Europe during the period between the expiring classical tradition and the Romanesque revival of the latter part of the 11th century. It is usual to include with the carvings produced within the empire of Charlemagne's successors those done in western Germany under the Ottonian emperors (936-1002), as both belong to a common stylistic origin. These ivories have recently been divided into three main groups. The earliest of these, known as the Ada group from its relationship to a manuscript of the Gospels at Trèves illuminated for the Abbess Ada, sister of Charlemagne, about A.D. 800, has been located in various centres in the middle Rhine and Moselle districts. Most of the carvings of this group are closely based on early Christian models.

The second or Liuthard group is associated with an ivory relief on the binding of a psalter in the Bibliothèque Nationale at Paris written by Liuthard for Charles the Bald not long after 870. This group has been localized in the Amiens or Rheims districts and should probably in any case be ascribed to the north-east of France. The style appears to have been influenced by some such manuscript as the celebrated Utrecht psalter, the figures being characterized by the same rather slender proportions and energetic action. Some of the carvings of this group, such as the fine book-cover in the National Library at Munich, have points of resemblance with the Byzantine caskets of the Veroli type mentioned above and as many of the reliefs may be assigned to the second half of the 9th century they have an important bearing on the dating of the caskets. A casket at Berlin obviously modelled on a Byzantine prototype is dated by Dr. Goldschmidt about 900.

A number of ivories belonging to the third group can be associated with the district of Metz from an early period, as for instance the reliefs on the cover of the sacramentary of Drogo, bishop of Metz, from 826 to 855, now in the Bibliothèque Nationale at Paris. The carving is usually in lower relief and the forms heavier than those of the Liuthard group. There are of course a number of other ivories mostly of a date rather late in the period which do not fall into either of these groups. The district of the lower Rhine, and Cologne in particular, was one of the chief centres of Romanesque ivory-carving in the 12th century. Among the ivories produced in this district is an important series of large reliefs in walrus tusk probably part of an altar-piece with scenes from the Life of Christ, two of which are in the collection of Mr. Blumenthal at New York and the remainder at South Kensington. Ivories for secular use, practically non-existent during the Carolingian period, reappear principally in the form of gaming pieces. The draughtsmen are usually of Rhenish origin, but chess-pieces appear to have been made in France as well as in the North, and some of the most famous, found in the island of Lewis off Scotland, are probably of Scandinavian, or possibly of British, origin.

A number of carvings of very high artistic quality were produced in England in the 11th century, and one very distinctive

IVORY SCULPTURE IN BRITISH MUSEUM. LEAF OF DIPTYCH REPRESENTING ARCHANGEL

group may be associated with the famous Winchester school of illumination. The well-known whale's bone relief at South Kensington with the Adoration of the Magi, has been ascribed alternatively to northern France or Belgium, but the balance of evidence is certainly in favour of an English origin. To England may also be ascribed a crozier head and a number of tau crosses of exceptional beauty at South Kensington and the British

Museum,* decorated with figure subjects and foliage scrolls. In Italy ivory-carvings of the Romanesque revival take a different form, derived closely in style and iconography from the Early Christian and Byzantine tradition. The famous ivory "paliotto" at Salerno forms the centre of a large group of carvings being based on an Early Christian model.

Spanish ivories of the 11th and 12th centuries, on the other hand, show a mixture of Moorish and Northern influence. They are closely allied to the contemporary manuscripts and seem to have been produced mainly in the north in Castile and Leon, one of the most famous, the shrine of San Millán de la Cogolla, being still preserved in the cathedral of that name. Others are in the Madrid museum, in the cathedral at Leon and at South Kensington.

THE MIDDLE AGES

Gothic Ivories.—From the great period of French Gothic monumental sculpture—the first half of the 13th century—there exist only a few isolated examples of ivory-carving, some of the most notable being a group of statuettes of the Virgin and Child and the magnificent crucifix at Herlufsholm in Denmark. But to the last half of the century must be ascribed some of the finest examples of Gothic ivory-carving, among them the groups of the Coronation of the Virgin and the Descent from the Cross in the Louvre. To the end of the same century belong a number of diptychs and triptychs with scenes from the Passion which may be associated with a very fine diptych at South Kensington, said to have come from Soissons. Another series belonging to the 14th century is a group of polyptychs in the form of small domestic altarpieces or tabernacles usually with statuettes of the Virgin and Child under a canopy with, on the wings, scenes from the New Testament. A third group of carvings, formerly described as English, is distinguished by bands of "roses" dividing the subjects; these reliefs show greater variety both in individual types and iconography than is found in the crowded scenes of another group of diptychs with scenes from the Infancy and Passion, mostly dating from the second half of the century.

Besides these main groups there are a host of small diptychs and plaquettes with one or more scenes on each leaf. Apart from the long sequence of statuettes of the Virgin and Child, which extends from the early 13th century to the end of the period, the best of which are of almost incomparable loveliness, there are comparatively few figures or groups and, though there is documentary evidence that crucifixes were made in great numbers, they have perished almost without exception. Ivory was a favourite material for pastoral staves and great ingenuity is shown in fitting in two subjects, generally the Virgin and Child with angels and the Crucifixion, back to back in the volute. Large altarpieces were also made, though no complete example has survived; these were composed of groups carved in high relief usually with scenes from the Passion, in architectural settings apparently mounted on coloured backgrounds of metal, wood or marble. The fine relief of the Maries at the Sepulchre at South Kensington is a good example of one of these groups.

There is a great increase at this period of ivories for domestic and civil use; caskets, mirror cases, combs, writing tablets were made in great quantities for export as well as for use at home. On these were usually depicted charming little scenes of love-making, or episodes drawn from the popular romances of the period, one of the finest examples of the mirror cases being that with a story of an elopement (sometimes called Lancelot and Guinevere) now at Liverpool. The reputation of ivory-carving of the Gothic period has suffered from the superabundance of the material, the great majority of the minor carvings being little better than tradework. After the middle of the 14th century there is a rapid decline in the quality of the work and the ivories produced, chiefly in northern France and Belgium, during the 15th and early 16th centuries are of little artistic importance. These consist mainly of Paxes, *memento mori* and small objects of devotion.

The rare ivories which can be ascribed to Germany in the 14th century are such close imitations of French work that they are hardly worthy of special mention. The case of England is rather different, in that not many carvings have survived but these are very individual and usually of fine quality, less elegant but more monumental in character than contemporary French examples. Work such as the well-known diptych of Christ and the Virgin and Child or the statuette of the Virgin and Child at South Kensington, or the two triptychs associated with Bishop Grandisson, in the British Museum, show that work of real beauty was produced outside France.

Of Italian ivory-carving of the 14th century the lovely statuette of the Virgin and Child by Giovanni Pisano in the cathedral at Pisa and a few crucifix figures, notably the fine fragment at South Kensington, are among the few survivors. The Embriachi family and their assistants produced at the end of the 14th and during the earlier part of the 15th centuries in northern Italy a quantity of caskets, triptychs and some large altarpieces in which narrow strips of bone, placed side by side, are associated with mounts of intarsia of coloured woods and ivory. This work has no great artistic value, though it has at times a sumptuous decorative effect.

RENAISSANCE AND LATER IVORIES

Only a few scattered examples of 16th century work remain, such as the fine figure of St. Mary Magdalene in the Metropolitan Museum at New York or the Virgin and Child statuette in the Louvre, both French in origin, or again the very individual German statuette of Death and the Maiden at Munich. In the 17th and 18th centuries Germany and Flanders appear in the forefront as centres of ivory-carving and the finest work of the period still remains in German and Austrian museums. For the first time ivory-carving ceases to be anonymous, we have a few carvings signed by definite artists and there is evidence that sculptors such as the Italianized Fleming François Duquesnoy (Il Fiammingo), Algardi and Leonard Kern, among others, worked in ivory. The influence of Rubens is very apparent in much of the carving of the period, especially in the large tankards with Bacchanalian groups and there are records that his pupil, Lucas

1 and 3. Carved ivory tusk, by Nomura Tomekichi. 2a. Ivory *netsuke* (ornamental piece fastened by cords to purse or *inro*), masks by Mitsushige (18th–19th c.). 2b. Ivory *netsuke*, *kirin*, unsigned. 4a and b. Ivory *netsuke*, by Yoshinaga (19th c.). 5a. Ivory *inro* (medicine case), inlaid with mother-of-pearl and coral, with *netsuke* similarly inlaid, by Shibayama (18th–19th c.). 5b. Ivory *inro*, carved with peony and butterfly; ivory

netsuke, with the signs of the zodiac, by Dōshōsai (19th c.). 6a. Ivory *netsuke*, by Rantei (18th c.). 6b. Ivory *netsuke*, by Yoshimasa (17th c.). 7. Ivory carving, by Soma Senrei, modern. 8. Fishermen with net, by Ikeda Shoten. 9. Falconer, by Ishikawa Mitsuaki, modern. 10. Skull, by Asahi Gyokuzan, (1842–c. 1900). 11. "Watching fireworks," by Ono Hōfū, modern. 12. Boy with a fowl, by Asahi Meldo, modern

Faidherbe, did a number of carvings from his master's designs. Two other Flemish carvers were famous for their bacchanalian groups of children, Gerhard van Opstal and Il Fiammingo mentioned above.

In Germany Christoph Angermair, who in the first half of the 17th century made the celebrated coin cabinet at Munich, was succeeded by a number of artists who produced a vast amount of work which, though frequently exhibiting high technical ability, shows little originality either in subject or treatment. The statuettes and groups of naked gods and goddesses, which form an appreciable proportion of the carvings, are mainly inspired by the antique or from the work of Late Renaissance and Baroque sculptors such as Giovanni Bologna and Bernini. The work of Ignaz Elhafen (born before 1685, died before 1725), one of the ablest sculptors of the period, is best seen at Munich; other characteristic works in the same manner are an elaborate group of bacchanals at Vienna ascribed to Mathias Rauchmiller (1645-1686) and a fine group of Nessus and Deianira at Munich ascribed to Rauchmiller or Jacob Auer, a South German working in the first half of the 18th century. Statuettes of saints, Christ at the Column and Crucifixion groups were also popular as well as reliefs with scenes from the New Testament; and it is to the 17th, and more especially to the 18th century, that we owe the figures of Christ on the Cross, which appear to have been carved all over Europe and examples of which exist in nearly every collection.

A characteristic feature of the period is the development of interest in portraiture from the large equestrian groups ascribed to Steinle (died 1727) at Vienna to the small portrait medallions by Jean Cavalier and Le Marchand (1674-1726). A peculiarly German type of work of the 18th century is the association of ivory with wood, the principal exponents of which were Simon Troger, Veit Graupensberg and others. Another group which must be mentioned is that of turned ivories produced mostly in the neighbourhood of Nurnberg by the Zick family. Other artists who excelled in this ingenious form of craftsmanship were M. Heider, Spengler and others.

In Italy ivory-carving follows similar lines as in Germany but almost the only artist whose work remains to us in any quantity (mostly at Munich) is Antonio Leoni who, in the first half of the 18th century, produced reliefs and statuettes in style very akin to that of Elhafen. In Scandinavia Magnus Berg (1666-1739) is responsible for an enormous output of rather uninteresting carvings, mainly reliefs with allegorical and mythological subjects.

The still surviving branch of the industry established at Dieppe in the 17th century, chiefly for the production of crucifixes and objects of devotion, is of relatively small artistic importance. Spain and Portugal too produced little original work of importance and, though the amount is considerable, the work turned out in the Portuguese colonies, chiefly Goa, is on an even lower level.

The Nineteenth and Twentieth Centuries.—In the early 19th century the interest in portraiture and the classical revival both find ingenious expression in the work of Benjamin Cheverton (1794-1876) who made with the partial aid of a machine reduced copies of marble busts, statuettes and reliefs. During the later part of the century, especially in Belgium, many sculptors interested themselves in ivory-carving, frequently associating it with other materials but this phase hardly calls for lengthy notice. In recent years there has been a distinct revival and some good work, chiefly for ecclesiastical use, has been produced.

Forgeries.—Another less praiseworthy phase of modern ivory-carving must be noticed, that of forgeries. Few materials lend themselves to such successful imitation and it is not beyond the power of a clever craftsman to so patinate, rub and colour the ivory as to make it almost indistinguishable from a genuinely old carving. The crackle of genuine age is rather more difficult to simulate and a regular network of cracks across the grain may raise suspicions, though even these are not always justified, natural crackle being very variable. The forger fortunately usually gives himself away in details of iconography and a general feeling of style; but the detection of both these points is a question of expe-

rience and long familiarity with and actual handling of genuine work. (See also IVORY-CARVING: Chinese; IVORY-CARVING: Japanese; IVORY-CARVING: North American.)

CHINESE

History.—Ivory has always been an important medium of expression for Chinese carvers, and many exquisite examples of their work have come down to us, though their names are rarely known. Chinese ivory carvers have generally had a greater appreciation of the intrinsic value of the material for their work than the carvers of Japan. An abundant supply and close intimacy with this material have doubtless helped to foster this appreciation among Chinese carvers, whereas the paucity of the supply and something in the Japanese character which was happier when carving wood, together with differences in certain phases of their culture, have prevented the higher development of ivory carving in Japan, though some excellent works have been produced. The former existence of elephants on Chinese soil is authenticated by linguistic, pictographic, historical, as well as archaeological evi-

dence. The *Tso Chwan* (548 B.C.) records that the elephant has tusks which lead to its destruction owing to their use as gifts, and there are also a number of other references showing that ivory was taken as tax and brought as tribute to China and was greatly valued in early times. It came next to jade and was used as a mark of luxury for various purposes. Even articles such as pins for scratching the head, and the tips of bows, were made of elephant ivory in early Chinese antiquity. A 3rd century B.C. minister of State, Mong Ch'ang-Kün, famous for his extravagance, possessed an ivory bed, which he presented to the prince of Ch'u. Ivory was used for personal ornament from time immemorial, and as early as the Ch'u dynasty (1122-247 B.C.) chopsticks were made of it and it was used to decorate the principal parts of some of the emperor's chariots. Later it became fashionable as a decoration on the palanquins of important officials. Narrow memorandum tablets or *hu* of ivory, originally used at court by princes and high officials, later a mere symbol of rank and an indispensable accessory to ceremonial dress, were articles of great importance. Examples of ornamental ivory carving with angular, spiral, geometrical and floral designs, dating back to the Ch'u period, have come down to us.

In time the demand for ivory outgrew the native supply and large quantities of tusks had to be imported from Siam, Burma and India, which were described as long and large, and from Annam, which were small and short, as well as a variety yielding a red powder when cut by a saw which was pronounced to be of excellent quality. As early as the 12th century the Chinese knew that African ivory was the best. From the early 14th century at least the ivory from a slain elephant was esteemed the best; that taken not too long after natural death came next, while tusks discovered long after the elephant's death were least esteemed because the ivory was dull and opaque, and irregularly speckled.

Uses.—The Chinese cultured classes had always appreciated articles made of ivory, and ivory carving received imperial attention. In 1263 a bureau for carving in ivory and rhinoceros horn was established with some 150 craftsmen and an official in charge, and couches, tables and chairs, various implements, and ornaments for girdles inlaid with ivory and horn were made for the imperial household. In 1680 the emperor K'ang Hsi established *Tsao pan chu*, or imperial ateliers covering 27 branches of industry, including one for ivory carving, within the palace at Peking, and practical craftsmen from all over the empire were here brought together to produce fine work. They were in existence for over 100 years, turning out large numbers of excellent works bearing the stamp of the artistic fervour of the age. Authentic pieces from this imperial ivory carving atelier may be hard to identify, but many which exist in museums and private collections may reasonably be credited to it by reason of their superior workmanship which often reveals a marvellous quality of technical skill and harmonious beauty.

Great ingenuity is often displayed in the delicate workmanship of such an article as a fan, which may be made of finely cut plaited ivory threads, overlaid with carved flowers and birds, held by firmer pieces, likewise of carved ivory, having exquisitely carved and incised designs, which form the rim and the handle. Even more wonderful in their technical achievement as ivory carvings are the concentric spheres made in Canton as early as the 14th century and known as "devil's work balls," which are still being produced there. Endless patience and toil are needed to produce such concentric balls, carved one within the other, each having the most delicate patterns in pierced work. Models of palaces with carved roofs and intricate screens, peopled by tiny figures, and surrounded by trees and walls, all of ivory, were also a speciality of Canton; but most of them are known for their technical rather than their aesthetic triumphs as ivory carvings. Chinese ivory carving, however, is by no means wholly represented by these minutely and elaborately carved works, though for more than a century China has catered to foreign taste in producing this line of work. Excellent pieces of high artistic value are often found among carved religious and philosophic figures, especially those of *Kwan-yin*, Goddess of Mercy, with her graceful form and flowing robes, and of the Arhats, with their beatific expressions.

Fine artistic work is also to be found in some of the brush-holders (*pi tung*), which are often covered with a landscape in relief enlivened by figures; and in the arm-rests likewise designed for the scholar's table, and in snuff bottles which are often dyed and then carved so as to bring out the unstained ivory beneath—a technique known in Japan under the name of *bachiru*, where examples of it are to be seen among the 8th century relics now preserved in the imperial treasure-house, Shōsōin. Works of no common talent are also frequently found among girdle pendants, covers for cricket-gourds, and ivory plaques in relief used as insets on carved wood or lacquered screens and cabinets. Other articles for which the Chinese have used ivory as a favourite material as ornament, in various degrees of elaborateness, are the handle and sheath of the writing brush, trays, cages for crickets and birds, implements for opium smoking, toilet articles such as combs, small boxes, and pieces for various games. The Chinese, in the course of their history, have utilized the ivory of the elephant, the mammoth, the walrus and the narwhal, the last three having been used as substitutes for the first. Ivory carving in one form or another is still an important industry in Canton, Peking, Shanghai, Amoy and Suchow, large numbers of carvings being produced for the foreign market.

JAPANESE

History.—In the Shōsōin (imperial treasure-house at Nara) collection, which consists mainly, if not entirely, of objects dating from the 8th century A.D., still housed in the original wooden structure, there are a number of ivories carved in the style known as *bachiru*. The name implies the method of decorating an ivory object in which an article with a finished surface is generally dyed or stained, and then designs are carved on it, the unstained parts, wherever the carving is deep, being either left plain or treated with other colours, producing a very beautiful and decorative effect. In some articles the carving is done on unstained ivory and colours are applied to the designs carved. In that unique collection there are several ivory foot-measures in blue and bright red, an ivory plectrum of bright red colour for the *biwa* (a stringed musical instrument), a large number of bright red and blue ivory *go* (a game resembling chess) pieces, a few ivory knife-hilts and several ivory scabbards, etc., which are all decorated in the *bachiru* style with minute carvings of birds, animals, flowers, etc., the colours still retaining their original freshness. Not only those so decorated, but a number of plain ivory pieces of sceptres, combs, flutes and foot-measures, are also found in that collection. Though ivory must have been imported into Japan, it was used extensively with horn, bone and wood in minute inlaid works, such as decorated *go* boards, arm rests, musical instruments, and various small boxes preserved in that treasure-house belonging to the imperial household of Japan.

For nearly ten centuries after the Tempō period (708-781), to which most of the articles mentioned above belong, nothing is known about ivory carving in Japan, there being left practically no examples worthy of note from an artistic standpoint. It was Yoshimura Shuzan of Osaka who first began in the Kyōhō era (1716-36) carving ivory *netsuke* (ornamental pieces fastened to the cords attached to a tobacco pouch, purse or *inro*; i.e., medicine case) which became very popular among the people. Of course, the wooden *netsuke* was already known to have been used with a bunch of keys in the Ashikaga period (1394-1573) and with *inro*, when they came to be a great fashion in the Tenshō era (1573-92). However, Shuzan seems to have popularized them in ivory, and he was followed by many artists who carved mostly *netsuke* and rarely *okimono*, or ornaments for the alcove, in ivory as well as in wood. Among the ivory carvers who worked under the Tokugawa régime, which came to an end in 1867 after continuing for about two and a half centuries, are Shibayama Senzo, who is known to have devised a method of inlay in the An-ei era (1772-81), using corals, ivory, horns, etc.; Garan of Osaka, who was fond of carving birds, animals and insects for *netsuke* at about the same time; Izumiya Tomotada of Kyoto, who is known to have excelled in the Tem-

mei era (1781-89) in *netsuke* of cows and oxen in realistic carving; Tametada of Owari, an expert relief carver; Tomotane of Kyoto, whose favourite subjects for *netsuke* were warriors, angels, insects and animals; Hōshin of Kyoto, skilled in carving palaces and landscapes in half-opened shells and miniature figures in buildings; Masanao of Kyoto, who generally drew his subjects from hermits, animals, birds and insects, especially frogs in the act of jumping; Masatoshi, also of the Temmei era, who was an expert *netsuke* carver, being fond of figures, demons and masks for his subjects; Nakayama Yamatome of Yedo, skilled in minute carving, such as 53 stages of the Tokaido road, or portraits of 36 famous poets, on a single small piece; Noriaki, who was well-known in the Kwansei era (1789-1801) for figures and animal subjects; Miyasaka Hakuryu of Kyoto, who excelled in carving tigers, monkeys and dragons; Genryosai Minkoku, whose favourite subjects were grotesque hermits, animals and fishes; Ranko of Izumo, who left good works in a variety of subjects, such as figures, animals, birds, flowers and attempted landscapes on *netsuke*; and such others as Masaharu, Rantei, Yoshimasa, Yoshinaga, Shokyusai, Mitsushige, Tadachika, Ik-kosai Tōun, Rakuwosai, Masakazu, Shinshisai, Tomochika, Gyo-kuyosai, and his pupil Ozaki Kokusai, some of whom have left masterpieces in ivory *netsuke* and other carvings.

Scope.—Immediately after the Restoration of 1868, ivory objects found their way abroad, having attracted the attention of foreign collectors. So great was the foreign demand for the ivory carvings that they became quite an item in the Japanese export for some time. It was a great encouragement to the carvers, as their native patrons were becoming scarce, and the call for *netsuke* in Japan came to an end when the cigarette drove away tobacco pouches. However, the demand was for a greater and cheaper production, rather than for a high quality of work, and the standard of the craft deteriorated in consequence. Nevertheless, there were a number of masters who did produce works of high merit. Among them Asahi Gyokuzan and Ishikawa Mitsuki stand pre-eminent. The former made his reputation in wonderfully minute and realistic carving of skulls in ivory and in intricate and beautiful inlaid works, while the latter produced excellent figure ornaments as well as exquisite low relief in ivory. Among other well-known ivory carvers of more recent times mention may be made of Shimamura Toshiaki, Asahi Meidō, Sōma Senrei, Kaneda Kenjiro, Nishino Kōgyoku, Otani Mitutoshi and Ōno Hōfū, whose works have been much admired.

Designs in ivory *netsuke* are manifold, embracing almost every imaginary subject. However, the striking feature was the rounded corners, avoiding sharp edges, so as not to scratch the *inro*, which is generally in lacquer of costly decoration. Influences of contemporary artists like Hokusai and of such comic styles of painting as Otsu-ye are shown in the choice and treatment of the subject. Taoists and, later, *genre* figures commonly supplied the motives, and various animals, especially those in the 12 signs of the zodiac, were treated in all moods and attitudes.

Uses.—Apart from the *netsuke* and ornaments for the alcove, ivory has been used extensively as an ornamental piece for the *kakemono*, the mounted hanging paintings that can be rolled up when not in use. For plectra for *shamisen* (popular three-stringed musical instruments) ivory has been invaluable. Moreover it has long occupied a dignified position as an important accessory to the *cha-no-yu* (ceremonial tea) utensils. The lid of the tea caddy (*cha-ire*) is almost exclusively made of ivory, the bottom being lined with gold foil. It is generally in a simple but graceful form, having a knob in the centre with concentric circular lines or relief as ornaments. However, the portion of the tusk with black stains or flaws is often chosen for making a lid, care being taken to let such a flaw appear as an ornament or "scenery," as it is called, which often constitutes a striking feature in the ware. Tea scoops also are sometimes made of ivory, though most commonly they are made of bamboo by bending the flattened end of it to scoop out pulverized tea leaves from the caddy in preparing the tea.

It is for *kakemono*, *shamisen* plectra, tea caddy lids and tea scoops, though these are not of very great artistic value, that

ivory is chiefly used in Japan at the present time, since *netsuke* are almost entirely out of fashion. One still sees in shop windows ivory carvings of wide variety, and there are some skilled carvers in ivory producing works of unquestionable merit, but it cannot be denied that most of them cater for the taste of Europeans and Americans, and that the true refined taste of the Japanese rarely admits an ivory carving to the *tokonoma*.

NORTH AMERICAN

To the primitive North American Indian unacquainted with metals except the soft copper found in a pure state in certain isolated places, the gleaming ivory teeth of the animals he hunted always possessed a special attraction. The tooth of the beaver made him an efficient knife or graving tool, the tooth of the bear an admirable fish-lure. Often he attached rows of teeth to his clothing, partly to show his success in hunting, partly also because he found pleasure in their sheen. But there are three animals, the walrus, the narwhal and the elephant, gifted by nature with a larger share of ivory than the rest, and it so happened that in North America two of these animals were available only in the Arctic and sub-Arctic regions where the timber that supplies so many of man's needs was either scarce or lacking. The third animal, the elephant, was extinct in every part of America, but its tusks were easily accessible in certain parts of Alaska, although rare and usually deeply buried elsewhere. Consequently it was among the Eskimo tribes inhabiting the Arctic and sub-Arctic regions that the art of carving ivory for both utilitarian and aesthetic purposes attained its highest development.

The ivory in commonest use is walrus ivory, which is densest in structure and easiest to secure. Narwhal tusks are twisted and hollow, which renders them unsuited for engraving or carving, although they served the old Eskimos of Hudson bay for harpoon shafts and other implements. Mammoth ivory is almost as dense as walrus ivory, and hollow only towards the base. Fossilization, i.e., darkening through long contact with minerals in the soil, gives a variety of soft, deep colours greatly appreciated by curio collectors; hence traders often immerse white ivory in boiling coffee and other liquids to give its surface a spurious fossilization.

Our earliest specimens of Eskimo carving seem to come from the Bering sea region. They are not numerous, and are scattered through several museums, their antiquity unrecognized because they were purchased from ignorant Eskimos and not excavated by trained archaeologists. We may distinguish them by two criteria, deepness of colour (a very unsafe guide) and the style of ornamentation; sometimes we may add a third, the shapes of the specimens, which often differ from the later Eskimo types. There is carving in the round, apparently,—heads of seals and other realistic figures very similar and perhaps not inferior to anything we find in more recent Eskimo remains; but still more abundant are finely etched geometric patterns covering surfaces even of utilitarian objects such as snow-goggles and harpoon foreshafts that in later periods seldom carried any ornamentation. The artists of this ancient school, unlike their successors, disliked straight lines, preferring the graceful curves, scrolls and concentric circles that are so characteristic of Maori and Melanesian art. Unlike the Melanesians, however, they did not allow their ornamentation to run riot, but subordinated it in conformity with the shape and purpose of the object so as to produce a natural balance. The freehand drawing on the more carefully worked specimens is admirable; many of the concentric circles with incised dots are so accurate that they seem hardly traceable without compasses (fig. 1).

The period at which this remarkable art flourished is as obscure as its origin. It surely dates back at least 1,000 years, but how much more than this we cannot guess.

The curtain then closes for a period on the early history of the Arctic. When it opens again some ten centuries ago, we find the Eskimos occupying the whole coast line from Bering sea to Labrador and Greenland. Ivory-carving flourished in both the west and the east, but the finest specimens come from the west.

Even the most everyday objects, such as needle-cases, toggles for the dog-harness and harpoon-heads, underwent ornamentation or were given a decorative form. There are ornaments made of two unbroken links each carrying a representation of an animal's head, sometimes slightly conventionalized but often quite realistic. The needle-case with thimble-holder attached that is shown in Pl. IX., fig. 9 dates from post-European times, but it also has been carved from one unbroken section of a walrus tusk.

The Eskimo needle-case is a hollow cylinder of bone or ivory that contains a sealskin thong carrying the bone or copper needles. The ivory carvers of ancient days could not remain content with a plain undecorated tube, but for some reason not as yet understood, expanded it into what has been called the "winged" form (Pl. X., fig. 7), which they engraved with their characteristic geometric designs. Winged needle-cases have been found in old ruins from Alaska to the Labrador peninsula, so that the type was established at least 1,000 years ago. In Alaska the artists let their fancy play with the different elements of this conventional form. Sometimes they developed the ends of the needle-case, sometimes the flanges or wings and the hardly perceptible knobs below them. Since all their sculpture (as opposed to their engraving) tended towards realism,

BY COURTESY OF THE NATIONAL MUSEUM OF CANADA

FIG. 1.—EXAMPLE OF FREEHAND, ESKIMO CARVING

these elements became elaborated into animal forms, as in Pl. IX., fig. 11. Attached to the sealskin thong that passed through the tube there was always a toggle of some kind to assist in drawing the needles in and out, and it may be that the round, button-like toggle, fitting on top of a "winged" needle-case, suggested the human figure. At all events, we have actually secured from quite early sites many needle-cases in human form,—always female, for though men were the ivory carvers, the women performed all the sewing. In some specimens the head is hollow, as in Pl. X., fig. 6; in others it is solid and separate from the trunk, serving as the button for the sealskin thong.

Animal heads, usually carved on tools connected with the chase, are nevertheless much commoner than human figures in these old remains. The implement in the form of two polar bear heads joined together (Pl. X., fig. 9) is a toggle for dragging home seals. The ears of the bears show admirable workmanship, and the eyes are skilfully represented by plugs of dark-coloured antler. Possibly the holes marking the nostrils were originally plugged in the same way. The heads would be almost identical if the artist had not fancifully depicted one bear with teeth and one without. This specimen is particularly interesting because of the wide deep groove on the underside, which still reveals the stone age method of its formation. The workman first drilled a series of holes, side by side, then broke away the intervening walls.

From a somewhat later period, the early iron age, comes the arrow-straightener shown in Pl. X., fig. 8, which is surmounted with the heads of what appear to be caribou. Here again the artist has used plugs of dark ivory to represent the eyes and nostrils, but for the somewhat misplaced ears he contented himself with a conventional design, an engraved dot and circle. This pattern, so widely spread over the globe, appears fairly frequently in Alaska, even from the earliest times. (See Pl. X., fig. 11, an ivory box with wooden base and lid; Pl. IX., fig. 2, a snuff box and Pl. IX., fig. 13, handle of a skin-scraper, all from vicinity of Norton sound.)

The Russian explorations of the Chukchee peninsula in the middle and latter half of the 17th century caused a steady stream of iron to flow across Bering strait. The possession of iron tools immediately brought about a striking development in ivory work, particularly in Alaska. Older implements and ornaments appeared in new forms, as the skin-scraper of Pl. IX., fig. 13, the thimble-holder of Pl. IX., fig. 7, the mouthpiece of the bow drill in Pl. IX.,

fig. 4 and the delicate little ear pendants with their concentric circles and holes for suspending glass beads (Pl. X., fig. 12). With more efficient tools the artist could give freer rein to his imagination, and for the first time, apparently, we find carvings in the round, or in high relief, arranged to compose a scene. To this post-iron period belongs the Alaskan bucket handle of Pl. X., fig. 1, where a polar bear is seizing a fish. The Labrador peninsula has produced some remarkable carved ivory tusks in the past, probably recent, that illustrate the same artistic growth.

Far more striking, however, than either of these developments was the sudden emergence of realistic engravings in Alaska, and the birth, nearly full-grown, of a picture-writing, that has often been compared by writers too apt to forget its modernity with the scenes painted by palaeolithic man on the walls of French and Spanish caves, and the drawings made on rocks by the Bushmen in South Africa. Actually very little realistic engraving seems to occur before the Eskimos had direct or indirect contact with Europeans, and for some time after this contact realistic designs contested the field with the older geometric patterns without gaining the supremacy (compare the designs on the two archer's wrist-guards in Pl. X., figs. 3 & 5). In museum collections the oldest pipes (which were first introduced from Siberia about the same time as iron) seem to be carved in relief, and engraved either with geometric designs or with realistic figures of animals arranged without any relation to each other except a purely spatial one (Pl. IX., fig. 18). It was not until the 19th century indeed that picture-writing became firmly established and succeeded in relegating the older geometric engraving to the background; and even then it failed to gain a foothold in the Eskimo area except Alaska.

From about 1750 onward picture-writing in Alaska overshadowed the older engraving of geometric patterns, but by no means superseded it. Nor did it seriously affect the carving of detached figures, or of figures in high or low relief. A few specimens from the last 150 years may be illustrated to compare with the earlier art forms. Pl. IX., fig. 1 shows a graceful tool that was used by hunters to simulate the scratching of seals on the ice; it dates from about the beginning of European contact, although the claws have been relished with sinew in modern times. Pl. IX., fig. 14, from the early 19th century perhaps, is a gauge for regulating the mesh of the sealing net; besides the seals carved on its upper surface there is some crude picture-writing on the under side. Pl. IX., figs. 3 & 16; Pl. X., fig. 4 are productions from the second half of the 19th century; Pl. IX., fig. 3 a needle for lacing skins together; Pl. X., fig. 4 an ornament, probably for a bucket; Pl. IX., fig. 16, a fish.

It is too early yet to foresee what will result from the commercialization of Eskimo ivory-carving during the last 50 years. Already it has produced in Alaska professional carvers who earn their livelihood by supplying the demands of the curio trade. Undoubtedly these modern artists possess as much skill as their ancestors (see Pl. X., fig. 10, from Hudson bay, a cleverly balanced statuette of a man carrying a pack, and Pl. IX., fig. 10, from Alaska, which represents a mythical monster); but they have failed to apply their skill to the production of objects that are acceptable to the civilized world at large. (See also SCULPTURE; SCULPTURE TECHNIQUE; NORTH AMERICAN INDIAN.)

IVORY COAST (*Côte d'Ivoire*), a French West African colony, bounded south by the Gulf of Guinea, west by Liberia and French Guinea, north by the colonies of French Soudan and of the Upper Volta, east by the Gold Coast. Its area is 315,000 square kilometres, the population is about 725,000 (density 5.45 per sq. kilometre), of which 1,200 are Europeans. The most densely populated regions are the Baoule and the lagoons.

Physical Features.—The coast-line extends from 7° 30' to 3° 7' W. and has a length of 380 m. It forms an arc of a circle of which the convexity turns slightly to the north; neither bay nor promontory breaks the regularity of its outline. The shore is low, bordered in its eastern half with lagoons, and difficult of

access on account of the submarine bar of sand which stretches along nearly the whole of the coast, and also because of the heavy surf caused by the great Atlantic billows. The principal lagoons, going west to east, are those of Grand Lahou, Grand Bassam or Ebrié and Assini. The coast plains extend inland about 40 m. Beyond the ground rises in steep slopes to a general level of over 1,000 ft., the plateau being traversed in several directions by hills rising 2,000 ft. and over, and cut by valleys with a general south-eastern trend. In the north-east, in the district of Kong (*q.v.*), the country becomes mountainous, Mt. Komono attaining a height of 4,757 ft. In the north-west, by the Liberian frontier, the mountains in the Gon region rise over 6,000 ft. Starting from the Liberian frontier, the chief rivers are the Cavalla (or Kavalli), the San Pedro, the Sassandra (240 m. long), the Bandama (225 m.), formed by the White and the Red Bandama, the Komoe (360 m.). All these streams are interrupted by rapids as they descend from the highlands to the plain and are unnavigable by steamers save for a few miles from their mouths. The rivers named all drain to the Gulf of Guinea; the rivers in the extreme north of the colony belong to the Niger system. The climate is in general very hot and unhealthy, the rainfall being very heavy. In some parts of the plateau healthier conditions prevail. The fauna and flora are similar to those of the Gold Coast and Liberia. Primeval forest extends from the coast plains to about 8° N., covering nearly 112,000 sq. kilometres.

Inhabitants.—The coast districts are inhabited by Negro tribes allied on the one hand to the Kru (*q.v.*) and on the other to the people of Ashanti (*q.v.*). The Assinis are of Ashanti origin, and chiefly of the Ochin and Agni tribes. The Mandés, Malinkés, Diulas, Mandingans, inhabit the north; they form nearly a quarter of the population. Inland live the Sienuf (Senoufos), a very primitive people. The Baulé, 340,000, who occupy the central part of the colony, are of Agni-Ashanti origin. The bulk of the inhabitants are fetish worshippers; only several Mandé groups are Muslim. In general the coast tribes are peaceful. The traders are chiefly Fanti, Sierra Leonians, Senegalese and Mandingos.

Towns.—The chief towns on the coast are Grand and Little Bassam, Jackville and Assini in the east and Grand Lahou, Sassandra and Tabu in the west. Grand and Little Bassam are built on the strip of sand which separates the Grand Bassam or Ebrié lagoon from the sea. This lagoon forms a commodious harbour, once the bar has been crossed. Grand Bassam is situated at the point where the lagoon and the river Komoe enter the sea and there is a minimum depth of 12 ft. of water over the bar. The town (pop. 7,000, including about 100 Europeans) is the seat of the customs administration and of the judicial department, and is the largest centre for the trade of the colony. A wharf equipped with cranes extends beyond the surf line. Little Bassam, renamed by the French Port Bouet, possesses an advantage over the other ports on the coast, as at this point there is no bar. Abidjan (Abidjan) (5,300 inhabitants), on the north side of the lagoon opposite Port Bouet, is the starting-point of a railway. On the northern shore of the Bassam lagoon, and 19 m. from Grand Bassam, is the capital of the colony, the native name Adjame having been changed into Bingerville, in honour of Captain L. G. Binger. The town (750 inhabitants) is built on a hill and is fairly healthy.

In the interior are several towns, though none of any size numerically. The best known are Koroko, Kong and Bona, entrepôts for the trade of the middle Niger, and Bontuku, on the caravan route to Sokoto and the meeting-place of the merchants from Kong and Timbuktu, engaged in the kola-nut trade with Ashanti and the Gold Coast. Bontuku is peopled largely by Wongara and Hausa, and most of the inhabitants, who number some 3,000, are Muslim.

Agriculture and Trade.—The natives cultivate maize, plantains, bananas, pineapples, limes, pepper, cotton, etc., and live on the products of their gardens, with occasional help from fishing and hunting. They also weave cloth, make pottery and smelt iron. Europeans introduced the cultivation of coffee, which gives good results, and of cocoa, which grows well between the oil-

palms. The export of coffee reaches 187 tons, that of cocoa 9,800 tons, that of cotton 800 tons. The forests are rich in palm-tree products and mahogany, which constitute the chief articles of export. The exploitation of the forests began in 1905, with 13,000 tons; to-day it reaches 119,000 tons, of which 96,000 tons are of cabinet-woods, 11,000 tons of palm-kernels and 8,000 tons of palm-oil have been exported.

In 1927 the trade of the Ivory Coast reached 428,772,000 francs (imports 193,305,000, exports 233,467,000). In the imports the share of France is 104 millions; then come Great Britain (37) and the United States (16); in the exports the share of France is 131 millions, then come Germany (30) and Great Britain (23).

Communications.—The railway from Abidjan serves the east central part of the colony and passes through Bouaké and Katiola and reaches Tarife (488 kilometres); it will be prolonged to Bobo Dioulasso. The line is of metre gauge. The cutting of two canals, whereby communication is effected by lagoon between Assini and Grand Lahou via Bassam, followed the construction of the railway.

Besides the wharf of Grand Bassam, another wharf is being built at Port Bouet, a bridge over the Ebrié lagoon will link it to Abidjan and to the railway. But the Ivory Coast needs a safe deep-water harbour, built either at the mouth of the Comoe or at that of the Sassandra. Grand and Little Bassam are in regular communication by steamer with Bordeaux, Marseilles, Liverpool, Antwerp and Hamburg. Grand Bassam is connected with Europe by submarine cable via Dakar. Telegraph lines connect the coast with all the principal stations in the interior, with the Gold Coast and with the other French colonies in West Africa.

Administration.—The colony is under the general superintendence of the government general of French West Africa. At the head of the local administration is a lieutenant-governor, who is assisted by a council on which nominated unofficial members have seats. To a large extent the native forms of government are maintained under European administrators responsible for the preservation of order, the colony for this purpose being divided into a number of "circles," each with its local government. The colony has a separate budget and is self-supporting. Revenue is derived chiefly from customs receipts and a capitation tax instituted in 1901 and levied on all persons over ten years old.

See *La Côte d'Ivoire* (published by the general government of West Africa, 1906); Gaston Joseph, *La Côte d'Ivoire* (1917).

HISTORY

The Ivory Coast is stated to have been visited by Dieppe merchants in the 14th century, and was made known by the Portuguese discoveries towards the end of the 15th century. It was thereafter frequented by traders for ivory, slaves, and other commodities. There was a French settlement at Assini, 1700-04, and a French factory was maintained at Grand Bassam from 1700 to 1707. In the early part of the 19th century several French traders had established themselves along the coast. In 1830 Admiral (then Commandant) Bouët-Willaumez (1808-71) began a series of surveys and expeditions which yielded valuable results. In 1842 he obtained from the native chiefs cessions of territory at Assini and Grand Bassam to France, and the towns named were occupied in 1843. From that time French influence gradually extended along the coast except during a period of temporary withdrawal (1872-83). Between 1887 and 1889 Captain Louis Gustave Binger traversed the whole region between the coast and the Niger, visited Bontuku and the Kong country, and signed protectorate treaties with the chiefs. In 1892 Captain Binger made further explorations in the interior of the Ivory Coast, and in 1893 he was appointed the first governor of the colony on its erection into an administration distinct from that of Senegal. Among other famous explorers who helped to make known the hinterland was Colonel (then Captain) Marchand. The boundary of the colony on the west was settled by Franco-Liberian agreements of 1892 and subsequent dates; that on the east by the Anglo-French agreements of 1893 and 1898. The northern boundary was fixed in 1899 on the division of the middle Niger territories among the other French West African colonies. The systematic development of the colony,

the opening up of the hinterland, and the exploitation of its economic resources date from the appointment of Captain Binger as governor, a post he held for over three years. Since 1902 the colony has been an autonomous unit, under a lieutenant-governor, of the French West African governorship general. A noteworthy stage in the opening up of the country was the building of a railway from the coast. This line had reached Buake (193 m.) in 1913 and after the World War was continued northward towards the Niger.

In the older books of travel are often found the alternative names for this region, Tooth Coast (*Côte des Dents*) or Kwa-Kwa Coast, and, less frequently, the Coast of the Five and Six Stripes (alluding to a kind of cotton fabric in favour with the natives).

See F. J. Clozel, *Dix ans à la Côte d'Ivoire* (1906); R. Villamur and Richaud, *Notre colonie de la Côte d'Ivoire* (1903). These two volumes deal with the history, geography, zoology, and economic condition of the Ivory Coast. Michellet and Clement, *La Côte d'Ivoire*, describe the administrative and land systems, etc.; another volume also called *La Côte d'Ivoire* (1908) is an official monograph on the colony. For ethnology see F. J. Clozel and R. Villamur, *Coutumes indigènes de la Côte d'Ivoire* (1902); R. Villamur and Delafosse, *Les Coutumes Agni*. Of books of travel see L. G. Binger, *Du Niger au Golfe de Guinée par Kong* (1892); Captain d'Ollone, *Mission Hostains-d'Ollone 1898-1900* (1901); R. Antonetti, "La Côte d'Ivoire" in *La Géographie* (1922).

IVREA, a town and episcopal see of Piedmont (anc. *Eporedia*), Italy, province of Turin, 38 m. north-north-east from the city of Turin by rail and 27 m. direct, 770 ft. above sea-level, on the Dora Baltea at the point where it leaves the mountains. Pop. (1921) 5,614 (town), 11,770 (commune). The cathedral was built between 973 and 1002, but nothing is left of this period save the ambulatory round the choir and the two bell-towers. The fine campanile of S. Stefano belongs to 1029-1042. The hill above the town is crowned by the imposing Castello delle Quattro Torri (1358).

The ancient Eporedia, at the junction of roads from Augusta Taurinorum and Vercellae, at the point where the road to Augusta Praetoria enters the narrow valley of the Duria (Dora Baltea), was a military position of the Salassi who inhabited the whole upper valley of the Duria. The importance of the gold-mines of the district led to its seizure by the Romans in 143 B.C. The centre of the mining industry seems to have been Victumulae (see TICINUM), until in 100 B.C. a colony of Roman citizens was founded at Eporedia itself; but prosperity was only assured when the Salassi were finally defeated in 25 B.C. and Augusta Praetoria founded. There are remains of a theatre of the time of the Antonines and the Ponte Vecchio rests on Roman foundations.

In the middle ages Ivrea was the capital of a Lombard duchy, and later of a marquise; both Berengar II. (950) and Arduin (1002) became kings of Italy for a short period. Later it submitted to the marquises of Monferrato, and in the middle of the 14th century passed to the house of Savoy. The surrounding district is known as the Canavese.

IVRY, BATTLE OF (1590). The battle of Ivry (Eure, France) was fought between the Huguenots under Henry IV. of France and the Catholics under the duke of Mayenne on March 14, 1590. On Aug. 1, 1589 Henry III. was assassinated, and Henry IV., of Navarre, ascended the French throne, and at the battle of Arques, won by him on Sept. 28, 1589, he, through his energy, gallantry and resourcefulness, established himself as the national hero. The next year the duke of Mayenne laid siege to Melun, but fell back on the approach of Henry. No sooner had the king withdrawn than he was recalled to confront Mayenne who, reinforced by the Spaniards, had returned. The two forces, the duke's numbering about 13,000 and the king's somewhat less, met on the plain of Ivry. The following brief account of the battle which then took place will give some idea of the desultory tactics in vogue at this date.

Henry first drew up his army, prayed and then adjusted his helmet on the crest of which floated three white plumes. Before lowering his visor he said to his companions: "I will conquer or die. Keep well your ranks, and if the heat of the battle compels you to leave them, always rally, it is the one thing to remember

in war. This you should do by the three pear-trees you see yonder on my right. If you lose your banners and your standards do not, however, lose sight of my white plume, for you will always find it on the road of honour and pointing towards victory." Colonel Schomberg, a captain of mercenaries, rode up to the king and demanded that his men should be paid. Henry in a rage rebuked him, and then throwing his arms about him kissed him, whereupon Schomberg with tears in his eyes replied, "Oh! Sire, in giving me back the honour you took from me you take away my life." The charge was sounded, and "*Schomberg part comme un trait; fond sur l'ennemi comme un lion furieux, et meurt les armes à la main*," (Schomberg sped forward like an arrow, hurled himself like a furious lion on the enemy, and died sword in hand). With shouts of "*Vive le Roi!*" battalions and squadrons followed him. The two sides clinched, and for several hours attacks were made and repulsed without any decided advantage being gained. A page bearing a white plume in his helmet being killed, a panic seized upon some of Henry's squadrons. At the moment he was busily engaged in a hand to hand fight, lost to sight in a mêlée. Cutting his way out, his white plumes were once again seen, whereupon his soldiers wild with joy charged forward, and the enemy was routed. A pursuit to the bridge of Ivry then followed, at which most of the foreign troops in Mayenne's pay were butchered, the French and Swiss alone receiving quarter.

The prestige won at Ivry was Henry's true gain and victory. He was accepted by France, and then as an act of political wisdom, in July 1593, he became a Catholic, and two years later brought about the collapse of all opposition.

See A. Poirson, *Histoire du règne de Henry IV., 1562-1567*; P. F. Willett, *Henry of Navarre; The Cambridge Modern History*, vol. iii., 1904. (J. F. C. F.)

IVRY-SUR-SEINE, a suburb of Paris, in the department of Seine, arrondissement of Sceaux, near the left bank of the Seine, 6 kilometres from Notre Dame cathedral. Pop. (1925) 41,192. It manufactures organs, earthenware, rubber and chocolates, and has engineering works, and oil-works, its trade being facilitated by a port on the Seine.

IVY, the collective designation of certain species and varieties of *Hedera*, a member of the family Araliaceae. There are fifty species of ivy recorded in modern books, but they may be reduced to two, or at the most, three. The European ivy, *Hedera Helix*, is a plant subject to infinite variety in the forms and colours of its leaves, but the tendency of which is always to a three- to five-lobed form when climbing and a regular ovate form of leaf when producing flower and fruit. The African ivy, *H. canariensis*, often regarded as a variety of *H. Helix* and known as the Irish ivy, is a native of North Africa and the adjacent islands. It is the common large-leaved climbing ivy, and also varies, but in a less degree than *H. Helix*, from which its leaves differ in their larger size, rich deep green colour, and a prevailing tendency to a five-lobed outline. When in fruit the leaves are usually three-lobed, but they are sometimes entire and broadly ovate. The Asiatic ivy, *H. colchica*, now considered to be a form of *H. Helix*, has ovate, obscurely three-lobed leaves of a coriaceous texture and a deep green colour; in the tree or fruiting form the leaves are narrower than in the climbing form, and without any trace of lobes. Distinctive characters are also to be found in the appendages of the pedicels and calyx, *H. Helix* having six-rayed stellate hairs, *H. canariensis* fifteen-rayed hairs and *H. colchica* yellowish two-lobed scales.

The Australian ivy, *H. australiana*, is a small glabrous shrub with pinnate leaves. It is a native of Queensland, and is practically unknown in cultivation.

It is important to note the difference of characters of the same species of ivy in its two conditions of climbing and fruiting. The first stage of growth, which we will suppose to be from the seed, is essentially scandent, and the leaves are lobed more or less. This stage is accompanied with a plentiful production of the clasps or modified roots by means of which the plant becomes attached and obtains support. When it has reached the summit of the tree or tower, the stems, being no longer able to maintain a perpendicular attitude, fall over and become horizontal or pendent.

Coincidentally with this change they cease to produce claspers, and the leaves are strikingly modified in form, being now narrower and less lobed than on the ascending stems. In due time this tree-like growth produces terminal umbels of greenish flowers, which have the parts in fives, with the styles united into a very short one. These flowers are succeeded by smooth black or yellow berries, containing two to five seeds. The yellow-berried ivy is met with

FROM COOPER AND WESTELL, "TREES AND SHRUBS OF THE BRITISH ISLES" (M. DENT, LTD.)

IVY (*HEDERA HELIX*)

- A. Branch with flowers
- B. Fruits
- C. Climbing stem with adventitious roots

in northern India and in Italy, but in northern Europe it is known only as a curiosity of the garden, where, if sufficiently sheltered and nourished, it becomes an exceedingly beautiful and fruitful tree.

A question of practical importance is the relation of the plant to its means of support. A moderate growth of ivy is not injurious to trees; still the tendency is from the first inimical to the prosperity of the tree, and at a certain stage it becomes deadly. Therefore the growth of ivy on trees should be kept within reasonable bounds, more especially in the case of trees that are of special value for their beauty, history, or the quality of their timber. In regard to buildings clothed with ivy, there is nothing to be feared so long as the plant does not penetrate the substance of the wall by means of any fissure. Should it thrust its way in, the natural and continuous expansion of its several parts will necessarily hasten the decay of the edifice. But a fair growth of ivy on sound walls that afford no entrance beyond the superficial attachment of the claspers is, without any exception whatever, beneficial. It promotes dryness and warmth, reduces to a minimum the corrosive action of the atmosphere, and is altogether as conservative as it is beautiful.

Many varieties are cultivated in gardens and to grow these is an extremely simple matter, as they will thrive in a poor soil and endure a considerable depth of shade, so that they may with advantage be planted under trees. The common Irish ivy is often to be seen clothing the ground beneath large yew trees where grass would not live, and it is occasionally planted in graveyards in London to form an imitation of grass turf, for which purpose it is admirably suited.

The ivy, though long cultivated in mild, moist districts, is, on the whole, a scarce plant on the American continent. In the northern United States and southern Canada the winters are not more severe than the ivy can endure, but the summers are too hot and dry. In districts where native ferns abound the ivy will usually

thrive, and the varieties of *Hedera Helix* should have the preference. But in the drier districts ivies should be planted on the north side of buildings, and encouraged with water and careful training for three or four years. A strong light is detrimental to the growth of ivy, but there are no hardy plants that may be compared with it for variety and beauty that will endure shade equally well.

The North American poison ivy (poison oak), *Rhus Toxicodendron* (Anacardiaceae), is a climber with three-foliolate leaves, which are very attractive in their autumn colour.

The ground ivy, *Nepeta hederacea* (family Labiatae), is a small creeping plant with rounded crenate leaves and small blue-purple flowers, occurring in hedges and thickets in Great Britain and widely in North America.

IWAKURA, TOMOMI, PRINCE (1835–1883), Japanese statesman, was born in Kyoto. He was one of the court nobles (*kuge*) of Japan, and he traced his descent to the emperor Murakami (A.D. 947–967). He took a leading part in the complications preceding the fall of the Tokugawa *shōgunate*, and was obliged to fly from Kyoto accompanied by his coadjutor, Prince Sanjō. They took refuge with the *Daimyō* of Chōshū, and, while there, established relations which contributed greatly to the ultimate union of the two great fiefs, Satsuma and Chōshū, for the work of the Restoration. From 1867 until the day of his death Iwakura was one of the most prominent figures on the political stage. In 1871 he proceeded to America and Europe at the head of an embassy of some fifty persons, to explain to foreign governments existing conditions in Japan, and to prepare for negotiating new treaties consistent with her sovereign rights. Little success attended the mission. Returning to Japan in 1873, Iwakura found the cabinet divided as to the manner of dealing with Korea. He advocated peace, and his influence carried the day.

IWASAKI, KOYATA, 2ND BARON (1879–), Japanese philanthropist, was born in 1879, and succeeded to the barony in 1909. Educated at the Imperial university of Tōkyō and at Cambridge, England, he became president of the banking department of the Mitsubishi company. His vast wealth was largely expended in experiments and benefactions. He instituted a research farm in the north of Japan for stock raising. His visit to England convinced him of the educational value of public libraries and when the library of G. E. Morrison, for many years *The Times* (London) correspondent in Peking, came into the market, Baron Iwasaki bought it for the students of Japan. He added to it the bulk of his own collection and in addition to buying a site and erecting a building to contain it, he allotted a sum of money annually to the institution for the purpose of keeping it up to date by the purchase of new books. The library is called the *Tōyō Bunko* (Oriental library) and is situated in Kamifujimae Chō in Hongō, Tōkyō.

I.W.W.: see INDUSTRIAL WORKERS OF THE WORLD.

IXION, in Greek legend, son of Phlegyas, king of the Lapithae in Thessaly (or of Ares), and husband of Dia. Having treacherously murdered his wife's father Deioneus he could find none to purify him until Zeus did so and admitted him as a guest to Olympus. Ixion abused his pardon by trying to seduce Hera; but the goddess substituted for herself a cloud, by which he became the father of the Centaurs. Zeus bound him on a fiery wheel, which rolls unceasingly through the air or (according to the later version) in the underworld (Pindar, *Pythia*, ii. 21; Ovid, *Metam.* iv. 461; Virgil, *Aeneid*, vi. 601). A plausible but by no means certain explanation connects the story with the not uncommon practice of carrying a blazing revolving wheel through fields which needed the heat of the sun, the legend being invented to explain the custom (see Mannhardt, *Wald- und Feldkulte*, ii. 1905, p. 83).

See Roscher's *Lexikon*, s.v.

IXTACCIHUATL (ēsh-tāk-sē-wātl) or **IZTACCIHUATL** ("white woman"), a lofty volcano, rom. N. of Popocatepetl and about 40m. S.S.E. of the City of Mexico, forming part of the short spur called the Sierra Nevada. According to Angelo Heilprin (1853–1907) its elevation is 16,960ft.; other authorities make it much less. Its apparent height is dwarfed somewhat by its elongated summit, and the large area covered. It has three sum-

mits of different heights standing on a north and south line, the central one being the largest and highest, and all three rising above the permanent snow-line. As seen from the City of Mexico the three summits have the appearance of a shrouded human figure, hence the poetic Aztec appellation of "white woman" and the unsentimental Spanish designation *La mujer gorda* ("the fat woman"). The ascent is difficult and perilous, and is rarely accomplished.

Heilprin says that the mountain is largely composed of trachytic rocks, and that it is older than Popocatepetl. It has no crater and no trace of lingering volcanic heat. It is surmised that its crater, if it ever had one, has been filled in and its cone worn away by erosion through long periods of time.

IXTLILXOCHITL II. (c. 1500–1550), chief of the Texcucans, one of the most civilized tribes of ancient Mexico. He became an enemy of Montezuma, emperor of Mexico, because Montezuma aided his brother in the struggle for leadership which followed upon the death of their father, Netzahualpilli. When the Spaniards under Cortés arrived Ixtlilxochitl offered his services against Montezuma and Cortés in turn aided him in becoming king of Texcucan. Ixtlilxochitl remained faithful to the Spaniards to the last and accompanied Cortés on many expeditions, but in the end he lost the favour of his own subjects whom he had really helped to conquer.

IYRCAE (i-ür'ki), an ancient nation on the north-east trade route described by Herodotus (iv.22) beyond the Thyssagetae (q.v.), somewhere about the upper basins of the Tobol and the Irtysh. They were distinguished by their mode of hunting, climbing a tree to survey their game, and then pursuing it with trained horses and dogs. They were almost certainly the ancestors of the modern Magyars, also called Jugra.

IZARD (*Rupicapra pyrenaica*), the chamois of the Pyrenees, differing from the typical Alpine form (see CHAMOIS) in its reddish colour and smaller size. The name is also spelt "isard."

IZBARTA or SPARTA (anc. *Baris*), a town in Asia Minor, well situated on the edge of a fertile plain at the foot of Aghlasun Dag. It was once the capital of the Emirate of Hamid. It suffered severely from an earthquake in 1889. It has been an important centre of Greek influence in Anatolia. It is connected by rail with Smyrna and Egerdir. Pop. (1927) 44,663.

IZHEVSK, the administrative centre of the Votyak Autonomous Area of the R.S.F.S.R. on the Izh river, a tributary of the Kama river, in lat. 56° 52' N. and long. 53° 14' E. Pop. (1926) 63,088. Its steel foundries and ammunition works were established in 1807, but have increased rapidly in importance in the last few years. Other industries include brewing, brick making, flour-milling and saw-milling.

IZU-NO-SHICHI-TO, the seven (*shichi*) islands (*to*) of Izu, included in the empire of Japan. They stretch in a southerly direction from a point near the mouth of Tokyo bay, and lie between 33° and 34° 48' N. and between 139° and 140° E. Their names, beginning from the north, are Izu-no-Oshima, To-shima, Nii-shima, Kozu-shima, Miyake-shima and Hachijo-shima. There are some islets in their immediate vicinity. Izu-no-Oshima, an island 10 m. long and 5½ m. wide, is 15 m. from the nearest point of the Izu promontory. It is known to western cartographers as Vries island, a name derived from that of Captain Martin Gerritsz de Vries, a Dutch navigator, who is supposed to have discovered the island in 1643. But the group was known to the Japanese from a remote period, and was used as a convict settlement from the 12th century. Izu-no-Oshima is remarkable for its smoking volcano, Mihara-yama (2,461 ft.).

IZVOLSKY, ALEXANDER PETROVICH (1856–1919), Russian statesman, was born at Moscow on March 17, 1856, of an ancient Polish family long settled in Russia. He graduated at the Imperial Lyceum of St. Petersburg (Leningrad) with the highest honours attainable, and entered the diplomatic service. He held appointments at Bucharest, Washington and at the Vatican, where he was charged with the resumption of relations between the tsar's government and the Holy See.

Izvolsky married Countess Toll, a friend of the dowager Empress Maria Feodorovna, to whose influence he owed much of

his professional success. His next posts, as minister plenipotentiary, were in Belgrade, Munich and Tokyo. From the Japanese capital he warned Lamsdorff, his chief, of what was brewing for Russia in the Far East, but without effect; his attempts to compose the differences by arranging the Marquis Ito's mission to Europe (1902) and obtaining moderate Japanese proposals (1904) were also thwarted. Before hostilities broke out Izvolsky was transferred to Copenhagen (1903). In 1906 he succeeded Count Lamsdorff as minister of foreign affairs, a post which he held until 1910. From 1910 to 1917 Izvolsky was Russian Ambassador in France. After the revolution he died in Paris Aug. 16, 1919.

As foreign minister Izvolsky has no claims to real greatness. He was a clever diplomatist—according to King Edward VII., the cleverest in Russia—with a very definite and circumscribed aim which he pursued with unflagging energy, an endless variety of means and untiring perseverance. When he became foreign secretary, France and Russia were but nominally allies, each one speculating on the intentions of the other; and the cardinal principle of his policy was to convert that alliance into an effective reality. This he did with occidental thoroughness. Hence he strove to draw Britain, Italy, Turkey, Bulgaria and Rumania into the Entente. Accepting as an axiom the inevitability of a great European war, the principal belligerents being France and Germany in the west, and Russia and Austria in the east, he came to the conclusion that between those future enemies there might be episodic arrangements and temporary makeshifts, but no complete settlement except by war.

Izvolsky's first success was the liquidation of the war with Japan, which he accomplished with remarkable foresight, breadth of view, thoroughness and moral courage. The next and more difficult task, the final elimination of the causes of Anglo-Russian rivalry, was begun by the arrangement with Britain about Persia, Afghanistan and Tibet (1907). This reconciliation definitely baffled Aehrenthal's scheme which the Russian tsaritzza favoured—of a renewal of the Three-Kaiser Alliance.

Soon after this Izvolsky sounded Vienna unofficially as to how Austria would view an attempt by Russia to obtain the freedom of the Straits. Aehrenthal, then minister of foreign affairs, who was still on relatively friendly terms with Izvolsky, replied unofficially that no objection would be raised if Russia agreed to the annexation of Bosnia and Hercegovina. This question and answer were, however, followed by a marked coolness in the mutual relations of the two empires, and the matter dropped. The two states came together again when charged by Europe to draft and execute a scheme for the reform of justice in Macedonia. But Austria secretly obtained from Turkey a railway concession in the sanjak of Novi Bazar. In St. Petersburg, London and Belgrade the news aroused intense indignation. But after King Edward's visit to Reval (June 1908), Izvolsky informed Aehrenthal that Russia had no objection to the Sanjak Railway if Austria would assent to an Adria Railway for Serbia. At the same time he proposed that the tsardom should obtain the freedom of the Straits and Austria promulgate the annexation of Bosnia and Hercegovina. Izvolsky and Aehrenthal then met at Buchlau, the Moravian residence of Count Berchtold (Sept. 15, 1908), and agreed to this arrangement. Izvolsky held that he made the proviso that the two points be referred to a European Conference, while Aehrenthal asserted that he announced the annexation as impending. Both were probably right. A few days later the annexation was proclaimed, whereas Russia was kept out of her *quid pro quo* owing to British-French opposition.

The resulting personal and national tension almost brought war within sight, but Russia being unprepared, it was staved off. Izvolsky attempted to draw Italy into the orbit of the Allies; but in spite of this Russia and Germany seemed for a while to become friends again, and during the Tsar's sojourn in Germany Izvolsky was relieved of his office and sent to Paris as ambassador, remaining, however, the real head of his country's policy until the outbreak of the World War, for which his enemies often held him responsible. But the hyperbole is unjustified. His policy, like that of Aehrenthal, was a sequence of cruel illusions for which the peoples had to pay.

J

This letter was not differentiated from I until comparatively modern times. It was the custom in mediaeval mss. to lengthen the letter I when it was in a prominent position, notably when it was initial. As initial I usually had consonantal force, the lengthened form came definitely to be regarded as representing the consonant and the shortened form the vowel in whatever position they occurred. The process of differentiation began about the 14th cent. but was not complete till the 17th. For certain purposes, an alphabetical series for example, the letters I and J are not even yet regarded as distinct, the enumeration passing generally from I to K.

The original consonantal sound represented by the letter was the semi-vowel or spirant *i* (the sound of *y* in the word *yacht*). This passed into *dy* and later into the sound *dž* which the letter represents to-day. This sound was already established in the language in words of Romance origin in which it was represented by *g* (e.g., in words such as *gesture*, *ginger*), and these words retain their spelling. J represents the same sound (*dž*) in all positions.

The minuscule form *j* is the lengthened form, retaining the dot, of minuscule *i*.

JA'ALIN, the largest, most widely distributed and most loosely knit main group of the Arabs of the Sudan. The term is used generally of most of the northern riverain tribes and in a more restricted sense of a large group comprising the Sa'adab, Nifi'at, Kiti'ab and other tribes. They claim to be of the Koreish tribe and even trace descent from Abbas, uncle of the prophet. They are of Arab origin, but now of very mixed blood. According to tradition they emigrated to Nubia in the 12th century. They are a proud religious people, formerly notorious as slave dealers.

See H. A. MacMichael, *History of the Arabs of the Sudan* (1922).

JABIRU, an American stork, *Mycteria americana*, found from Mexico to the Argentine. It stands between 4 and 5 ft. in height, with a massive bill and white plumage. The head and neck are bare, and black and red in colour. The Old World genera *Xenorhynchus* and *Ephippiorhynchus* are nearly allied to the true jabiru, but the head and neck are feathered. Less closely related are the adjutant birds (*q.v.*).

THE COMMON BRAZILIAN JABIRU

JABLOCHKOV, PAUL

(1847-1894), Russian electrical engineer and inventor, was born at Serdobsrk, in the government of Saratov, on Sept. 14, 1847, and educated at St. Petersburg. He devoted himself to research on electric lighting by arc lamps and in 1876 he brought out the Jablochkov "candles," which consisted of two carbon parallel rods, separated by a non-conducting partition. His system was gradually superseded (*see* LIGHTING and ARTIFICIAL ILLUMINATION). Jablochkov died in poverty in Russia on March 19, 1894.

JABLONEC NAD NISOU, a manufacturing town in north-eastern Bohemia noted for the famous Gablonz ware, and a centre for the glass industry and the preparation of cheap jewellery and imitation stones. Apart from this it has important textile factories and is an administrative centre. Pop. (1926) 26,929.

JABLONSKI, DANIEL ERNST (1660-1741), German theologian, was born at Nassenhuben, near Danzig, on Nov. 20, 1660, the son of a Moravian pastor. He studied at Frankfort-on-Oder and Oxford, became a preacher at Magdeburg in 1683, and

then from 1686 to 1691 he was head of the Moravian college at Lissa. He was appointed court preacher at Königsberg in 1691 by the elector of Brandenburg, Frederick III., and had considerable influence in court circles. In 1693 he became court preacher at Berlin and in 1699 he was consecrated a bishop of the Moravian Church. Jablonski worked hard for union between the Lutherans and the Calvinists; the courts of Berlin, Hanover, Brunswick and Gotha were interested in his scheme, and his principal supporter was Leibnitz. His idea appears to have been to form a general union between the German, the English and the Swiss Protestants. In spite of the failure of negotiations, Jablonski and Leibnitz, however, did not cease to believe in their purpose. Jablonski was one of the founders of the Berlin Academy of Sciences, of which he was president in 1733. He died on May 25, 1741.

Jablonski's son, Paul Ernst Jablonski (1693-1757), was professor of theology and philosophy at Frankfort-on-Oder.

Correspondence between Jablonski and Leibnitz was published at Leipzig in 1747 and at Dorpat in 1899. See H. Dalton, *Daniel Ernst Jablonski* (1903).

JABORANDI, a name given in Brazil and South America generally to various plants which increase perspiration and the flow of saliva. In the year 1875 a drug was introduced under this name, its botanical source being then unknown. *Pilocarpus pennatifolius*, a member of the family Rutaceae, the plant from which it is obtained, is a slightly branched shrub about 10 ft. high, growing in Paraguay and eastern Brazil.

The leaves are the part of the plant most commonly imported. The active principle is called *pilocarpine*. It is a liquid alkaloid, slightly soluble in water, and very soluble in alcohol, ether and chloroform. It strongly rotates the plane of polarization to the right, and forms crystalline salts of which the nitrate is that chiefly used in medicine. The formula of the alkaloid is $C_{11}H_{16}N_2O_2$. Certain other alkaloids are present in the leaves. They have been named *jaborine*, *jaboridine* and *pilocarpidine*. The first of these is the most important. It is possibly derived from pilocarpine, and has the formula $C_{22}H_{32}N_4O_4$. Jaborine resembles atropine pharmacologically, and is antagonistic to pilocarpine. The various preparations of jaborandi leaves are therefore undesirable for therapeutic purposes, and only the nitrate of pilocarpine itself should be used.

The action of this powerful alkaloid closely resembles that of physostigmine, but pilocarpine exerts its greatest power on the secretions. It has no external action. When taken by the mouth the drug is rapidly absorbed and stimulates the secretions of the alimentary tract, though not of the liver. The action on the salivary glands is the most marked. The great flow of saliva is due to an action of the drug, on the terminations of the nerves of salivary secretion. The gland cells themselves are unaffected. The nerves are so violently excited that direct stimulation of them by electricity adds nothing to the rate of salivary flow. The action is antagonized by atropine, which paralyzes the nerve terminals. About $\frac{1}{100}$ of a grain of atropine antagonizes half a grain of pilocarpine. The circulation is depressed by the drug, the pulse being slowed and the blood pressure falling. Its dangerous action is upon the bronchial secretion, which is greatly increased. Pilocarpine is also the most powerful diaphoretic known.

JABORANDI (*PILOCARPUS PENNATIFOLIUS*). BRANCH WITH RACEMES OF FLOWERS. THE DRUG IS OBTAINED FROM LEAVES AND YOUNG SHOOTS. NATIVE OF BRAZIL

One dose may cause the flow of nearly a pint of sweat in an hour.

JACA, a city of northern Spain, in the province of Huesca, 114 m. N. by W. of Saragossa, on the left bank of the river Aragon, and among the southern slopes of the Pyrenees, 2,380 ft. above the sea. Pop. (1920), 5,526. The origin of the city is unknown. The Jaccetani (*Ἰάκκηται*) are mentioned as one of the most celebrated of the numerous small tribes inhabiting the basin of the Ebro by Strabo. They are probably identical with the Lacetani of Livy (xxi. 60, 61) and Caesar (B.C. i. 60). Early in the 8th century Jaca fell into the possession of the Moors, by whose writers it is referred to under the name of Dyaka as one of the chief places in the province of Sarkosta (Saragossa). It was reconquered before the time of Ramiro I. of Aragon (1035-1063), who gave it the title of "city," and in 1063 held a council within its walls. During the Peninsular War Jaca surrendered to the French in 1809, and was recaptured in 1814. Jaca is an episcopal see, and was formerly the capital of the Aragonese county of Sobrarbe. Its massive Gothic cathedral dates at least from the 11th century, and possibly from the 9th.

JACAMAR, the Brazilian name of birds forming the family *Galbulidae*, with zygodactylous or pair-toed feet, and glossy white eggs. They are all rather small birds, the largest known being little over roin. in length, with long sharp bills, and the plumage with golden or bronze reflections. With the exception of *Galbula melanogenia*, which is found also in Central America, all the jacamars inhabit tropical South America east of the Andes, *G. ruficauda*, however, extending its range to the islands of Trinidad and Tobago. They are seen sitting motionless on trees, whence they dart at any passing insect and, catching it on the wing, return to their perch.

JACANA, the Brazilian name of certain wading birds of the family *Pardidae* which seem to be connected with the *Limicolae*. The most obvious characteristic of the jacanas is the extraordinary length of their toes and claws, whereby they are enabled to walk with ease over water-lilies and other aquatic plants. The genus *Parra* inhabits South America; *Metopidius*, hardly differing from it, has representatives in Africa, Madagascar and India; *Hydrolactor* belongs to the north Australian region; and *Hydrophasianus*, the most extravagant form of the whole, is found in India and China. The *Pardidae* lay very peculiar eggs of a rich olive-brown colour, in most cases closely marked with dark lines.

JACANA or **ACANA** (native West Indian name), a very common timber-tree (*Lucuma multiflora*, family Sapotaceae) of the West Indies. The tree grows to a height of 75 to 90 feet and gives straight logs of very durable timber. The wood is hard, very fine-grained, light-coloured and very heavy, and used in construction work where great strength is required; formerly used for cane-mill rolls. It is being used in afforestation work in Porto Rico.

JACARÉ, a Brazilian name for the spectacled cayman (*Caiman sclerops*) of tropical America. The *jacaré tinga* is the smaller *C. trigonatus*. (See CROCODILE, CAYMAN.)

JACK, a word with a great variety of meanings and applications. In the *History of the Monastery of St. Augustine* at Canterbury, 1414, Jack is given as a form of John—"pro Johanne Jankin sive Jacke" (see E. W. B. Nicholson, *The Pedigree of Jack and other Allied Names*, 1892). "Jack" was early used as a general term for any man of the common people. The *New English Dictionary* quotes from the *Coventry Mysteries*, 1450: "And I wole kepe the feet this tyde Thow ther come both Iakke and Gylle." Jack or Jack Tar for a sailor seems to date from the 17th century, and such uses as steeple-jack, "jack of all trades," etc. may be noted. It is a further extension of this that gives the name to the knave in a pack of cards, and also to various animals, as jack-snipe, jack-rabbit; it is also used as a general name for pike.

The word "jack" is applied to mechanical devices and other objects smaller than the ordinary, or to appliances which take the place of manual labour. In the first class are the small object bowl in the game of bowls and jack rafters, those rafters in a building shorter than the main rafters. The jack as a ship's flag is always a smaller flag than the ensign. The jack is flown on a

staff on the bowsprit of a vessel. In the British navy the jack is a small Union flag. (The Union flag should not be styled a Union Jack except when it is flown as a jack.) (See FLAG.)

A more common use of "jack" is for various mechanical and other devices used as substitutes for men or boys. Thus the origin of the boot-jack and the meat-jack is explained. The *New English Dictionary* finds a transitional sense in the use of the name "jack" for mechanical figures which strike the hours on a bell of a clock. Such a figure in the clock of St. Lawrence Church at Reading is called a jack in the parish accounts for 1498-99. There are many different applications of "jack" to certain levers and other parts of textile machinery; the principal mechanical application of the word, however, is to a portable hand-worked appliance for raising weights from below. Jacks range in power from a few hundred weights to 500 tons; the simple type is a crow-bar pivoted in an upright frame, giving a direct and rapid lift. To this simple pivoted lever have been added a screw turned by a tommy-bar, ratchet devices, pinion and rack, etc., for increasing power or rapidity of action; and special forms have been evolved for use with motor

HYDRAULIC JACK. BY WORKING THE LEVER, WATER IS PUMPED FROM TANK INTO SPACE ABOVE THE RAM

cars, tram-cars, cable-drums, locomotives, railway and tram rails, ships, bridges, etc.

In most European languages the word "jack" in various forms appears for a short upper outer garment, particularly in the shape of a sleeveless (quilted) leather jerkin, sometimes with plates or rings of iron sewn to it. It was the common coat of defence of infantry in the middle ages. It was probably from some resemblance to the leather coat that the well-known leather vessels for holding liquor or for drinking were known as jacks. These drinking vessels, which are often of great size, were not described as black jacks till the 16th century, though known as jacks much earlier. About 1700 a jack of a different form, like an ordinary drinking mug with a tapering cylindrical body, often mounted in silver, came into vogue. The jack-boot, the heavy riding boot with long flap covering the knee and part of the thigh, and worn by troopers first during the 17th century, was so called probably from association with the leather jack or jerkin.

JACKAL (*Canis aureus*), a wolf-like wild member of the dog family inhabiting eastern Europe and southern Asia. The name is also applied to a number of allied species. Jackals resemble wolves and dogs in their dentition, the round eye-pupils, the period of gestation, and to a large extent also in habits. The European species grows to a height of 15 in. at the shoulders, and to a length of about 2 ft., exclusive of its bushy tail. The fur

BY COURTESY OF THE NEW YORK ZOOLOGICAL SOCIETY

THE COMMON JACKAL (*C. AUREUS*)

is greyish-yellow, darker on the back and lighter beneath. The range of the common jackal extends from Dalmatia to India. In Senegal this species is replaced by *C. anthus*, while in Egypt occurs the larger *C. lupaster*, known as the Egyptian wolf. Nearly allied to the last is the Indian wolf (*C. pallipes*). Several other African species exist. Jackals are nocturnal, concealing themselves until dusk in jungles and other lurking places, and then sallying forth in packs to visit farmyards, villages, and towns in search of food. This consists for the most part of the smaller mammals and poultry, although the association in packs enables

these marauders to hunt down antelopes and sheep. When unable to obtain living prey, they feed on carrion and refuse of all kinds, and are thus useful in removing putrescent matter from the streets. They also follow lions and tigers in order to finish the carcase after the larger animal has eaten its fill. The cry of the jackal is even more appalling than that of the hyena. Like the fox, it has an offensive odour, due to the secretion of a gland at the base of the tail.

JACK BY THE HEDGE: see GARLIC MUSTARD.

JACKDAW or **DAW**, one of the smallest species of the genus *Corvus* (see CROW), and a well-known inhabitant of Europe, *C. monedula*. It associates with the rook during a great part of the year; but almost invariably chooses holes for its nest of sticks, sometimes even breeding in rabbit burrows. Nearly every church-tower and castle is occupied by daws. Their industry in collecting materials for their nests is marvellous. In some cases the stack of loose sticks piled up by daws in a tower has been known to form a structure 12 ft. in height. The style of architecture practised by the daw thus brings it more than the rook into contact with man, and its familiarity is increased by the boldness of its disposition which, though tempered by cunning, is hardly surpassed among birds. Its pilferings are not to be denied, though its services to the agriculturist are great, for in the destruction of injurious insects it is hardly inferior to the rook, and it has the useful habit of ridding sheep of some of their parasites.

ENGLISH JACKDAW

The daw displays a glossy black plumage in the adult, varied by grey ear-coverts, and nape and sides of the neck. Examples from the east of Europe and western Asia have these parts much lighter. Further to the eastward occurs the *C. dauuricus*, which has much of the lower parts of the body white also. Japan and northern China are inhabited by a form (*C. neglectus*) wanting the grey nape. The daws are sometimes placed in a genus (*Monedula*) of their own.

JACK-IN-THE-PULPIT (*Arisaema triphyllum*), a North American plant of the arum family (Araceae), called also Indian turnip, bog-onion, brown-dragon and starchwort, native to wet woods and thickets from Nova Scotia to Minnesota and southward to Florida and Texas. It is a stoutish perennial, 1 to 2½ ft. high, rising from an acrid corm and usually bearing two long-stalked, three-parted, dull green leaves, which overshadow the conspicuous green- and purple-striped flowering spathe that rises on a separate stalk between them. The flowering spathe curves in a broad canopy-like portion over the top of a club-shaped spadix, 2 to 3 in. long, near the base of which, concealed within the enclosing spathe, are borne the minute flowers, the staminate and pistillate commonly though not always found on different plants. Fertilization is aided by small insects, especially gnats of the genus *Mycetophila*. The fruit, a handsome cluster of brilliant red berries, ripens in late summer. This interesting aroid, in many respects a North American counterpart of the British cuckoo-pint (*C.v.*), is one of the best-known late spring wild flowers of the eastern United States and Canada. The exceedingly pungent, starchy corm, which is made edible by boiling, was formerly used for food by the Iroquois and other American Indians. (See ARACEAE; GREEN DRAGON.)

JACK-O'-LANTERN: see IGNIS FATUUS.

JACKS, LAWRENCE PEARSALL (1860—), British Unitarian divine, was born in Nottingham. He studied at London University, and at Göttingen and Harvard. In 1887 he became assistant to Stopford Brooke, at Bedford chapel, London, and in 1889 he married Brooke's daughter, Olive Cecilia. He was subsequently minister of Unitarian churches in Liverpool and Birmingham. In 1902, on the foundation of *The Hibbert Journal*, Jacks was appointed first editor. In the following year he became instructor in philosophy at Manchester college, Oxford, and in 1915 was chosen principal of that college. Jacks wrote *Life*

and *Letters of Stopford Brooke* (1917); *All Men are Ghosts* (1913); *From the Human End* (1916); *From Authority to Freedom* (1920); *Legends of Smokeover* (1921); *The Challenge of Life* (1924); *The Faith of a Worker* (1925); *Heroes of Smokeover* (1926).

JACKSON, ANDREW (1767–1845), American soldier and statesman, 7th president of the United States, was born on March 15, 1767, at the Waxhaw settlement in Lancaster county, S.C. (some scholars hold the theory that the place of his birth was just across the border in Union county, N.C.), whither his parents had immigrated from Carrickfergus, Ireland, in 1765. Young Andrew was wild, quick tempered and independent, with little disposition to be studious. His few years of formal education were interrupted by the call for soldiers to resist the British invasion, an appeal most in keeping with his spirit. At the age of 13 he participated in the battle of Hanging Rock (Aug. 1, 1780) and in the following year he and his next older brother joined their neighbours in trying to capture a body of British troops at Waxhaw church. The attempt failed and the boys were taken prisoners. Upon refusing to black the officer's boots, Andrew received a sabre blow which left him marked for life and established within him a lifelong dislike for Great Britain. In 1784 he took up the study of law at Salisbury, N.C., was admitted to the bar there in 1787, and began to practise at Martinsville, Guilford county, N.C. In 1788, having been appointed prosecuting attorney of the western district of North Carolina (now the State of Tennessee), he removed to Nashville, the seat of justice of that district. In 1791 he married Mrs. Rachel Robards (*née* Donelson), having heard that her husband had obtained a divorce through the legislature of Virginia. The legislative act, however, had only authorized the court to determine whether or not there were sufficient grounds for a divorce and to grant or withhold it accordingly. It was more than two years before the divorce was actually granted, and only on the basis of the fact that Jackson and Mrs. Robards were then living together. On receiving this information, Jackson had the marriage ceremony performed a second time.

In 1796 Jackson assisted in framing the Constitution of Tennessee. From Dec. 1796 to March 1797 he represented that State in the Federal House of Representatives, where he distinguished himself as an irreconcilable opponent of President Washington. In 1797 he was elected a U.S. senator; but he resigned in the following year. He was judge of the supreme court of Tennessee from 1798 to 1804. In 1804–05 he contracted a friendship with Aaron Burr; and at the latter's trial in 1807 Jackson was one of his conspicuous champions. Up to the time of his nomination for the presidency, the biographer of Jackson finds nothing to record but military exploits in which he displayed perseverance, energy and skill of a very high order, and a succession of personal acts in which he showed himself violent, quarrelsome and astonishingly indiscreet. His combative disposition led him into numerous personal difficulties. In 1795 he fought a duel with Col. Waitstill Avery (1745–1821), an opposing counsel, over some angry words uttered in a court room; but both, it appears, intentionally, fired wild. In 1806 in another duel, after a long and bitter quarrel, he killed Charles Dickinson, and himself received a wound from which he never fully recovered. In 1813 he exchanged shots with Thomas Hart Benton and his brother Jesse in a Nashville tavern, and received a second wound. Jackson and Thomas H. Benton were later reconciled.

In 1813–14 he commanded in the campaign against the Creek Indians in Georgia and Alabama, defeated them (at Talladega, on Nov. 9, 1813, and at Tohopeka, on March 29, 1814), and thus first attracted public notice. In May 1814 he was commissioned as major-general in the regular army to serve against the British; in November he captured Pensacola, Fla., then owned by Spain, but used by the British as a base of operations; and on Jan. 8, 1815, he inflicted a severe defeat on the enemy before New Orleans. (See NEW ORLEANS, BATTLE OF.) During his stay in New Orleans he proclaimed martial law, and carried out his measures with unrelenting sternness, banishing from the town a judge who attempted resistance. When civil law was

restored, Jackson was fined \$1,000 for contempt of court; in 1844 Congress ordered the fine with interest (\$2,700) to be repaid. In 1818 Jackson received the command against the Seminoles. His conduct in following them up into the Spanish territory of Florida, in seizing Pensacola, and in arresting and executing two British subjects, Alexander Arbuthnot and Robert Ambrister, gave rise to much hostile comment in the cabinet and in Congress; but the negotiations for the purchase of Florida put an end to the diplomatic difficulty. In 1821 Jackson was military governor of the Territory of Florida, and there again he came into collision with the civil authority. From this, as from previous troubles, John Quincy Adams, then secretary of State, extricated him.

In July 1822 the general assembly of Tennessee nominated Jackson for president; and in 1823 he was elected to the U.S. Senate, from which he resigned in 1825. The rival candidates for the office of president in the campaign of 1824 were Jackson, John Quincy Adams, W. H. Crawford and Henry Clay. Jackson obtained the largest number of votes (99) in the electoral college (Adams receiving 84, Crawford 41 and Clay 37); but no one had an absolute majority, and it thus became the duty of the House of Representatives to choose one of the three highest candidates. At the election by the House (Feb. 9, 1825) Adams was chosen, receiving the votes of 13 States, while Jackson received the votes of 7 and Crawford the votes of 4. Jackson, however, was recognized by the abler politicians as the coming man. Martin Van Buren and others, going into opposition under his banner, waged from the first a relentless and factious war on the administration. Jackson, when told that he had been cheated in the matter of the presidency, became possessed with the idea that the people had been deprived of their choice by a conspiracy. The charge was freely made then and afterwards (though, it is now believed, without justification) that Clay had supported Adams and by influencing his followers in the House had been instrumental in securing his election, as the result of a bargain by which Adams had agreed to pay him for his support by appointing him secretary of State.

There was great significance in the election of Jackson in 1828. The frontiers of the nation had expanded well beyond the Alleghenies. A new generation was growing up under new economic and social conditions. They despised Old World traditions and ways as represented by Hamiltonian nationalism; and they accepted the Jeffersonian dogmas, not only as maxims, but as social forces—the causes of the material prosperity of the country. By this generation, therefore, Jackson, the first president from the New West, was recognized as a man after their own heart. They liked him because he was vigorous, brusque, uncouth, relentless, straightforward and open. They made him president in 1828, and he fulfilled all their expectations. He had 178 votes in the electoral college against 83 given for Adams. Though the work of redistribution of offices began almost at his inauguration, it is yet an incorrect account of the matter to say that Jackson corrupted the civil service. His administration is rather the date at which a system of democracy, organized by the use of patronage, was introduced into the Federal arena by Van Buren. It was at this time that the Democratic or Republican Party divided, largely along personal lines, into Jacksonian Democrats and National Republicans, the latter led by such men as Henry Clay and J. Q. Adams. The administration itself had two factions in it from the first, the faction of Van Buren, the secretary of State in 1829–31, and that of Calhoun, vice-president in 1829–32. The refusal of the wives of the cabinet and of Mrs. Calhoun to accord social recognition to Mrs. J. H. Eaton brought about a rupture, and in April 1831 the whole cabinet was reorganized. Van Buren, a widower, sided with the president in this affair and grew in his favour. Jackson in the meantime had learned that Calhoun, as secretary of War, had wished to censure him for his actions during the Seminole War in Florida in 1818, and henceforth he regarded the South Carolina statesman as his enemy. The relations between Jackson and his cabinet were unlike those existing under his predecessors. Having a military point of view, he was inclined to look upon the cabinet members as

inferior officers, and when in need of advice he usually consulted a group of personal friends, who came to be called the "kitchen cabinet." The principal members of this clique were William B. Lewis, Amos Kendall, Isaac Hill and Duff Green, the last named being editor of the *United States Telegraph*, the organ of the administration.

In 1832 Jackson was re-elected by a large majority over Henry Clay, his chief opponent. The battle raged mainly around the re-charter of the Bank of the United States. It is probable that Jackson's advisers in 1828 had told him, though erroneously, that the bank had worked against him, and then were not able to control him. The first message of his first presidency had contained a severe reflection on the bank; and in the very height of this second campaign (July 1832) he vetoed the re-charter, which had been passed in the session of 1831–32. Jackson interpreted his re-election as an approval by the people of his war on the bank, and he pushed it with energy. In Sept. 1833 he ordered the public deposits in the bank to be transferred to selected local banks, and entered upon the "experiment" whether these could not act as fiscal agents for the Government, and whether the desire to get the deposits would not induce the local banks to adopt sound rules of currency. During the next session the Senate passed a resolution condemning his conduct. Jackson protested, and after a hard struggle, in which Jackson's friends were led by Senator Thomas Hart Benton, the resolution was ordered to be expunged from the record, on Jan. 16, 1837.

In 1832, when the State of South Carolina attempted to "nullify" the tariff laws, Jackson at once took steps to enforce the authority of the Federal Government, ordering two war vessels to Charleston and placing troops within convenient distance. He also issued a proclamation warning the people of South Carolina against the consequences of their conduct. In the troubles between Georgia and the Cherokee Indians, however, he took a different stand by refusing to enforce a decision of the Supreme Court favourable to the Indians. (See NULLIFICATION; GEORGIA: History.)

Jackson was very successful in collecting old claims against various European nations for spoiliations inflicted under Napoleon's continental system, especially the French spoliation claims, with reference to which he acted with aggressiveness and firmness. Aiming at a currency to consist largely of specie, he caused the payment of these claims to be received and imported in specie as far as possible; and in 1836 he ordered land-agents to receive for land nothing but specie. About the same time a law passed Congress for distributing among the States some \$35,000,000 balance belonging to the United States, the public debt having all been paid. The 80 banks of deposit in which it was lying had regarded this sum almost as a permanent loan, and had inflated credit on the basis of it. The necessary calling in of their loans in order to meet the drafts in favour of the States, combining with the breach of the overstrained credit between America and Europe and the decline in the price of cotton, brought about the "panic" of 1837 which prostrated the whole financial, industrial and commercial system of the country for six or seven years. The crash came just as Jackson was leaving office; the whole burden fell on his successor, Van Buren.

In the 18th century the influences at work in the American Colonies developed democratic notions. In fact, the circumstances were those which create equality of wealth and condition, as far as civilized men ever can be equal. The Revolutionary War was attended by a grand outburst of political dogmatism of the democratic type. A class of men were produced who believed in very broad dogmas of popular power and rights. There were a few rich men, but they were almost ashamed to differ from their neighbours and, in some known cases, they affected democracy in order to win popularity. After the 19th century began, the class of rich men rapidly increased. It was an industrial and commercial class greatly interested in the tariff, and deeply interested also in the then current form of issue banking. The Southern planters were rich but were agriculturists and remained philosophically Democrats. Jackson came upon the political stage when a wealthy class first existed and at a time when certain

political leaders were first expressing alarm at the increase of the "money power" as a growing peril to democracy. He was a man poor from birth, uneducated, a leader of the middle-class democracy, prejudiced and marked by strong personal feelings in all his beliefs and disbeliefs. Because of these qualities, the educated and moneyed classes of that day believed him not to be in the class from which a president should be chosen. This opposition caused him to believe that the Bank of the United States was leading the money power against him. In turn Jackson felt that he was the champion of the masses of democracy and the common people. The opposite party, led by Clay, Adams, Biddle and others, had schemes for banks and tariffs, enterprises which were open to criticism. Men like Thomas H. Benton, Edward Livingston, Amos Kendall and the Southern statesmen, found in these issues material for strong attacks on the Whigs. The great mass of voters felt the issue as Jackson's managers stated it. That meant that the masses recognized Jackson as their champion. Therefore, his personality and name became a power on the side opposed to banks, currency, corporations and other forms of the new growing power of capital.

That Jackson was a typical man of his generation is certain. He represented the spirit and temper of the free American of that day, and it was a part of his way of thinking and acting that he put his whole life and interest into the conflict. He accomplished several things of great importance in the history of the nation; he gave the common people an opportunity to participate in the government; his stand against South Carolina nullification crushed excessive State rights and established the contrary doctrine in fact and in the political orthodoxy of the Democrats; he destroyed the great bank. The way in which Jackson accomplished these things was such that it cost the country ten years of the severest liquidation, and left conflicting traditions of public policy in the Democratic Party. After he left Washington, Jackson disagreed with many of his most intimate old friends, and turned his interest to the cause of slavery, which he thought to be attacked and in danger.

Jackson is perhaps the only president of whom it may be said that he went out of office far more popular than he was when he entered. When he went into office he had no political opinions, only some popular notions. He left his party strong, perfectly organized and enthusiastic on a platform of low expenditure, payment of the debt, no expenditure for public improvement or for glory or display in any form and low taxes. His name still remained a spell to conjure with, and the politicians sought to obtain the assistance of his approval for their schemes; but in general his last years were quiet and uneventful. He died at his residence near Nashville, Tenn., on June 8, 1845.

BIBLIOGRAPHY.—The most authoritative biography of Jackson is that by J. S. Bassett (1911, rev. ed., 1916). Of the early biographies, that by J. H. Eaton (Philadelphia, 1824) is a history of Jackson's early military exploits, written for political purposes. Amos Kendall's *Life* (1843) is incomplete, extending only to 1814. James Parton's elaborate work (1860) is still useful. Parton prepared a shorter biography for the Great Commanders Series (1893), which emphasizes Jackson's military career. W. G. Sumner's *Andrew Jackson* in the American Statesmen Series (1882; rev., 1899) is a judicious work combining the leading facts of Jackson's life with a history of his times. W. G. Brown wrote an appreciative sketch (1900) for the Riverside Biographical Series. Other works are A. C. Buell, *History of Andrew Jackson* (1904), marred by numerous errors; A. C. Colyar, *The Life and Times of Andrew Jackson* (Nashville, 1904); E. O. Rowland, *Andrew Jackson's Campaign against the British* (1926). The history and politics of the period are treated in C. H. Peck, *The Jacksonian Epoch* (1899); Wm. MacDonald, *Jacksonian Democracy* (1907); F. A. Ogg, *The Reign of Andrew Jackson* (1919); C. G. Bowers, *The Party Battles of the Jackson Period* (1922). See also J. S. Bassett, ed., *Correspondence of Andrew Jackson* (1926-); Helen Nicolay, *Jackson, the Fighting President* (1929).

JACKSON, CHARLES THOMAS (1805-1880), American geologist, was born in Plymouth, Mass., June 21, 1805. He graduated from Harvard in 1829 and studied for two years in Paris. He was appointed State geologist of Maine in 1836, of Rhode Island in 1839, and of New Hampshire in 1840. He surveyed the public lands in the Lake Superior region in 1847, where he discovered copper and iron. He established a laboratory in

Boston in 1836 for research in analytical chemistry where, as early as 1842, he experimented with the anaesthetic qualities of sulphuric ether. He died in Somerville, Mass., Aug. 28, 1880. He wrote *The Final Report of Geology and Mineralogy for the State of New Hampshire* (1884), and *The Manual of Etherization* (1861).

For the part he played in the discovery of ether, see "Ether Discovery—A Consideration of the Claims made by W. T. G. Morton, Horace Wells and C. T. Jackson"—A Report before the 32nd Congress, 2nd ses., 1853.

JACKSON, CYRIL (1746-1819), dean of Christ Church, Oxford, was born in Yorkshire, and educated at Westminster and Oxford. From 1771 to 1776 he was sub-preceptor to the two eldest sons of George III. He then took holy orders, and after holding (1779-83) the preachingship at Lincoln's Inn, became dean of Christ Church. In this position he showed a genius for government, and maintained a strict discipline. He had a large share in the framing of the "Public Examinations Statute" (1802) and always encouraged his pupils to compete for scholarships. In 1799 he refused the offer of the bishopric of Oxford, and in 1800 the primacy of Ireland, preferring to remain at his college, where many afterwards famous men studied under him, including Canning and Sir Robert Peel, whom he is reported to have advised to "work like a tiger." Jackson resigned his deanery in 1809, and retired to Felpham, near Bognor, where he died on Aug. 31, 1819.

JACKSON, FREDERICK GEORGE (1860-), British Arctic explorer, was educated at Denstone college and Edinburgh university. His first voyage in Arctic waters was on a whaling-cruise in 1886-87, and in 1893 he made a sledge-journey of 3,000 miles across the frozen tundra of Siberia between the Ob and the Pechora. On his return, he was given the command of the Jackson-Harmsworth Arctic expedition (1894-97), which was to explore Franz Josef Land. He received a knighthood of the first class of the Danish Royal Order of St. Olaf in 1898. He obtained the rank of Captain during the Boer War. He also travelled across the Australian deserts. During the World War he served in the East Surrey Regiment, and after being invalided home was for some time in command of the Southwark recruiting district. In 1919 he was in charge of Russian prison camps in Hanover and Westphalia.

He wrote *The Great Frozen Land* (1895), describing his first Arctic journey; and *A Thousand Days in the Arctic* (1899), describing the 1894-97 expedition, and many articles in scientific journals.

JACKSON, HELEN MARIA (1831-1885), American poet and novelist, who wrote under the initials "H. H." (Helen Hunt), was born in Amherst (Mass.) Oct. 18, 1831, the daughter of Prof. Nathan Welby Fiske. A girl of unusual versatility and vivacity, she was educated at the Ipswich Female Seminary and at a private school in New York. In Oct. 1852 she married Captain (afterwards Major) Edward Bissell Hunt (1822-63), of the U.S. corps of engineers. The sudden deaths of her husband and two sons within a period of about ten years caused her at first to feel that her life was ended, and then to turn to writing. In 1870 she published a little volume of meditative *Verses*, which was praised by Emerson in the preface to his *Parnassus* (1874). In 1875 she married William S. Jackson, a banker, of Colorado Springs.

Although she became a prolific writer of prose and verse, including juvenile tales, books of travel, household hints and novels, she is remembered primarily for her efforts on behalf of the red men. *A Century of Dishonor* (1881) was an arraignment of the treatment of the Indians by the United States, written after careful research in the Astor library. Later she was appointed special commissioner with Abbot Kinney to investigate the conditions and needs of the Mission Indians in California. Feeling that she had accomplished little, she conceived the idea of setting forth the evils in a novel, *Ramona* (1884). The injustices she portrayed did, as she intended, "move people's hearts." Nevertheless the book has been admired chiefly because of its romantic picture of the old patriarchal life in California. Mrs. Jackson died in San Francisco Aug. 12, 1885.

See "Helen Jackson ('H. H.')" in T. W. Higginson's *Contemporaries* (1899); G. W. James, *Through Ramona's Country* (1908); and C. C. Davis and W. A. Alderson, *The True Story of "Ramona"* (1914).

JACKSON, HENRY (1839-1921), English classical scholar, was born at Sheffield on March 12, 1839. He was educated at Cheltenham college and Trinity college, Cambridge, where he was elected fellow in 1864. From 1875 to 1906 he was praelector in ancient philosophy, acting virtually as an unofficial university reader in that subject and taking charge of candidates for that section of the second part of the classical tripos. He published an edition of Aristotle's *Ethics*, Book V. (1879), many papers dealing with ancient philosophy, and a book *About Edwin Drood* (1911). Probably his greatest contribution to learning was his study of Plato's "later theory of ideas" published in a series of articles in the *Journal of Philology*, in which he expounded a view that Plato continually reviewed the comparatively crude ideas of his earlier dialogues, and even after the *Republic* saw reason to criticise his own theories and alter them substantially.

But the personal qualities of the man counted far more than anything he published. He was a modern incarnation of the Platonic Socrates, with the same extraordinary gift of inducing his pupils to think out problems for themselves by questions apparently simple but leading to depths beyond the pupil's imagination. His sympathy, his untiring energy, and his readiness to help, invoked the love and admiration of generations of Cambridge men. As an administrator of university affairs and an educational reformer he took a prominent place and was actively concerned in the commission which dealt with Trinity college, Dublin. He was appointed Regius professor of Greek at Cambridge in 1906, and elected vice-master of Trinity college in 1914. His distinction was officially recognized in 1908 by the grant of the Order of Merit. He died at Bournemouth on Sept. 25, 1921.

See R. St. John Parry, *Henry Jackson* (1926).

JACKSON, JOHN HUGHLINGS (1834-1911), English neurologist, was born at Green Hammerton, Yorkshire. In 1862 he became physician to the London Hospital and to the National Hospital for the Paralysed and Epileptic. Jackson utilized the ophthalmoscope in diagnosing brain disease (1863), studied aphasia, described unilateral convulsions (Jacksonian epilepsy), and in the Croonian lectures for 1884 on the evolution and dissolution of the nervous system originated the doctrine of "levels" in the evolution of the nervous system. He did much to advance the notion of cerebral localization. A full list of his papers is given in the *London Hospital Gazette* for 1895. Jackson died on Oct. 7, 1911.

JACKSON, SIR THOMAS GRAHAM, BART. (1835-1924), English architect, was born in London on Dec. 21, 1835, the son of a solicitor, and educated at Oxford, where he became a fellow of Wadham. He worked in the office of Sir George Gilbert Scott for three years, but was not very deeply influenced by the Gothic tradition of Scott. Upon Oxford he has left an especial impress by his additions to Brasenose, Lincoln and Balliol. For Cambridge he designed important university buildings, including the Law library and school, the Archaeological museum, and the Physiological laboratories. Less bound there than at Oxford to the precedent of an existing design, his work, mostly of a late English Renaissance character, shows facility and invention. Jackson was architect to many great English schools. The interior of the chapel at Giggleswick school, Yorks., is an example of that treatment of colour—in marble and mosaic—upon which he relied so much as a complement to his architectural design. He was a member, and in 1896 master, of the Art Workers' Guild. Jackson made a special study of the architecture of Ragusa, Dalmatia, Istria and the Adriatic coast. The Dalmatians sought his help, as an authority on their traditional type of Romanesque building, in the restoration of the Campanile at Zara which he completed in 1882. He was elected A.R.A. in 1892, and R.A. in 1896, and was created a baronet in 1913. He was the author of several books on architectural subjects. He died on Nov. 7, 1924.

JACKSON, THOMAS JONATHAN (1824-1863), American general, commonly known as "Stonewall Jackson," was born at Clarksburg, Virginia (now West Virginia), on Jan. 21, 1824. His father died leaving his family almost penniless, and the son, called early to help in the support of his mother, had few opportunities for education, but by industry and application he

obtained in 1842 a nomination to the United States military academy at West Point, from which in 1846 he received a commission as second-lieutenant of artillery. Joining his regiment in Mexico, with which country the United States was then at war, he served there with distinction and was, after a few years of peace service, appointed, in 1851, professor of artillery tactics and natural philosophy at the Virginia military institute. At this institution he remained for ten years until, in April 1861, on the outbreak of the Civil War, he offered his services to his State and was ordered to bring his cadets to Richmond.

Jackson was appointed colonel of Virginia volunteers and sent to command at Harper's Ferry, the northern outpost of the Shenandoah valley which was to be the scene of his most famous exploits. When, in July 1861, the first Federal invasion of Virginia began he was in command of the 1st Brigade of Johnston's force in the valley, which moved thence to unite on the field of Bull Run with Beauregard's command, in time to meet the advance of the Federal army under McDowell. The impetuosity of the first Federal attack brought some confusion into the Confederate ranks, and in a crisis of the battle a neighbouring brigadier, Gen. Bee, rode up to Jackson with the cry "General, they are beating us back." "Then, sir," came the quick reply, "we will give them the bayonet." Encouraged by this answer Bee galloped back to his men shouting, "Look, there is Jackson standing like a stone wall. Rally behind the Virginians." The Federal attack was utterly repulsed, the nickname Stonewall rang through Virginia and was thenceforth and forever attached to Jackson's name.

A long pause followed the first battle of Bull Run, while the North, aroused to the extent of its task, was preparing an adequate army. In the first months of 1862 that army under the command of McClellan was ready for action. Jackson was then in command of a small force in the Shenandoah valley. Unknown to the Confederates McClellan was preparing to move his main army by sea to the Yorktown peninsula, in order to attack the Confederate capital, Richmond. Some of the Federal troops in the valley were ordered to join McClellan for this movement, and Jackson, learning of these withdrawals, believed he could strike an effective blow at Winchester, and advanced with barely 3,000 men. He had been misinformed of the Federal strength, and was met on March 23, at Kernstown, with 7,000 men. He was repulsed, but his bold manoeuvre caused his strength to be exaggerated in Washington, and, a great part of McClellan's force being at sea, created a sense of alarm which greatly influenced future events.

In the third week of April McClellan had completed his landing and was opposed in the Yorktown peninsula by an army of less than half the Federal strength. Three other Federal armies were converging on Richmond, from the north and west, watched by Confederate detachments, each much weaker than its opponents. In this crisis Robert E. Lee, who had been called to Richmond to be chief military adviser to the Confederate president, saw that the only hope of saving Richmond lay in keeping the converging Federals at a distance, and it was to Jackson he turned. On April 21 he wrote suggesting he should unite the Confederate detachments to fall on Banks, who commanded the Federal forces in the valley. Jackson needed but a hint, but before Banks could be struck with safety it was necessary to check the advance of the Federal troops from the west, which would threaten Jackson's rear and communications. Therefore on May 8 he drove them back into the mountains of western Virginia, and turned with 17,000 on Banks, whose force, weakened by the withdrawals, was some 10,000 strong.

In mid-May McClellan was in sight of the spires of Richmond, and the general expectation in the North was that the war would soon be over. Suddenly, on May 23, Jackson, while feinting at Strasburg, advanced down the North Fork and overwhelmed Kenly. Banks retreating was caught up ten days later, defeated at Winchester, and driven back on the Potomac. At once there was alarm and confusion at Washington, the reinforcements to McClellan were stopped, and President Abraham Lincoln himself intervened to protect Washington and direct the

attempts to intercept Jackson. By rapid marching Jackson escaped to the southern end of the valley. Then striking right and left at his pursuers he drove back their advanced guards at Cross Keys on June 8, and at Port Republic next day. He left the valley having completely deranged the Federal campaign, for McClellan in front of Richmond being deprived of his expected reinforcements hesitated to attack. Thus Jackson's skill and courage had enabled 17,500 men to neutralize the action of 175,000.

BATTLES OF THE "SEVEN DAYS"

Meanwhile, on May 31 and June 1, Johnston had attacked McClellan in the battle of Fair Oaks (Seven Pines) and fell wounded, Lee succeeding to the command of the Confederate army in Virginia. Lee first openly reinforced Jackson with some 7,000 men from Richmond in order to create a fresh alarm of a Confederate advance on Washington, and then brought him by road and rail towards Richmond to envelop the right flank of McClellan's army. Thus, on June 26, began the battles of the "Seven Days." Jackson was late at his first rendezvous, and some of his movements during the battle, notably at White Oak Swamp on June 30, were slow. This apparent dilatoriness in one notorious for bold, quick and decisive movement has by many been ascribed to physical exhaustion, but it seems more probable that it was due to the fact that Jackson was without experience of handling in a great battle, in combination with other troops, so large a force as he then commanded, and was without an adequate and experienced staff.

Though the "Seven Days" did not bring all the results Lee hoped, McClellan was driven back to the James river, and Jackson was then dispatched by Lee to the Rapidan to make head against the Federal forces which, recovering from his previous blows, were now commanded by Gen. Pope. When McClellan's evacuation of the peninsula was well advanced Lee joined Jackson, and Pope fell back before them behind the Rappahannock. Lee now decided on a bold manoeuvre. Detaching Jackson with nearly half his force to move by a wide encircling movement upon Pope's rear, he followed with the remainder. Jackson came down upon Pope's advanced base at Manassas Junction, dispersing Federal detachments and destroying quantities of stores. This done he struck at a Federal column which moved along his front ignorant of his presence, and so, on Aug. 28, brought on the second battle of Bull Run, in which Pope was utterly defeated.

Lee then crossed the Potomac, invaded Maryland, and then detached Jackson to capture Harper's Ferry, which was held by a Federal garrison of 11,000 men. Beginning the attack on Sept. 13, Jackson compelled the place to surrender on Sept. 15, only to learn that McClellan, who had become aware of the division of Lee's forces, was advancing to attack the Confederates on the Antietam. By prompt movement Jackson reached the field in time to avert a disaster to the Confederate arms, and Lee having repulsed McClellan's attack was able to retire without molestation over the Potomac. The campaign ended with the Federals as far from Richmond as they had been at the beginning of the year, a result due to the military genius of two men, Lee and Jackson.

Jackson was now recognized as Lee's right arm. He was promoted lieutenant-general and given command of the 2nd Army Corps of the army of northern Virginia. In the winter of 1862 he, in command of that corps, awaited on the Rappahannock the next Federal move, which came on Dec. 13. Burnside, now in command of the army of the Potomac, attacked the Confederates at Fredericksburg. In that battle Jackson was in command of the Confederate right, where his task was easy. The injudicious attack was easily and severely repulsed.

It took the Federals some time to recover from the disaster of Fredericksburg, and it was not until April 1863 that Hooker, Burnside's successor, initiated the next campaign by an attempt to turn the Confederate position on the Rappahannock. Hooker had some 120,000 opposed to Lee's 60,000, and when his turning movement had been well advanced on May 1, he was confident of victory. Lee, leaving a detachment to oppose the Federals on the Rappahannock, moved his main body, including Jack-

son's corps, to meet Hooker's threatened envelopment, which was developing in the woods of Chancellorsville. On the night of May 1-2 Lee and Jackson planned one of the boldest strokes in the history of war. Whilst Lee kept barely 10,000 men to demonstrate against Hooker's front, he sent Jackson with his whole corps to move secretly round Hooker's right. The enveloper was to be enveloped. This manoeuvre was completely successful; on the evening of May 2, Jackson had his whole corps in position; and his attack rolled up the flank of the unsuspecting Federals. In the moment of victory Jackson, who had ridden forward to organize the pursuit, was shot down in the dusk by his own men, and mortally wounded. "I should have wished," wrote Lee to him, "for the good of the country to be disabled in your stead." The loss of Jackson was fatal to the Confederate cause. Never again was Lee, without one who at once grasped what was in his mind and executed brilliantly his plans, able to attempt those bold manoeuvres which had enabled victory to be won against greatly superior numbers. Jackson was a tactician and a leader of men of the first order. He was never called upon to command large forces independently, but his valley campaign remains a classic example of what a small force can achieve when led by a man who understands the value of resolution, secrecy and mobility in war. In the major operations he was the ideal lieutenant to one who was a real master of the art of war. (F. B. M.)

Jackson, *Memoirs of Stonewall Jackson* (1895); R. L. Dabney, *Life and Campaigns of T. J. Jackson (Stonewall Jackson)* (1866); W. Allan, *Jackson's Valley Campaign*; A. Tate, *Stonewall Jackson, the Good Soldier* (1928).

JACKSON, WILLIAM (1730-1803), English musician, was born at Exeter on May 29, 1730. He published many works during his lifetime, the most famous of which were *Twelve Songs* (1755), which deserved their great popularity. But he is remembered only for his *Te Deum* (Jackson in F), which was a popular favourite in Church music for over a century. He died at Exeter, where he passed the greater part of his life, on July 5, 1803.

JACKSON, a city of Michigan, U.S.A., 75m. W. of Detroit, on the Grand river; county seat of Jackson county. It is on Federal highways 12 and 127; has a municipal airport of 166ac. (Reynolds field); and is served by the Cincinnati Northern, the Grand Trunk, the Michigan Central, and the New York Central railways, two electric railways, and motor coach and freight lines in every direction. The population was 48,374 in 1920 (87% native white) and was estimated by the census bureau at 63,700 in 1928. Jackson is in the heart of a beautiful and productive agricultural region. There are 40 lakes in the county, well stocked with fish, and the summer resorts are numerous. The county fair grounds and the Michigan State prison (established 1839) are within the city, and a short distance to the north are large State farms, operated largely by convict labour. The assessed valuation of property in 1927 was \$84,877,353. Since 1915 the city has had a commission-manager form of government. Jackson has a large shipping and distributing trade. The Michigan Central has extensive shops here, and the city's manufactures are numerous and diversified, with an output in 1925 valued at \$62,268,047. Bank clearings in 1926 amounted to \$90,800,000. Among the 250 or more factories is one of the largest plants in the country making automobile and tractor wheels. The site of Jackson was a favourite camping-ground of the Indians, and it was visited as early as 1812 by two soldiers of Harrison's army corps. Permanent settlement began in 1829. A town was laid out in 1829, made the county seat, and named after Andrew Jackson, then President. For a few years it was called Jacksonburg. It was chartered as a city in 1857. "Under the oaks of Jackson," at a State convention on July 6, 1854, the Republican party was organized and named.

JACKSON, the capital city of Mississippi, U.S.A., on the west bank of the Pearl river, 45m. E. of Vicksburg; the county seat of Hinds county. It is on Federal highways 49, 51 and 80, has a municipal airport, and is served by the Gulf, Mobile and Northern, the Illinois Central, and the New Orleans Great Northern railways. The population was 22,817 in 1920 (43% negroes)

and was estimated locally at 43,500 in 1928. The city has a large trade in cotton and other agricultural products, and its manufacturing industries (including cotton-seed oil mills, iron foundries, woodworking plants and a variety of others) had an output in 1925 valued at \$9,681,740. The State capitol, finished in 1903, is a fine building. In the old capitol (built in 1839) Jefferson Davis made his last speech (1864), and it was the scene of the secession convention (1861) and of the "Black and Tan Convention" (1868). Jackson is the seat of the State penitentiary, the State hospital for the insane, and the State institutions for the deaf and the blind; of Millsaps college (Methodist Episcopal, 1890) and Belhaven college (Presbyterian, 1894). In 1821 the site was designated as the seat of the State Government, and in 1822 the town was laid out and named after Andrew Jackson. It was chartered as a city in 1840. During the Civil War it was in the theatre of active campaigning. On May 14, 1863, the Confederates, under Johnston, were driven out by Sherman and McPherson. After the fall of Vicksburg, Johnston concentrated his forces here, where he was attacked by Sherman on July 9. Sherman's army entered the city on July 17, 1863, and remained five days, burning a large part of it. In the decade 1900-10 the population of the city increased from 7,816 to 21,262. A commission form of government was adopted in 1912.

JACKSON, a city of southern Ohio, U.S.A., about 70m. S.E. of Columbus; the county seat of Jackson county. It is served by the Baltimore and Ohio, the Detroit, Toledo and Ironton, and the Hocking Valley railways. The population in 1920 was 5,842 (97% native white) and was estimated locally at 7,000 in 1928. Jackson is in the heart of the natural gas belt and is surrounded by a coal and iron mining region. It has iron furnaces, foundry and machine shops, railroad shops and several other manufacturing industries. The city was founded about 1817 and incorporated in 1847.

JACKSON, a city of western Tennessee, U.S.A., on the Forked Deer river, 85m. N.E. of Memphis; the county seat of Madison county. It is on Federal highway 70, and is served by the Gulf, Mobile and Northern, the Illinois Central, the Mobile and Ohio, and the Nashville, Chattanooga and St. Louis railways. The population was 18,860 in 1920 (33% negroes) and was estimated locally at 25,000 in 1928. Jackson has a large wholesale trade; is a shipping point for cotton (of which 21,360 bales were ginned in the county in 1926), corn, fruits and other agricultural products, and has railroad repair shops and numerous other manufacturing industries, with an output in 1925 valued at \$7,012,544. It is the seat of Union university; a State agricultural experiment station; and Lane college for negroes, founded in 1880 by the Colored Methodist Episcopal Church, which was organized in Jackson and has its publishing offices here. Jackson was settled about 1820, incorporated as a town in 1823, chartered as a city in 1854 and in 1907 adopted a new charter establishing local prohibition. In 1862, after Gen. Grant's advance into Tennessee, it became an important base of operations for the Federal army, and from October of that year was Grant's headquarters.

JACKSON HIGHWAY, an American thoroughfare beginning at Chicago, Ill., and ending at New Orleans, La. It is 1,060 m. in length and is mostly paved from Chicago to Florence, Tenn., where it crosses the Tennessee river at Muscle Shoals, the site of the great dam of that name. It passes Indianapolis, Nashville, Columbus, Macon, Meridian, Hattiesburg and Slidell and enters New Orleans over the concrete bridge at Lake Pontchartrain.

JACKSONVILLE, a city of north-eastern Florida, U.S.A., on the St. John's river, 27m. above the Government jetties at the mouth; a port of entry and the county seat of Duval county. It is on Federal highways 1, 17 and 90; has a fully equipped municipal airport, and is served by the Atlantic Coast Line, the Florida East Coast, the Seaboard Air Line, the Southern and the Jacksonville Terminal railways, and by seven coastwise steamship lines and four operating to foreign ports. The population in 1925 (State census) was 135,886, of whom 50,335 were negroes, and was estimated locally at 145,000 in 1928. Jacksonville is an attractive city, in a charming setting of thickly wooded country and romantic river scenery. It is an important commercial centre. The commerce of the port in 1927 amounted to 4,608,882 tons, valued at \$778,481,803. Exports to foreign countries (chiefly naval stores and lumber) accounted for \$18,068,446; imports (chiefly coffee, crude oil, gasoline [petrol] and chemicals) for \$27,186,578; but the bulk of the traffic consists of domestic receipts and shipments, among which oils, automobiles, canned foods, lumber, naval stores and oranges are conspicuous. The city has a large wholesale and jobbing trade. Its manufacturing industries are many (472 in 1928) and varied, with an output in 1927 valued at \$142,000,000. The assessed valuation of property was \$99,004,820. The first settlement was made in 1816. A town was laid out in 1822 and named after Andrew Jackson, and in 1832 it was incorporated. During the Civil War Jacksonville was thrice occupied by Federal troops. In 1888 there was an epidemic of yellow fever; and on May 3, 1901, 150 blocks, nearly the whole of the business section, were destroyed by fire, involving a loss of over \$15,000,000. In 1850 the population was 1,045, and by 1880 it had reached only 7,650; but between 1880 and 1900 it increased 272%, and in the next 20 years 222%.

JACKSONVILLE, one of the oldest and most beautiful cities of Illinois, U.S.A., on Mauvaiseterre creek, 90m. N. of Saint Louis; the county seat of Morgan county. It is on Federal highway 36, and is served by the Burlington, the Chicago and Alton, the Jacksonville and Havana, and the Wabash railways. The population was 15,713 in 1920 (86% native white), and was estimated locally at 18,000 in 1928. The distinctive manufactures are Ferris wheels and steel bridges. There are also railroad shops, woollen and planing mills and other factories. The aggregate output in 1925 was valued at \$7,039,464. Jacksonville is the seat of Illinois college (Presbyterian), founded in 1829 through the efforts of the Rev. John Millot Ellis (1793-1855), of the American Home Missionary Society, and of the "Yale Band," seven young graduates of Yale who were devoting themselves to promoting higher education in the growing West; the Illinois Women's college (Methodist Episcopal) chartered in 1847; a State hospital for the insane, opened in 1851; the State school for the deaf (established in 1839, opened 1845), the first charitable institution of the State; and the State school for the blind (1849). Jacksonville was laid out as the county seat in 1825, and named after Andrew Jackson. It was chartered as a city in 1867.

JACOB was the son of Isaac and Rebecca, the grandson of Abraham, and the traditional ancestor of the people of Israel. He is represented as the twin brother of Esau, the ancestor of Edom, and the two are representatives of two grades of social order, Jacob being a pastoral nomad, and Esau the typical Bedawin hunter and raider. Whilst Esau is actually the elder, Jacob by a double artifice (Gen. xxv. 28-34 and xxvii.) obtains the rights and privileges of seniority. He then goes to the Aramaean tribe from which his ancestry had sprung, and on the way receives a special revelation from God at Bethel. He marries two of his cousins, Leah and Rachel, and after serving Laban seven years for each of them, and an additional six years during which he amasses a large property in small cattle, he returns to Palestine. He receives a second revelation at Peniel, meets and is reconciled to Esau, and settles in Canaan. Twelve sons are born to him, six by Leah, and two each by Rachel and the female slaves of his wives. The story of his later years belongs rather to the life of Joseph, and it was as a result of the latter's success in Egypt that Jacob and his sons migrated thither in time of famine and took up their residence on the north-eastern border

—the land of Goshen. Here Jacob ultimately died and was buried in Palestine.

These narratives are full of much valuable evidence regarding marriage customs, pastoral life and duties, popular beliefs and traditions, and are evidently typical of what was currently retailed. Their historical value has been variously estimated. The name existed long before the traditional date of Jacob, and the Egyptian phonetic equivalent of Jacob-el (*cf.* Isra-el, Ishma-el) appears to be the name of a district of central Palestine (or possibly east of Jordan) about 1500 B.C. But the stories in their present form are very much later. The close relation between Jacob and Aramaeans confirms the view that some of the tribes of Israel were partly of Aramaean origin; his entrance into Palestine from beyond the Jordan is parallel to Joshua's invasion at the head of the Israelites; and his previous journey from the south finds independent support in traditions of another distinct movement from this quarter. Consequently, it would appear that these extremely elevated and richly developed narratives of Jacob-Israel embody, among a number of other features, a recollection of two distinct traditions of migration which became fused among the Israelites. *See* further GENESIS; JEWS.

(S. A. C.; T. H. R.)

JACOB, JOHN (1812–1858), Indian soldier and administrator, born on Jan. 11, 1812, was educated at Addiscombe, and entered the Bombay artillery in 1828. As commandant of the Sind Horse and political superintendent of Upper Sind he imposed peace on the Sind frontier, reducing the tribes as much by his commanding personality as by his military measures. In 1853 he warned the government of India of the danger which came to a head in the Indian Mutiny; but he was only rebuked by Lord Dalhousie for his pains. He died of brain fever, brought on by excessive heat and overwork. The town of Jacobabad is named after him.

See A. I. Shand, *General John Jacob* (1900).

JACOBA or **JACQUELINE** (1401–1436), countess of Holland, was the only daughter and heiress of William, duke of Bavaria and count of Holland, Zeeland and Hainaut. She was married as a child to John, duke of Touraine, second son of Charles VI., king of France, who on the death of his elder brother Louis became dauphin. John of Touraine died in April 1417, and two months afterwards Jacoba lost her father. Acknowledged as sovereign in Holland and Zeeland, Jacoba was opposed by her uncle John of Bavaria, bishop of Liège. She had the support of the Hook faction in Holland. Meanwhile she had been married in 1418 by her uncle, John the Fearless, duke of Burgundy, to her cousin John IV., duke of Brabant. By the mediation of John the Fearless, a treaty of partition was concluded in 1419 between Jacoba and John of Bavaria; but it was merely a truce, and the contest between uncle and niece soon began again and continued with varying success.

In 1420 Jacoba fled to England; and there, declaring that her marriage with John of Brabant was illegal, she contracted a marriage with Humphrey, duke of Gloucester, in 1422. Two years later Jacoba, with Humphrey, invaded Holland, where she was now opposed by her former husband, John of Brabant, John of Bavaria having died of poison. In 1425 Humphrey deserted his wife, who sought refuge with her cousin, Philip V., duke of Burgundy, to whom she had to submit, and she was imprisoned in the castle of Ghent. John of Brabant now mortgaged the two counties of Holland and Zeeland to Philip, who assumed their protectorate. Jacoba, however, escaped from prison in disguise, and for three years struggled gallantly to maintain herself in Holland against the united efforts of Philip of Burgundy and John of Brabant, and met at first with success. The death of the weak John of Brabant (April 1427) freed the countess from her quondam husband; but nevertheless the pope pronounced Jacoba's marriage with Humphrey illegal, and Philip, putting out his full strength, broke down all opposition.

By a treaty, made in July 1428, Jacoba was left nominally countess, but Philip was to administer the government of Holland, Zeeland and Hainaut, and was declared heir in case Jacoba should die without children. Two years later Philip mortgaged Holland

and Zeeland to the Borselen family, of which Francis, lord of Borselen, was the head. Jacoba now made her last effort. In 1432 she secretly married Francis of Borselen, and endeavoured to foment a rising in Holland against the Burgundian rule. Philip invaded the country, however, and threw Borselen into prison. Only on condition that Jacoba abdicated her three countships in his favour would he allow her liberty and recognize her marriage with Borselen. She submitted in April 1432, retained her title of duchess in Bavaria, and lived on her husband's estates in retirement. She died on Oct. 6, 1436, leaving no children.

JACOBABAD, a town of British India, the administrative headquarters of the Upper Sind frontier district in Bombay with a station on the Quetta branch of the North-western railway, 37 m. from the junction at Ruk, on the main line. Pop. (1921), 10,583. It is famous as having consistently the highest temperature in India. During the month of June the thermometer ranges between 120° and 127° F. The town was founded on the site of the village of Khanghar in 1847 by General John Jacob, for many years commandant of the Sind Horse, who died here in 1858. The town is the centre of a thriving grain trade and a headquarters of caravans from Central Asia. It is watered by two canals. An annual horse show is held in January.

JACOB BEN ASHER (1280–1340), codifier of Jewish law, was born in Germany and died in Toledo. A son of Asher ben Yehiel (*q.v.*), Jacob helped to restore the legal casuistry overthrown by Maimonides (*q.v.*). Jacob ben Asher is known as the Ba'al ha-turim (literally "Master of the Rows") from his chief work, the four *Turim* or Rows (the title is derived from the four *Turim* or rows of jewels in the High Priest's breastplate).

See Graetz, *History of the Jews* (Eng. trans.), vol. iv. ch. iii.; Weiss, *Dor dor we-dorashav*, v. 118–123.

JACOBAN STYLE, in architecture, that style of early English Renaissance (*see* RENAISSANCE ARCHITECTURE) which followed the Elizabethan (*see* ELIZABETHAN STYLE) and is generally contemporary with the reign of James I. (1603–1625). It is characterized by a combination of late Perpendicular Gothic motives with a great use of crude and misunderstood classic detail, in which the influence of Flanders is strong. The Tudor pointed arch is common and in interior work there is considerable simple, Tudor panelling and an occasional use of perpendicular vaulting forms. Doorways, fireplaces and the like, are usually framed with classic forms, and both outside and in, there is a wide use of gables (*q.v.*), pilasters, S-scrolls and that type of pierced, flat ornament known as strap work. This style, despite its name, is found over a longer period of time than the strict limits above stated, thus Wollaton Hall, Nottinghamshire (1580) can rightly be termed Jacobean, and traces of the same style are found in the colleges of Oxford and Cambridge up to the beginning of the 18th century.

JACOBI, ABRAHAM (1830–1919), German-American physician, was born at Hartum, Westphalia (Germany), on May 6, 1830, and educated at the Gymnasium of Minden and the Universities of Griefswald, Göttingen and Bonn (M.D., 1851). Because he participated in the German revolutionary movement he was imprisoned, 1851–53, in Berlin and Cologne for "high treason." Upon his release he came to the United States and began practice in New York city. In 1860 he became professor of children's diseases at the New York Medical college, holding the first chair in the subject founded in the United States. From 1865–70 he was professor of children's diseases in the medical department of New York university, and from 1870 to 1903 in the College of Physicians and Surgeons of Columbia university, becoming professor emeritus in 1903. He was physician to the German hospital, beginning in 1857, to Mount Sinai, 1860–83, to Bellevue Babies Orthopaedic, beginning 1874, to Roosevelt hospital, beginning 1898, and consulting physician to many others and to the New York city department of health. He established the first special clinic for diseases of children in the country in

New York city in 1862 and later established many others. He taught and wrote on his specialty for more than half a century, is ranked among the foremost authorities on the diseases of children, and is considered the founder of pediatrics in America. He died at Bolton Landing, N.Y., on July 10, 1919.

His more important books were *Dentition and Its Derangements* (1862); *Infant Diet* (1872); *The Value of Life* (1879); *Cold Pack and Anaemia* (1880); *Treatise on Diphtheria* (1880); *Intestinal Diseases of Infancy and Childhood* (1887); *Pathology of the Thymus Gland* (1889); *Therapeutics of Infancy and Childhood* (1896). His many scientific articles, miscellaneous writings and addresses are found in the eight volumes of *Collectanea Jacobi*, W. G. Robinson, ed. (1909).

See F. H. Garrison, "Abraham Jacobi," *Annals of Medical History*, vol. ii. (1919).

JACOBI, FRIEDRICH HEINRICH (1743–1819), German philosopher, was born at Düsseldorf on Jan. 25, 1743. He was educated at Geneva for a commercial career, but in 1770 gave up the management of his father's business, and became a member of the council for the duchies of Jülich and Berg, where he distinguished himself by his ability in financial affairs, and his zeal in social reform. Jacobi's interest in literary and philosophic matters led him to found with C. M. Wieland a new literary journal, *Der Teutsche Mercur*, in which some of his early economic essays were published. Here too appeared in part his *Edward Allwills Briefsammlung* (1776), a combination of romance and speculation. This was followed in 1779 by *Woldemar*, a philosophic novel. A conversation with Lessing in 1780, in which Lessing avowed that he knew no philosophy, save Spinozism, led him to study Spinoza's works. This resulted in his *Briefe über die Lehre Spinozas* (1785; 2nd ed., 1789) in which he strenuously objected to Spinoza's method of demonstration in Philosophy, and drew upon himself the enmity of the Berlin clique, led by Moses Mendelssohn. In his work, *David Hume über den Glauben, oder Idealismus und Realismus* (1787), Jacobi identified faith or belief with the immediacy of experience, and critically examined the subjective idealism of Kant.

On the outbreak of the war with France he moved to Holstein, and in 1801 published his important *Über das Unternehmen des Kriticismus, die Vernunft zu Verstande zu bringen*. During the same period the accusation of atheism brought against Fichte at Jena led to the publication of Jacobi's *Letter to Fichte* (1799), in which he made more precise the relation of his own philosophic principles to theology, and set forth his efforts to establish theism. Jacobi received a call to Munich in connection with the new academy of sciences in 1804, and from 1807 to 1812 was president of the academy. In 1811 appeared his last philosophic work, *Von den göttlichen Dingen*, directed against Schelling. Jacobi died on March 10, 1819.

The philosophy of Jacobi is an attempt to define the spheres of reason and of faith. For him, reason is purely elaborative, its results never transcending the material supplied to it by the senses. But besides the things of the senses spiritual things are involved in our experience, and to these the exact method of scientific understanding cannot be applied without ending, as Spinoza does, in atheism and fatalism. Spiritual things are known only in an immediacy of experience; even God is found by finding ourselves in Him, and certainly, freedom as self-activity can be apprehended only by intuition. This appreciation of the richness of experience made Jacobi one of the chief champions of the *Gefühlphilosophie* movement.

The best introduction to Jacobi's philosophy is the preface to vol. 2 of the *Works*, 6 vols. Leipzig (1812–20), and Appendix 7 to the *Letters on Spinoza's Theory*. Jacobi's *Auserlesener Briefwechsel* has been edited by F. Roth in 2 vols. (1825–27). See also J. Kuhn, *Jacobi und die Philosophie seiner Zeit* (1834); F. Deycks, *F. H. Jacobi im Verhältnis zu seinen Zeitgenossen* (1848); H. Düntzer, *Freundesbilder aus Goethes Leben* (1853); E. Zirngiebl, *F. H. Jacobi's Leben, Dichten, und Denken* (1867); F. Harms, *Über die Lehre von F. H. Jacobi* (1876); L. Lévy-Bruhl, *La Philosophie de Jacobi* (1894), and H. W. Crawford, *The Philosophy of Jacobi* (New York, 1905).

JACOBI, JOHANN GEORG (1740–1814), German poet, elder brother of F. H. Jacobi (q.v.), was born at Düsseldorf on Sept. 2, 1740. He was professor of philosophy at Halle (1766–69), then, through the influence of his friend Gleim, prebendary at Halberstadt (1769–74), editor of the *Iris* at Düsseldorf (1774–

76), and professor of literature at Freiburg-im-Breisgau (1784–1814). He died at Freiburg on Jan. 4, 1814. He wrote many charming lyrics and sonnets. In addition to the earlier *Iris*, to which Goethe, his brother F. H. Jacobi, Gleim and other poets contributed, he published from 1803–13, another periodical, also called *Iris*, in which Klopstock, Herder, Jean Paul, Voss and the brothers Stolberg also collaborated.

Jacobi's *Sämliche Werke* were published in 1774 (Halberstadt, 3 vols.). Other editions appeared at Zürich in 1807–13 and 1825. See *Ungedruckte Briefe von und an Johann Georg Jacobi* (Strassburg, 1874); Longo, *Laurence Sterne und Johann Georg Jacobi* (Vienna, 1898).

JACOBI, KARL GUSTAV JACOB (1804–1851), German mathematician, was born at Potsdam, of Jewish parentage, on Dec. 10, 1804. He studied at Berlin University, where he obtained the degree of doctor of philosophy in 1825, his thesis being an analytical discussion of the theory of fractions. In 1827 he became extraordinary and in 1827 ordinary professor of mathematics at Königsberg, and this chair he filled until 1842. He investigated elliptic functions and produced in 1829 his important treatise *Fundamenta nova theoriae functionum ellipticarum*. He also made notable researches on differential equations, and applied his analysis to various dynamical problems. He introduced the theory of the last multiplier, which is fully treated in his *Vorlesungen über Dynamik*, edited by R. F. A. Clebsch (Berlin, 1866). Jacobi advanced the theory of configurations of rotating liquid masses by showing that the ellipsoids which are now known as Jacobi's ellipsoids should be figures of equilibrium. He was one of the early founders of the theory of determinants, and he invented the functional determinant formed of the n^2 differential coefficients of n given functions of n independent variables, which now bears his name (Jacobian), and which has played an important part in many analytical investigations (see ALGEBRAIC FORMS). Valuable also are his papers on Abelian transcendents, and his investigations in the theory of numbers, which supplement the labours of Gauss. He left a vast store of manuscript, portions of which have been published at intervals in Grelle's Journal. He died in Berlin on Feb. 18, 1851.

His *Gesammelte Werke* were published by the Berlin Academy (1881–91). See Königsberger, *Karl Gustav Jacob Jacobi* (1904).

JACOBI, MARY PUTNAM (1842–1906), American pioneer woman physician and wife of Abraham Jacobi (q.v.), was born at London, England, on Aug. 31, 1842, the daughter of George P. Putnam, American publisher. She was educated at home, studied anatomy with a private instructor, and gained admission, as its first woman student, to the New York College of Pharmacy, at which she graduated in 1862. She then attended the Women's Medical college in Philadelphia and was admitted to practice in 1864. After a year she went to Paris and studied in hospitals for 18 months before she gained entrance to the École de Médecine, as its first woman student, the influence of the Minister of Education being necessary to persuade the school to break its precedent. She graduated with the highest honours of her class. On returning to New York city she entered practice and also lectured on therapeutics at the newly established Medical College for Women of the New York infirmary. When the post-graduate school was founded in 1881 she became professor of children's diseases. She attained note as a writer on medical topics and gave many addresses before learned societies. She died in New York city, on June 10, 1906.

Her chief publications were: *The Question of Rest for Women during Menstruation* (1877); *Hysteria and Other Essays* (1880); *Prophylaxis of Insanity* (1881); *Physiological Notes on Primary Education* (1889); *Common Sense Applied to Woman Suffrage* (1894); *Stories and Sketches* (1907). See *Life and Letters of Mary Putnam Jacobi*, Ruth Putnam, ed. (1925), which also contains a bibliography of her publications.

JACOBINS, THE, the most famous of the political clubs of the French Revolution. It originated in the Club Breton, established at Versailles shortly after the opening of the States General in 1789. At first composed of deputies from Brittany, it was soon joined by others from various parts of France, among its early members being Mirabeau and Robespierre. After Oct. 6 the club followed the National Assembly to Paris, where it rented the refec-

tory of the monastery of the Jacobins in the Rue St. Honoré, near the seat of the Assembly. The name "Jacobins," given in France to the Dominicans, because their first house in Paris was in the Rue St. Jacques, was first applied to the club in ridicule. The title assumed by the club itself, after the promulgation of the constitution of 1791, was *Société des amis de la constitution séants aux Jacobins à Paris*, which was changed on Sept. 21, 1792, after the fall of the monarchy, to *Société des Jacobins, amis de la liberté et de l'égalité*.

Once transferred to Paris, the club underwent rapid modifications. The first step was the admission as members or associates of others besides deputies. On Feb. 8, 1790, the society was formally constituted by the adoption of the rules drawn up by Barnave. The objects of the club were defined as (1) to discuss in advance questions to be decided by the National Assembly; (2) to work for the establishment and strengthening of the constitution; (3) to correspond with other societies of the same kind. The club was to have a president, elected every month, four secretaries, a treasurer and committees elected to superintend the correspondence and the administration of the club's affairs.

Any member who showed that his principles were contrary to the constitution and the rights of man was to be expelled, a rule which later on facilitated the "purification" of the society by the expulsion of its more moderate elements. The 7th article provided for the admission of other similar societies as associates.

This last provision was of far-reaching importance. By Aug. 10, 1790 there were already one hundred and fifty-two affiliated clubs, and at the close of 1791 the Jacobins had a network of branches all over France. It was this widespread yet highly centralized organization that gave to the Jacobin Club its formidable power.

At the outset the Jacobin Club was not distinguished by extreme political views. The high subscription confined its membership to men of substance, and to the last the central society in Paris was composed almost entirely of professional men, such as Robespierre, or well-to-do *bourgeois*, like Santerre. Other elements, however, were present. Besides Louis Philippe, duc de Chartres (afterwards king of the French), liberal aristocrats of the type of the duc d'Aiguillon, and the *bourgeois* who formed the mass of the members, the club contained such figures as "Père" Michel Gérard, a peasant proprietor from Brittany, whose rough common sense was admired as the oracle of popular wisdom, and whose countryman's waistcoat and plaited hair were to become the model for the Jacobin fashion. The provincial branches, although more democratic, were usually led by members of the middle classes. The club took no official part in the insurrections of June 20 and Aug. 10, 1792, and only formally recognized the republic on Sept. 21. But the character and extent of its influence cannot be gauged by its official acts alone, and long before it emerged as the principal focus of the Terror, its character had been profoundly changed by the secessions of its more moderate elements, some to found the Club of 1789, some in 1791 to found the club of the Feuillants scoffed at by their former friends as the *club monarchique*.

From the date of the admission of the general public to its sittings (Oct. 14, 1791), the constituency to which the club was responsible, and from which it derived its power, was the Paris mob; the *sans-culottes*—decayed lackeys, cosmopolitan ne'er-do-weels and starving workpeople—who crowded its tribunes. To this audience, and not primarily to the members of the club, the speeches of the orators were addressed and by its verdict they were judged. As the chaos in the body politic grew, and with it the appalling material misery, the mob, no longer satisfied with the platitudes of the *philosophes*, began to clamour for the blood of the "traitors" in office by whose corrupt machinations the millennium was delayed, and only those orators were listened to who pandered to its suspicions. Hence the elimination of the moderate elements from the club; hence the ascendancy of Marat, and finally of Robespierre, the secret of whose power was that they really shared the suspicions of the populace, to which they gave a voice and which they did not shrink from translating into action. After the fall of the monarchy Robespierre was in

effect the Jacobin Club; for to the tribunes he was the oracle of political wisdom, and by his standard all others were judged.¹ With his fall the Jacobins too came to an end.

SECRET OF THEIR STRENGTH

Not the least singular thing about the Jacobins is the slender material basis on which their power rested. France groaned under their tyranny: yet it was reckoned by competent observers that, at the height of the Terror, the Jacobins could not command a force of more than 3,000 men in Paris. The secret of their strength was this: in the midst of the general disorganization, they alone were organized. The Girondin government was urged to meet organization by organization, force by force; and it is clear from the daily reports of the police agents that even a moderate display of energy would have saved the National Convention from the humiliation of being dominated by a club, and the French Revolution from the blot of the Terror. But the Girondins were too convinced of the ultimate triumph of their own persuasive eloquence, to act. In the session of April 30, 1793 a proposal was made to move the Convention to Versailles out of reach of the Jacobins, but the motion was not carried, and the Girondins remained to become the victims of the Jacobins.

The Jacobin Club was closed after the fall of Robespierre on the 9th of Thermidor of the year III., and some of its members were executed. An attempt was made to re-open the club, which was joined by many of the enemies of the Thermidorians, but on the 21st of Brumaire, year III. (Nov. 11, 1794), it was definitely closed. Its members and their sympathizers were scattered among the cafés, where a ruthless war of sticks and chairs was waged against them by the young "aristocrats" known as the *jeunesse dorée*. Nevertheless the "Jacobins" survived, in a somewhat subterranean fashion, emerging again in the club of the Panthéon, founded on Nov. 25, 1795, and suppressed in the following February (see BABEUF; FRANÇOIS NOEL). The last attempt to reorganize them was the foundation of the *Réunion d'amis de l'égalité et de la liberté*, in July 1799, which had its headquarters in the *Salle du Manège* of the Tuileries, and was thus known as the *Club du Manège*. It was patronized by Barras, and some two hundred and fifty members of the two councils of the legislature were enrolled as members, including many notable ex-Jacobins. But public opinion was now preponderatingly moderate or royalist, and the club was violently attacked. It was suppressed in August, after barely a month's existence. Its members revenged themselves on the Directory by supporting Napoleon Bonaparte.

Long before the suppression of the Jacobin Club the name of "Jacobins" had been popularly applied to all promulgators of extreme revolutionary opinions. In this sense the word passed beyond the borders of France and long survived the Revolution. Canning's paper, *The Anti-Jacobin*, directed against the English Radicals, consecrated its use in England; and in the correspondence of Metternich and other leaders of the repressive policy which followed the second fall of Napoleon, "Jacobin" is the term commonly applied to anyone with Liberal tendencies, not excepting the emperor Alexander I. of Russia.

See F. A. Aulard, *La société des Jacobins, Recueil de documents* (1889, etc.), where a critical bibliography will be found. This collection does not contain all the printed sources—notably the official Journal of the Club is omitted—but these sources, when not included, are indicated. The documents published are furnished with valuable explanatory notes. See also W. A. Schmidt, *Tableaux de la révolution française* (Leipzig, 1867-70), notably for the reports of the secret police, which throw much light on the actual working of the Jacobin propaganda, and Albert Mathiez, *Études robespierristes* and other works. (W. A. P.)

JACOBITE CHURCH. The name of "Jacobites" is first found in a synodal decree of Nicaea A.D. 787, and was invented by hostile Greeks for the Syrian monophysite Church as founded, or rather restored, by Jacob or James Baradaeus, who was ordained its bishop A.D. 541 or 543. James was born a little before A.D. 500

¹In the published reports only the speeches of members are given, not the interruptions from the tribunes. But see the report (May 18, 1793) of Dutard to Garat on a meeting of the Jacobins (Schmidt, *Tableaux* ii, 242).

at Tella or Tela, 55 m. east of Edessa, of a priestly family, and entered the convent of Phesilta on Mount Isla. About 528 he went with a fellow-monk Sergius to Constantinople to plead the cause of his co-religionists with the empress Theodora, and lived there fifteen years. Justinian during those years imprisoned, deprived or exiled most of the monophysite clergy of Syria, Mesopotamia, Cilicia, Cappadocia, and the adjacent regions. Once ordained bishop of Edessa, with the connivance of Theodora, James, disguised as a ragged beggar, traversed these regions preaching, and ordained many thousands of clergy. He died in 578. In the middle ages there were 150 Jacobite archbishops and bishops under a patriarch, but in 1842, the Jacobites in all Turkey had dwindled to about 100,000 souls.

See A. J. Maclean, art. "Syrian Christians" in Hastings' *Encyclopaedia of Religion and Ethics*, vol. xii. pp. 172 ff., with many ref., G. P. Badger, *The Nestorians*, 1852; O. H. Parry, *Six Months in a Syrian Monastery*, 1895; R. Duval, *La littérature syriaque*, 1899; F. C. Burkitt, *Early Eastern Christianity*, 1904.

JACOBITES, the name given after the revolution of 1688 to the adherents, first of the exiled English king James II., then of his descendants, and after the extinction of the latter in 1807, of the descendants of Charles I., i.e., of the exiled house of Stuart (Lat. *Jacobus*, James).

The history of the Jacobites, culminating in the risings of 1715 and 1745, is part of the general history of England, and especially of Scotland; there were also many Jacobites in Ireland. They were recruited largely, but not solely, from among the Roman Catholics, and the Protestants among them were often identical with the Non-Jurors. Owing to a variety of causes Jacobitism began to lose ground after the accession of George I.; and the suppression of the revolt of 1715 and the total failure of "the '45" marked its end as a serious political force. But as a sentiment it remained for some time longer. In 1750, during a strike of coal workers at Elswick, James III. was proclaimed king; and in Manchester a Jacobite rendezvous known as "John Shaw's Club" lasted from 1735 to 1892; North Wales was another Jacobite centre. Jacobite traditions also lingered among the great families of the Scottish Highlands. Until the accession of King Edward VII. finger-bowls were not placed upon the royal dinner-table, because in former times those who secretly sympathized with the Jacobites were in the habit of drinking to the king *over the water*. Sentimental Jacobitism was practically extinguished during the World War by the fact that the "rightful king" was Prince Ruprecht of Bavaria.

Upon the death of Henry Stuart, Cardinal York, the last of James II.'s descendants, in 1807, the rightful occupant of the British throne according to legitimist principles was to be found among the descendants of Henrietta, daughter of Charles I., who married Philip I., duke of Orleans. The table of succession runs as follows:

Charles I. (1600-1649)		
Henrietta (1644-1670) =		
Philip I., duke of Orleans (1640-1701)		
Anne Marie (1669-1728) =		
Victor Amadeus II., king of Sardinia (1666-1732)		
Charles Emmanuel III.		
king of Sardinia (1701-1773)		
Victor Amadeus III.		
king of Sardinia (1726-1796)		
Victor Emmanuel I.		
king of Sardinia (1759-1824)		
Marie Beatrice (c. 1780-1840) =		
Francis IV., duke of Modena (1779-1846)		
Ferdinand (1821-1849)		
Marie Thérèse (1849-1919) =		
Louis, prince of Bavaria (1845-1921)		
Ruprecht, ex-crown-prince of Bavaria (b. 1869)	Charles (b. 1874)	Francis (b. 1875)
Luitpold (d.)	Albrecht (b. 1905)	Rudolph (d.)

See James Hogg, *The Jacobite Relics of Scotland* (Edinburgh, 1819-21); *Historical Papers relating to the Jacobite Period*, edited by J. Allardyce (Aberdeen, 1895-96); F. W. Head, *The Fallen Stuarts* (1901); de Ruigny, *The Jacobite Peerage* (Edinburgh, 1904). The chief collections of Jacobite poems are: Charles Mackay's *Jacobite Songs and Ballads of Scotland, 1688-1746, with Appendix of Modern Jacobite Songs* (1861); *English Jacobite Ballads*, edited by A. B. Grosart from the Towneley manuscripts (1877); and G. S. Macquoid's *Jacobite Songs and Ballads* (1888).

JACOB OF EDESSA, who ranks with Barhebraeus as the most distinguished for scholarship among Syriac writers, was born at 'En-dēbhā in the province of Antioch, probably about A.D. 640. He spent nine years in revising and emending the Peshitta version of the Old Testament by the help of the various Greek versions. He died on June 5, 708. In doctrine Jacob was undoubtedly Monophysite.

His works include a Monophysite revision of the Old Testament; commentaries and scholia on the sacred books; many contributions to the Syrian liturgy; an Enchiridion, a tract on philosophical terms; a Syriac grammar; and a version of the homilies of Severus.

See Assemani, *Bibliotheca orientalis*; and Wright, *Catalogue of Syriac MSS. in the British Museum*.

JACOB OF SĒRŪGH (451-521), Syriac author, was born at Kurtam, a village on the Euphrates to the west of Hārārān, and was probably educated at Edessa. He wrote a series of metrical homilies (ed. P. Bedjan, Paris, 1905 seq.). Ordained to the priesthood, he became episcopal visitor of Haurā, in Sērūgh, not far from his birthplace. In 519, at the age of 68, Jacob was made bishop of Batnān, another town in the district of Sērūgh, but only lived till November 521.

According to Barhebraeus (*Chron. Eccles.* i. 191) Jacob employed 70 amanuenses and wrote in all 760 metrical homilies, besides expositions, letters and hymns of different sorts. Of Jacob's prose works, the most interesting are his letters, which show his attachment to the Monophysite doctrine which was then struggling for supremacy in the Syrian churches, and particularly at Edessa, over the opposite teaching of Nestorius.

See Wright, *Short History of Syrian Literature*.

JACOBS, CHRISTIAN FRIEDRICH WILHELM (1764-1847), German classical scholar, was born at Gotha on Oct. 6, 1764, and died there on March 30, 1847. He was a notable teacher and publicist, but his great work was an edition of the Greek Anthology, with copious notes, in 13 volumes (1798-1814), supplemented by a revised text from the Codex Palatinus (1814-17). He published also notes on Horace, Stobaeus, Euripides, Athenaeus and the *Iliad* of Tzetzes; translations of Aelian (*History of Animals*); miscellaneous essays on classical subjects.

See E. F. Wüstemann, *Friderici Jacobsii laudatio* (Gotha, 1848); C. Bursian, *Geschichte der classischen Philologie in Deutschland* (1883); and the appreciative article by C. Regel in *Allgemeine deutsche Biographie*.

JACOBS' CAVERN, a cavern in latitude 36° 35' N., 2 m. E. of Pineville, McDonald county, Mo., named after its discoverer, E. H. Jacobs, of Bentonville, Ark. It was scientifically explored by him, in company with Professors Charles Peabody and Warren K. Moorehead, in 1903. This small cave is hardly more than a rock-shelter, and is entirely in the "St. Joe Limestone" of the sub-carboniferous age. The ash surface of its floor was staked off into square metres, and the substance carefully removed in order. Each stalactite, stalagmite and pilaster was measured, numbered, and removed in sections. Six human skeletons were found buried in the ashes. Seven-tenths of a cubic metre of animal bones were found: deer, bear, wolf, raccoon, opossum, beaver, buffalo, elk, turkey, woodchuck, tortoise and hog; all contemporary with man's occupancy. Three stone metates, one stone axe, one celt and 15 hammer-stones were found. The cavern was peculiarly rich in flint knives and projectile points. The rude type of the implements, the absence of fine pottery, and the peculiarities of the human remains, indicate a race of occupants more ancient than the "mound-builders."

JACOBSEN, JENS PETER (1847-85), Danish writer, was born at Thisted, Jutland, on April 7, 1847. In 1870, although he was secretly writing verses already, Jacobsen adopted botany as a profession. He was sent by a scientific body in Copenhagen

to report on the flora of the islands of Anholt and Laesö. He translated into Danish *The Origin of Species* and *The Descent of Man*. Jacobsen contracted tuberculosis, and was obliged to give up scientific work. Under the influence of Georg Brandes he then began his great historical romance of *Marie Grubbe*, completed in 1876. In 1879 he was too ill to write at all; but in 1880 he finished his second novel, *Niels Lyhne*. In 1882 he published a volume of six short stories, entitled *Mogens*. He died at Thisted on April 30, 1885. In 1886 his posthumous fragments were collected. It was early recognized that Jacobsen was the greatest artist in prose that Denmark has produced. He has been compared with Flaubert, with De Quincey, with Pater; but these parallelisms merely express a sense of the intense individuality of his style, and of his untiring pursuit of beauty in colour, form and melody.

His *Samlede Skrifter* appeared in two volumes in 1888; in 1899 his letters (*Breve*) were edited by Edvard Brandes. In 1896 an English translation of part of the former was published under the title of *Siren Voices: Niels Lyhne*, by Miss E. F. L. Robertson.

See also G. Brandes in *Samlede Skrifter* (vol. 3, 1900).

JACOB'S WELL, the scene of the conversation between Jesus and the "woman of Samaria" narrated in the Fourth Gospel, is described as being in the neighbourhood of an otherwise unmentioned "city called Sychar." From the time of Eusebius this city has been identified with Sychem or Shechem (modern Nablus), and the well is still in existence $1\frac{1}{2}$ m. E. of the town, at the foot of Mt. Gerizim. When Robinson visited it in 1838 it was 105 ft. deep, but it is now much shallower and often dry.

JACOBUS, the name of a British gold coin issued in the reign of James I. and called after him, Jacobus being Latin for James. It was of the value of 25 shillings.

JACOBUS DE VORAGINE (c. 1230–c. 1298), Italian chronicler, archbishop of Genoa, was born at Varazze, near Genoa, and joined the Dominicans in 1244. He was provincial of Lombardy from 1267 till 1286, and represented his own province at the councils of Lucca (1288) and Ferrara (1290). In 1288 Nicholas IV. empowered him to absolve the people of Genoa for their offence in aiding the Sicilians against Charles II. Early in 1292 Jacobus was consecrated archbishop of Genoa where he distinguished himself by his efforts to appease the civil discords of Genoa. He died in 1298 or 1299, and was buried in the Dominican church at Genoa.

His chief works are the *Chronicon januense* and the *Golden Legend* or *Lombardica hystoria*. The former, partly printed in Muratori (*Scriptores Rer. Ital.* ix. 6), deals with the history of Genoa from its earliest days to the time of the writer himself. The latter, one of the most popular religious works of the middle ages, is a collection of the legendary lives of the greater saints, ornamented with much curious information.

See Potthast, *Bibliotheca, hist. med. aevi.*, 13th ed. (Berlin, 1896), U. Chevalier, *Répertoire des sources hist. Bio.-bibl.* (1905), and F. L. Mannucci, *La Cronaca di Jacops da Varagine* (Genoa, 1904).

JACOPONE DA TODI (JACOBUS DE BENEDICTIS) (c. 1230–1306), Italian Franciscan poet, was born of noble family at Todi. He practised as an advocate in his native town and acquired considerable wealth, but on the death of his wife about 1268 became a Franciscan. On account of his satire on Benedict VIII., who was not well disposed towards the Spirituals with whom Jacopone sympathized, he was imprisoned from 1298–1303. On his release he lived at Collazzone where he died, Dec. 25, 1306.

Jacopone's poems, which were written chiefly in the Umbrian dialect, and are a curious mixture of coarseness and tenderness, early acquired great popularity. They relate his inner experiences and reflect his profound piety, his missionary zeal, his Franciscan devotion to love and to poverty, and his mystical but practical bent. The best edition is that of 1490, recently reprinted (1923) with preface by G. Papini. The short spiritual prose treatises were edited by Parenti at Modena (1832) and by Gigli at Rome (1843).

JACOTOT, JOSEPH (1770–1840), French educationist, author of the method of "emancipation intellectuelle," was born at Dijon on March 4, 1770. He was educated at the university of Dijon, where in his nineteenth year he was chosen professor of Latin. In 1788 he organized a federation of the youth of Dijon for the defence of the principles of the Revolution; and in 1792 served in the Belgian campaign. On the institution of the central schools at Dijon he was appointed to the chair of the "method of sciences," where he made his first experiments in educational method. On the central schools being replaced by other educational institutions, Jacotot occupied successively the chairs of mathematics and of Roman law until the overthrow of the empire. After the second restoration he had to leave France. He went to Brussels, and in 1818 he was nominated by the Government teacher of the French language at the university of Louvain, where he perfected into a system the educational principles which he had already practised with success in France. His method was based on three principles: (1) all men have equal intelligence; (2) every man has received from God the faculty of being able to instruct himself; (3) everything is in everything. As regards (1) he maintained that it is only in the will to use their intelligence that men differ; and his own process, depending on (3), was to give any one learning a language for the first time a short passage of a few lines, and to encourage the pupil to study, first the words, then the letters, then the grammar, then the meaning, until a single paragraph became the occasion for learning an entire literature. After the revolution of 1830 Jacotot returned to France. He died at Paris on July 30, 1840.

His system was described by him in *Enseignement universel, langue maternelle* (Louvain and Dijon, 1823)—which passed through several editions—and in various other works; and he also advocated his views in the *Journal de l'émancipation intellectuelle*. For a complete list of his works and fuller details regarding his career, see A. Guillard, *Biographie de J. Jacotot* (1860).

JACQUARD, JOSEPH MARIE (1752–1834), French inventor, was born at Lyons on July 7, 1752. In 1793 he took part in the unsuccessful defence of Lyons against the troops of the Convention; but afterwards served in their ranks on the Rhône and Loire. He then worked in a Lyons factory, and employed his spare time in constructing his improved loom, of which he had conceived the idea several years previously. In 1801 he exhibited his invention at the industrial exhibition at Paris; and in 1803 he was summoned to Paris and attached to the Conservatoire des Arts et Métiers. A loom by Jacques de Vaucanson (1709–82), deposited there, suggested various improvements in his own, which he gradually perfected to its final state. Although his invention was fiercely opposed by the silk-weavers, who feared that its introduction, owing to the saving of labour, would deprive them of their livelihood, its advantages secured its general adoption, and by 1812 there were 11,000 Jacquard looms in use in France. The loom was declared public property in 1806, and Jacquard was rewarded with a pension and a royalty on each machine. He died at Oullins (Rhône) on Aug. 7, 1834, and six years later a statue was erected to him at Lyons (see WEAVING).

JACQUELINE OF HAINAULT: see JACOBA.

JACQUERIE, THE, an insurrection of the French peasantry which broke out in the Ile de France and about Beauvais at the end of May 1358. The hardships endured by the peasants in the Hundred Years' War and their hatred for the nobles who oppressed them were the principal causes which led to the rising, though the immediate occasion was an affray which took place at the village of Saint-Leu between "brigands" (militia infantry armoured in brigandines) and country-folk. The latter having got the upper hand united with the inhabitants of the neighbouring villages and placed Guillaume Karle at their head. They destroyed numerous châteaux in the valleys of the Oise, the Brèche and the Thérain, where they subjected the whole countryside to fire and sword, committing the most terrible atrocities. Charles the Bad, king of Navarre, crushed the rebellion at the battle of Mello, and the nobles then took violent reprisals upon the peasants, massacring them in great numbers.

See Simeon Luce, *Histoire de la Jacquerie* (1859 and 1895). (J.V.)

JACTITATION, in English law, the maliciously boasting or giving out by one party that he or she is married to the other. In such a case, in order to prevent the common reputation of their marriage that might ensue, the procedure is by suit of jactitation of marriage, in which the petitioner alleges that the respondent boasts that he or she is married to the petitioner, and prays a declaration of nullity and a decree putting the respondent to perpetual silence thereafter.

JADE or **JAHDE**, a deep bay and estuary of the North Sea, belonging to Oldenburg. The bay, which was for the most part made by storm-floods in the 13th and 16th centuries, measures 70 sq.m., and has communication with the open sea by a fairway, 1½ m. wide, which never freezes, and with the tide gives access to the largest vessels. On the west side of the entrance to the bay is the port of Wilhelmshaven. A stream, about 14 m. long, also known as the Jade, enters the head of the bay.

JADE, a name applied to certain minerals of compact texture and colour varying from nearly white to dark green which have been used from prehistoric times in the manufacture of weapons, utensils and ornaments. The name is often restricted to two minerals, jadeite and nephrite. The word jade is derived (through Fr. *le jade*, for *Pejade*) from Span. *ijada* (Lat. *ilia*), the loins, this mineral having been known to the Spanish conquerors of Mexico and Peru under the name of *piedra de ijada* or *yjada* (colic stone). The superstitions of the Mexicans regarding the stone were perpetuated in the Old World. When powdered and mixed with water it was supposed a powerful remedy for all kinds of internal disorders, to strengthen the frame and prevent fatigue, to prolong life and if taken in sufficient quantities just before death to prevent decomposition.

Jadeite is essentially a silicate of aluminium and sodium but generally contains small quantities of iron, calcium and magnesium. In the variety called chloromelanite, the iron amounts to 10%. In chemical composition and crystalline characters jadeite belongs to the pyroxene group of minerals and its chemical formula is therefore written $\text{NaAlSi}_2\text{O}_6$. It occurs very rarely in distinct crystals, though two small specimens were obtained from the Heber Reginald Brooke Collection of sufficient size to allow of morphological and optical investigation. Its hardness is 7 and specific gravity 3.33; it fuses in the blowpipe flame.

Nephrite is a silicate of calcium and magnesium, generally having a little iron replacing the magnesium. It belongs to the amphibole group of minerals and is identical in composition with actinolite and tremolite of that species, which have the formula $\text{CaMg}_3(\text{SiO}_3)_4$. Its hardness is 6 and specific gravity 3.0, and it has a lower melting point than jadeite.

Both jadeite and nephrite are very tough, owing to the way in which the constituent fibres interlace. This toughness is very well illustrated in the case of nephrite by the fact that a pressure of 50 tons was required to crush certain cubical pieces of one inch size: large pieces can often only be broken by heating and then rapidly cooling by immersion in water. Suitably cut jade possesses the property of emitting a very clear musical tone when struck and of maintaining the vibrations for a comparatively long time. This has led to its use in the manufacture of bells and sounding plates and tubes. The colours which are very varied passing from black through brown to green and white are chiefly due to iron oxides and silicates and to some extent to chromium. Because of similarity in external appearance a number of minerals are often confused with jade and among these are included saussurite, bowenite, californite and verdite.

The Chinese value jade above all precious stones, as is indi-

cated by the following quotation from T'ang Jung-tso in a discourse on jade: "The magic powers of heaven and earth are ever combined to form perfect results: so the pure essences of hill and water become solidified into precious jade." The Chinese word *yu* and the Japanese equivalents represent not only jade and gems in general, but signify the five cardinal virtues, charity, modesty, courage, justice and wisdom.

In spite of its toughness jade is worked into complicated forms and elaborately carved. This is done principally in China, where most beautiful specimens have been found. On many prehistoric sites in Europe, as in the Swiss lake-dwellings, celts and other carved objects both in nephrite and jadeite have been found; and as no kind of jade had until recent years been discovered *in situ* in any European locality, it was believed that either the raw material or the worked objects must have been brought by some of the early inhabitants from a jade locality probably in the East. The discovery of native jade in Europe was, therefore, very important—nephrite was found in Silesia and jadeite in the Alps, whilst pebbles of jade were found in Austria and north Germany—and proved that the jade implements were not of exotic origin.

Jadeite is found in several places in upper Burma, notably in the Mogaung district and in the Kachin hills. The export trade to China, which absorbs practically the whole of the output, is exceedingly valuable and is worth nearly as much as the produce of the ruby mines. Jadeite is found in Tibet and in China in the provinces of Shensi and Yunnan.

Nephrite occurs in New Zealand, particularly in the South island, in New California, in Siberia at Batugol, Lake Baikal, in Alaska and many places in China. The Chinese derive their main supply from places near the southern boundary of Eastern Turkestan, especially from the valleys of the rivers Karakash and Yarkand and the Kuen Lun range of mountains.

See H. Fischer, *Nephrit und Jadeit* (Stuttgart, 1880); H. R. Brooke, *Investigation and Studies in Jade* (privately printed, New York, 1906); G. F. H. Smith, *Gem-stones* (London, 1926).

(W. A. W.)

JADE AND OTHER HARD STONE CARVINGS.

There are three minerals that are called jade: (1) Nephrite, known since earliest times; (2) Jadeite, described in 1868 by A. Damour, the famous French mineralogist, as new. The stone was of pure white with a faint purple tint. Jadeite is also often the finest jade; it is almost emerald green; (3) Chloromelanite, a dark green, almost black material. Analyses of these three minerals are given below. Although the most intensive investigations have been carried on concerning the origin and uses of Jade from the earliest times, it was not until 1868 that Damour found that nephrite contained lime and magnesia, whereas jadeite and chloromelanite contained alumina and soda.

Structure.—The structure of jadeite is either granular or fibrous, the former being more characteristic. It may be studied to the best advantage in such thin, translucent, highly polished objects as bowls, cups or plates. On holding such a specimen against a light each crystal composing it often stands out quite sharply, owing to the fact that the light strikes the surface and cleavages of each crystal at a different angle, thus giving to each a slightly different appearance. The individual grains are sometimes prismatic in shape, and sometimes equidimensional, with diameters up to 3 mm. in exceptional cases.

The structure of nephrite is characteristically fibrous, and of such a fine grain that the individual fibres are but rarely visible except under the microscope. The fibres in this aggregate are arranged in various ways: parallel to one another over considerable areas; in tufted or fan-shaped groups; or curved, twisted, interlocked and felted in most intricate fashion. The coarser visible structure is due to groups of these fine fibres, and is dependent on their internal arrangement. A sinewy or horn-like appearance is extremely common, being visible on both rough and polished surfaces. It seems to be due to the groupings of the fibres into tufted or fan-shaped bundles, sometimes of considerable size, and separated from each other by indistinct parting surfaces which are often curved into irregular forms.

JADE, LAPIS LAZULI AND OTHER STONES

Chinese: 1. Pi disc or symbol of heaven with associated symbols of dragons. 2. Jade images and symbols of the deity Earth. Chou period, 1122-255 B.C. 3. Jade celt, 22 cm. long. 4. Symbol of Deity of Earth, ornament for scabbard, and archer's thumb-ring. Han period, 206 B.C.-A.D. 220. 5. Lapis lazuli vase, ht. 28 in. Ch'ien Lung period, 1736-96. 6. Green jade

monster, Han period. 8. Ornamental green jade table screen. Ch'ien Lung period. 9. Crystal ball, 12.83 in. diam., wt. 106.75 lb.; the most perfect one of large size known. Made in China in 1924. In the U.S. National Museum. 10. Resonant white and greenish jade. Ch'ien Lung period. *Mexican:* 7. Votive ceremonial axe from Oaxaca; green jade

Colour.—Absolutely pure jadeite should be white, without a tinge of colour. So also an ideal nephrite, containing only lime and magnesia, should be colourless. The colours which actually exist are due to the admixture of other bases in the composition. In general, the green colour of jadeite is due to chromium—the colouring matter of the emerald, but jadeite is never transparent as is the emerald, but is at its best translucent—and that of nephrite to iron. Occasionally, however, anomalies are found, and the analytical data fail to account for the colour or lack of it of an occasional particular specimen.

Lustre.—The lustre of both jadeite and nephrite on fresh fracture is dull and wax-like, with very few reflecting surfaces. Polished jadeite has ordinarily a somewhat vitreous lustre, while polished nephrite ordinarily has an oily lustre. This oily appearance is highly characteristic of many of the green nephrites.

Sonority.—The resonant character of jade has been known to the Chinese since ancient times, and when united with the proper translucency and colour, was regarded as a sure sign of the genuineness of the material. "Sounding-stones" and stones for polishing them are mentioned in the earliest historical records of China (23 centuries B.C.).

The musical jade is often cut in the form of a fish and suspended by a thong, and when struck the full tones can be heard.

Composition.—The following table shows characteristic chemical analyses for nephrite, jadeite and chloromelanite.

	Nephrite	Jadeite	Chloromelanite
	%	%	%
Silica (SiO ₂)	58.00	58.24	56.12
Titanium dioxide (TiO ₂)	0.19
Alumina (Al ₂ O ₃)	1.30	24.47	14.96
Ferric oxide (Fe ₂ O ₃)	..	1.01	3.34
Ferrous oxide (FeO)	2.07	..	6.54
Manganese oxide (MnO)	0.47
Lime (CaO)	13.24	0.69	5.17
Magnesia (MgO)	24.18	0.45	2.79
Soda (Na ₂ O)	1.28	14.70	10.99
Potash (K ₂ O)	..	1.55	trace
	100.07	101.11	100.57

Occurrence.—Although jade objects in considerable numbers have been found over rather wide-spread areas, there are only a few localities identified where it is known to occur in place. In addition to these there are several others where jade has been found, having been transported there from its place of origin by the action of rivers or glaciers. And finally, there are other localities in which worked jade is found, sometimes in considerable profusion; in many of these cases the source of the material is pure conjecture, while in others the character of the material is such as to give some indication as to its point of origin. The greatest source of material, and the one that has been studied the most, is in the Kachin country of Upper Burma, near the junction of the Chadwin and Uru rivers, at about 25° to 27° N. lat. and 95° to 97° E. longitude. These quarries were discovered in the 13th century, but it was not until 1784 that trade was established with China, and a regular supply of stone was carried to Yunnan. Since the beginning of the 19th century Mogaung has been the centre of the jade trade in Burma.

Jade occurs in small amounts in several places in Central India, particularly in the State of Rewa. Although conclusive evidence is lacking, the indications seem to show that the Indian jade is all nephrite. One of the oldest and most important of the jade-producing districts is in the K'un Lun mountains, south of Khotan, in south-eastern Turkistan, described by the Seklogewitt brothers. Here are found both nephrite and jadeite, the former, however, greatly predominating. It was from this district that much of the early Chinese material was obtained.

The occurrence of nephrite in Siberia has been known since early in the 19th century, but it was not until 1896-97 that any definite information was obtained. At that time a Russian Government expedition under von Jaczewski, discovered several occurrences of nephrite in place in the Sajon mountains of central

Siberia, between the Belaja and Kitou rivers on the north and south, and the Onot and Urick rivers on the east and west.

Although boulders and worked objects of jade had been known in Europe for many years, it was not until 1884 that it was discovered in place by Traube at Jordansmühl, and a few years later at Reichenstein, in Silesia. This material is nephrite. These discoveries were supplemented in 1899 by that of Dr. George F. Kunz, who found at Jordansmühl one of the largest pieces of nephrite that has ever been quarried. This specimen, weighing 4,812 lb., is now in the American Museum of Natural History in New York city. Although several nephrite boulders have been found in glacial deposits in other localities, no other occurrences of nephrite in place are known in Europe. No occurrence of jadeite *in situ* is known in Europe but it is mined extensively in Mogoung, Burma.

In North America nephrite has been found in place in Alaska, about 150 m. above the mouth of the Kowak river, at 67° 5' N. lat. and 158° 15' W. longitude. Boulders of nephrite have also been found along the lower Fraser and the upper Lewes rivers in British Columbia. While material has not been found in place in either of these localities, all indications lead to the conclusion that the boulders had originated in the immediate locality.

Nephrite has long been used by the natives of New Zealand in tools, ornaments and magnificent ceremonial implements of various kinds. The material occurs in boulders chiefly on the west coast of South island, although other localities of lesser importance are known. Nephrite is found in place on the west coast of the island of Uen, off the south-eastern point of New Caledonia.

Although a fondness for jade is almost a national characteristic in China, there are no known occurrences in China. Most of the material used by the Chinese has come from either Chinese Turkistan or Burma. It is also possible that some Siberian or New Zealand material has been used.

Of the many thousand pieces of carved jade from China and India, with the possible exception of the small buttons, there are scarcely two pieces alike. The artist studied the piece of rough material to discover what could best be made of it and then made the design to fit the piece. The result is that most of the pieces are artistic and the lapidary work unique. They stand in an art by themselves.

In Europe worked objects of both nephrite and jadeite have been found over wide areas. Nephrite has been found particularly in the vicinity of the ancient lake villages of Switzerland. Jadeite objects were more widely distributed in Germany, France, Belgium, Switzerland and Italy. In Mexico and Central America large numbers of jadeite objects have been found. While these are the chief localities, there are also numerous others in which either jadeite or nephrite objects, or both, have been found, without clear evidence as to the source of the material.

There have been two historic debates concerning the occurrences of jade, both of which extended over many years. The first was concerned with the question as to whether jade was to be found in place in Europe, or whether the material used by the prehistoric peoples of central Europe was all brought from the outside, either by glacial action or by commerce. This question was definitely settled by the discoveries of Traube and Kunz, described above. The second concerned a similar question with regard to Mexican and Central American material. No jade has as yet been discovered in place in these countries, and many have thought that its presence and use there was an indication of ancient contacts between these peoples and the Orient. While this theory has been actively promulgated by many adherents, no definite proofs have as yet been forthcoming on either side.

Uses.—It is remarkable that men even from the earliest times, whether the prehistoric lake-dwellers of Europe, the ancient inhabitants of the valley of Mexico, the aborigines of north-west America, the natives of New Zealand, or the people of China, found small blocks or boulders of jade, of a wide variety and range of colour, but which they had the acumen to determine were of a hard, tough material suitable for axes and other utilitarian purposes, as well as for artistic uses. We know that there was prehistoric jade in the graves in China, and more would

have been found had there not been a sentiment against opening up the buried remains in that country. Later on jade was selected as a material possessing many of the most charming qualities of beauty, lustre and toughness, so that many thousands of pieces of jade, from the purest white and the palest green to a dark green, have been carved in the designs of many countries, pieces that in many cases have required years to make. As an example of the endless patience used in the execution of such pieces, there is a necklace of 100 links with a pendant, all of one unbroken piece in the American Museum of Natural History. And in the F. O. Mathieson bequest to the Metropolitan Museum of Art are four covered vases which open in the centre for fruits, the cover and lower part all of one unbroken piece.

The greatest rulers of the East have treated this stone with a reverence attributed to no other material. The poems of emperors have been recorded on tablets of jade and the great fish bowl in the Bishop collection, weighing 120 lb., has the poem of an emperor on its inner base. The respect and reverence placed in this stone is well deserved, and if the Chinese had all the articles that were originally in China, they would form a collection not rivalled by that of any other nation or by that of any other material.

Great masses of a wonderful material stained brown by contact with bodies, or stained brown to look as if they had been buried with bodies, is known as tomb jade. Some of it is believed to date back 20 centuries. The Chinese have obtained some of the most magnificent jade and frequently have spent as much as a year searching for a single piece. Some splendid examples of these may be seen in the Heber R. Bishop collection in the Metropolitan Museum of Art; the Johnson collection in Philadelphia, gifts in memory of Dr. George Byron Gordon. Other specimens are in the Boston Museum of Fine Arts, the British Museum, the Louvre and in Berlin, and many other places throughout the world.

Jade of different colours was used in China for the six precious tablets employed in the worship of heaven and earth and the four cardinal points. For the worship of heaven there was a dark-green round tablet, and for the earth an octagonal yellow tablet; the east was worshipped with a green pivoted tablet, the west with a white "tiger tablet," the north with a black semi-circular tablet, and the south with a tablet of red jade. The yellow girdles worn by the Chinese emperors of the Manchu dynasty were variously ornamented with precious stones, according to the different ceremonial observances at which the emperor presided. For the services in the temple of heaven, lapis lazuli was used; for the altar of earth, yellow jade; for a sacrifice, at the altar of the sun, red coral; and for ceremonies before the altar of the moon, white jade.

Jade amulets of many different forms were popular with the Chinese, as were also rings, ear-rings and beads, but in general, jade was much more used for decorative pieces than for articles of personal adornment. While in other localities jade has been used extensively for axes, adzes, knives and other purely utilitarian objects, for which its hardness and toughness make it peculiarly applicable, the reverence with which the stone was held in China seems to have precluded its use in such fashion, and the purely utilitarian is almost entirely absent in the Chinese uses; here the ornamental features greatly predominate, and where the utilitarian features do come in, it is usually in a vase, cup, plate or bowl, or some similar object, in which beauty may be combined with utility. It is possible that the pre-Chinese used jade for axes and celts but the later Chinese ornamented and recarved these.

The jade objects found in Mexico and Central America are frequently of a rich, almost emerald green colour, and there have been thousands of pieces found, from the smallest fragments to the great adze weighing 16 lb., which is now in the American Museum of Natural History. Much of the Mexican material has been used in religious ceremonies, but utilitarian and ornamental material is also found. The outstanding find of jade objects in Mexico was at the sacred well of Chitznitza in Yucatán, into which had been cast as votive offerings hundreds of pieces of jadeite. This valuable discovery was made by Dr.

E. H. Thompson of the Peabody Museum, who spent a lifetime in this region.

In New Zealand, where the most primitive methods held, jade was in high esteem among the Maori chiefs, who had their *patou-patous* (small axes which they held under the arm) perforated at the upper end and ornamented with jade. *Hei tikis*—crudely carved small human figures—were made of jade with narrow slant eyes of abalone shell, usually facing to the right, but occasionally to the left. These were worn as amulets and frequently handed down from one generation to another, as the material is almost indestructible.

Commercial Value.—Jade of medium colour cut into the form of bead necklaces sell as low as \$50, but exceptional quality commands correspondingly high prices. An emerald green *feitsui* necklace, 30 in. long, of 125 beads, weighing 304 carats (approximately 2 oz. Troy), with a centre bead $\frac{1}{2}$ in. in diameter, and end beads $\frac{1}{8}$ in. in diameter, commanded a price of \$80,000; larger necklaces have brought more than \$100,000. Exceptional pieces have been made into brooches at prices from \$1,000 to \$5,000. Ring stones cut cabochon on top sell at from \$100 to \$2,000 each. The thumb rings worn by the Chinese nobility frequently commanded over £1,000, and, it is claimed, even up to £2,000 for the ring which is a relic of the time when the archer drew his bow with a thumb ring of wood, horn, agate or jade. An exceptionally fine ring of this character was worn by the former ambassador to the United States, Wu Ting Fang; this ring had been originally worn on a larger hand, and had a lining of fine gold to fit it to the finger of the new wearer of the ring.

Minerals and Imitations Mistaken for Jade.—Under this heading we have three types of material to consider: those which through a close similarity to jade in colour, toughness and lustre may be mistaken for the true material; those which have been stained, coloured, or otherwise treated in order to enhance this similarity; and those that are purely and entirely artificial imitations. The natural minerals that resemble jade most closely are those having a similar chemical composition, *i.e.*, complex silicates, but various forms of pure quartz and a few other minerals also fall into this group. The determination of the hardness and specific gravity of the specimen is usually sufficient to differentiate between the true and false jade. Jadeite has a hardness of approximately 7.0 and a specific gravity of 3.2 to 3.4; nephrite has a hardness of 6.5 and a specific gravity of 2.9; very few other minerals show this particular combination of hardness and gravity.

Saussurite is probably the most important of these materials easily mistaken for true jade. It is a compact, tough, heavy mineral with a hardness and gravity almost identical with jadeite, and this makes the differentiation difficult. Next in point of resemblance is fibrolite, or sillimanite. Like saussurite it has the hardness and gravity of jadeite, but it is readily identified chemically, being a practically pure silicate of aluminium. The Alaskan natives have frequently used pectolite for jade. This has a gravity close to nephrite, but is much softer. Wollastonite, occasionally confused with jade, can be detected by its softness as compared with jade. A number of different varieties of feldspar sometimes resemble jade. These are also lower in gravity than jade, and most of them are lower in hardness. Chief among these are amazon-stone, eupholide, saccharite and labradorite.

Jadeite is classed chemically as a pyroxene, and in the same family of rocks are several other minerals quite similar to it, particularly omphacite and eclogite. These have the gravity of jadeite, but are softer. Diopside has the hardness of nephrite and the gravity of jadeite, but can be distinguished by the difference in cleavage. Nephrite is an amphibole rock, and in this group we find also actinolite closely resembling it, but differing in the texture of the fibrous structure.

Outstanding among the green minerals is the emerald, a green variety of beryl, and it is possible for an opaque emerald to be mistaken for jade, though it may be readily differentiated by its higher hardness, lower gravity, and the presence of beryllium in its composition.

One of the minerals that most frequently resembles jade, especially in the East, is a variety of serpentine known as bowen-

ite. This has both hardness and gravity higher than the average serpentine, but still lower than nephrite. It has a texture similar to that of jadeite, and where the colour was lacking, it has been stained in imitation. Antigorite and williamsite are translucent varieties of serpentine of a rich, green colour. Although the latter is much harder than the former, both are far softer than jade. Williamsite has an intense rich green colour.

A material recently placed on the market as South African jade is really a compact, translucent, green garnet. It is higher than jade in both gravity and hardness. Numerous forms of pure quartz may, by their colour and opacity be mistaken for jade, particularly prase, plasma, chrysoprase, jasper, aventurine and moss agate. All these have a lower gravity than jade, and a hardness equalled only by the hardest jadeite. The minerals most difficult to differentiate from jade are prehnite, epidote, vesuvianite and agalmatolite. Prehnite has the hardness of nephrite and a gravity close to the lower limit for nephrite; its colour is good, but it lacks lustre, and is more brittle than true jade. Epidote has the hardness of jade, and a gravity in the upper limits of the range for jadeite, from which it may be distinguished by its strong cleavage, a more vitreous lustre, and the presence of considerable iron in its composition. Vesuvianite has about the same hardness and gravity as epidote, and like it has a more vitreous lustre than jade; it is also more brittle, and has an uneven fracture. Another form of vesuvianite is named californite by the author. Agalmatolite is one of the minerals most frequently sold to the uninitiated in China, under misrepresentation as jade. It is readily detected, however, by its extreme softness, and less readily by its lower gravity. It has a compact, fine and homogeneous structure that makes it ideal for carving, but its colour is such that it is usually stained green in imitation of nephrite. It is stained in many other colours.

Under some conditions turquoise (a phosphate), malachite (a copper carbonate), and mosstote (a lime carbonate), may be mistaken for jade, but identification is simple in all cases by hardness, gravity and chemical composition.

China probably takes the lead over all other countries in the number of substances that have been mistaken, or substituted, for jade. This is due partly, particularly in earlier times, to lack of exact mineralogical information and technical methods of identification, and partly to the natural tendency toward substitution for, or imitation of, a highly prized and equally highly priced material. Prominent among these fabrications is the so-called pink jade, which, if truly pink, and not the pinkish-lavender characteristic of some Burmese jade, has always turned out on careful examination to be quartz, aniline dye absorbed into fine cracks and fissures in the material. This may be detected by rubbing the piece with cotton moistened in alcohol.

Another important type of fabricated material is made from a heavy lead glass, carefully tinted and most ingeniously polished to give the characteristic jade-like lustre by first giving a high polish and then deadening this to the desired degree by a fine hard powder. One form of this is made in imitation of the white and green "imperial jade" of China, and may be found in bracelets, ear-rings and other trinkets, in almost every Chinese shop. Another type is all green, in imitation of the Burmese jadeite, and another, known under the name of *pâte de riz*, is white with a faint bluish-green or bluish-grey tint. This same method of preparation of the surface has also been used on varieties of green quartz to simulate the lustre of jade.

Descriptive Literature.—Of all the Chinese works on jade the most interesting and most remarkable is the *Ku yü t'ou pu*, or *Illustrated Description of Ancient Jade*, a catalogue divided into 100 books and embellished with nearly 700 figures. It was published in 1176, and lists the magnificent collection of jade objects belonging to the first emperor of the Southern Sung dynasty. One of the treasures here described was a four-sided plaque of pure white jade, over 2 ft. in height and breadth. The design was a figure seated on a mat, with a flower vase on its left and an alms-bowl on its right, in the midst of rocks enveloped in clouds.

The most complete and modern descriptive work on jade is the catalogue of the H. R. Bishop collection of jade in the Metro-

politan Museum of Art. This is the most remarkable collection of jade in existence, and the two great volumes of the catalogue and accompanying descriptive matter fully match the collection itself in magnificence. The catalogue was illustrated by some of the greatest artists of the time. The volumes were not sold, but were distributed to libraries and museums here and abroad, to a few royal personages, and to several of Mr. Bishop's relatives. The author of this article devoted 12 years of his leisure to the mineralogical studies and the guidance of the scientific study of the many experts whom he called upon to aid in this great work.

OTHER HARD STONES

Among the other hard stones that have been cut, engraved and polished along lines similar to jade are the various forms of quartz (rock crystal, agate, carnelian, chalcedony and jasper) and the softer but highly valued materials, such as malachite, fluorite, rhodonite and lapis lazuli. All of these materials lend themselves well to this type of treatment, and in fact, as has already been mentioned, many of them have in some form or other frequently been mistaken, or substituted, for jade.

Of all the hard stones, probably rock crystal and agate have been most used, and in a wide variety of forms. Crystal has been particularly popular in vases and other ornamental forms, and as crystal balls. The outstanding example of the latter form is a ball 30 in. in diameter, made from Burmese crystal, and finished in Japan.

Jasper (*q.v.*) found in Russia is not excelled by that of any other country. It has a grey, almost putty colour, and a texture of wonderful homogeneity. Of this material tables and other pieces are made which are unequalled by any other lapidary work in existence. Aventurine, a quartz containing brilliant scales of other coloured minerals, is found in the Ural mountains, and has been used in vases up to 6 ft. in height. Rhodonite (*q.v.*) is a member of the pyroxene group, the same family to which jadeite belongs; it is usually a beautiful rose or red colour, but is sometimes a light brown. The name rhodonite, from the Greek word *rhodon*, rose, suggests its colour. The mineral has been used as a gem, and for various types of ornamental objects; the sarcophagus of the Tsar Alexander II. was constructed from rhodonite found near Ekaterinburg (now Sverdlovsk). It is also found associated with manganese deposits in other parts of the world, its composition being manganese silicate. It has a hardness between 5 and 6, and a specific gravity of 3.5 to 3.6. It is slightly translucent, has little lustre, but takes a fairly good polish. Rhodonite was especially the imperial stone of Russia, and is there found in great masses.

One of the tsarinas of Russia wished an egg cut of pure rose rhodonite, without a streak of black in it, and one ton of this material was cut without finding a single piece large enough to cut the egg which did not have a streak of some kind in it.

It is strange that two great colours have been generally known and appreciated throughout the ages, one a royal blue and the other a royal green—lapis lazuli and malachite. Both of these being opaque, very wonderful pieces can be made from them, as they can be cut into thin sections, from $\frac{1}{8}$ to $\frac{1}{4}$ in. in thickness, and then strengthened by cementing them to a suitable backing, either slate or some material that does not contract or bend.

Lapis lazuli (*q.v.*) is one of the oldest of the gem materials, having been used for 6,000 years, and the supply has been continuous. During this entire period the chief sources of supply have been Persia and Afghanistan. It is sent to the markets in masses of from 1 to 5 lb. One mass of 160 lb. reached the United States several years ago, and another of 30 lb. was found in the Oxus river district of Afghanistan. One of the results of the visit to Europe of King Amanullah in 1928 was a grant to a German firm of a monopoly for the exportation of Afghan lapis lazuli.

Obsidian (*q.v.*), or volcanic glass, is found in great quantities in the Valley of Mexico. Some wonderful chipping, grinding and polishing has been done on this material. One of the best examples is the Father Fisher knife in the Blake collection in the National Museum in Washington—a knife 19 in. in length. Another fine example is a mask, almost the size of a human face.

Ornaments for the ear and for the lips were frequently made with the thinness of paper and polished exquisitely and carved in the centre. Mirrors 1 in. thick were made of this material, some of which may be seen in the American Museum of Natural History that are 15 by 12 inches.

Emeralds (*q.v.*) were looted and mined in great quantities by the Spanish when they invaded Peru; these stones were also brought from the mines of the United States of Colombia. Five cases are believed to have been lost at sea. Large assignments were shipped to Spain and then sold in Paris. The more perfect stones were kept by the Spanish and French and the rest were shipped to India, Persia and Turkey, where the natives engraved them to hide the flaws. For many centuries they were known, and still are, as Indian emeralds. It is quite possible that these sustained the expense of the great traveller, Tavernier, who took many of these to India where he traded them for rubies from the Burmese mines and then sold the rubies in Europe. Louis XIV. is said also to have financed him. Some of these—very large ones—were found when the British captured King Thebaw's palace at Rangoon and they are now in the Indian museum at London. Several hexagonal sections of the crystal were used, over three inches. There is hardly an Indian, Persian or Turkish ruler who does not possess some of these emeralds even to the present day, and frequently an encabochon unengraved emerald is worn in one ear and an encabochon ruby in the other ear. These emeralds must have been sent to Turkey and Russia eastward by the thousands and it is very possible that Tavernier is responsible for the placing of many of them, and the great quantity that he had made his great trip possible. Among the Russian crown jewels and in some of the jewels of the Ourejene, Kremlin, and the treasury of the bishops are many fine emeralds, one of which the writer saw which was more than an inch across and excellent in colour. (See also JADE, GEMS, JEWELLERY.)

JAEGER, in ornithology, the name given in North America to several of the skuas (*q.v.*).

JAEN, an inland province of southern Spain, formed in 1833 of districts belonging to Andalusia; bounded on the north by Ciudad Real and Albacete, east by Albacete and Granada, south by Granada, and west by Cordova. Pop. (1920), 592,297; area, 5,848 sq.m. Jaen comprises the upper basin of the river Guadalquivir. The Sierra Morena, which divides Andalusia from New Castile, extends along the northern half of the province, its most prominent ridges being the Loma de Chiclana and the Loma de Ubeda; the Sierras de Segura, in the east, derive their name from the river Segura, which rises just within the border; and between the last-named watershed, its continuation the Sierra del Pozo, and the parallel Sierra de Cazorla, is the source of the Guadal-

quivir. The loftiest summits in the province are those of the Sierra Magina (7,103 ft.).

In a region which varies so markedly in the altitude of its surface, the climate is naturally unequal; and, while the bleak, wind-swept highlands are available only as sheep-walks, the well-watered and fertile valleys favour the cultivation of the vine, the olive and all kinds of cereals. The mineral wealth of Jaen has been known since Roman times, and mining is an important industry, with its centre at Lináres. Lead chiefly, but also iron, copper and salt are obtained. There is some trade in sawn timber and cloth; esparto fabrics, alcohol and oil are manufactured. The main line Madrid-Cordova-Seville is joined south of Lináres by two important railways—from Algeciras and Malaga on the south-west, and from Almería on the south-east. The eastern half of Jaen is inaccessible by rail. In the western half are Jaen (*q.v.*), the capital, with Andujar, pop. (1920) 17,950, Baeza 15,326, Bailen 8,998, Lináres 40,010, Martos 19,833 and Ubeda 22,988.

JAEN, the capital of the Spanish province of Jaen, on the Linares-Puente Genil railway, 1,500 ft. above the sea. Pop. (1920), 33,444. Jaen is finely situated on the well-wooded northern slopes of the Jabalcuz Mountains, overlooking the valleys of the Jaen and Guadalbullon rivers, which flow north into the Guadalquivir. The hillside upon which the narrow and irregular city streets rise in terraces is fortified with Moorish walls and a Moorish citadel. After the Moorish conquest the town became an important commercial centre with the name *Jayyan*. Jaen is an episcopal see. Its cathedral was founded in 1532; and, although it remained unfinished until late in the 18th century, its main characteristics are those of the Renaissance period. The identification, sometimes suggested, of Jaen with the Roman Aurinx, is most questionable.

JAFARABAD, state of India, in the Western India States agency, Kathiawar, Bombay, forming part of the territory of the nawab of Janjira; area, 53 sq.m.; pop. (1921), 10,996. The town of Jafarabad (pop. 5,230), situated on the estuary of a river, carries on a coasting trade.

JAFFA: see JOPPA.

JAFFNA (native Yalpannan), a town of Ceylon, at the northern extremity of the island. Pop. (1921) 42,436. It was occupied by the Tamils about 204 B.C., and there continued to be Tamil rajahs of Jaffna till 1617, when the Portuguese took possession of the place. As early as 1544 missionaries under Francis Xavier had made converts in this part of Ceylon, and after the conquest the Portuguese maintained their proselytizing zeal. They had a Jesuit college, a Franciscan and a Dominican monastery. The Dutch drove out the Portuguese in 1658. The European section still has Dutch associations. Several of the church buildings date from the time of the Portuguese. The natives grow palmyras freely, and have a trade in the fibre of this palm. They also grow and export tobacco, but not enough rice for their own requirements.

JÄGER, GUSTAV (1832-1917), German naturalist and hygienist, was born at Bürg, Württemberg, on June 23, 1832. After studying medicine at Tübingen he became a teacher of zoology at Vienna. In 1867 he was appointed professor of zoology at the academy of Hohenheim, and subsequently he became teacher of zoology and anthropology at Stuttgart polytechnic and professor of physiology at the veterinary school. In 1884 he abandoned teaching and started practice in Stuttgart. In 1876 he anticipated Weismann's germ-plasm theory by suggesting that the germinal protoplasm retains its specific properties from generation to generation, dividing in each reproduction into an ontogenetic portion, from which the individual arises, and a phylogenetic portion, reserved to form its reproductive material. In *Die Normalkleidung, als Gesundheitsschutz* (1880, 4th ed. 1885), he advocated the system of clothing associated with his name, objecting especially to the use of vegetable fibre for clothes. He died at Stuttgart on May 14, 1917.

Jäger's other works include: *Die Darwinsche Theorie* (1869), *Lehrbuch der allgemeinen Zoologie* (1871-78), and *Die Entdeckung der Seele* (1878); *Selbstarznei im Heilmagnetismus* (1908) and *Leben im Wasser* (3rd ed. 1908).

JÄGERNDORF: see KRNÖV.

JAGERSFONTEIN, a town in South Africa, 29° 42' S., 25° 25' E. Pop. (1921), 1,742 whites, 2,345 non-Europeans. The town is situated about 4,500 ft. above sea-level, and owes its existence to the most important diamond mine in the Orange Free State. The mine was originated in 1870, and produces stones of fine quality. Here were found the "Excelsior" (971 carats), and the "Jubilee." (See DIAMONDS.)

JAGO, RICHARD (1715–1781), English poet, son of Richard Jago, rector of Beaudesert, Warwickshire, was born on Oct. 1, 1715, and educated at University college, Oxford. After holding various preferments, he died at Smitherfield May 8, 1781.

See the edition of his poems in Chalmers's *English Poets*, vol. xvii.

JAGOW, GOTTLIEB VON (1863–), German Foreign secretary at the outbreak of the World War, was born on June 22, 1863 in Berlin. He entered the diplomatic service in 1895 and after having been Prussian minister at Munich, German ambassador at Rome and German minister at The Hague, was appointed in 1913 foreign secretary. He played an active part in the negotiations preceding the outbreak of the World War, and was, in particular, concerned in the German relations with Austria, having been the first member of the Imperial Government in Berlin to become acquainted with the terms of the Austrian ultimatum to Serbia. He wrote a defence of German policy entitled *Ursachen und Ausbruch des Weltkrieges* (1919).

JAGUA: see CIENFUEGOS.

JAGUAR (*Felis onca*), the largest species of the *Felidae* on the American continent, where it ranges from Texas through Central and South America to Patagonia. In the countries which bound its northern limit it is not frequently met with, but in South America it is quite common. The jaguar is usually found singly and preys upon such quadrupeds as the horse, tapir, capybara, dogs, or cattle. Occasionally the jaguar becomes a man-eater. The cry of this great cat, which is heard at night, and most frequently during the pairing season, is deep and hoarse. Towards the close of the year the female brings forth from two to four cubs which are able to follow their mother in about 15 days after birth. The ground colour of the jaguar varies greatly, ranging from white to black, these extremes being, however, definite spots. The typical coloration is a rich tan upon the head, neck, body, outside of legs and tail near the root, marked, except towards the end of the tail, which is ringed, with black spots, arranged in rosettes with a black spot in the centre (unlike the leopard). The nose and upper lip are light rufous brown. The average length is about 4ft. from nose to root of tail. The jaguar is thick-set; it does not stand high upon its legs and in comparison with the leopard is heavily built; but its movements are rapid, and it is fully as agile as its more graceful relative. There are a number of local races in various parts of its range.

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

JAGUAR, AN AMERICAN WILDCAT

JAGUARONDI or **YAGUARONDI** (*Felis jaguarondi*), a South American wild cat, found in Brazil, Paraguay, and Guiana, ranging to north-eastern Mexico. This small cat is generally brownish-grey, but in some individuals the fur has a rufous coat, while in others grey predominates. The names jaguarondi and eyra are applied indifferently to this species and *Felis eyra*.

JAHANGIR or **JEHANGIR** (1569–1627), Mogul emperor of Delhi, succeeded his father Akbar the Great in 1605. His name was Salim, but he assumed the title of Jahangir, "Conqueror of the World," on his accession. During his father's Deccan campaign of 1598–99, he had meditated rebellion, but in 1604 they were reconciled, the son being made viceroy of southern and western India and allowed to live in Agra as heir apparent. After his enthronement on Oct. 24, 1605, Jahangir won a certain amount of popularity by declaring himself a Muslim, but his zeal soon waned, and his natural scepticism manifested itself in his indifferent toleration both of Christians and Hindus. In 1606, his son, the popular prince Khusru, attempted rebellion

with the result that some 300 of his supporters were brutally put to death and he himself blinded and imprisoned until 1622 when he was strangled by order of his brother Prince Khurram. Jahangir succeeded in keeping under control the rana of Udaipur, Malik Amber the vizier of the Nizam Shah in the Deccan, and the rebels of Bengal, though in 1622 he lost Kandahar to the Shah of Persia. The rebellion of his son Shahjahan in 1624 was patched up by an apparent reconciliation in the following year.

In spite of opposition from the Portuguese, the missions of the Englishmen, William Hawkins, William Edwards, and the ambassador, Sir Thomas Roe, led to the emperor's sanction of English trade at Surat. Though possessed of many natural abilities and a lover of art and literature, Jahangir was a dissolute, capricious and tyrannical ruler who gradually allowed his Persian wife, Nur Jahan, to secure the reins of government and thereby to satisfy the interests of her relatives and her own thirst for gold. He died while returning from Kashmir in Oct. 1627, and is buried in the gardens of Shahdera on the outskirts of Lahore.

The best editions of his *Memoirs*, which were either written by himself or dictated to a scribe, appeared at Ghazipur in 1863 and at Aligarh in 1864 (Eng. trans. by Rogers and Beveridge, 2 vols., 1909–14). See also *Jahangir's India*, a translation from the Dutch of F. Pelsaert by W. H. Moreland (1925) and bibliography in W. A. Smith's *Oxford History of India* (2nd ed., 1923).

JĀHĪZ (ABŪ 'UTHMĀN 'AMR IBN BAHR UL-JĀHĪZ; i.e., "the man the pupils of whose eyes are prominent") (d. 1869), Arabian writer, spent his life in Basra where he devoted himself chiefly to the study of polite literature. A Mu'tazilite in his religious beliefs, he developed a system of his own and founded a sect named after him. He was favoured by Ibn uz-Zaiyāt, the vizier of the caliph Wāthiq.

His work, the *Kitāb ul-Bayān wat-Tabyīn*, a discursive treatise on rhetoric, appeared in 2 vols. at Cairo (1895). The *Kitāb ul-Mahāsīn wal-Addād* was edited by G. van Vloten as *Le Livre des beautés* (Leiden, 1898); the *Kitāb ul-Bu-halā*, *Le Livre des avarices*, ed. by the same (Leiden, 1900); two other smaller works, the *Excellences of the Turks* and the *Superiority in Glory of the Blacks over the Whites*, also prepared by the same. The *Kitāb ul-Hayawān*, or "Book of Animals," a philological and literary work, was published at Cairo (1906).

(G. W. T.)

JAHN, FRIEDRICH LUDWIG (1778–1852), German pedagogue and patriot, commonly called *Turnvater* ("Father of Gymnastics"), was born in Lanz on Aug. 11, 1778. He studied theology and philology from 1796 to 1802 at Halle, Göttingen and Greifswald. After Jena he joined the Prussian army. In 1809 he went to Berlin, where he became a teacher at the Gymnasium zum Grauen as well as at the Plamann School. Brooding upon the humiliation of his native land by Napoleon, he conceived the idea of restoring the morale of his countrymen by the development of their physical and moral powers through the practice of gymnastics. The first *Turnplatz*, or open-air gymnasium, was opened by him at Berlin in 1811, the young gymnasts being taught to regard themselves as members of a kind of guild for the emancipation of their fatherland. In 1813 he took an active part at Breslau in the formation of the famous corps of Lützow, a battalion of which he commanded, though during the same period he was often employed in secret service. After the war he returned to Berlin, where he was appointed state teacher of gymnastics. As such he was a leader in the formation of the student *Burschenschaften* (patriotic fraternities) in Jena.

A man of democratic nature, rugged, honest, eccentric and outspoken, Jahn often came into collision with the reactionary spirit of the time, and in 1819 the *Turnplatz* was closed and Jahn was arrested. He was detained at the fortress of Kolberg until 1824, and sentenced to imprisonment for two years; but this sentence was reversed in 1825, though he was forbidden to live within ten miles of Berlin. He settled at Freyburg on the Unstrut, where he remained until his death (Oct. 15, 1852), with the exception of a short period in 1828, when he was exiled to Cölleda on a charge of sedition. In 1840 he was decorated by the Prussian government with the Iron Cross for bravery in the wars against Napoleon. In the spring of 1848 he was elected by the district of Naumburg to the German national parliament.

Among his works are: *Bereicherung des hochdeutschen Sprach-*

schatzes (Leipzig, 1806), *Deutsches Volksthum* (Lübeck, 1810), *Runenblätter* (Frankfurt, 1814), *Neue Runenblätter* (Naumburg, 1828), *Merke zum deutschen Volksthum* (Hildburghausen 1833), and *Selbstvertheidigung* (Vindication) (Leipzig, 1863). A complete edition of his works appeared at Hof in 1884-87. See the biography by Schultheiss (Berlin, 1894), and *Jahn als Erzieher*, by Friedrich (Munich, 1895).

JAHN, JOHANN (1750-1816), German Orientalist, was born at Tasswitz, Moravia, on June 18, 1750. He studied philosophy at Olmütz, and in 1772 began his theological studies at the Premonstratensian convent of Bruck, near Znaim, where, after a short interval, he became professor of Oriental languages and biblical hermeneutics. On the suppression of the convent by Joseph II. in 1784, Jahn took up similar work at Olmütz, and in 1789 he was transferred to Vienna as professor of Oriental languages, biblical archaeology and dogmatics. His *Einleitung ins Alte Testament* (2 vols., 1792), rendered him suspect to the cardinal-archbishop of Vienna who laid a complaint against him for having departed from the traditional teaching of the Church, e.g., by asserting Job, Jonah, Tobit and Judith to be didactic poems, and the cases of demoniacal possession in the New Testament to be cases of dangerous disease. An ecclesiastical commission reported that the views themselves were not necessarily heretical, but he was advised to modify his expressions in future. At last (1806) he was compelled to resign his chair and to accept a canonry at St. Stephen's, Vienna. Both his *Introductio in libros sacros veteris foederis in compendium redacta* (1804) and his *Archaeologia biblica in compendium redacta* (1805) were condemned. He died on Aug. 16, 1816.

He also published *Hebräische Sprachlehre für Anfänger* (1792); *Aramäische od. Chaldäische u. Syrische Sprachlehre für Anfänger* (1793); *Arabische Sprachlehre* (1796); *Elementarbuch der hebr. Sprache* (1799); *Chaldäische Chrestomathie* (1800); *Arabische Chrestomathie* (1802); *Lexicon arabico-latium chrestomathiae accommodatum* (1802); an edition of the Hebrew Bible (1806); *Grammatica linguae hebraicae* (1809); *Enchiridion Hermeneuticae* (1812); and a critical commentary on the Messianic passages of the Old Testament (*Vaticinia prophetarum de Jesu Messia*, 1815). The English translation of the *Archaeologia* by T. C. Upham (1840) passed through several editions.

JAHN, OTTO (1813-1869), German archaeologist, philologist, and writer on art and music, was born at Kiel on June 16, 1813. He was professor of archaeology at Greifswald, and then at Leipzig, but was dismissed (1851) from the Leipzig chair for political reasons. He was then director of the art museum at Bonn, and in 1867 was appointed to a chair in Berlin. He died at Göttingen, on Sept. 9, 1869. Jahn wrote many books on Greek art, and prepared editions of various classical authors. Of his works on musical history the most important is his *Biographie Mozarts* (3rd ed. by H. Distert, 1889-1891; Eng. trans. by P. D. Townsend, 1891).

JAHNUM, a town of Persia in the province of Fars, about 90 miles S.E. of Shiraz. The neighbourhood is celebrated for its dates, which are exported in great quantities; it also produces much tobacco and fruit. The water supply depends on wells. It has a population of about 15,000.

JAI-ALAI, the national Spanish ball game, a combination of three games, tennis, handball and lacrosse, originated in the Basque country of Spain in the 17th century. The terrific speed of the game calls for great strength, endurance, skill and dexterity. Eight balls about as large as baseballs are used in a game. The balls are thrown and caught with a *cesta* (basket) fastened to a glove worn by each player.

JAINS, an important sect of dissenters from Hinduism, whose wealth gives them greater influence than their numbers, only 1,178,596 in 1921. Being generally traders they are found in most Indian cities, especially in those of Mewār, Guzerāt and the upper Malabār coast. Their religious centres are Mt. Abu in Rājputāna, Gīrnār and Satrunjāya, "one of the loveliest temple cities of the world," and Ellora. Jainism is at least as old as Buddhism, the canons of the latter referring to it as a rival sect, the *Nirgrantha*, (Skt. "free from bonds").

Vardhamana Mahāvira, their last leader, is identifiable on strong grounds with Nigantha Nata-putta (Nirgrantha of the Jnatrika clan) of the Buddhist *Pitakas* and Buddha's contemporary. But Jain tradition claims a far greater antiquity, averring that Mahā-

vira was preceded by 23 Tirthankaras or saints who have attained *nirvāna* and are also called *Jinas*, "conquerors" or leaders of schools of thought, whence the term "Jain." But how far these were historical personalities is open to grave doubt. The first, Rishabha, depicted as a golden bull, is probably mythical. The 23rd, Parshva ("a snake, and blue"), has better claims to have founded the sect some 250 years before Mahāvira. The Tirthankaras, though without care for or influence on the world, are

FROM RUSSEL "TRIBES AND CASTES OF THE CENTRAL PROVINCES OF INDIA"

JAIN ASCETICS. CLOTH COVERING MOUTHS, WITH SWEEPING BRUSHES

worshipped as gods (*devas*), the three mentioned being specially affected, while Nemi or Aristanemi, Parshva's predecessor (a black conch) also has many temples. Nemi is indeed related to Krishna in legend and this may indicate that he too is purely mythical. Mahāvira, on the other hand, is said to have been a Kshatriya (like all the rest of the 24 Jinas) of Vaishali, 27m. north of Patna; brought up as a pious Jain he became a monk who discarded clothing; and after instructing 11 disciples he died at Pava (confirmed by Buddhist canons) aged 72, probably in 476 or 477 B.C.

It appears, then, safe to regard the nucleus of the sect as a strict monastic order, which eschewed ownership of everything mundane, even garments, as the Digambara ascetic does still when feasible. But Jain history has suffered much from schism. Still some facts may be regarded as ascertained. About 317 B.C. under Bhadrabāhu, Jainism expanded vigorously in north and north-west India, and good proof of this is that the language of the canons, redacted about A.D. 600 (though the Digambaras deny their authenticity), was old Magadhi (the tongue of south Behār). While it is doubtful if Samprati, a grandson of Asoka, was the first patron King of the Jains, inscriptions show that the Jains were powerful in Orissa in the 2nd century B.C., and during the 1st at Mathura.

At an early stage, however, schisms had weakened the sect. Mahāvira was succeeded by patriarchs. But we have two distinct lines of them. According to the Digambaras, in the time of Bhadrabāhu arose the Ardhaphālakas, an order of laxer principles, which in A.D. 80 developed into the Svetāmbaras, so called because they wear "white" clothes. The Svetāmbaras however claim to be the original order, and aver that the Digambaras originated in an heretical sect called Botika, three years later. Both orders agree that Bhadrabāhu was the 6th patriarch, but the Digambaras claim that he led the true monks to the south, accompanied by Chandragupta Maurya, who had abdicated his throne. The truth may be that Chandragupta was deposed and exiled, but he was eclectic in his beliefs and can only have embraced Jainism late in life. Since this exodus the Digambaras have been strongest in the south. In the north the Svetāmbara patriarchs each set up his own *gachchha* or "school of thought"; among them the Upakesa, followed by the Oswāl Jains. About 1125 the conversion of the powerful King of Guzerāt, Siddharāja, gave the Jains their first historical royal patron, and under that dynasty they established their strong position in the west. The two orders differ little in theology, but, if we except the Svetāmbara canons, the Digambara have the older literature, mostly in Sanskrit. They deny that women can attain *nirvāna*.

Jainism may be described as lacking an absolute Godhead. Sharing in the theoretical pessimism of the Buddhist, Sankhya and Yoga philosophies, it aims in practice at the goal of liberation from the transmigration of the soul. Matter exists, but only as something which may become anything. Being is indefinite, yet complex, not simple: a thesis upheld by a subtle dialectic. All substances are divided, broadly, into lifeless things, and souls or lives (*jiva*). The former may become anything, whence the ele-

ments are bodies of souls in the lowest stage of development. But souls, though substances, are not matter: yet they are capable of expansion, indestructible and characterized by intelligence which can never be annihilated. And they are of two kinds, mundane and liberated; the former still subject to the Birth Cycle, the latter disembodied for ever. Into the mundane soul pours subtle matter, ready to be transformed into *karma*, of eight kinds, and combining almost chemically with the soul it forms a subtle body which, clinging to it, determines its state and lot. Having done its work every *karma* is purged off from the soul until it is light enough to ascend to the top of the universe. But in actual life fresh *karma* tends to replace those eliminated, and then the soul must at death enter a new body. Moreover, the soul has transcendental colours, three good and three bad, indicating its character, and the soul itself may enter five stages, according as *karma* is neutralized, annihilated or partly one or the other. There are as many vows, first of which comes that "not to kill." This leads to a remarkable care to preserve all living things, and in strict practice the mouth should be covered with a cloth, lest the air be injured. Vermin must be removed, not killed, a Jain house being kept scrupulously clean. Monastic discipline is intense, and is not confined to bodily restraints, chastity, abstinence from alcohol, flesh, honey and roots, but includes mental discipline, purity of thought, contemplation, confession and repentance. The strength of Jainism lies in its association of the laity in these principles to a degree compatible with secular pursuits. A layman may make vows, after he has made sufficient progress, without entering an order or taking its full obligations upon him. While suicide is a sin, both ascetics and laymen may hasten death by voluntary starvation, though to the latter this is only permissible in old age. The weakness of Jainism is that it is essentially a creed of a cultivated class, from which the masses are excluded. Its stability is due to its recognition of lay co-partnership in spirituality, and though many minor schools weakened the Jain solidarity, only one new movement threatened to destroy it. At the close of the 15th century Lonka Sha denounced idol-worship and founded the Dhundhia ("Searchers") or Sthānakavāsi sect, which in turn split up into several sub-sects.

The Jain literature is vast, but only a fraction of it has been published. The Digambaras say that most of the older has been lost, and the Svetāmbaras have only preserved a part of theirs. Books are strictly safeguarded and some may be concealed. In architecture the Jains excel, and though Buddhist models were adopted in *stupas* and cave-temples, they carried the art of carving in stone to the highest point. Under Brahman influence Ajāyapala (A.D. 1174-76) is said to have destroyed many fanes in Delhi and the north, but more were pillaged by the Muslims to furnish materials for mosques. To save their temples from desecration the Jains often made miniatures of Mohammedan tombs in them, and blended their style with Moghul features. In the south the original characteristics were kept more intact. The temple courtyards contain colossi of the Digambara saint, Gomata or Gomateshvara, and those in Kanara, with their reversed eaves, recall those of Nepal.

JAINTIA HILLS. A mountainous region which with the Khasi Hills forms one of the districts of British India in the Hills division of Assam. (See KHASI and JAINTIA HILLS.)

JAIPUR, an Indian state in the Rajputana agency; area 15,579 sq.m.; pop. (1921) 2,338,802. The centre of the state is a sandy and barren plain 1,600 ft. above sea-level, bounded on the east by ranges of hills running north and south. On the north and west it is bounded by a broken chain of hills, an offshoot of the Aravalli mountains, beyond which lies the Rajputana desert. The hills are more or less covered with jungle trees, of no value except for fuel. Towards the south and east the soil becomes more fertile. Salt is largely manufactured from the Sambhar lake (q.v.). The maharaja of Jaipur belongs to the Kachwaha clan of Rajputs, claiming descent from Rama, king of Ajodhya. The state is said to have been founded about 1128 by Dulha Rai, from Gwalior, who with his Kachwahs is said to have absorbed or driven out the petty chiefs. The Jaipur house furnished to the Moguls some of their most distinguished generals. Among them were Man Singh,

who fought in Orissa and Assam; Jai Singh, commonly known by his imperial title of Mirza Raja, whose name appears in all the wars of Aurangzeb in the Deccan; and Jai Singh II., or Sawai Jai Singh, the famous mathematician and astronomer, and the founder of Jaipur city. Towards the end of the 18th century the state was in great confusion; there was a constant rivalry between Jaipur and Jodhpur for the honour of marrying a princess of Udaipur, and at the same time Amir Khan with the Pindaris was exhausting the country. By a treaty in 1818 the protection of the British was extended to Jaipur and an annual tribute fixed. During the Mutiny the maharaja assisted the British and was rewarded by an extension of territory. His adopted son and successor, Maharaja Madho Singh, was a type of the old school of orthodox rajput chiefs; when he went to England for King Edward's coronation, he chartered his own ship and took not only all the food and water that would be required during his stay out of India, but even the plot of Indian earth on which he could sit for his meals. In his time the state was opened up by railways, and the city greatly improved. It was also he who took a lead in establishing the "Indian People's Famine Fund," to which he and his maharani contributed in all 25 lakhs of rupees (£167,000). The present maharaja is a minor; the salute is 17 guns. The state maintains a transport corps, with an ambulance section, which saw service on the frontier, in Afghanistan, and in Mesopotamia during the World War.

Jaipur City was founded in 1728 by the warrior-astronomer, Maharaja Jai Singh II. It is well laid out and lighted, with wide (111 feet) and regular main streets which divide it into six rectangular blocks; it is also a city of colour, as the houses are painted, and the whole town is surrounded by crenellated walls, overhung by rugged hills crowned with forts. The chief buildings are the maharaja's huge palace in the middle of the city; a remarkable open-air observatory erected by Jai Singh; a college where no fees are charged; a public library and a hospital; and a School of Art, for teaching and perfecting the local artistic industries. There is also a fine public garden with a menagerie. The city is a busy and prosperous commercial centre; its trades comprise jewel cutting and setting, as a variety of precious stones are found locally; enamel and metal work; the colour printing of cloths and muslins; and the treatment of marble and inlay. Pop. 120,207 in 1921. The ancient capital of Jaipur was Amber (q.v.).

JAISALMER, an Indian state in the Rajputana agency. Its area is 16,062 sq.m.; and in 1921 the population was 67,652. Jaisalmer is almost entirely a sandy waste, forming a part of the great Indian desert (q.v.). The general aspect of the country is that of an interminable sea of sandhills, of all shapes and sizes, some rising to a height of 150 ft. There are no perennial streams, and only one small river, the Kakni, which, after flowing a distance of 28 m., spreads over a large surface of flat ground, and forms a lake or *jhil* called the Bhuj-Jhil. The climate is dry and healthy. Throughout Jaisalmer only the poorer rain-crops are grown; spring crops of wheat, barley, etc., are very rare. The main part of the population lead a wandering life, grazing their flocks and herds. Large herds of camels, horned cattle, sheep and goats are kept. The principal trade is in wool, *ghi*, camels, cattle and sheep. The capital is a small town, famed for its yellowish sandstone buildings, its Jain temples and a fine fort. The ruler has the style of Maharawal, and a salute of 15 guns.

The majority of the inhabitants are Bhatti Rajputs, who take their name from an ancestor named Bhatti, renowned as a warrior before the tribe were driven from the Punjab into this oasis in the Great desert. Deoraj, a famous prince of the Bhatti family, is esteemed the real founder of the present Jaisalmer dynasty, and with him the title of *rawal* commenced. In 1156 Jaisal, the sixth in succession from Deoraj, founded the fort and city of Jaisalmer, and made it his capital. It was sacked by the emperor Ala-ud-din after an eight years' siege; ultimately, in the time of Rawal Sabal Singh the clan had to accept the supremacy of the Mogul emperor Shah Jahan. The Jaisalmer princes had now arrived at the height of their power, but from this time till the accession of Rawal Mulraj in 1762 the fortunes of the state rapidly declined, and

most of its outlying provinces were lost. In 1818 Mulraj entered into political relations with the British, and some of the territory which had been lost in the previous century was restored after the conquest of Sindh.

JAJCE, a town of Bosnia, Yugoslavia. Pop. (1921) 4,132. Jajce occupies a conical hill, overlooking one of the finest waterfalls in Europe, where the Pliva rushes down into the Vrbas, 100 ft. below. The 14th century citadel which crowns the hill is said to have been built for Hrvoje, duke of Split (*Spalato*). The ruined church of St. Luke, the legendary burial place of the Evangelist, has a fine Italian belfry, and dates from the 15th century. Jezero, 5 m. W. of Jajce, contains the Turkish fort of Djöl-Hissar or the "Lake Fort." Here a line of waterfalls and meres formed by the Pliva stretches for several miles, enclosed by steep rocks and forest-clad mountains. Chemicals form the principal industry and the power supplied by the main fall, at Jajce, is used for the calcium carbide works which are the largest in Europe, but the beauty of the town remains unimpaired.

From 1463 to 1528 Jajce was the principal outwork of eastern Christendom against the Turks. Venice contributed money for its defence, and Hungary provided armies; while the pope entreated all Christian monarchs to avert its fall. In 1463 Mohammed II. seized Jajce, and beheaded the last king of Bosnia under its walls, in a field still called "The King's Field." His coffin and skeleton are preserved in St. Luke's church. In 1463 the Hungarians recovered the town and held it till the battle of Mohacs in 1526 destroyed their power. Two years later Jajce surrendered, and remained Turkish until the Austrian occupation (1908-18), when, at the close of the World War, Bosnia was incorporated in the kingdom of Yugoslavia.

See Bräss, *Jajce, die alte Königstadt Bosniens*, in *Deutsche Geog. Blätter* (Bremen, 1899).

JAJPUR, a town of British India, in Cuttack district, Behar and Orissa, situated on the right bank of the Baitarani river. Pop. (1921) 11,015. It was the capital of Orissa some time prior to the 11th century, when it was superseded by Cuttack. A monolithic shaft, called the Chandeswar pillar, standing 20 ft. high, dates back to the 5th century A.D. A stone bridge, 240 ft. long, with 11 spans is another monument of the Hindu kings, to whom also may be ascribed some of the many temples.

JAKOVA (also written *Diakovo*, *Gyakovo* and *Gjakovica*), the largest town in Montenegro, Yugoslavia. Pop. (1921) 12,724. almost entirely Muslim Albanians. It is a miserable, badly-paved town, lying in a fertile plain surrounded by wild, wooded mountains. Its inaccessibility and the lawlessness of its inhabitants protect it from the inroads of civilization, the only good approach being by the road from Prizren to Ipek. With improved communication Jakova would become an important market for agricultural produce. There is a carpet factory in the town, and iron is said to exist in the district. Jakova was captured by the Serbs in the Balkan Wars (1912-13) and ceded to Montenegro by the Treaty of Bucharest (1913).

JAKUN, a Proto-Malayan tribe of the Malay Peninsula, divided into the Orang Bukit or Hill Jakun and the Orang Laut or Sea Jakun. The former include sub-tribes such as Besisi, Badu-anda, Mantra, and the latter, including the Seletar among others, are akin to the Mawken tribe. They are largely nomadic, though some of the Orang Bukit practise a little agriculture, and hold a marriage carnival at harvest time. They smoke tobacco, chew betel, file their teeth to a point, do not circumcise, but practise a form of incision. The general weapon is the blow-gun; the spear, and sword or kris are also used. Their huts, built of leaves or bark and raised on piles, are small and flimsy; dug-out boats are used on the rivers. At tribal feasts they sing and dance in imitation of animals. They have chiefs (*batin*), bury their dead and erect a hut for the deceased's soul.

See Skeat and Blagden, *Pagan Races of the Malay Peninsula* (1906).

JALALABAD or **JELLALABAD**, a town and province of Afghanistan. The town lies at a height of 1,950 ft. in a plain on the south side of the Kabul river, 96 m. from Kabul and 76 from Peshawar. Estimated pop., 6,000. Between it and Peshawar

intervenes the Khyber pass, and between it and Kabul the passes of Jagdalak, Khurd Kabul, etc. The site was chosen by the emperor Baber, and he laid out some gardens here; but the town itself was built by his grandson Akbar in A.D. 1560. It resembles the city of Kabul on a smaller scale, and has one central bazaar, the streets generally being very narrow. The most notable episode in the history of the place is the famous defence by Sir Robert Sale during the first Afghan war, when he held the town from Nov. 1841 to April 1842. The town is now fortified, surrounded by a high wall with bastions and loopholes. The province of Jalalabad is about 80 m. in length by 35 in width, and includes the large district of Laghman north of the Kabul river, as well as that on the south called Ningrahar. The climate of Jalalabad is similar to that of Peshawar. It is one of the most important positions in Afghanistan, for it dominates the entrances to the Laghman and the Kunar valleys, commanding routes to Chitral or India north of the Khyber, as well as the Kabul-Peshawar road.

JALAP, a cathartic drug consisting of the tuberous roots of *Ipomaea purga*, a convolvulaceous plant growing on the eastern declivities of the Mexican Andes at an elevation of 5,000 ft. to 8,000 ft. above the level of the sea. The jalap plant has slender herbaceous twining stems, with alternately placed heart-shaped pointed leaves and salver-shaped deep purplish-pink flowers. The underground stems are slender and creeping; their vertical roots

FROM KOEHLER, "MEDIZINALE PFLANZEN"

JALAP, CULTIVATED IN MEXICO FOR THE MEDICINAL RESIN IT CONTAINS enlarge and form turnip-shaped tubers. The roots are dug up in Mexico throughout the year, and are suspended to dry in a net over the hearth of the Indians' huts, and hence acquire a smoky odour. The large tubers are often gashed to cause them to dry more quickly. In their form they vary from spindle-shaped to ovoid or globular, and in size from a pigeon's egg to a man's fist. Externally they are brown and marked with small transverse paler scars, and internally they present a dirty white resinous or starchy fracture. The ordinary drug is distinguished in commerce as *Vera Cruz jalap*, from the name of the port whence it is shipped.

Jalap has been cultivated for many years in India, chiefly at Ootacamund, and grows there as easily as a yam, often producing clusters of tubers weighing over 9 lb.; but these, as they differ in appearance from the commercial article, have not as yet obtained a place in the English market. They are found, however, to be rich in resin, containing 18%. In Jamaica also the plant has been grown, at first amongst the cinchona trees, but more recently in new ground, as it was found to exhaust the soil.

Besides Mexican or Vera Cruz jalap, a drug called Tampico jalap has been imported for some years in considerable quantity. It has a much more shrivelled appearance and paler colour than ordinary jalap, and lacks the small transverse scars present in the true drug. This kind of jalap, the Purga de Sierra Gorda of the Mexicans, was traced by Hanbury to *Ipomaea simulans*. It grows in Mexico along the mountain range of the Sierra Gorda in the neighbourhood of San Luis de la Paz, from which district it is carried down to Tampico, whence it is exported. A third variety of jalap known as woody jalap, male jalap or Orizaba root, or by the Mexicans as Purgo macho, is derived from *Ipomaea orizabensis*, a plant of Orizaba. The root occurs in fibrous pieces, which are usually rectangular blocks of irregular shape, 2 in. or more in diameter, and are evidently portions of a large root. It is only occasionally met with in commerce.

The dose of jalap is from five to 20 grains, the British Pharmacopœia directing that it must contain from 9 to 11% of the resin, which is given in doses of two to five grains. One preparation of this drug is in common use, the *Pulvis jalapae compositus*, which consists of 5 parts of jalap, 9 of cream of tartar and 1 of ginger. The dose is from 20 grains to a dram. It is best given in the maximum dose which causes the minimum of irritation.

The chief constituents of jalap resin are two glucosides—*convolvulin* and *jalapin*—sugar, starch and gum. Convolvulin constitutes nearly 20% of the resin. It is insoluble in ether, and is more active than jalapin. It is not used separately in medicine. Jalapin is present in about the same proportions. It dissolves readily in ether, and has a soft resinous consistence. It may be given in half-grain doses. It is the active principle of the allied drug *scammony*. According to Mayer, the formula of convolvulin is $C_{34}H_{50}O_{16}$, and that of jalapin $C_{31}H_{50}O_{16}$.

Jalap is a typical hydragogue purgative, causing the excretion of more fluid than scammony, but producing less stimulation of the muscular wall of the bowel. For both reasons it is preferable to scammony. It is a powerful cholagogue, an action possessed by few hydragogue purgatives. The drug is largely employed in dropsy from any cause, being especially useful when the liver shares in the general venous congestion. It is not much used in ordinary constipation.

JALAPA (or **JALAPA ENRÍQUEZ**), a city of Mexico and capital of the State of Veracruz, 70 m. by rail N.W. of the port of Veracruz. Pop. (1921) 27,623. It is picturesquely situated on the slopes of the sierra which separates the central plateau from the *tierra caliente* of the gulf coast, at an elevation of 4,300 ft., and with the Cofre de Perote behind it rising to a height of 13,419 feet. Its climate is cool and healthy and the town is frequented in the hot season by the wealthier residents of Veracruz. The city is well built, in the old Spanish style. Among its public buildings are a fine old church, a Franciscan convent founded by Cortés in 1556, and three hospitals, one of which, that of San Juan de Dios, dates from colonial times.

JALAUN, a town and district of British India, in the Allahabad division of the United Provinces. Pop. of town (1921), 7,324. Formerly it was the residence of a Mahratta governor, but never the headquarters of the district, which are at Orai, an equally insignificant village (pop. 8,914).

The DISTRICT OF JALAUN has an area of 1,549 sq.m. It lies entirely within the level plain of Bundelkhand, north of the hill country, and is almost surrounded by the Jumna and its tributaries the Betwa and Pahuj. The central region thus enclosed is a dead level of cultivated land, largely black-cotton soil, and almost treeless. The river Non flows through the centre of the district, which it drains by innumerable small ravines instead of watering. Jalaun has suffered much from the noxious *kans* grass, owing to the

spread of which many villages have been abandoned and their lands thrown out of cultivation. Pop. (1921) 405,439. The two largest towns are Kunch (14,503), and Kalpi (10,037). The district is particularly susceptible to famine and only a small part of it is watered by the Betwa canal. Grain, oil-seeds, cotton and *ghi* are exported.

In early times Jalaun seems to have been the home of two Rajput clans, the Chandels in the east and the Kachwahs in the west. The town of Kalpi on the Jumna was conquered for the princes of Ghor as early as 1196. Early in the 14th century the Bundelas occupied the greater part of Jalaun, and even after Akbar's governors established at Kalpi a nominal authority over the surrounding district, the Bundela chiefs were in a state of chronic revolt, which culminated in the war of independence under Chhatar Sal. In 1671, assisted by the Mahrattas, he reduced the whole of Bundelkhand. On his death he bequeathed one-third of his dominions to his Mahratta allies, who before long succeeded in annexing them completely. Under Mahratta rule the country was a prey to constant anarchy and intestine strife. To this period must be traced the origin of the poverty and desolation which are still conspicuous throughout the district. In 1806 Kalpi was made over to the British, and in 1840, on the death of Nana Gobind Ras, his possessions lapsed to them also. Various interchanges of territory took place, and in 1856 the present boundaries were substantially settled.

JALISCO or **XALISCO**, a Pacific coast State of Mexico. Pop. (1921) 1,208,855. Area, 31,151 sq. miles. Jalisco is traversed from north north-west to south south-east by the Sierra Madre, locally known as the Sierra de Nayarit and Sierra de Jalisco, which divides the State into a narrow, heavily forested coastal plain and a high plateau region, part of the great Anáhuac tableland, with an average elevation of about 5,000 ft., broken by spurs and flanking ranges of moderate height. The sierra region is largely volcanic and earthquakes are frequent; in the south are the active volcanoes of Colima (12,750 ft.) and the Nevado de Colima (14,363 ft.). The *tierra caliente* zone of the coast is tropical, humid and unfavourable to Europeans, while the inland plateaux vary from subtropical to temperate and are generally drier and healthful. The greater part of the State is drained by the Río Grande de Lerma (called the Santiago on its lower course) and its tributaries, chief of which is the Río Verde. Lakes are numerous, the largest being Chapala, about 80 m. long by 10 to 35 m. wide, which is considered one of the most beautiful inland sheets of water in Mexico.

The agricultural products of Jalisco include Indian corn, wheat and beans on the uplands, and sugar-cane, cotton, rice, indigo and tobacco in the warmer districts. Rubber and palm oil are natural forest products of the coastal zone. Stock-raising is an important occupation in some of the more elevated districts. The mineral resources include silver, gold, cinnabar, copper, bismuth and various precious stones. There are reduction works and some manufactures, including cotton and woollen goods, pottery, refined sugar and leather. The State has railway outlets eastward to Mexico City, westward to Manzanillo on the coast and northward, via the Southern Pacific of Mexico to the United States.

There is a large percentage of Indians and mestizos in the population. The capital is Guadalajara, and other important towns with their populations (1921) are: Ciudad Guzmán (16,842), 60 m. N.E. of Colima; Lagos (10,012), a mining town 100 m. E.N.E. of Guadalajara, on the Mexican Central railway; Autlán (12,383); Ameca (11,304), in a fertile agricultural region on the western slopes of the sierras.

JALPAIGURI, a town and district of British India, in the Rajshahi division of Bengal. The town is on the right bank of the river Tista, with a station on the Eastern Bengal State railway. Pop. (1921), 14,520. It is the headquarters of the commissioner of the division.

The DISTRICT OF JALPAIGURI occupies an irregularly shaped tract south of Darjeeling and Bhutan and north of the State of Cooch Behar. Area, 2,931 sq. miles. Pop. (1921), 936,269. The district is divided into a "regulation" tract, and a strip of country, about 22 m. in width, running along the foot of the Himalayas,

and known as the Western Duars, annexed from Bhutan after the war of 1864-65. The former is a continuous expanse of level paddy fields. The latter is a centre of tea cultivation; there were 131 tea gardens in the district in 1921, 102,000 ac. were plucked, and the out-turn of tea was 43½ million pounds. The staple crop elsewhere is rice; jute and tobacco are largely grown. The frontier towards Bhutan is formed by the Sinchula mountain range, some peaks of which attain an elevation of 6,000 feet. Buxa, standing 2,000 ft. high and commanding one of the chief passes into Bhutan, was formerly a cantonment; it has a rainfall of 209 inches.

JALUD, a tributary of the river Jordan in Palestine. It descends from the plains of Esdraelon to near Beisan. See JORDAN; PALESTINE.

JAMAICA, the largest island in the British West Indies. It lies about 80 m. S. of the eastern extremity of Cuba, between 17° 43' and 18° 32' N. and 76° 10' and 78° 20' W., is 144 m. long, 50 m. in extreme breadth and has an area of 4,207 sq.m. A mountainous backbone runs through the island from east to west, broken by pressure into a series of ridges running diagonally N.W. and S.E. The highest of these ranges is towards the east end of the island and is called the Blue mountains. They trend west by north, culminating in Blue Mountain Peak (7,360 ft.) and are crossed by five passes at altitudes varying from 3,000 to 4,000 feet. Two-thirds of the island are occupied by a plateau of deep-sea white limestone, forming a region of great beauty broken by innumerable hills, valleys, "cockpits" and sink-holes, and covered with luxuriant vegetation. These uplands usually terminate in steep slopes or bluffs, separated from the sea, in most cases, by a strip of level land. On the south coast, especially, these plains are often extensive, the Liguanea plain, on which Kingston and Spanish Town stand, having an area of 200 sq.m. More than a hundred rivers and streams find their way to the sea, with numerous tributaries which issue from every ravine in the mountains. These streams are mostly not navigable, and in times of flood become violent torrents. Some of the larger rivers have laid down alluvial plains in their lower valleys and considerable deltas at their mouths. The Black river threads a vast morass, once the seabed, and is navigable by small craft for about 30 m. The Salt river and the Cabaritta, also in the south, are navigable by barges. Vestiges of intermittent volcanic action occur (including one truncated cone of basaltic lava), and there are several radio-active hot springs. Jamaica has 16 harbours, the chief of which are Port Morant, Kingston, Old Harbour, Lucea, Montego Bay, Falmouth, St. Ann's Bay, Port Maria and Port Antonio.

Geology.—The greater part of Jamaica is bedded with Tertiary deposits, but in the Blue mountains and some of the other ranges older rocks emerge. The foundation of the island is composed of stratified shales and conglomerates, with tuffs and other volcanic rocks and occasional bands of marine limestone. The limestones contain Upper Cretaceous fossils, and the whole series has been heavily folded. Upon this foundation rests unconformably a series of marls and limestones of Eocene and early Oligocene age. Some of the limestones are composed of Foraminifera, together with Radiolaria, and indicate a subsidence to great depths, whilst the higher peaks of the island still remained above the sea. Towards the middle of the Oligocene period, when the folding pressure took place, the island was lifted far above its present level and was probably connected with the rest of the Greater Antilles and perhaps with the American mainland also. In the same period plutonic rocks of various kinds were intruded into the deposits already formed, and in some cases produced considerable metamorphism. During the Miocene and Pliocene periods the island again sank, but never to the depths which it reached in the Eocene period. The deposits formed in this period were shallow-water conglomerates, marls and limestones, with Mollusca, Brachiopoda, corals, etc. Finally, a series of successive small upliftings, less than 500 ft. in the aggregate, raised the island to its present level. The terraces which mark the successive stages in this elevation are well shown near Montego bay. The remarkable cavities of the

Cockpit country and the closed basins of various rivers have been formed by the solution of the white limestone layer resting upon insoluble rocks. The island produces a great variety of marbles, porphyrites, granite and ochres. Traces of gold have been found associated with some of the oxidized copper ores (blue and green carbonates) in the Clarendon mines. Copper ores are widely diffused and lead and cobalt are found, but do not pay to work. Manganese iron ores and a form of arsenic occur.

Climate.—The climate is one of the island's chief attractions. Near the coast it is warm and humid, tempered by sea breezes, but in the uplands is delightfully mild and equable. At Kingston the temperature ranges from 70.7° to 87.8° F, and this is generally the average of all the low-lying coast land. At Hill Gardens in the Blue mountains, 4,907 ft. above the sea, it varies from 57.5° to 68.5°. The vapours from the rivers and the ocean generate in the upper regions clouds saturated with moisture which there maintain vegetation belonging to a colder climate. During the rainy seasons the accumulation of these vapours causes a general coolness and occasional heavy showers, and sometimes destructive floods. These seasons, in May and October, last for about three weeks, although, as a rule, no month is quite without rain. The fall varies greatly; while the annual average for the island is 66.3 in., at Kingston it is 32.6 in., at Hill Gardens 105.5 in., and at some places in the north-east exceeds 200 in. The climate of the Santa Cruz mountains is very favourable to sufferers from tubercular and rheumatic diseases. Excepting near morasses and lagoons, the island is very healthy, and yellow fever, once prevalent, is extinct. In the early part of the 19th century, hurricanes often devastated Jamaica, but now, though they frequently pass to the N.E. and S.W. they more rarely strike the island itself.

Flora.—The flora is remarkable, showing types from North, Central and South America, with a few European forms, besides the common plants found everywhere in the tropics. Of flowering plants, 2,180 distinct species have been identified, and of ferns 450 species, several of both being indigenous. This abundance may be to some extent accounted for by differences of altitude, temperature and humidity. There are many beautiful flowers, such as the aloe, the yucca, the datura and the mountain pride; and the cactus tribe is well represented. The sensitive plant is a pest in pastures. There are pretty wild orchids. Though most of the ancient forests have been cut or destroyed, and the existing woodlands are of secondary growth, there is still much useful timber: cedar and mahoe being the most important. Fine cabinet-making woods are mahogany, yucca, rosewood, satin wood, lignum vitae and ebony. Lancelwood spars and hardwoods suitable for railway ties are cut in great quantities. Logwood is a very important crop, grown in lowland pastures. This wood is exported, but the making of logwood extract for dye is a valuable industry. Fustic is used for khaki dye. A very conspicuous but useless tree is the huge silk-cotton tree (*Ceiba Bombax*). Pimento (allspice) is indigenous. Bamboo is plentiful. Several species of palm abound—the mountain cabbage, the fan palm, screw palm and palmetto royal. There are large plantations of coco palms. Other noticeable trees and plants are the mango, the breadfruit tree, the papaw, the lacebark tree, the guava and the castor oil plant. English vegetables grow in the hills. There is much cultivation of bananas, plantains, coffee, cocoa, yams, cassava, ochra, beans, pease, ginger, annatto and arrowroot. Maize and guinea-corn are grown and the guinea-grass, accidentally introduced in 1750, is very valuable for horses and cattle. Among the principal fruits are the orange, shaddock, lime, grape-fruit, pine-apple, mango, banana, grapes, melons, star-apple, avocado pear, breadfruit and tamarind.

Fauna.—There are fourteen sorts of *Lampyridae* or fireflies, besides the *Elateridae* or lantern beetles. There are no venomous serpents, but a few harmless snakes and many lizards. The land crab is highly reputed as a table delicacy. The scorpion and centipede, though poisonous, are not very dangerous. Ants, sand-flies and mosquitoes abound in the lowlands. There are

20 different song-birds, and 43 varieties of birds are believed to be peculiar to the island. The sea and the rivers swarm with fish. Turtles are plentiful, and the seal, the manatee and the crocodile are occasionally found. The coral reefs, with their varied polyps and anemones, the numerous alcyonarians and coral-dwelling animals are readily accessible to the student, and the island is also celebrated for the number of species of its land-shells.

People.—The population of the island was estimated in 1925 as 916,620. Jamaica is rich in traces of its former Arawak inhabitants. Aboriginal petaloid celts and other implements, flattened skulls and vessels are common. Images and drawings have been found in limestone caverns. Of the present inhabitants, according to the 1921 census less than 2 per cent were white, 18 per cent "coloured," *i.e.*, of mixed race, and 77 per cent black: but among these there is probably in many cases some share of European descent. Coloured persons and negroes are found in all professions and occupations represented in the community, but leadership and initiative still remain predominantly with the white and lighter-coloured citizens. Most of the elementary school teachers of both sexes are black.

The capital, Kingston, stands on the south-east coast, and near it is the town of Port Royal. Spanish Town (pop. about 9,000), the former capital, is in the parish of St. Catherine, Middlesex, 11½ m. by rail west of Kingston. After the transfer of the seat of government to Kingston, Spanish Town sank greatly in importance, but has revived as the centre of valuable banana and sugar cultivation in the irrigated Liguanea plain. In the cathedral many of the governors of the island are buried. A marble statue of Rodney commemorates his victory over the Count de Grasse off Dominica in 1782. Montego Bay (pop. 6,000), on the north-west coast, is the second town on the island, and is a favourite bathing resort. Port Antonio (pop. 4,000) lies between two secure harbours on the north-east, and owes its prosperity mainly to the development of the trade in fruit, for which it is the chief place of shipment.

Industries.—Agricultural enterprise falls into two classes—planting and pen-keeping, *i.e.*, the breeding of horses, mules, cattle and sheep. The chief products are in order of value of exports, bananas 40%, sugar and rum 20%, coffee 12%, pimento, coconuts and copra, logwood and its extract, cocoa ginger, oranges and their oil, cigars, grape-fruit and honey.

The island contains about 120,000 head of cattle and 25,000 horses and mules. Motor carriage has diminished the importance of horse and mule breeding. The banana industry (export latterly exceeding 20 million bunches a year) is highly organized, both as regards the cultivation, much of it in large arable fields, and the transport and shipping of the fruit. There is a strong Government Department of Agriculture and Science, which co-operates with the Jamaica Agricultural Society, a very efficient institution, which directs the activities of 16 agricultural instructors, doing their work through contact with 260 branch agricultural societies, mostly composed of peasants. The board of management of the society meets monthly, with the Governor as president, to discuss agricultural interests in all aspects. The Jamaica Imperial Association and the Producers Association are valuable auxiliaries in the political and commercial spheres. In regard to productive agriculture Jamaica is the most highly developed community in the British West Indies. The estates are ably managed, whilst there are about 140,000 peasant holdings of land valued at from £20 to £100, which largely feed the population, supply the local markets, produce fruit, coffee, spices, honey and other minor staples for export, and contribute to the labour supply of estates. Provision is made through a Government Land Bank for the purchase and cutting up of estates for small holders. The manufactures are few. In addition to the sugar and coffee estates there are cigar factories, tanneries, distilleries, breweries, electric light and gas works, iron foundries, potteries and factories of logwood extract, coconut oil, essential oils, ice, matches and mineral waters. Of the imports (valued £5,636,188 in 1925), about 45% are from the British Empire, 40% from the United States, which took about the same proportion of the exports (value, 1925, £3,935-

059). Jamaica was a signatory of the Canada-West Indies trade agreements of June 18, 1920 and July 6, 1925. Under the latter, Canada imposes a customs duty of 50 c. per bunch on foreign bananas, admits Jamaica bananas free and provides a fortnightly mail passenger and freight service with refrigeration for 70,000 bunches of bananas, alternating with a fortnightly freight service with refrigeration for 50,000 bunches between Canadian ports and Kingston. At present the fruit industry is handled by five concerns, of which all but one carry the fruit to America.

Under the Canada-West Indies agreement Jamaica sugar enjoys the increased preference of \$1.00 per 100 lb. on 96° sugar entering the Dominion. In the United Kingdom the preference on British colonial sugar was restored in 1925 to 3s. 8½d. per cwt., and an undertaking was given by Parliament that it would remain at that figure for 10 years. This has helped to establish confidence in the industry. The revenue averages about £2,000,000 p.a. (£866,000 from customs duties). Direct property and income taxes are levied. Of the expenditure (normally somewhat less than the revenue), the largest items are debt charges £273,600, public works, £315,160, constabulary £178,600, education, £155,600, medical services, £136,470.

There is a government savings bank at Kingston with branches throughout the island, and branches of Barclay's Bank, the Bank of Nova Scotia, the Canadian Bank of Commerce and the Royal Bank of Canada at Kingston and in most of the towns. There is a system of Agricultural Loan Banks, under Government control, with an issued Share Capital of £70,602. The coins in circulation are British gold and silver, but not bronze, instead of which local nickel currency is used. United States gold is current. Notes of the various Banks are in circulation and a Government currency of £1 and 10/- notes, which are legal tender. English weights and measures are used.

Communications.—There is frequent regular steamer communication with England by the Elders and Fyffes fruit boats, also by the Harrison Leyland and Pacific Steam Navigation lines and the Royal Mail S.P. Co.: with the U.S.A. by the United Fruit Co., the Hamburg American Line and the Atlantic Fruit Co.; with Canada by the Canadian Government Merchant Marine line and Pickford & Black's. Sailing "droghers" ply from port to port of the island. Jamaica has an excellent system of good motoring roads, subsidiary metalled roads and bridle paths; the main roads are controlled by the public works department, the parochial roads by the parish boards. The railway runs from Kingston in the south-east to Montego Bay in the north-west with branches to Port Antonio, and to Ewarton and Frankfield in the interior of the island. Jamaica is included in the Imperial 1½d. post, and there is almost daily mail communication with the United States and England. There is cable connection with the United States via Cuba, and with Halifax, Nova Scotia, via Bermuda. A new and improved wireless telegraphic station near Kingston was completed in 1927.

Administration.—The public administration is conducted by a Governor who bears the old Spanish title of Captain General, a Privy Council, of three public officers, *ex-officio*, and not more than eight nominated members, and a Legislative Council, composed of the Governor, as President, five public officers *ex-officio*, nominated members not exceeding ten in number, and fourteen elected members, one for each parish of the island. The vote of nine elected members controls finance. The qualification for membership is residence in the parish or an income of £150 a year arising from lands therein. The electors are all adult men and women occupying premises on which taxes of not less than 10/- a year are paid, or having personal property paying not less than 30/- a year in taxes or a salary or wages of not less than £50 a year, or paying a rent of not less than £10 a year. There were, in 1921, 42,267 electors on the register. Local administration is carried on by elected parochial boards (Kingston and Saint Andrew's being united, with a mayor and corporation), which deal with local roads, markets, public health, poor relief and water supplies. The revenues of parochial boards amount to about £350,000 a year. There is a small imperial garrison consisting of Royal Engineers, Royal Artillery, three infantry companies and

the appropriate staff and auxiliary services. There is a local militia artillery company, and a corps of infantry volunteers.

Previous to 1870 the Church of England was established in Jamaica, but in that year a disestablishment act was passed which provided for gradual disendowment. It is still the most numerous body, and is presided over by the bishop of Jamaica. The Baptists, Wesleyans, Presbyterians, Roman Catholics and Moravians are considerable communities. There is a Jewish synagogue at Kingston, and the Salvation Army has a branch on the island. The Church of England maintains a theological college, a deaconesses' home and an orphanage. The Baptists have a theological college, and the Roman Catholics support a training college for teachers, two industrial schools and two orphanages. Elementary education is maintained by Government grants. There are (1927) 118 Government schools, 193 Church of England, 111 Baptist, 74 Wesleyan, 57 Moravian, 126 of other denominations—total 679. The number of students amounts to 120,000; average attendance 75,000. The excellent Mico Training college (endowed and receiving a Government capitation grant) provides male teachers, and Shortwood college and Bethlehem (Moravian) college for women. The Government maintains a continuation technical and commercial school in Kingston. The provision for secondary and higher education is very good and efficient: there being a number of endowed foundations in different parts of the island, supplemented elsewhere by Government and denominational colleges and high schools. The Government gives liberal annual scholarships (tenable for 3, 4 or 5 years) for boys and girls to maintain them at universities: and a Rhodes Scholarship of £400 a year for 3 years is also awarded annually.

HISTORY

Jamaica was discovered by Columbus on May 3, 1494. He was subsequently stranded for 12 months on the north coast, in 1503-4. In 1509 Don Juan de Esquivel was appointed by Diego, Columbus's son, as governor, and from that date till 1655 the island remained under Spanish rule. The Spaniards named it Sant' Jago. Its native Arawak name was Xaymaca, "Isle of Springs." Villa de la Vega (first called by the English Sant' Jago de la Vega and, later, Spanish Town), was founded in 1523 and was the capital till 1872. Sir Anthony Shirley, a British admiral plundered and burnt that town in 1596, but effected no occupation. Another raid was made in 1635, by Colonel Jackson. During the Spanish occupation the inoffensive Arawak inhabitants, with whom Las Casas said the island "abounded as an ant-hill with ants," were exterminated by oppression, and negro slaves were imported. The whole island was divided among eight noble Spanish families, who so discouraged immigration that when Jamaica was taken by the British the white and slave population together did not exceed 3,000. Cromwell attacked the empire of Spain in the West Indies, and Admirals Penn and Venables succeeded in capturing and holding Jamaica in 1655. The Spanish were completely expelled in 1658. Their slaves took to the mountains, and till the end of the 18th century the efforts of these Maroons, as they were called, to maintain their independence gave rise to repeated fighting. Jamaica continued to be governed by military authority until 1661, when Colonel D'Oyley was appointed captain-general and governor-in-chief with an executive council. He was succeeded next year by Lord Windsor, under whom a legislative assembly was established with power to make laws subject to disallowance by the Crown. Jamaica soon became the chief resort of the buccaneers, who not infrequently united the profession of merchant or planter with that of pirate or privateer. By the Treaty of Madrid, 1670, the British title to the island was recognized, and the buccaneers were suppressed. The Royal African Company was formed in 1672 with a monopoly of the slave trade, and from this time Jamaica was one of the greatest slave marts in the world. At this date there were in Jamaica 70 sugar works, 60 indigo works and 60 cacao works. An attempt was made in 1678 to impose on the island a yearly tribute to the Crown and to supersede the powers of the legislature. The privileges were restored in 1682; but not till 46 years later was the question of revenue settled, by a compromise by which Jamaica undertook to

pay £8,000 (afterwards reduced to £6,000) per annum to the Crown, provided that English statute laws were made binding in Jamaica.

In 1692 a severe earthquake destroyed the greater part of the town of Port Royal. Hurricanes occurred in 1712, 1714 and 1722, the last doing so much damage that the seat of commerce was transferred from Port Royal to Kingston.

The most important event during the later years of the 18th century was the threatened invasion by the French and Spanish in 1782, averted by the victory of Rodney and Hood off Dominica. The last attempt at invasion was made in 1806, when the French were defeated by Admiral Duckworth. When the slave trade was abolished (in 1807) the island was at the zenith of its prosperity; sugar, coffee, cocoa, pimento, ginger and indigo were being produced in large quantities, and it was the depot of a very lucrative trade with the Spanish Main. There were then 319,351 slaves in Jamaica. The anti-slavery agitation in Great Britain was paralleled in the island, and in 1831 some of the negroes revolted, believing that emancipation had been granted. They killed a number of whites and destroyed property valued at £657,000. Two years later the Emancipation Act was passed, and, subject to a short term of apprenticeship, 125,590 slaves were freed. Emancipation crippled the planters. The British Government awarded them compensation at the rate of £19 per slave, but most of this compensation went into the hands of their creditors. They were left financially exhausted and with a scarcity of labour. The abolition in 1846 of the tariff protection of colonial produce in the British market reduced the price of sugar by one-half and in many cases destroyed the profits of the already impoverished planter. Many estates, already heavily mortgaged, were abandoned, and the trade of the island was greatly diminished. Dissensions between the executive, the legislature, and the home Government, as to the means of retrenching public expenditure, created much bitterness. Although some slight improvement marked the administration of Sir Charles Metcalfe and the earl of Elgin, when Indian immigration was introduced to redress the scarcity and irregularity of labour and the railway was opened, the improvement was not permanent. In 1865 Edward John Eyre became governor. The public finances were in great difficulties and the colonial treasury showed a deficit. To meet this difficulty new taxes were imposed and from this and other causes of grievance (notably exclusion from land and maladministration of justice) discontent was rife among the negroes. On Oct. 11, 1865, there was an outbreak at Morant bay and the chief magistrate of the parish and 18 other white persons were killed. The disturbance which followed filled the island with terror, and many excesses were committed on both sides. The assembly passed an act under which martial law was proclaimed, and subsequently one abrogating the constitution.

THE COLONY REORGANIZED

The action of Governor Eyre, in hanging G. W. Gordon, a leading spokesman of the popular discontents, and the severities with which the rising was punished, though generally applauded in the West Indies, caused much indignation in England, and he was recalled. A prosecution was instituted against him, resulting in an elaborate exposition of martial law by Chief Justice Cockburn, but the jury threw out the bill and Eyre was discharged. He was succeeded in the government of Jamaica by Sir John Peter Grant. Crown colony government was established and Grant did a magnificent work in reorganizing the affairs of the colony. He established a constabulary on the lines of that of Ireland, reconstructed the judicial establishment, substituting stipendiary magistrates for the planter-justices, established a public medical service, a public works department and Government savings bank; improved education and irrigated the fertile but drought-stricken plain between Spanish Town and Kingston. During his government the planters were helped by the importation of Indian labourers, and the fruit (banana) trade with America, which has restored the prosperity of the island, was started by Capt. A. W. Baker of Boston, U.S.A.

In 1884 the constitution of the legislature was altered by the

introduction of nine elected members, whose number was in 1895 increased to fourteen.

On Jan. 14, 1907, a violent earthquake visited Kingston. Almost every building in the capital and in Port Royal, and many in St. Andrews, were destroyed or seriously damaged. About 800 persons were killed and a large part of the city was burnt. On Jan. 17 assistance was brought by three American warships under Rear-Admiral Davis, who withdrew them on the 19th, owing to a misunderstanding with the governor of the island, Sir Alexander Swettenham, on the subject of the landing of marines from the vessels to help in preserving order. The incident caused considerable sensation, and led to Sir A. Swettenham's resignation in the following March. The earthquake and fire afforded the opportunity of considerably improving Kingston, and under the government of Sir Sydney (Lord) Olivier the scattered public offices were reconstructed in two blocks flanking a planted square on the finest street of the city.

During the World War of 1914-18, 250 officers and 11,042 non-commissioned officers and men, for the British West India Regiment, and 381 officers for other regiments went overseas from Jamaica. Eighty-two commissioned officers connected with Jamaica lost their lives and 1,019 non-commissioned officers and men.

JAMAICA, formerly a village of Queens county, Long Island, N.Y., U.S.A., but since 1898 a part of the borough of Queens, New York city. For two guns, a coat and a quantity of powder and lead, several New Englanders obtained from the Indians a deed for a tract of land here in 1655. In 1657 they received permission from Gov. Stuyvesant to found a town, which was chartered in 1660 and was named Rustdorp by Stuyvesant, but the English called it Jamaica. The village was incorporated in 1814 and reincorporated in 1855. In 1665 it was made the seat of justice of the north riding; in 1683-1788 it was the shire town of Queens county. With Hempstead, Gravesend, Newtown and Flushing, also towns of New England origin and type, Jamaica was early disaffected towards the provincial government of New York. In 1669 these towns complained that they had no representation in a popular assembly, and in 1670 they protested against taxation without representation. The founders of Jamaica were mostly Presbyterians, and they organized one of the first Presbyterian churches in America. At the beginning of the Revolutionary War Jamaica was under the control of Loyalists; after the defeat of the Americans in the battle of Long Island (Aug. 27, 1776) it was occupied by the British; and until the end of the war it was the headquarters of Gen. Oliver Delancey.

JAMB, in architecture, originally the post at each side of a door, window or opening to carry the lintel; now, more loosely, the side surfaces of any opening. Colonettes, flanking doors and windows, are known as jamb-shafts.

JAMBI, a residency in Sumatra, Dutch East Indies, area 44,452 sq.km., on the east coast, separated from the islands of Singkep and Lingga by the Straits of Berhala, bounded on the south by Palembang residency, north by the mainland dependency of Riouw and west by Sumatra West Coast residency (Dutch: *Djambi*). It is a long and narrow strip of territory, extending nearly across the country to the mountain range which traverses Sumatra west coast and throws out spurs into Jambi. On its borders are Mt. Tuju, 8,466 ft., and the Peak of Indrapura, 12,484 ft., and, well within them, Mts. Tebatalas, 6,662 ft., and Mesarai, 8,125 feet. Except for a hilly range in the mid-north region extending from Bukit Merbau, 2,500 ft., the country slopes gradually to the sea, and, some distance before reaching it, is very flat and swampy, whilst near the coast it is intersected by numerous small rivers, Sungei Tungal being the largest. A number of rivers, large and small, flow down from the western mountains, water

the country abundantly and unite at a point in the centre, not far from Muaru Tembesi, to form the Batang Hari (Jambi river), which is navigable for ocean-going ships from Jambi, the capital, to the sea, a distance of 50 miles. High up among the western mountains there is a small lake—Korinchi. There are no railways, and roads are few and poor, but Jambi is connected by road with Palembang. Many of the rivers are used for great distances by the natives for small-craft transport; and Jambi is sea-connected with Java, Sumatra and Straits Settlements' ports, and by telegraph with Padang, whilst several of the small towns of the interior are connected with each other and with Palembang by telephone. Jambi with a population of 180,584 (263 Europeans and Eurasians and 7,424 foreign Asiatics, including Chinese), is almost wholly village-settled and Malay in character, though in the extreme west there are some Korinchis, a warlike and very little-known people. Jambi (pop. 16,164), Muaru Tembesi, Bangku, Sarolangun, Muaru, Bungu, Muaru Tebu and Sungai Penuh are the chief centres of population, and all but Jambi are quite small. The people are agriculturists and fishermen, rice is grown very largely, and a great proportion of it is *sawah*, or dry culture. Coffee is grown for export, chiefly in the districts of Muaru Bungu and Bangku, and Jambi is one of the chief centres of native-grown rubber which is also exported. Jambi, under an independent sultan, caused the Dutch considerable trouble (they were established in the neighbouring territory of Palembang), until, in 1901, they sent an armed expedition into the country, and later made it into a Dutch residency. (E. E. L.)

JAMES, a masculine proper name popular in Christian countries as having been that of two of Christ's apostles (a variant of the name Jacob, Heb. יַעֲקֹב, one who holds by the heel, outwitted, through O.Fr. *James*, another form of *Jacques*, *Jaques*, from Low Lat. *Jacobus*). It has been borne by many sovereigns and princes.

JAMES, the name of several persons mentioned in the New Testament (Gr. *Ἰάκωβος*, the Heb. *Yā'akob* or Jacob).

1. JAMES, the son of Zebedee: see APOSTLE.

2. JAMES, the son of Alphaeus: see APOSTLE.

3. JAMES, the little, is described as the son of a Mary (Matt. xxvii. 56; Mark xv. 40), who was in all probability the wife of Clopas (John xix. 25). And on the ground that Clopas is another form of the name Alphaeus, this James has been thought by some to be the same as 2. But the evidence of the Syriac versions, which render Alphaeus by *Chalphai*, while Clopas is simply transliterated *Kleopha*, makes it extremely improbable that the two names are to be identified. And as we have no better ground for finding in Clopas the Cleopas of Luke xxiv. 18, we must be content to admit that James the little is an almost unknown personality.

4. JAMES, the father of Judas. There can be no doubt that in the mention of "Judas of James" in Luke vi. 16 the ellipsis should be supplied by "the son" and not as in the A.V. by "the brother" (cf. Luke iii. 1, vi. 14; Acts xii. 2, where the word ἀδελφός is inserted). This Judas, known as Thaddaeus by Matthew and Mark, afterwards became one of the apostles, and is expressly distinguished by St. John from the traitor as "not Iscariot" (John xiv. 22).

5. JAMES, the Lord's brother. In Matt. xiii. 55 and Mark vi. 3 we read of a certain James as, along with Joses and Judas and Simon, a "brother" of the Lord. The exact nature of the relationship there implied has been the subject of much discussion. Jerome's view (*de vir. ill.* 2), that the "brothers" were in reality cousins, "sons of Mary the sister of the Lord's mother," may be said to have been finally disposed of by Bishop Lightfoot in his essay on "The Brothers of the Lord" (*Galatians*, pp. 252 sqq., *Dissertations on the Apostolic Age*, pp. 1 sqq.). Even, however, if we understand the word "brethren" in its natural sense, it may be applied either to the sons of Joseph by a former wife, or to sons born to Joseph and Mary after the birth of Jesus. The former of these views, generally known as the *Epiphonian* view from its most zealous advocate in the 4th century, can claim for its support the preponderating voice of tradition (see the catena of references given by Lightfoot, *loc. cit.*, who himself inclines to this view). On the other hand the *Helvidian* theory as propounded by Helvidius, and apparently accepted by Tertullian (cf. *adv.*

Marc. iv. 29), which makes James a brother of the Lord, as truly as Mary was his mother, undoubtedly seems more in keeping with the direct statements of the Gospels, and also with the after history of the brothers (see W. Patrick, *James the Brother of the Lord*, 1906, p. 5). In any case there can be no question as to the important place which James occupied in the early Church. Converted to a full belief in the living Lord, perhaps through the special revelation that was granted to him (1 Cor. xv. 7), he became the recognized head of the Church at Jerusalem (Acts xii. 17, xv. 13, xxi. 18, cf. Gal. ii. 9). He was traditionally the author of the epistle of the New Testament which bears his name (see JAMES, EPISTLE OF). According to Hegesippus (see Eus. *H.E.* ii. 23) he was a Nazarite, and on account of his eminent righteousness was called "Just" and "Oblitas." So great was his influence with the people that he was appealed to by the scribes and Pharisees for a true and (as they hoped) unfavourable judgment about the Messiahship of Christ. But from a pinnacle of the temple, he made public confession of his faith, and was at once thrown down and murdered. This happened immediately before the siege. Josephus (*Antiq.* xx. 9, 1) tells that it was by order of Ananus the high priest that James was put to death; and his narrative gives the idea of some sort of judicial examination, for he says that James and some others were brought before an assembly of judges, by whom they were condemned and delivered to be stoned. Josephus is also cited by Eusebius (*H.E.* ii. 23) to the effect that the miseries of the siege were due to divine vengeance for the murder of James. Later writers describe James as an *ἐπίσκοπος* (Clem. Al. *apud* Eus. *H.E.* ii. 1) and even as an *ἐπίσκοπος ἐπισκόπων* (Clem. *Hom.*, *ad init.*). According to Eusebius (*H.E.* vii. 19) his episcopal chair was still shown at Jerusalem at the time when Eusebius wrote.

JAMES I., THE CONQUEROR (1208–1276), king of Aragon, son of Peter II. and of Mary of Montpellier, was born at Montpellier on Feb. 2, 1208. Peter, whose possessions in Provence entangled him in the wars between the Albigenses and Simon de Montfort, arranged an alliance between James and Simon's daughter, and in 1211 he entrusted the boy to Montfort's care. At his death (Sept. 12, 1213) the Aragonese and Catalans appealed to the pope for the surrender of the child, and he was put in the care of the Templars, who brought him in 1216 to Saragossa. In 1221 he married Leonora, daughter of Alphonso VIII. of Castile, but divorced her later on the ground of consanguinity and married Yolande, daughter of Andrew II. of Hungary. James was astute and patient, of gigantic stature and immense strength, and by 1228 he had so far reduced his unruly vassals that he was able to undertake the conquest of the Balearic islands, which he achieved in four years. He then turned his attention to the territory of the decadent Mohammedan princes of Valencia, conquering the town on Sept. 28, 1238. Physical, social and political obstacles were against his endeavours to form a southern State on both sides of the Pyrenees, and on May 11, 1258, he signed the Treaty of Corbeil with Louis IX., contenting himself with the surrender of antiquated French claims to the overlordship of Catalonia.

During the last 20 years of his life James carried on war with the Moors in Murcia on behalf of his son-in-law, Alphonso the Wise of Castile. As a legislator and organizer he occupies a high place among the Spanish kings. Though orthodox and pious, he had an ample share of moral laxity and the favour he showed his bastards led to protest from the nobles and to conflicts between his sons, legitimate and illegitimate. He divided his States between his sons Pedro and James, leaving the Spanish possessions on the mainland to the first, the Balearic islands and the lordship of Montpellier to the second—a division which inevitably produced fratricidal conflicts. James died at Valencia on July 27, 1276.

JAMES II. (c. 1260–1327), king of Aragon, grandson of James I. and son of Peter III. and Constance, daughter of Manfred of Beneventum, was left king of Sicily (1285) by his father. Upon inheriting Aragon on the death of his brother Alphonso (1291), he resigned Sicily and married Blanca, daughter of Charles of Anjou, king of Naples, in the endeavour to restore peace between his family and the Angevin house.

JAMES I. (1566–1625), king of Great Britain and Ireland and James VI. of Scotland, the only child of Mary Queen of Scots, and her second husband, Henry Stewart Lord Darnley, was born in Edinburgh castle on June 19, 1566. He was proclaimed king of Scotland on July 24, 1567, upon the forced abdication of his mother, but was kept in the castle of Stirling for safety's sake amid the confused fighting of the early years of his minority, until 1578. He was a weakly boy, and although he lived until he was nearly sixty, he was never a strong man.

James was brought up by the earl and countess of Mar. When the earl died in 1572 his place was well filled by his brother, Sir Alexander Erskine. The king's education was placed under the care of George Buchanan, assisted by Peter Young, and two other tutors, who gave the boy a sound training in languages and in theology. The scholastic quality of his education helped to give him a taste for learning, but also tended to make him a pedant.

James was only twelve when the earl of Morton was driven from the regency, and for some time after he can have been no more than a puppet in the hands of intriguers and party leaders. The so-called raid of Ruthven in 1582, was in fact a kidnapping enterprise carried out in the interest of the Protestant party. It was not indeed till 1583, when he broke away from his captors, that James began to govern in reality.

His work can be divided into the part which was a failure and a preparation for future disaster, and the part which was solid achievement, honourable to himself and profitable to his people. His native kingdom of Scotland had the benefit of the second. Between 1583 and 1603 he reduced the anarchical baronage of Scotland to obedience, and replaced the subdivision of sovereignty, which had been the very essence of feudalism, by a strong centralized royal authority. In fact he did in Scotland the work which had been done by the Tudors in England, by Louis XI. in France, and by Ferdinand and Isabella in Spain. But James not only brought his disobedient and intriguing barons to order but also quelled the attempts of the Protestants to found what Hallam has well defined as a "Presbyterian Hildebrandism." He enforced the superiority of the state over the church. Both before his accession to the throne of England (1603) and afterwards he took an intelligent interest in the prosperity of his Scottish kingdom, and did much for the pacification of the Hebrides.

James's methods of achieving ends in themselves honourable and profitable have made posterity unjust to his real merits. He boasted of his "king-craft" and probably believed that he owed it to his studies. But it was in reality the resource of the weak, the art of playing off one possible enemy against another by trickery. The marquis de Fontenay, the French ambassador, who saw him in the early part of his reign, speaks of him as cowed by the violence about him, and the terror in which he passed his youth sufficiently explains his preference for guile. He would make promises to everybody, as when he wrote to the pope in 1584 more than hinting that he would be a good Roman Catholic if helped in his need. His very natural desire to escape from the poverty and insecurity of Scotland to the opulent English throne led him to behave basely in regard to the execution of his mother in 1587, taking good care to do nothing to offend Elizabeth. His crafty methods did him harm in England, where his reign prepared the way for the great civil war. In his southern kingdom his failure was complete. Although England accepted him as the alternative to civil war, and received him with fulsome flattery, he did not win the respect of his English subjects. His undignified personal appearance was against him, and so were his garrulity, his Scottish accent, his slovenliness and his toleration of disorders

in his court, and his favour for handsome male favourites. In ecclesiastical matters he offended many, who contrasted his severity and rudeness to the Puritan divines at the Hampton Court conference (1604) with his politeness to the Roman Catholics. In a country where the authority of the state had been firmly established and the problem was how to keep it from degenerating into the mere instrument of a king's passions, his insistence on the doctrine of divine right aroused distrust and hostility, though the doctrine had originated in a necessary assertion of the independence of the state in face of the "Hildebrandism" of Rome and Geneva alike. James's favour for his countrymen helped to defeat his wise wish to bring about a full union between England and Scotland. His profusion kept him necessitous, and drove him to shifts. Posterity can give him credit for his desire to forward religious peace in Europe, but his Protestant subjects could not see the consistency of a king who married his daughter Elizabeth to the elector palatine, a leader of the German Protestants, and also sought to marry his son to an infanta of Spain. The king's subservience to Spain was indeed almost besotted, and allowed him to be befooled by the ministers of Philip III. and Philip IV. The end of his scheming was that he was dragged into a needless war with Spain by his son Charles and his favourite George Villiers, duke of Buckingham, just before his death on March 5, 1625 at his favourite residence, Theobalds.

James married in 1589 Anne, second daughter of Frederick II., king of Denmark, by whom he had three children who survived infancy: Henry Frederick, prince of Wales, who died in 1612; Charles, the future king; and Elizabeth, wife of the elector palatine, Frederick V.

Not the least of James's many ambitions was the desire to excel as an author. He left a body of writings which, though of mediocre quality as literature, entitle him to a unique place among English kings since Alfred for width of intellectual interest and literary faculty. His efforts were inspired by his preceptor George Buchanan. His first work was a youthful production in verse, *Essays of a Prentise in the Divine Art of Poesie* (Edin. Vautrollier, 1584), containing fifteen sonnets, "Ane Metaphorically invention of a tragedie called Phoenix," a short poem "Of Time," translations from Du Bartas, Lucan and the Book of Psalms ("out of Tremellius"), and a prose tract entitled "Ane short treatise, containing some Reulis and Cautelis to be observit and eschewit in Scottis Poesie." This tract shows acquaintance with the critical reflections of Ronsard and Du Bellay, and of Gascoigne in his *Notes of Instruction* (1575). In 1591 James published *Poeticall Exercises at Vacant Houres*, including a translation of the *Furies* of Du Bartas, his own *Lepanto*, and Du Bartas's version of it, *La Leparthe*. His *Daemonologie*, a prose treatise denouncing witchcraft and exhorting the civil power to the strongest measures of suppression, appeared in 1599. In the same year he printed the first edition (seven copies) of his *Basilikon Doron*, strongly Protestant in tone. A French edition, specially translated for presentation to the pope, has a disingenuous preface explaining that certain phrases (e.g., "papistical doctrine") are omitted, because of the difficulty of rendering them in a foreign tongue. The original edition was, however, translated by order of the suspicious pope, and was immediately placed on the Index. In his famous *Counterblaste to Tobacco* (published anonymously, 1604), James forsakes his Scots tongue for Southern English. James's prose works (including his speeches) were collected and edited (folio, 1916) by James Montagu, bishop of Winchester, who also translated them into Latin, in 1619 (also Frankfurt, 1689). "The True Law of Free Monarchies," appeared in 1603; "An Apology for the Oath of Allegiance" in 1607; and a "*Déclaration du Roy Jacques I. . . pour le droit des Rois*" in 1615. In 1588 and 1589 James issued two small volumes of *Meditations* on some verses of (a) Revelations and (b) 1 Chronicles. Other two "meditations" were printed posthumously.

Hume Brown's *George Buchanan* (1890), pp. 250-261, for a sketch of James's association with Buchanan. *New Poems by James I. of England*, from a hitherto unpublished manuscript, edited by A. F. Westcott (1911); *Mary, Queen of Scots, and the Prince, Her Son*; transcribed from a contemporary Venetian manuscript, edited by Robt. McClure (1913); *The Political Works of James I.*, reprinted from the edition of 1616, with an introduction by C. H. McIlwain, Cambridge, Mass. (1928); C. MacLaurin, *Mere Mortals* (1925).

JAMES II. (1633-1701), king of Great Britain and Ireland, second surviving son of Charles I. and Henrietta Maria, was born on Oct. 14, 1633, and created duke of York in January, 1643. James was at Oxford when the city surrendered in 1646, and by the terms of capitulation was handed over to the Parliamentarians. He was sent to London and, with his younger brother and sister, placed in St. James's Palace. He escaped on April 20, 1648, in disguise, took ship at Greenwich, and settled at The Hague with his sister the princess of Orange. His mother sent for him at Paris, and after some time spent in the poverty and squabbles of the exiled court he entered the French army. He was now nineteen, he liked a soldier's life, and showed not only consummate courage but a keen scientific interest in his profession which won him the praise of Condé. He then spent some time in the Spanish service.

At the Restoration, therefore, when he returned to England with his brother, he was already an experienced and able soldier. He was now appointed Lord High Admiral and Warden of the Cinque Ports. Pepys, who was secretary to the navy, has recorded the patient industry and unflinching probity of his naval administration. Indeed, James improved memorably the organization of the British navy. The fleet was provisioned, the naval arsenals put in repair, and he created a permanent and professional body of naval officers. He arranged for the regular recruitment of officers from young lads trained on board ship and overhauled and reorganized the administration. His victory over the Dutch in 1665 and his drawn battle at Southwold bay with De Ruyter in 1672 show that he was a good commander as well as an excellent administrator.

In December 1660 he admitted having contracted a secret marriage with Anne Hyde (1637-1671), daughter of Lord Clarendon, in the previous September. Both before and after the marriage he seems to have been a libertine as unblushing, though not so fastidious, as Charles himself.

Catholicism.—In 1672 he made a public avowal of his conversion to Roman Catholicism. His wife, who had a strong hold over him, had died on March 31, 1671, and before her death had been received into the Roman Catholic Church. At what date James's reception took place is unknown, but it was probably in 1671. The passage of the Test Act (1673), nominally directed against both Non-Conformist and Roman Catholic officials, was, in fact, since it demanded repudiation of the doctrine of transubstantiation, an absolute bar to Catholics. James had to choose between his life work at the Admiralty and his religion. He resigned. On Sept. 30 he married a Catholic princess, Mary of Modena. Both his children by Anne Hyde, Mary and Anne were, however, brought up as Protestants, and in November 1677 he assented reluctantly to Charles II.'s insistence on the marriage of Mary to William, prince of Orange. The hysterical excitement which attended the disclosures of the Popish plot made James's position extremely difficult. In Oct. 1678 Shaftsbury demanded his removal from the council. He withdrew to Antwerp, The Hague, and then to Brussels. Meanwhile, the second reading of the exclusion bill (May 1679) threatened his exclusion from the succession. But many Whigs who detested James feared the influence of the duke of Monmouth on his father Charles II.; they were not prepared to see the succession fall to him, and when Charles fell ill in August, James was recalled.

He was made High Commissioner in Scotland, with the idea of removing him from English politics, and seems to have been at

first acceptable to the Scots. In Feb. 1680 he returned to England, but his enemies demanded his return to Edinburgh, and in October he again left London. The Oxford parliament of 1681 rejected the compromises suggested by Halifax and insisted on the duke's absolute exclusion. Charles dissolved it. James's administration in Scotland now became more severe, and Argyll who opposed the rigorous tests applied under the Test Act passed through the Scottish parliament in 1680, was sentenced to death, but escaped from his prison in Edinburgh castle. Discontent in the west showed itself in the holding of armed conventicles. In 1682 James returned to London and became a powerful personage at court. The exclusionists were finally vanquished, and James became once more Lord High Admiral (1684). On Feb. 6, 1685, Charles died; before his death James had secured the admission to his bedside of a priest, and he was received into the Catholic Church.

As King.—James's accession took place without incident on the same day. Parliament was summoned for May 19 and showed a large Tory majority. Relations with Louis XIV. showed a certain coolness, for Louis disapproved the summoning of parliament, and the payments under the Treaty of Dover, though they were continued for a few months, soon ceased. James showed unremitting attention to public business, especially to the affairs of the army and of the navy. The administration of the navy was strengthened according to the plans laid down by Pepys. The nation showed its loyalty by its firm adherence to James during the rebellions of the duke of Argyll (*q.v.*) in Scotland and of Monmouth (*q.v.*) in England (1685). The savage reprisals on their suppression, especially the "Bloody Assizes" of Jeffreys, who was rewarded for his services with the chief justiceship, caused a revulsion of public feeling. The Tory supporters of James were horrified. Moreover, the death of Monmouth removed the objection which the Whigs had felt to the exclusion of James. They had desired to exclude James but not to substitute Monmouth for him. The way was now clear for the prince of Orange.

James was not a mere tyrant or bigot, as the popular imagination speedily assumed him to be. He was rather a mediocre and obtuse man, who lacked political judgment and had never learned to understand his fellow-men. Thus he greatly underrated the strength of the Establishment, and preposterously exaggerated that of Dissent and Catholicism. He perceived that opinion was seriously divided in the Established Church, and thought that a vigorous policy would soon prove effective. He thought the hatred of high churchmen for dissent indicated a leaning to the older Church. Hence he publicly celebrated Mass, prohibited preaching against Catholicism, and showed exceptional favour to renegades from the Establishment. By undue pressure he secured a decision of the judges, in the test case of *Godden v. Hale* (1687), by which he was allowed to dispense Catholics from the Test Act. Catholics were now admitted to the chief offices of the army, and to some important posts in the state, in virtue of the dispensing power of James. The judges had been intimidated or corrupted and the royal promise to protect the Establishment violated. The army had been increased to 20,000 men and encamped on Hounslow Heath to overawe the capital. James put implicit and, as the event proved, mistaken confidence in his army. Public alarm was speedily manifested and suspicion to a high degree awakened. Halifax had been dismissed in Oct. 1685, and Father Petre became one of James's chief advisers. Rochester resigned in Jan. 1687.

Toleration.—James now made a bid for the support of the Dissenters by advocating a system of joint toleration for Catholics and Dissenters. In April 1687 he published a Declaration of Indulgence, exempting Catholics and Dissenters from penal statutes. No doubt the immediate political motive was to favour the Catholics, but in his later years, when he was an exile, he continued to advocate toleration. In this he was in advance of his time. He followed up the Declaration of Indulgence by dissolving parliament and by antagonizing the universities. He had sought to impose Roman Catholic fellows on the colleges; he introduced Catholics and Dissenters into all departments of State and into the municipal corporations. The Declaration was destructively analysed in Halifax's *Letter to a Dissenter*. In April 1688 James took the suicidal step of issuing a proclamation to force the clergy

and bishops to read the Declaration in their pulpits and thus personally advocate a measure they detested. Seven bishops refused, were indicted by James for libel, but acquitted (June 30, 1688), amid the enthusiasm of the populace. Prominent English gentry, enraged at the tolerant policy of James, had been in touch with William of Orange since 1687. In that year William's envoy, Dykvelt, sent over a polite mission to James, met Halifax, Danby, Shrewsbury and others to ascertain their views on the Declaration and other matters. He seems to have informed James of their views, so that there was no question of conspiracy. But from that time William knew where he was likely to find support. The birth of a son to James (June 10), which was likely to ensure a Catholic succession, and the trial of the seven bishops, now induced the Whig lords to send William a definite invitation (June 30). The letter was carried by Admiral Herbert.

FLIGHT TO FRANCE

Meanwhile, James, relying on his navy, refused the proffered help of Louis XIV., who warned him repeatedly of danger. He was determined not to accept foreign help against his subjects. Louis was offended, and turned his army, not against Holland, but towards the Rhine. In August James ordered all officers in the army and navy to be at their posts. On Sept. 21 he issued a proclamation that Roman Catholics would be ineligible for the coming parliament; on the 29th he issued a general pardon, but made the blunder of excluding the clergy. The pardon was issued on the day of the Declaration of William of Orange to the people of England.

William landed at Tor bay (Nov. 5, 1688) and swept all before him. Churchill went over to the enemy on Nov. 24. James, who had been with the army at Salisbury, returned to London on Nov. 26 to find that his daughter Anne had fled with Lady Churchill. James pretended to treat, and in the midst of the negotiations started for France (Dec. 10–11). He was intercepted at Faversham, and brought back (Dec. 16), but the politic prince of Orange allowed him to escape a second time (Dec. 23, 1688). Louis XIV. gave him a home at St. Germain.

Manœuvres in Exile.—At the end of 1688 James seemed to have lost his old courage. He had been in touch with Tyrconnell in Ireland, and on March 12, 1689, he landed at Kinsale, and proceeded to Dublin, where he summoned a parliament. After his defeat by William at the Boyne (July 1, 1690), he left Ireland, where he had shown none of his former military capacity. His proclamations and policy towards England during these years show unmistakable traces of the same incompetence. On May 17, 1692, he saw the French fleet designed for England destroyed before his very eyes off Cape La Hogue. He was aware of, though he did not advocate, the "assassination plot" which was directed against William. By its revelation and failure (Feb. 10, 1696), the third and last serious attempt of James at his restoration failed.

He refused in the same year to accept the French influence in favour of his candidature to the Polish throne on the ground that it would exclude him from the English. Henceforward he ceased to be a political factor. A mysterious conversion had been effected in him by a Cistercian abbot. He was transformed into an austere penitent, who worked miracles of healing. He died at St. Germain on Sept. 17, 1701.

The political ineptitude of James is clear; he often showed firmness when conciliation was needful, and weakness when resolution alone could have saved the day. Moreover, though he mismanaged almost every political problem with which he personally dealt, he was singularly tactless and impatient of advice. At no point in his life did he display any real judgment of men. But in general political morality he was not below his age, and in his advocacy of toleration far in advance of it. He was more honest and sincere than Charles II., more genuinely patriotic in his foreign policy, and more consistent in his religious attitude. That his brother retained the throne while James lost it is an ironical demonstration that a more pitiless fate awaits the ruler whose faults are of the intellect than the one whose faults are of the heart.

By Anne Hyde James had eight children, of whom two only, Mary and Anne, both queens of England, survived their father. By

Mary of Modena he had seven children, among them being James Francis Edward (the Old Pretender) and Louisa Maria Theresa, who died at St. Germain in 1712. By one mistress, Arabella Churchill (1648–1730), he had two sons, James, duke of Berwick, and Henry (1673–1702), titular duke of Albemarle and grand prior of France, and a daughter, Henrietta (1667–1730), who married Sir Henry Waldegrave, afterwards Baron Waldegrave; and by another, Catherine Sedley, countess of Dorchester (1657–1717), a daughter, Catherine (d. 1743), who married James Annesley, 5th earl of Anglesey, and afterwards John Sheffield, duke of Buckingham and Normandy.

JAMES I. (1394–1437), king of Scotland and poet, son of Robert III. and Annabella Drummond of Stobhall, was born at Dunfermline in July 1394. Robert, suspecting Robert, duke of Albany, of complicity in the mysterious death of his elder son David, sent James to France for safety in 1406. He was captured on the journey by English sailors, and imprisoned by Henry IV., who refused ransom. Shortly after the accession of Henry V. in 1413 James was taken to Windsor, where he was treated with great kindness by the king. He was given capable tutors, devoted much time to study, and became a poet of some repute. It is evident from his subsequent career that he made a thorough study of jurisprudence. In person he was short and stout, but well-proportioned and very agile, and he excelled in all forms of sport. He also showed proficiency in music and singing.

Robert of Albany had been virtual ruler of Scotland for some years, as Robert III. was an invalid, and on the king's death in 1406 he made no attempt to obtain the release of James, who became nominally king. In 1420 Henry V. took James on his French campaign, but failed in his intention of detaching the Scotch auxiliaries from the French standard. James returned to England after Henry's death in 1422. About this time, Robert of Albany having died in 1419, negotiations were begun for James's release, and a Scottish commission was appointed to treat with England. In Sept. 1423, in a treaty signed at York, Scotland undertook to pay 60,000 marks for his "maintenance in England," and agreed to his marriage with a "high-born English lady," Jane, daughter of John Beaufort, earl of Somerset. It is doubtful whether *The Kingis Quair* (see below) was addressed to her or not. Ten thousand marks of his ransom were remitted as Jane's dowry, and they were married at Southwark on Feb. 12, 1424, entering Scotland in April. James was crowned at Scone on May 21, 1424.

James I.'s reign is noteworthy for the introduction of a system of statute law, modelled to some extent on that of England. An attempt was also made to institute social legislation. He thought the independence of the nobles was harmful to the country, and tried to weaken their power by increasing the power of parliament. To this end he used more violent measures. Albany's son, Sir Walter Stewart, and brother-in-law, Malcolm Fleming, were arrested in the first months of James's reign and, later, Duncan, earl of Lennox. Although James allowed the second duke of Albany, as earl of Fife, to crown him, Albany and his son Alexander were arrested in March 1425 at a parliament in Perth. They were executed on May 26–27 with Sir Walter Stewart and Malcolm Fleming. At Inverness in 1427 many other turbulent northern chiefs were arrested, but while order was to some extent restored, a spirit of rebellion was aroused which eventually cost James his life. Just before Christmas 1436, in spite of a warning of danger, he went to Perth, where he was

the victim of a dynastic conspiracy by Walter Stewart, earl of Atholl, whose ultimate hope of the throne had been destroyed by the birth of a son to James. Sir Robert Graham (who had been imprisoned by James and subsequently banished), instigated by Atholl, burst into the king's presence on Feb. 20, 1437, and stabbed him to death. Graham and Atholl were afterwards tortured and executed.

James had two sons: Alexander, who died young, and James II., who succeeded to the throne; and six daughters, among them being Margaret, the queen of Louis XI. of France. His widow, Jane, married Sir James Stewart, the "black knight of Lorne," and died on July 15, 1445.

During the latter part of James's reign difficulties arose with England and also with the papacy. Part of the king's ransom was still owing to England; other causes of discord between the two nations existed, and in 1435 the earl of Mar defeated an invading English force at Piperden. In ecclesiastical matters James showed himself merciless towards heretics, but his desire to reform the Scottish Church and to make it less dependent on Rome brought him into collision with Popes Martin V. and Eugenius IV.

James was the author of two poems, *The Kingis Quair* and *Good Counsel* (a short piece of three stanzas). The *Song of Absence*, *Pebblis to the Play* and *Christis Kirk on the Greene* have been ascribed to him without conclusive evidence. *The Kingis Quair* (preserved in the Selden MS. B. 24 in the Bodleian) is an allegorical poem of the *cour d'amour* type. Its language is an artificial blend of northern and southern (Chaucerian) forms, of the type shown in *Lancelot of the Laik* and the *Quair of Jelousy*.

Laing (Edinburgh, 1872–1879); Walter Bower's continuation of John of Fordun's *Scotichronicon*, ed. T. Hearne (Oxford, 1722). See also J. Pinkerton, *History of Scotland* (1797); A. Lang, *History of Scotland*, vol. i. (1900); and G. Burnett, *Introduction to the Exchequer Rolls of Scotland* (Edinburgh, 1878–1901). *The Kingis Quair* was first printed in the *Poetical Remains of James the First*, edited by William Tytler (1783). Later editions are Morison's reprint (Perth, 1786); J. Sibbald's, in his *Chronicle of Scottish Poetry* (1802, vol. i.); Thomson's in 1815 and 1824; G. Chalmers's, in his *Poetical Remains of some of the Scottish Kings* (1824); Rogers's *Poetical Remains of King James the First* (1873); Skeat's edition published by the Scottish Text Society (1884). J. T. T. Brown's arguments against James's authorship of the poem *The Authorship of the Kingis Quair* (Glasgow, 1896) have been answered by Jusserand in his *Jacques I^{er} d'Écosse fut-il poète? Étude sur l'authenticité du cahier du roi* (1897, reprinted from the *Revue historique*, vol. lxxiv.). See also the full correspondence in the *Athenaeum* (July–Aug. 1896 and Dec. 1899); W. A. Neilson, *Origins and Sources of the Court of Love* (Boston, 1899), pp. 152, etc., 235, etc.; and Gregory Smith, *Transition Period* (1900), pp. 40, 41.

JAMES II. (1430–1460), king of Scotland, the only surviving son of James I., was born on October 16, 1430. Crowned king at Holyrood in March 1437, shortly after the murder of his father, he was at first under the guardianship of his mother. Archibald, 5th earl of Douglas, was regent of the kingdom, and considerable power was possessed by Sir Alexander Livingstone and Sir William Crichton (d. 1454). When in 1439 Queen Jane was married to Sir James Stewart, the knight of Lorne, Livingstone obtained the custody of the young king (Sept. 4, 1439) whose minority was marked by fierce hostility between the Douglasses and the Crichtons, with Livingstone first on one side and then on the other. About 1443 the royal cause was espoused by William, 8th earl of Douglas, who attacked Crichton in the king's name, and civil war lasted until about 1446. In July 1449 James was married to Mary (d. 1463), daughter of Arnold, duke of Gelderland, and undertook the government himself; and in 1450 Livingstone was arrested and executed. In 1452 the king heard of the earl of Douglas's attempt to conspire with Crawford against him. The earl was invited to Stirling by the king, and, after being charged with treachery, stabbed by James and killed by attendants. Civil war broke out at once between James and the Douglasses, which ended in the attainder of James, the new earl of Douglas, and the forfeiture of his lands. Fortified by this success and assured of the support of the parliament and of the nobles, James could view without alarm the war which had broken out with England. After two expeditions across the borders, a truce was made in July 1457. During the Wars of the Roses he showed

his sympathy with the Lancastrian party after the defeat of Henry VI. at Northampton by attacking the English possessions to the south of Scotland. While conducting the siege of Roxburgh Castle James was killed, through the bursting of a cannon, on Aug. 3, 1460. He left three sons, his successor, James III., Alexander Stewart, duke of Albany, and John Stewart, earl of Mar (d. 1479); and two daughters. His reign is a period of some importance in the legislative history of Scotland, as measures were passed with regard to the tenure of land, the reformation of the coinage, and the protection of the poor, while the organization for the administration of justice was greatly improved.

JAMES III. (1451–1488), king of Scotland, eldest son of James II., was born on July 10, 1451. He was crowned at Kelso in 1460. After the death of his mother in 1463, and of her principal supporter, James Kennedy, bishop of St. Andrews, two years later, the person of the young king, and with it the chief authority in the kingdom, were seized (1456) by Sir Alexander Boyd and his brother Lord Boyd, while the latter's son, Thomas, was created earl of Arran and married to the king's sister, Mary. In July 1469 James himself was married to Margaret (d. 1486), daughter of Christian I., king of Denmark and Norway, but before the wedding the Boyds had lost their power. Having undertaken the government in person, the king's authority was strengthened by the submission of the powerful earl of Ross. About 1479, probably with reason both suspicious and jealous, James arrested his brothers, Alexander, duke of Albany, and John, earl of Mar; Mar met his death in a mysterious fashion at Craigmillar, but Albany escaped to France and then visited England, where in 1482 Edward IV. recognized him as king of Scotland by the gift of the king of England. War broke out with England, but James, made a prisoner by his nobles, was unable to prevent Albany and his ally, Richard, duke of Gloucester (afterwards Richard III.), from taking Berwick and marching to Edinburgh. Peace with Albany followed, but soon afterwards the duke was again in communication with Edward, and was condemned by the parliament after the death of the English king in April 1483. He died in France in 1485. James's policy of peace with England did not commend itself to the turbulent section of his nobles; his lavish expenditure added to the discontent, and a rebellion broke out. Fleeing into the north of his kingdom James collected an army and came to terms with his foes; but the rebels, having seized the person of the king's eldest son, afterwards James IV., renewed the struggle. The rival armies met at the Sauchieburn near Bannockburn, and James was defeated and subsequently murdered (June 11, 1488), according to rumour, by a soldier in the guise of a priest. He left three sons—his successor, James IV.; James Stewart, duke of Ross, afterwards archbishop of St. Andrew, and John Stewart, earl of Mar. James was a cultured prince with a taste for music and architecture, but was a weak and incapable king.

JAMES IV. (1473–1513), king of Scotland, eldest son of James III., was born on March 17, 1473. He was nominally the leader of the rebels who defeated the troops of James III. at the Sauchieburn in June 1488, and became king when his father was killed. Few if any of the kings of Scotland have won such general popularity, or passed a reign so untroubled by intestine strife. Crowned at Scone a few days after his accession, James began at once to take an active part in the business of government. A slight insurrection was easily suppressed, and a plot formed by some nobles to hand him over to the English king, Henry VII., came to nothing. In spite of this proceeding Henry wished to live at peace with his northern neighbour; a five years' truce was concluded on Dec. 21, 1491. When, in 1495, Perkin Warbeck, pretending to be the duke of York, Edward IV.'s younger son, came to Scotland, James prepared to invade England in his interests, but the war was confined to a few border forays, and a seven years' peace was negotiated in 1497. In 1502 a marriage was arranged between James and Henry's daughter Margaret (1489–1541) which took place at Holyrood in Aug. 1503. This union led to the accession of the Stewart dynasty to the English throne.

About this time James crushed a rebellion in the western isles, and parliament took measures to strengthen the royal authority

therein. He may be said to have been responsible for the unification of the country. James also began to treat as an equal with the powerful princes of Europe, Maximilian I., Louis XII. and others; sending assistance to his uncle Hans, king of Denmark, and receiving special marks of favour from Pope Julius II. But his position was weakened when Henry VIII. succeeded to the English throne in 1509. Causes of quarrel already existed, and Henry's attitude was not conciliatory; sea-fights took place between their ships, while war was brought nearer by the treaty of alliance which James concluded with Louis XII. in 1512. Urged on by his French ally and his queen, James declared for war, in spite of the counsels of his advisers. Gathering a large and well-armed force, he took Norham, Ford and other castles in August 1513. He met the advancing English army under Thomas Howard, earl of Surrey, at Flodden, or more correctly, at the foot of Brankston Hill. The battle, which took place on Friday, Sept. 9, 1513, is among the most famous and disastrous, if not among the most momentous, in the history of Scotland. Having led his troops from their position of vantage, the king himself was killed while fighting on foot, together with nearly all his nobles. He left one legitimate child, his successor James V., but he had many illegitimate children, among them (by Marion Boyd) Alexander Stewart, archbishop of St. Andrews and chancellor of Scotland, who was killed at Flodden, and (by Janet Kennedy) James Stewart, earl of Moray (d. 1544). One of his other mistresses was Margaret Drummond (d. 1501).

James appears to have been a brave and generous man, and a wise and energetic king. He was possessed of considerable learning; during his reign the Scottish court attained some degree of refinement, and Scotland began to count in European politics. Literature flourished under the royal patronage, education was encouraged, and the material condition of the country improved enormously. The king was specially interested in his navy. The tournaments which took place under his auspices were worthy of the best days of chivalry in France and England. He is said to have worn an iron belt as penance for his share in his father's death; and by his frequent visits to shrines, and his benefactions to religious foundations, he won a reputation for piety.

JAMES V. (1512–1542), king of Scotland, only legitimate son of James IV., was born at Linlithgow on April 10, 1512, and succeeded his father in 1513. The regency was at first vested in his mother, but after Queen Margaret's second marriage, with Archibald Douglas, 6th earl of Angus, in Aug. 1514, it was transferred by the estates to John Stewart, duke of Albany. The minority of James was disturbed by constant quarrels between a faction, generally favourable to England, under Angus, and the partisans of France under Albany; while the queen-mother and the nobles struggled for possession of the king's person. The English had not followed up their victory at Flodden, but Henry VIII. was watching affairs in Scotland with an observant eye, and other European sovereigns were not indifferent to the possibility of a Scottish alliance. In 1524, when Albany had retired to France, the parliament declared James fit to govern with the advice of his mother and a council. This "erection" of James as king was mainly due to the efforts of Henry VIII. In 1526 Angus obtained control of the king, and kept him in close confinement until 1528, when James, escaping from Edinburgh to Stirling, compelled him to flee to England. In 1529 and 1530 the king made a strong effort to suppress his turbulent vassals in the south of Scotland. Negotiations for peace with England were begun, and in May 1534 a treaty was signed. Henry VIII. wished James to marry his daughter Mary, but the Scottish king married Madeleine, daughter of King Francis I. at Paris in Jan. 1537. Madeleine died on June 7, 1537, and in 1538 James made a much more important marriage, being united to Mary (1515–60), daughter of Claude, duke of Guise, and widow of Louis of Orleans, duke of Longueville. This connection probably induced James to forsake his vacillating foreign policy, and to range himself definitely among the enemies of England. In 1536 he had refused to meet Henry VIII. at York, where Henry had hoped to kidnap him, and in the following year had received the gift of a cap and sword from Pope Paul III., thus renouncing the friendship of his uncle. Although in 1540 the English king made another attempt to win the support of James for his religious pol-

icy, the relations between the two countries became very unfriendly, and in 1542 Henry sent an army to invade Scotland. James's forces, owing to the lack of support from the nobles, were easily scattered at the rout of Solway Moss on Nov. 25, 1542. This blow preyed upon the king's mind, and on Dec. 14 he died at Falkland, having just heard of the birth of his daughter. His two sons had died in infancy, and his successor was his only legitimate child, Mary. He left several bastards, among them James Stewart, earl of Moray (the regent Moray), Lord John Stewart (1531-63) prior of Coldingham and Lord Robert Stewart, earl of Orkney (d. 1592).

James showed great vigour and independence as a sovereign, both in withstanding the machinations of his uncle, Henry VIII., and in opposing the influence of the nobles, and his habit of mingling with the peasantry secured for him a large amount of popularity. The persecutions of heretics during this reign were due mainly to the influence exercised by the ecclesiastics, especially by David Beaton, archbishop of St. Andrews.

JAMES (JAMES FRANCIS EDWARD STUART) (1688-1766), prince of Wales, known to the Jacobites as James III. and to the Hanoverian party as the Old Pretender, the son and heir of James II. of England, was born in St. James's Palace, London, on June 10, 1688. The scandalous story that he was a supposititious child has been completely disproved, and contemporary writers allude to his family likeness to the Royal Stuarts. Shortly before the flight of the king to Sheerness, the infant prince with his mother was sent to France, and afterwards he continued to reside with his father at the court of St. Germain. On the death of his father, on Sept. 16, 1701, he was immediately proclaimed king by Louis XIV. of France, but a fantastic attempt to perform a similar ceremony in London so roused the anger of the populace that the mock pursuivants barely escaped with their lives. A bill of attainder against him received the royal assent a few days before the death of William III. in 1702, and the Princess Anne, half-sister of the Pretender, succeeded William on the throne. An influential party continued to adhere to the Jacobite cause; but an expedition from Dunkirk in favour of James in the spring of 1708 failed, although the French ships reached the Firth of Forth. At the Peace of Utrecht James withdrew from French territory to Bar-le-Duc in Lorraine. A rebellion in the Highlands of Scotland in his favour in Sept. 1715 was checked in November by the indecisive battle of Sheriffmuir and by the surrender at Preston. James landed in Dec. 1715 at Peterhead, and advanced as far south as Scone, accompanied by a small force under the earl of Mar; but on learning of the approach of the duke of Argyll he retreated to Montrose, where the highlanders dispersed to the mountains, and he embarked again for France. A Spanish expedition sent out in his behalf in 1719, under the direction of Alberoni, was scattered by a tempest, only two frigates reaching the appointed rendezvous in the island of Lewis.

In 1718 James had become affianced to the young princess Maria Clementina Sobieski, grand-daughter of the warrior king of Poland, John Sobieski. The marriage was forbidden by the emperor, who kept the princess and her mother in honourable confinement at Innsbruck. Clementina was abducted by a zealous Jacobite, Charles Wogan, reached Italy in safety, and married James at Montefiascone on Sept. 1, 1719. James and Clementina were now invited to reside in Rome at the special request of Pope Clement XI., who openly acknowledged their titles of British King and Queen, gave them a papal guard of troops, presented them with the Palazzo Muti, and made them an annual allowance of 12,000 crowns. At the Palazzo Muti, the chief centre of Jacobite intrigue, were born James's two sons, Charles Edward (the Young Pretender) and Henry Benedict Stuart. James's married life proved turbulent and unhappy, owing to the hot temper and jealous nature of Clementina, who soon after Henry's birth in 1725 left her husband and spent over two years in a Roman convent. At length a reconciliation was effected, but Clementina died in Feb. 1735. Full regal honours were paid to the Stuart queen at her funeral, and the splendid but tasteless monument by Pietro Bracchi (1700-73) in St. Peter's was erected to her memory by order of Pope Benedict XIV.

His wife's death affected James's health and spirits greatly, and he began to grow indifferent, so that the political adherents of the Stuarts were gradually led to fix their hopes upon the two young princes. James appeared seldom in public, and much of his time was given up to religious exercises; he was *dévoit à l'excès*, so Charles de Brosses, an unprejudiced Frenchman, informs us. With great reluctance James allowed his elder son to leave Italy for France in 1744; in the following year, he permitted Henry to follow his brother's example, but with the news of Culloden regarded his cause as definitely lost. Henry's adoption of an ecclesiastical career so embittered his last years that he sank into a moping invalid and rarely left his chamber. With the crushing failure of the "Forty-five" and his quarrel with his heir, the once-dreaded James soon became a mere cipher in British politics, and his death at Rome on Jan. 2, 1766 passed almost unnoticed in London. He was buried with regal pomp in St. Peter's, where Canova's famous monument, erected by Pius VII. in 1819, commemorates him and his two sons. James was grave, high-principled, industrious and dignified, and the unflattering portrait drawn of him by Thackeray in *Esmond* is utterly at variance with historical facts. Although a fervent Roman Catholic, he was far more reasonable and liberal in his religious views than his father, as many extant letters testify.

See Earl Stanhope, *History of England and Decline of the Last Stuarts* (1853); *Calendar of the Stuart Papers at Windsor Castle*; J. H. Jesse, *Memoirs of the Pretenders and their Adherents* (1845); Dr. John Doran, "Mann," and *Manners at the Court of Florence* (1876); Charles de Brosses, *Lettres sur l'Italie* (1885). (H. M. V.)

JAMES, DAVID (1839-1893), English actor, was born in London, his real name being Belasco. He began his stage career at an early age, and after 1863 gradually made his way in humorous parts. His creation, in 1875, of the part of Perkyn Middlewick in *Our Boys* made him famous as a comedian, the performance obtaining for the piece a then unprecedented run from the 16th of January 1875 till the 18th of April 1879. In 1885 he had another notable success as Blueskin in *Little Jack Sheppard* at the Gaiety Theatre, his principal associates being Fred Leslie and Nellie Farren. His song in this burlesque, "Botany Bay," became widely popular. In the part of John Dory in *Wild Oats* he again made a great hit at the Criterion Theatre in 1886; and among his other most successful impersonations were Simon Ingot in *David Garrick*, Tweedie in *Tweedie's Rights*, Macclesfield in *The Guv'nor*, and Eccles in *Caste*. His unctuous humour and unfailing spirits made him a great favourite with the public. He died on the 2nd of October, 1893.

JAMES, GEORGE PAYNE RAINSFORD (1799-1860), English novelist, son of Pinkstan James, physician, was born in London, on Aug. 9, 1799, and was educated at a private school at Putney, and in France. He had, according to his own account, composed the stories afterwards published as *A String of Pearls* before he was 17. His early works were: *Life of Edward the Black Prince* (2 vols., 1822), and *Richelieu* (1829), which was well thought of by Sir Walter Scott. James took up historical romance writing at a lucky moment. Scott had firmly established the popularity of the style, and James in England, like Dumas in France, reaped the reward of their master's labours as well as of their own. For 30 years the author of *Richelieu* continued to pour out novels of the same kind, and also some historical works and verse narrative. In the British Museum 67 of his works are catalogued. The best examples of his style are *Richelieu* (1829); *Philip Augustus* (1831); *Henry Masterton* (1832); *Mary of Burgundy* (1833); *Darnley* (1839); *Corse de Léon* (1841); *The Smuggler* (1845). His poetry does not require special mention. For a short time during the reign of William IV. he held office of historiographer royal. In 1850 he went to America as British Consul for Massachusetts. He was consul at Richmond, Virginia in 1852, and in Venice from 1856 until his death on June 9, 1860.

JAMES, HENRY (1843-1916), Anglo-American novelist, brother of William James, was born in New York on April 15, 1843. His father, Henry James the elder (1811-1882) was a

highly original philosophical and theological author, a Swedenborgian by faith, profoundly devoted equally to the life of thought and to the education of his children. Both sons inherited a large part of their psychological insight and subtlety and their feeling for English style from their father. James's early life was spent first in New York, then, off and on during the impressionable years, from 12 to 17, in Europe, chiefly in Geneva, and finally in Newport, R.I., where he began to fit himself for his career by a profound study of French fiction of the realistic school. No novelist probably has ever undergone a more severe and devoted apprenticeship, and it was one that left its mark on James's entire literary career. He entered the Harvard Law school in 1862, his family joining him in Cambridge two years later, and while he gained little from his academic studies he came in touch for the first time in Boston and Cambridge with a purely literary circle. There he formed the friendship of Prof. Charles Eliot Norton and began a lifelong intimacy with William Dean Howells who opened for him the pages of *The Atlantic Monthly*, for he had already begun writing; and his stories began to attract notice while he was still in his early twenties. But although he had become in a sense a New Englander he had never lost that sense of the fascination of Europe which had become the dominant fact and impulse of his adolescence; and in 1868 he returned there, settling first in London and then in Paris and establishing tentatively a European residence that was to be unbroken, save for a few brief visits to his native country, for the remainder of his life. His first two principal contacts, with London and Paris, signified respectively his initiation into English society, which was to form so largely the theme of his writings, and into the society of the writers whose work he had studied so assiduously, Flaubert, Zola, Maupassant and Daudet, whose actual friendship greatly increased, if such a thing were possible, his ambition, while destroying certain of his illusions in regard to their personal lives and characters. The charm of Europe at once assumed a complete and final domination over him. At first this charm extended to France and Italy as well as England, and under its compulsion he wrote the travel books, *Transatlantic Sketches* (1875), *Portraits of Places* (1883) and *A Little Tour in France* (1884), that interrupted the steady stream of novels and stories, most of which dealt with the relations between Americans in Europe and European society. His first volume had borne the prophetic title, *A Passionate Pilgrim and Other Tales* (1875) and this was followed by *Roderick Hudson* (1876), *The American* (1877), *Watch and Ward* (1878), *The Europeans* (1878), *Daisy Miller* (1878), his first pronounced success, *An International Episode* (1878), *Washington Square* (1881) and *The Portrait of a Lady* (1881), after which he published a new volume, and sometimes two or three volumes, virtually every year to the end of his life. Only two of his novels, *Washington Square* and *The Bostonians* (1886), although they were among the most distinguished, dealt exclusively with American life. Meanwhile he had gradually entered into the social life of London, at first as an extremely critical guest but more and more as what one of his critics describes as an old-established colonist, now identified with his surroundings, a sharer in the general fortunes and responsibilities of the place. The outward events of his life were few, chiefly indeed purely social engagements, varied by occasional trips to the continent for the sake of recreation or seclusion. His English friends included a few men of his own profession, the most notable being Robert Louis Stevenson and Edmund Gosse. The first phase of his career, and with it his first "manner," had ended with *The Bostonians*. *The Tragic Muse* (1890) represented his first attempt to deal exclusively with English characters in an English setting. Thereafter for some years he devoted himself chiefly to the writing of short stories, although he made constant but constantly defeated attempts to succeed as a playwright, producing two volumes of *Theatricals* (1894-95). He also published during this period several volumes of critical and topographical essays, *Partial Portraits* (1888), *Picture and Text* (1893) and *Essays in London* (1893). In 1896, feeling the need of a permanent establishment, whither he could retire to some extent from the social world whose claims had become more and

more exhausting to him, he purchased Lamb house at Rye in Sussex which became his home henceforth. It was from there that he made his periodical trips to the continent and especially, during the season, to London. There, too, he began the series of works that marked his second and more complex manner, *The Spoils of Poynton* (1897) and *What Maisie Knew* (1897), short novels that were followed by the more ambitious *The Awkward Age* (1899), *The Wings of the Dove* (1902), *The Ambassadors* (1903) and *The Golden Bowl* (1904). With the exception of a few briefer works, these brought to an end the list of his novels and tales. In 1899, on a visit to Rome, he accepted the suggestion that he should write the life of his old friend William Wetmore Story which was published in 1903. And in 1904 he made the long visit to America, the first in 20 years, which resulted in the memorable volume of impressions entitled *The American Scene* (1907). During the years immediately preceding his death he wrote the two volumes of autobiography, *A Small Boy and Others* (1913) and *Notes of a Son and Brother* (1914). A final volume of his critical essays was published in 1914 under the title *Notes on Novelists*. In June 1915, as a result of his passionate attachment to the Allied cause in the war, James became naturalized as a British subject, and in 1916 he received the Order of Merit. He died in his flat in Chelsea, London, on Feb. 28, 1916. Two unfinished novels, *The Sense of the Past* and *The Ivory Tower*, were published in 1917, and in 1919 appeared also a collection of papers dealing with the war entitled *Within the Rim*.

It is James's peculiarity and distinction that he carried to its utmost limits, to the limits virtually of the impossible, the objective psychological novel. His effort was always to reflect faithfully the social life that he studied with such scrupulous devotion, and in this he was in the main successful, although his necessarily inadequate "saturation," to use his own word, in the milieu which he adopted in early middle life restricted his field to such an extent that his work developed into subtleties that were increasingly abnormal. From this point of view the later works of his early maturity, especially *Washington Square* and *The Portrait of a Lady*, are his most successful, although they are not generally so regarded by the special disciples of the master. James chose his characters from among those leisured people of the world for whom life is naturally a work of art and who are far removed from all the more practical aspects of existence. Their main preoccupations are problems of ethical conduct which they feel and discuss with a measure of casuistry never before reflected in fiction, and for the most part with a conscientiousness that reveals the author's nonconformist American heredity. They reflect also with remarkable fidelity their race and class, James having been to a rare degree familiar with at least three nationalities. It may be said that his own point of view and the tendency of his fiction became increasingly tragic. No novelist has been more profoundly concerned with the technique of his art, none has ever been more sensitive as a receiver and transmitter of impressions, whether of persons or places. Indeed, he might be described as pre-eminently a novelists' novelist, one who has been studied to an extraordinary degree by other practitioners of his craft, but whose general public is, for the same reason, among others, necessarily limited, while it is limited also by the extremely restricted character of his own outlook on life. In his later work, as markedly distinguished from his earlier, the characters are frequently to such a degree in solution, the solution of psychological analysis, that they exist only in the minds of other characters, having no objective life, while the setting also exists only in the same way. But James's originality, his distinction of style and his fineness of feeling are acknowledged by all and place him very close to the first rank of modern writers.

The New York edition of the novels and tales of Henry James, embodying drastic revisions by which the author's earlier work was virtually rewritten in the later manner, appeared in 1908-09. Two volumes of his letters were issued in 1920 under the editorship of Percy Lubbock. Critical and biographical studies of James have been written by Rebecca West (1916), Ford Madox Hueffer (1916) and Pelham Edgar (1927).

V. W. B.)

JAMES, JESSE WOODSON (1847-1882), American outlaw, was born Sept. 5, 1847, in Clay county, Mo., U.S.A. In the early months of the Civil War the family was partisan to the Southern cause, and as a result suffered greatly at the hands of the Union forces. By way of retaliation, Jesse turned informer and later, when only 15 years of age, joined the guerrilla forces of C. W. Quantrell. Here he soon established a reputation for marksmanship and daring. At the conclusion of the war, he, with other members of the band, surrendered, but soon afterward was treacherously shot and severely wounded. In the following year he was declared an outlaw, and thereafter until his death, he was a fugitive from the law. In 1867 he became the leader of the "James band" of bank and train robbers, and during the following years attained a wide repute for crimes of the most daring and cold-blooded type. As the result of a reward of \$10,000 offered by Governor Crittenden of Missouri for the capture of Jesse James, dead or alive, two members of his own band, Robert and Charles Ford, turned traitors and shot and instantly killed him in his home at St. Joseph, Mo., April 3, 1882. Jesse's brother, Frank (1843-1915), was a partner in crime in most of the exploits of the James band. He surrendered soon after the death of his brother, but was never brought to trial. The closing years of his life were spent quietly on a farm in Missouri.

JAMES, WILLIAM (d. 1827), English naval historian, author of the *Naval History of Great Britain from the Declaration of War by France in 1793 to the Accession of George IV.*, practised as a proctor in the admiralty court of Jamaica between 1801 and 1813. He was in the United States when the war of 1812 broke out, and was detained as a prisoner, but escaped to Halifax. His literary career began by letters to the *Naval Chronicle* over the signature of "Boxer." In 1816 he published *An Inquiry into the Merits of the Principal Naval Actions between Great Britain and the United States*. In 1819 he began his *Naval History* (1822-1824). James died on May 28, 1827, in London.

An edition of the *Naval History* epitomized by R. O'Byrne appeared in 1888, and an *Index* by C. G. Toogood was issued by the Navy Records Society in 1895.

JAMES, WILLIAM (1842-1910), psychologist, philosopher, leader of the movement known as Pragmatism, and most renowned and representative of the thinkers of America, was born in New York city, on Jan. 11, 1842. He was the eldest of the five children of Henry and Lucy (Walsh) James; the second of the five, William's brother Henry, became the distinguished author of novels proclaimed for their psychological subtlety and their refinement of style. The other brothers and sisters do not figure notably; nor do the ancestors of William and Henry James. There is no indication in the American line of Irish, Scotch and English forbears, whose bloods mingled in their veins, of that deep and urgent concern with the ultimates of nature and human nature which moved the two brothers and their father. The grandfathers were "farmers, traders and merchants," prosperous and Presbyterian, with hardly even a doctor or a lawyer among them. There is a probable connection between the father's philosophic interests and an accidental burning during his boyhood that required the amputation of one leg above the knee. Both the physical and the spiritual life of Henry James the elder are marked by restlessness and wanderings, largely in Europe, which affected the training of his children at school and their education at home. He had himself graduated from Union college, in Schenectady, N.Y., and then gone to the Princeton Theological seminary, to prepare himself for the Presbyterian ministry, but had developed while there "antipathy to all ecclesiasticisms which he expressed with abounding scorn and irony throughout all his later years." In 1844, when William was two years old, a friend introduced to his father the works of Swedenborg. In these he seems to have found something of the consolation and security that he was seeking, and upon them he built a system of his own which seems to have served as a vision of spiritual life adequate to compensate for his bodily misfortune. The best of it William James conserved in "The Literary Remains of Henry James," published in 1886. It provided the permanent intellectual

atmosphere of William James' home life. Its perdurance made up for the disciplineless irregularity of his schooling, which ranged from New York in the United States to Boulogne in France, Geneva in Switzerland, and back. The habits acquired in dealing with the father's views at dinner and at tea, carried over into the extraordinarily sympathetic yet critical manner of dealing with anybody's views on any occasion.

When James was 18 years old and the family was living in Newport, R.I., he tried his hand at studying art, with William M. Hunt for a teacher and John LaFarge for a fellow pupil. But he soon tired of it, and the following year entered the Lawrence Scientific school of Harvard university. From courses in chemistry, anatomy and similar subjects there, he went to the study of medicine in the Harvard Medical school, but interrupted this study in order to accompany Louis Agassiz, in the capacity of assistant, on an exploring expedition to the Amazon. There his health failed and his duties irked him. He returned to the medical school for a term, and then during 1867-68, went to Germany for courses with Helmholtz, Virchow and Bernard, among others. At the same time he read widely in the psychology and philosophy then current, especially Renouvier.

The acquaintance with Renouvier is a focal point in James' personal and intellectual history. He seems from adolescence to have been a delicate boy, always ailing, and at this period of his stay in Germany to have suffered a breakdown, with thoughts of suicide. When he returned home, in Nov. 1868, after 18 months in Germany, he was still ill. Though he took the degree of M.D. at the Harvard Medical school in June 1869, he was unable to begin practice. Between that date and 1872 he lived in a state of semi-invalidism in his father's house, doing nothing but reading, and writing a very occasional review. Early in this period he experienced a sort of phobic panic which persisted until the end of April 1870. It was relieved, according to his own statement, by the reading of Renouvier on Freewill and the decision that "my first act of freewill shall be to believe in freewill." The decision carried with it the abandonment of all determinisms—both the scientific kind which his training had established for him, and which seems to have had some relation to his neurosis, and the theological, metaphysical kind, that he kept combating in the notion of "the block universe." His revolutionary discoveries in psychology and philosophy, his views concerning the methods of science, the qualities of men and the nature of reality, seem all to have received a definite propulsion from this resolution of his poignant personal problem.

In 1872 James was appointed instructor in physiology in Harvard college. He served in this capacity till 1876. But he could not be diverted from his ruling passion, and the step from teaching physiology to teaching psychology—not the traditional "mental science" but physiological psychology—was as inevitable as it was revolutionary. It meant a challenge to the vested interests of the mind, mainly theological, which were entrenched in the colleges and universities of the United States. It meant a definite break with what Mr. Santayana has called "the genteel tradition." Psychology ceased to be mental philosophy and became a laboratory science. Philosophy ceased to be an exercise in the grammar of assent and became an adventure in methodological invention and metaphysical discovery.

With his marriage in 1878, to Miss Alice H. Gibbens of Cambridge, Mass., a new life began for James. The old neurasthenia practically disappeared. He went at his tasks with a zest and an energy his earlier record had given no hint of. It was as if some deeper level of his being had been tapped: his life as an originitive thinker began in earnest. He signed a contract with Henry Holt and Company to produce a text-book of psychology by 1880. But the work grew under his hand and did not appear till 1891. When it did appear, as *The Principles of Psychology*, it was not a text-book but a monumental work in two great volumes from which the text-book was condensed the following year. The *Principles* was at once recognized as both definitive and innovating in its field. It established the "functional point of view" in psychology. It assimilated mental science to the biological disciplines and treated also thinking and knowledge in the aspect

of instruments in the struggle to live. It made at one and the same time the fullest use of principles of psychophysics and defended, without embracing, freewill.

The *Psychology* completed, James seems to have lost interest in the subject. Creator of the first psychological laboratory in America, he had an aversion to laboratory work and did not think himself fitted for it. He liked best the adventure of free observation and reflection. Compared with the problems of philosophy and religion, psychology seemed to him "a nasty little subject" that he was glad to have done with. His studies were now of the nature and existence of God, the immortality of the soul, freewill and determinism, the values of life. They differed from the usual thing in method. They were empirical, not dialectical. James went directly to religious experience for the nature of God, to psychical research for survival after death, to the fields of belief and action for freewill and determinism. He was searching out these things, not arguing foregone conclusions. He had begun to teach ethics and religion in the late '80s and his collaboration with the psychical researchers dated even earlier. Survival after death he found at the end to be unproved, but the existence of divinity he held to be established by the record of the religious experience, but as a plurality of saving powers, "a more of the same quality" as oneself, that one's personality can in a crisis, make contact with and be saved. Freedom he found to be a certain looseness in the conjunction of things, so that what the future shall be is not made inevitable by past history and present form; freedom or chance corresponds to Darwin's "spontaneous variations"; it is what saves history from being mere repetition. These views were set forth in the period between 1893 and 1903 in various essays and lectures, afterwards collected into works: *The Will to Believe and Other Essays in Popular Philosophy* (1897); *Human Immortality* (1898); *Talks to Teachers on Psychology and to Students on Some of Life's Ideals* (1899); *The Varieties of Religious Experience* (1902). The decade may be correctly described as James' religious period. All his studies are concerned with one aspect or another of the religious question. His natural interest in the subject was reinforced by the practical stimulus of an invitation to give the Gifford lectures on natural religion at the University of Edinburgh. He was not able to give them until 1901-02 and the preparation of them focussed his labours for a number of years.

His disability, involving his heart, was due to prolonged effort and exposure during a holiday in the Adirondacks, in June 1899. A trip to Europe which was to have taken up a sabbatical year away from university duties turned into two years of invalidism. The Gifford lectures were prepared during this distressful period. Published as *The Varieties of Religious Experience*, they had an even greater acclaim as a book than as articles. Cautious and tentative though it was, the rich concreteness of the material, the final summary of the evidence that the varieties of religious experience point to the existence of specific and various reservoirs of consciousness-like energies which we can make specific contact with in times of trouble, touched something fundamental in the minds of religionists and at least provided them with apologetic material not in conflict with science and scientific method.

The book also topped off James' interest in the psychology of religion. He now explicitly turned his attention to the ultimate philosophic problems that were at least marginally present with his other interests. Already in 1898, in a lecture at the University of California on philosophical conceptions and practical results, he had formulated the theory of method known as Pragmatism. Having its roots in the strict analysis of the *real* logic of the sciences made in the middle '70s by that extraordinary eccentric genius, Charles S. Peirce, it underwent, in James' hands a transforming generalization. He showed how the meaning of any idea whatsoever—scientific, religious, philosophical, political, social, personal—can be found ultimately in nothing save the succession of experiential consequences it leads through and to, that truth and error are identical with these consequences or else nothing within reach of the mind at all. He had made use of the pragmatic rule in his study of religious experience. He now turned it upon the ideas of change and chance, of freedom, variety, pluralism, novelty, which, from the time he had read Renouvier it had been his

preoccupation to establish. He used the pragmatic rule in his polemic against monism and the "block universe," against internal relations, *i.e.*, the notion that you can't have one thing without having everything, against all finalities, staticisms and completenesses. His classes rang with the polemic against absolutes, and a new vitality crept into the veins of American philosophers. The historic controversy over Pragmatism saved the profession from iteration and dullness.

Meantime (1906) James had been asked to lecture at Stanford university, in California, and experienced there the earthquake which destroyed San Francisco. The same year he delivered the Lowell lectures, in Boston, Mass., afterwards published as *Pragmatism: A New Name for Old Ways of Thinking*. Various studies: "Does Consciousness Exist," "The Thing and its Relations," "The Experience of Activity," etc. appeared, chiefly in the *Journal of Philosophy*, which were essays in the extension of the empirical and pragmatic method to everything that has a name. These studies were collected after James' death and published as *Essays in Radical Empiricism* (1912). The fundamental point of these essays is that the relations between things, holding them together or separating them, are at least as real as the things themselves, that their function is real and that no hidden substrata is necessary to account for the clashes and coherences of the world. The empiricism was *radical*, because until this time even empiricists believed in a hidden turtle on whose back the cosmic elephant rode.

James was now the centre of a new life for philosophy in the English speaking world; the continentals did not "get" Pragmatism; if its German opponents altogether misunderstood it, its Italian adherents—Papini, of all people—travestied it. In England it was championed by Schiller; in the United States there were Dewey and his school. The pragmatists were by no means unanimous among themselves, but that added to the interest of the situation. In 1907 James gave his last course—an introduction to philosophy—in Harvard, and the students surprised him and broke an academic precedent, by presenting him with a loving cup. In the spring he went to Columbia university in New York city to repeat the lectures on "Pragmatism." It was as if a new prophet had come: the lecture halls were crowded on the last day as on the first, with people standing outside the door. He was fêted and photographed; he himself describes the visit as the "high tide of my existence." His hope was, when the thing was over, to settle down at last, to a free consideration of the philosophical questions that obsessed him. But there came an invitation to give the Hibbert lectures at Manchester college in Oxford, England, that constituted, he felt, a challenge which, in view of the status of Pragmatism in England at that time, he might not disregard. These lectures, published in 1909 as *A Pluralistic Universe*, state in a more systematic and less technical way than the *Essays in Radical Empiricism*, the same essential positions. They present in addition certain religious overbeliefs of James' which further thinking, if one may trust the implications of the posthumous *Some Problems in Philosophy*, seemed to be mitigating. These overbeliefs involve a pan-psychistic interpretation of experience which goes beyond radical empiricism and the pragmatic rule into conventional metaphysics.

Home again, James found himself working, against growing physical trouble, upon the material of which some was published after his death (1911) as the *Some Problems*, etc. referred to above. He also collected the occasional pieces in the controversy over Pragmatism and published them as *The Meaning of Truth* (1909). He remained available to students and good causes, and he wrote various other pieces—the last one about B. P. Blood, the "pluralistic mystic." Finally his physical discomfort exceeded even his remarkable voluntary endurance. It was decided to try again a cure at Nauheim and he sailed with Mrs. James in the spring of 1910 for Europe. But in Europe he gave himself too freely to people and Nauheim did not help him. They came back, in the company of his brother Henry, in midsummer, going straight to the country home in Chocorua, N.H. There he died on Aug. 26, 1910. He was survived by his widow, three sons and one daughter.

It is still too early to estimate James' significance and influence.

In psychology, his work is of course dated, but it is dated as Galileo's was in physics or Darwin's in biology, because it was the originative matrix of the great variety of new developments which are the current vogue. In philosophy, his positive work still is prophetic. The world he argued for is that which the new physics, the physics of Einstein and Russell and Bohr definitely point to—a world of events connected with one another by kinds of next to next relations, a world various, manifold, changeful, originating in chance, perpetuated by habits (we call such habit laws) and transformed by breaks, spontaneities and freedoms. In human nature, James thinks, these visible traits of the world are equally manifest. The real specific event is the individual; his character, his beliefs, his endeavour are an adventure in autobiography of which the conclusion is not established in advance. He integrates societies as he lives, and he breaks them. He validates beliefs by living them out or he makes them false. He is the primary event from which history dates, and whose intervention gives it in each case a new and unexpected turn. But in history as in nature, the flux of change and chance transforms every being, invalidates every law and alters every ideal. "What," he asks, "has concluded, that we should conclude about it"? Let us therefore, he urged, allow the claim of everything that makes a claim before us, let us give it an opportunity to make good its claim. The world of thought and the world of things, are alike to be treated in the spirit of sportsmanlike fair play; the new, the untried, the doubtful are to have their chance whenever they arise, and however.

James lived his philosophy. It enters into the texture and rhythms of his rich and vivid literary style. It determined his attitude toward scientifically unaccepted therapies, like Christian Science or mind cure and repugnant ideals like militarism. It made him an anti-imperialist, a defender of the small, the variant, the unprecedented, the weak, wherever and whenever they appeared. His philosophy is too viable and subtle, too hedged, experiential and tentative to have become the dogma of a school. It has functioned rather as a germinative of new thought in others than as a standard old system for others to repeat.

JAMES, EPISTLE OF. This epistle, according to its opening verse, is addressed by James to "the twelve tribes of the dispersion," which probably means Christendom in general, conceived as the new Israel (*cf.* 1 Peter i. 1, 3, 23-5; Gal. vi. 16). According to the traditional view, this James is the Lord's brother, the "pillar" of Gal. ii. 9. But this is very far from being certain. With the superscription of this epistle may be compared that of the Epistle of Jude (*q.v.*), whose author, it would seem, seeks to clothe a message of denunciation against heretics guilty of moral laxity with similar apostolic authority, the "kindred of the Lord" being regarded in post-apostolic times as guardians of faith and morals for the Church (Hegesippus *ap.* Euseb., *H. E.* iv., xxii. 4).

Though some conservative critics still maintain the authenticity of the work, the superscription failed, even in antiquity, to secure its general acceptance; for Origen (A.D. 230), who is the first writer to make explicit mention of it, speaks of it as only "the so-called Epistle of James," Eusebius classes it among the "disputed" writings, and even Jerome admits that it was "said to have been published by another in the name of James." It is included in the *Catalogus Claromontanus* (Alexandria, 4th century) and in the lists of Athanasius, Cyril of Jerusalem and Epiphanius. But the Western Church, like the Syrian, refused it recognition down to the 5th century.

Luther maintained that the epistle was not apostolic (*Sämmil. Werke*, Erl., vol. lxiii. p. 157), but his objections were largely doctrinal in character and the later reformers, disregarding the well-founded doubts of Erasmus and Cajetan, fell back upon the traditional view. Modern criticism begins with de Wette's *Introd. to the N.T.* (1826), which definitely denied the claim to apostolic origin. It is true that the epistle cannot have been composed later

than A.D. 150, and that from the beginning it bore the name of James. But the language in which it was composed is a strongly Hellenized type of patristic Greek. This, and its motive, that of combating the type of degenerate Paulinism denounced in the Pastoral Epistles, Polycarp, and Papias as "vain talk" in place of a life in accordance with the new commandment of love, serve to link it, so far as motive is concerned, with the Gospel of Matthew, the Epistles of John (*cf.* 1 John iii. 16-24), Ps.-Barnabas (A.D. 132?), and the Ignatian Epistles (115).

Zahn and Mayor would avoid the difficulty of taking ii. 14-26 as a direct polemic against the watchword of Paul by assuming a date shortly before the beginning of the legalistic controversy or immediately after the death of Paul. But internal evidence shows that the date must fall "in the period of quiet after the destruction of Jerusalem in A.D. 70 and before the disturbances which culminated in the rebellion of Bar-Cochba, A.D. 132-135." This conclusion is that of Prof. J. H. Ropes of Harvard in the most thorough treatment ever given to the epistle (*I.C. Comm.*, 1916).

While, as regards motive, the writer stands close to the Pastoral Epistles and Matthew, his use of the moral teachings of Jesus is closer to the form reflected in Luke. Like the Lucan source James shows affinity with the Jewish wisdom literature as well as with the Hellenistic diatribe. His extraordinary lack of interest in Jesus as actual Leader and Founder of the Church (*cf.* James v. 10, 11 with 1 Peter iii. 13-iv. 6), resulting in a type of religion equivalent to the Jewish doctrine of the Torah as an indwelling better impulse (*yetser hatob*), informing and sustaining the spiritual life, can scarcely be paralleled unless in the *Preaching of Peter*, an early product of the Syrian Church in which, as Clement reports, the titles applied to Christ were Word and Law (*Λόγος καὶ Νόμος*). Hermas at Rome, who shows several other contacts with James, has also the strange declaration that "The Law of God given to the whole world is the Son of God" (*Simil.* viii. 3). The foundation is seemingly 1 Peter i. 23-25, adopted in James i. 18, 21; but the outcome is a Logos doctrine widely different from that developed in Asia under the influence of Paul.

As between Syria and Rome internal indications, such as the reference to conditions of agriculture (v. 7) as well as the pseudonym invoked, suggest a Syrian origin as more probable. As an example of the kind of surroundings likely to give rise to such a writing Ropes suggests Caesarea, second only to Jerusalem as a Palestinian cradle of the Church. In his carefully chosen words "The epistle is probably the pseudonymous production of a Christian of Jewish origin, living in Palestine in the last quarter of the 1st century or the first quarter of the 2nd."

JAMES-LANGE THEORY OF EMOTIONS. The usual way of thinking about the emotional experiences and their facial or other bodily manifestations is that the emotional experience is excited by the perception of some object, and that the emotional feeling then expresses itself in the bodily manifestations in question. The feelings, in other words, are commonly regarded as causing, or expressing themselves in, the physical manifestations, and that is why these are called the "expressions" of the former. In opposition to this view, the theory of C. G. Lange (1834-1900) and W. James (1840-1910) states that the so-called expressions or bodily changes are the direct results of the perception of the exciting object, and that the emotion is just the feeling of these bodily changes as they occur. Common sense says, we lose our fortune, are sorry and weep; we meet a bear, are frightened and run; we are insulted, are angry and strike. But this, says James, misrepresents the actual sequence. Really we feel sorry because we cry; we feel angry because we strike; we are frightened because we run away. The main argument by which this theory is supported is that it is impossible to imagine a strong emotion, like anger or fear, in the absence of all those widespread organic disturbances which constitute its bodily symptoms. But this would only show that emotions cannot be experienced without these organic disturbances; it does not prove

that these sense experiences are the whole emotion. There are organic sensations, like hunger and thirst, which are not emotional at all. It has been shown, moreover, that different organic changes may be connected with the same emotion, and similar organic changes with different emotions. The mere sight of a bear, in fact, does not even produce any organic disturbances unless it is felt to threaten the instinct of self-preservation, and so induces fear. As James Ward has said, "Let Professor James be confronted first by a chained bear and then by a bear at large; to the one object he presents a bun and to the other a clean pair of heels" (*Psychological Principles*, p. 586).

See *PSYCHOLOGY*; *PSYCHOLOGY, HISTORY OF*; W. James, *Principles of Psychology* (1890); J. Ward, *Psychological Principles* (1918); G. F. Stout, *Manual of Psychology* (1919).

JAMES OF HEREFORD, HENRY JAMES, 1ST BARON (1828-1911), English lawyer and statesman, son of P. T. James, surgeon, was born at Hereford on Oct. 30, 1828, and educated at Cheltenham college. He was called to the bar at the Inner Temple in 1852 and joined the Oxford circuit. In 1867 he was made "postman" of the court of exchequer, and in 1869 became a Q.C. At the General Election of 1868 he obtained a seat in parliament for Taunton as a Liberal, by the unseating of Mr. Serjeant Cox on a scrutiny in March 1869, and he kept the seat till 1885, when he was returned for Bury. He attracted attention in parliament by his speeches in 1873 in the debates on the Judicature Act, and in September he was made solicitor-general, and in November attorney-general, and knighted; and when Gladstone returned to power in 1880 he resumed his office. He was responsible for carrying the Corrupt Practices Act of 1883. On Gladstone's conversion to Home Rule, Sir Henry James parted from him and became one of the most influential of the Liberal Unionists; Gladstone had offered him the lord chancellorship in 1886, but he declined it; and the knowledge of the sacrifice he had made in refusing to follow his old chief in his new departure lent great weight to his advocacy of the Unionist cause in the country. He was one of the leading counsel for *The Times* before the Parnell Commission, and from 1892 to 1895 was attorney-general to the prince of Wales.

From 1895 to 1902 James was a member of the Unionist ministry as chancellor for the duchy of Lancaster, and in 1895 he was made a peer as Baron James of Hereford. The next year he joined the judicial committee of the Privy Council, and sat there and as a lord of appeal in the House of Lords. He delivered a number of important decisions as chairman of the Coal Conciliation Board from 1898 to 1909. In his later years the new policy of the Unionist Government drove him into opposition again; he opposed the Tariff Reform policy, and he opposed the rejection of the Budget by the House of Lords. He died on Aug. 18, 1911 at Kingswood Warren near Epsom.

JAMESON, ANNA BROWNELL (1794-1860), English writer on art, was born in Dublin on May 17, 1794, the daughter of Denis Brownell Murphy, a miniature and enamel painter. Anna went to England as a governess, and married, in 1825, Robert Jameson. The marriage was unhappy, and when Jameson was appointed a colonial judge the two parted. Anna Jameson is remembered for her essays on Shakespeare's heroines, *Characteristics of Shakespeare's Women* (1832), and her books on sacred art: *Poetry of Sacred and Legendary Art* (1848), *Legends of the Monastic Orders* (1850), *Legends of the Madonna* (1852), and *History of Our Lord as represented in Art* (1864), completed by Lady Eastlake.

Anna Jameson also took a keen interest in questions affecting the education, occupations and maintenance of her own sex. On these subjects she wrote *Sisters of Charity* (1855) and *The Communion of Labour* (1856). She died on March 17, 1860.

See Geraldine Macpherson, *Memoirs of Mrs. Jameson* (1878), and Mrs. Stuart Erskine, *Letters and Friendship* (1915).

JAMESON, SIR LEANDER STARR (1853-1917), British colonial statesman, son of R. W. Jameson, a writer to the signet in Edinburgh, was born at Edinburgh in 1853, and was educated for the medical profession at University College Hospital, London (M.R.C.S. 1875; M.D. 1877). After acting as

house physician, house surgeon and demonstrator of anatomy, his health broke down from overwork in 1878, and he went out to South Africa and settled down in practice at Kimberley. There he came into contact with Cecil Rhodes. In 1888 he used his influence with Lobengula, who was one of his patients, to induce him to grant the concessions to the agents of Rhodes which led to the formation of the British South Africa Company; and when the company proceeded to open up Mashonaland, Jameson abandoned his medical practice and joined the pioneer expedition of 1890. From this time his fortunes were bound up with Rhodes's schemes in the north. Immediately after the pioneer column had occupied Mashonaland, Jameson, with F. C. Selous and A. R. Colquhoun, went east to Manicaland and secured the greater part of that country, to which Portugal was laying claim, for the Chartered Company. In 1891 Jameson succeeded Colquhoun as administrator of Rhodesia. At the end of 1894 "Dr. Jim" (as he was familiarly called) came to England and was fêted on all sides.

On the last day of 1895 the world was startled to learn that Jameson, with a force of 600 men, had made a raid into the Transvaal from Mafeking in support of a projected rising in Johannesburg, which had been connived at by Rhodes at the Cape (*see RHODES, CECIL, and TRANSVAAL*). Jameson's force was compelled to surrender at Doornkop, receiving a guarantee that the lives of all would be spared; he and his officers were sent to Pretoria, and, after a short delay, President Kruger, on the surrender of Johannesburg (Jan. 7), handed them over to the British government for punishment. They were tried in London under the Foreign Enlistment Act in May 1896, and Dr. Jameson was sentenced to 15 months' imprisonment at Holloway. He served a year in prison, and was then released on account of ill health. He still retained the affections of the white population of Rhodesia, and returned there in an unofficial capacity. He was the constant companion of Rhodes on his journeys up to the end of his life, and when Rhodes died in May 1902, Jameson was left one of the executors of his will. In 1903 Jameson came forward as the leader of the Progressive party in Cape Colony; and after the Progressive victory at the general election in Jan.-Feb. 1904, Jameson was prime-minister. He attended the Colonial conference held in London in 1907. In September of that year the Progressives were defeated at the polls, and Jameson resigned office on Jan. 31, 1908. In 1908 he was one of the delegates from Cape Colony to the inter-colonial convention for the closer union of the South African states. The union of the South African colonies in 1909 accomplished the principal object which Jameson had set before himself as a political leader. He wished to carry the spirit of union further by forming a combination of political parties to support a non-racial government for the new Union, regarded General Botha as the natural leader of such a combination, and was completely ready to serve under him. This project of a "best man" government, however, was not accepted by Botha, who thought that the Dutch-speaking people of South Africa were not ready for it. The alternative, to which Jameson then set himself, was the formation of a new party representing the majority of the English-speaking people in the Cape, the Transvaal, the Orange Free State and Natal. The programme of the new Unionist party of South Africa showed his influence in every clause.

For two years Jameson led the Unionists in the South African house of assembly with moderation and self-restraint, but he was compelled by ill-health to retire from the leadership of the party in 1912. He returned to England and settled in London, devoting himself to business interests. He died on Nov. 26, 1917. Diffident and utterly free from self-seeking, Jameson's labours for racial reconciliation and material progress in South Africa were conspicuous, and the close friendship of Botha was a final proof of the quality of his patriotism. Jameson was created a K.C.M.G. on the inauguration of the Union in 1909 and a baronet in 1911. *See also SOUTH AFRICA, UNION OF*.

JAMESON, ROBERT (1774-1854), Scottish naturalist and mineralogist, was born at Leith on July 11, 1774. He became assistant to a surgeon in his native town. He studied natural

history under Dr. John Walker in 1792 and 1793, and went in 1800 to Freiberg to study for nearly two years under Werner. In 1804 he succeeded Walker as regius professor of natural history in Edinburgh university. He became perhaps the first eminent exponent in Great Britain of the Wernerian geological system, but was ultimately converted to the views of Hutton. His influence in the classroom gave a marked impetus to the study of geology in Britain. His energy also amassed a great part of the splendid collection in the natural history department of the Royal Scottish museum in Edinburgh. In 1819 Jameson, with Sir David Brewster, started the *Edinburgh Philosophical Journal*, and after the 10th volume edited it alone, until his death in Edinburgh on April 19, 1854.

Jameson was the author of *Outline of the Mineralogy of the Shetland Islands and of the Island of Arran* (1798), incorporated with *Mineralogy of the Scottish Isles* (1800); *Mineralogical Description of Scotland*, vol. i. pt. 1 (Dumfries, 1805); this was to have been the first of a series embracing all Scotland; *System of Mineralogy* (3 vols., 1804-08; 3rd ed., 1820); *Elements of Geognosy* (1809); *Mineralogical Travels through the Hebrides, Orkney and Shetland Islands* (2 vols., 1813); and *Manual of Mineralogy* (1821); and occasional papers, of which a list will be found in the *Edinburgh New Philosophical Journal*, July, 1854, with a portrait and biographical sketch of the author.

JAMESTOWN, city, Chautauqua county, New York, U.S.A., at the southern outlet of Lake Chautauqua, 68m. S. by W. of Buffalo. It is served by the Erie and the Jamestown, Westfield and North-western railways, by inter-urban trolley and motor-bus lines, and in summer by lake steamers. The population was 38,917 in 1920 (29% foreign-born white, largely from Sweden) and was estimated locally at over 50,000 in 1928. It has a delightful situation among the hills of Chautauqua county, in a fertile farming and dairying region. The shores of the lake are lined with summer cottages and hotels, and on the west side, near the upper end, are the grounds of the Chautauqua Institution. Jamestown has important and rapidly growing manufactures, notably of furniture (metal and wood) and building trim. The factory output in 1925 was valued at \$51,805,812. Bank clearings in 1926 amounted to \$78,600,000, and the assessed valuation of property in 1927 was \$62,347,354. Jamestown was settled in 1810, incorporated as a village in 1827, and chartered as a city in 1886. It was named after James Prendergast, an early settler.

JAMESTOWN, a city of North Dakota, U.S.A., on the James river and Federal highway 10, midway between Fargo and Bismarck, at an altitude of 1,429 ft.; the county seat of Stutsman county. It is served by the Midland Continental and the Northern Pacific railways. The population in 1925 (State census) was 7,230. It is the trading and shipping point of a fine farming and stock-raising country. The Northern Pacific has division headquarters and repair shops here. Jamestown college, a Presbyterian institution established in 1909, has an enrolment of over 500. Just south of the city is the State hospital for the insane. Settlement began here in 1873, near Ft. Seward (established in 1872 and abandoned in 1877). The city was chartered in 1883. Between 1900 and 1920 the population increased 32 per cent.

JAMESTOWN, a former village in what is now James City county, Va., U.S.A., on Jamestown island, in the James river, about 40 m. above Norfolk. It was here that the first permanent English settlement in America was founded on May 13, 1607, that representative government was inaugurated on the American Continent in 1619, and that negro servitude was introduced into the original 13 Colonies, also in 1619. In Jamestown was the first Anglican church built in America. The settlement was in a low marshy district which proved to be unhealthy; it was accidentally burned in Jan. 1608, and was almost completely destroyed by Nathaniel Bacon in Sept. 1676. The State house and other buildings were again burned in 1698, and after the removal of the seat of Government of Virginia from Jamestown to the Middle Plantations (now Williamsburg) in 1699 the village fell rapidly into decay. Its population had never been large: it was about 490 in 1609 and 183 in 1623; the mortality was always very heavy. By the middle of the 19th century the peninsula on which Jamestown had been situated had become an island, and by 1900 the James river had worn away the shore but had hardly touched the territory of the "New Towne" (1619), immediately east of

the first settlement; almost the only visible remains, however, were the tower of the brick church and a few gravestones. In 1900 the association for the preservation of Virginia antiquities, to which the site was deeded in 1893, induced the U.S. Government to build a wall to prevent the further encroachment of the river; the foundations of several of the old buildings have since been uncovered, many interesting relics have been found, and in 1907 there were erected a brick church (which is as far as possible a reproduction of the fourth one built in 1639-47), a marble shaft marking the site of the first settlement, another shaft commemorating the first house of burgesses, a bronze monument to the memory of Capt. John Smith, and another monument to the memory of Pocahontas. (For additional details concerning the early history of Jamestown, see VIRGINIA: History.)

The founding at Jamestown of the first permanent English-speaking settlement in America was celebrated in 1907 by the Jamestown Tercentennial Exposition, held on grounds at Sewell's point on the shore of Hampton Roads. About 20 foreign nations, the Federal Government and most of the States of the Union took part in the exposition.

See L. G. Tyler, *The Cradle of the Republic: Jamestown and James River* (Richmond, 2nd ed., 1906); Mrs. R. A. Pryor, *The Birth of the Nation: Jamestown 1607* (1907); and particularly S. H. Yonge, *The Site of Old "James Towne" 1607-1698* (Richmond, 1904), embodying the results of the topographical investigations of the engineer in charge of the river-wall built in 1900-01. See also J. T. Faris, *The Romance of Forgotten Towns* (1924).

JĀMĪ (NŪR-ED-DIN 'ABD-UR-RAHMAN IBN AHMAD) (1414-1492), Persian poet and mystic, was born at Jām in Khurasan, whence the name by which he is usually known. In his poems he mystically utilizes the connection of the name with the same word meaning "wine-cup." He was the last great classic poet of Persia, and a pronounced mystic of the Sūfī philosophy. His three *diwans* (1479-1491) contain his lyrical poems and odes; among his prose writings the chief is his *Bahārīstān* ("Spring-garden") (1487); and his collection of romantic poems, *Haft Awrang* ("Seven Thrones"), contains the *Salāmān wa Absāl* and his *Yūsuf wa Zalikha* (Joseph and Potiphar's wife) in 74 cantos.

On Jāmī's life and works see V. von Rosenzweig, *Biographische Notizen über Mawlana Abdurrahman Dschami* (Vienna, 1840); Gore Ouseley, *Biographical Notices of Persian Poets* (1846); W. N. Lees, *A Biographical Sketch of the Mystic Philosopher and Poet Jami* (Calcutta, 1859); E. Beauvois (s.v. Djami) in *Nouvelle Biographie générale*; and H. Ethé in Geiger and Kuhn's *Grundriss der iranischen Philologie*, ii. There are English translations of the *Bahārīstān* by E. Rehatsek (Benares, 1887) and Sorabji Fardunji (Bombay, 1899); of *Salāmān wa Absāl* by Edward FitzGerald (1856, with a notice of Jāmī's life); of *Yūsuf wa Zalikha* by R. T. H. Griffith (1882) and A. Rogers (1892); also selections in English by F. Hadland Davis, *The Persian Mystics: Jāmī* (1908). (See also PERSIA: Literature.)

JAMIESON, JOHN (1759-1838), Scottish lexicographer, son of a minister, was born in Glasgow on March 3, 1759. He was educated at Glasgow university and at Edinburgh. Jamieson was licensed to preach in 1789 and became pastor of an Anti-burgher congregation in Forfar; and in 1797 he was called to the Anti-burgher church in Nicolson street, Edinburgh. The union of the Burgher and Anti-burgher sections of the Secession Church in 1820 was largely due to his exertions. He retired from the ministry in 1830, and died in Edinburgh on July 12, 1838.

Jamieson's *An Etymological Dictionary of the Scottish Language . . . to which is prefixed a Dissertation on the Origin of the Scottish Language* (Edinburgh, 2 vols., 1808), with *Supplement* (2 vols., 1825) was issued in a revised edition by Longmuir and Donaldson in 1879-87.

JAMIESON, ROBERT (c. 1780-1844), Scottish antiquary, was born in Morayshire. In 1806 he published a collection of *Popular Ballads and Songs from Tradition, Manuscript and Scarce Editions*. Two pleasing lyrics of his own were included. Scott, through whose assistance he received a Government post at Edinburgh, held Jamieson in high esteem and pointed out his skill in discovering the connection between Scandinavian and Scottish legends. Jamieson's work preserved much oral tradition which

might otherwise have been lost. He was associated with Henry Weber and Scott in *Illustrations of Northern Antiquities* (1814). He died on Sept. 24, 1844.

JAMKHANDI, a native state of India, in the Deccan division of Bombay, ranking as one of the southern Mahratta Jagirs. Area, 492 sq.m. Pop. (1921), 101,195; tribute, £1,300. The chief is a Brahman of the Patwardhan family. Cotton, wheat and millet are produced, and weaving and dyeing carried on. The town of JAMKHANDI, the capital, is situated 68 m. E. of Kolhapur. Pop. (1921), 12,620.

JAMMES, FRANCIS (1868–), French poet and novelist, was born at Tournai Dec. 2, 1868, and when still a child went to live at Orthez. He studied at the Collège de Pau and the Collège de Bordeaux, and afterwards became for a short time a notary's clerk at Orthez. There he published his first verses, in 1893, and from the countryside of Orthez he drew much of the matter of his poetical work. After that date, his poems and novels succeeded each other rapidly. The chief characteristics of his style are a great simplicity and a preoccupation with the humble manifestations of everyday life, especially of French provincial life. Much of his work is profoundly religious and Catholic. His *Oeuvres* (2 vols.) were collected in 1925.

Among his works are: *De l'Angelus de l'aube à l'Angelus du soir* (1898); *Clara d'Ellébeuse* (1899); *Les georgiques chrétiennes* (1912); *Feuilles dans le vent* (1914); *Le Rosaire au Soleil* (1916); *Le Curé d'Ozeron* (1918); *Les livres des quatrains* (1923–25); *Ma France poétique* (1926). See also T. Braun; *Des poètes simples: Francis Jammes* (1900); A. de Bersancourt, *Francis Jammes, poète chrétien* (1910); A. Lowell, *Six French Poets* (1915); P. Lasserre, *Les chapelles littéraires* (1920).

JAMMU or **JUMMOO**, capital of the state of Jammu and Kashmir in northern India, on the river Tavi (Ta-wi), a tributary of the Chenab. Pop. (1921), 36,506. The town and palace stand upon the right bank of the river; the fort overhangs the left bank, at a height of 150 ft. above the stream. The city was the seat of a Rajput dynasty. After conquest by the Sikhs, it formed part of Ranjit Singh's dominions. After his death it was acquired by Gulab Singh as the nucleus of his dominions, to which the British added Kashmir in 1846. It is connected with Sialkot in the Punjab by a railway 16 m. long.

The province of Jammu proper, consists of a submontane tract, the upper basin of the Chenab. Pop. (1921), 1,640,259.

JAMNIA, an ancient town of southern Palestine 13 m. S. of Joppa and 4 m. from the sea. The name is a Graecized form of the Jabneh, or Jabneel, of the Old Testament. The modern inheritor of the site is a large village on a sandy hill in the midst of gardens and coppices. It has two mosques, one taking the place of an ancient church.

A Canaanite town, it was allotted to Judah, surrendered later to Dan, and passed to the Philistines. Its port, in ancient times also called Iamnia, is the modern *Mînet er-Rubîn*, where Judas Maccabaeus burned the vessels (164 B.C.). Simon, Alexander Jannaeus and Pompey possessed it in turn. In A.D. 70 a rabbinic college was established there by Jochanan ben Zakkai, traditionally believed to have escaped from the siege of Jerusalem concealed in a coffin. The Great Sanhedrin transferred its activities thither and continued there until Bar Cochba had come into the open against the Romans (A.D. 132). It was erected into a bishopric at the time of Eusebius, and its bishop was present at Nicaea (A.D. 325). The Crusaders, to whom the place was known as Ibelin, built a fortress there (1144).

There was a Jabneel (mod. Yemma), 8 m. S. of Tiberias, and Josephus describes a fortress in Upper Galilee named Jamnia (*Vita* 37). (E. Ro.)

JAMRUD, a fort and cantonment in India, just beyond the border of Peshawar district, North-West Frontier Province (q.v.), situated at the mouth of the Khyber Pass, 9 m. W. of Peshawar on the extension of the North-Western railway to the Afghan frontier. It was occupied by Hari Singh, Ranjit Singh's commander in 1836; but in April 1837 Dost Mohammed sent a body of Afghans to attack it. The Sikhs gained a doubtful victory, with the loss of their general. During the military operations of 1878–79, Jamrud was a place of considerable importance as the

frontier outpost on British territory towards Afghanistan, and it was also the base of operations for a portion of the Tirah campaign in 1897–98. It is the headquarters of the Khyber Rifles, and the collecting station for the Khyber tolls. Pop. (1921), 6,128.

JAMS AND JELLIES. In the article **FOOD PRESERVATION** it is pointed out that concentrated sugar solutions inhibit the growth of organisms and so have a preservative action. The preparation of jams and jellies is based upon this fact. All fresh and succulent fruit contains a large percentage of water, amounting to at least four-fifths of the whole, and a comparatively small proportion of sugar usually not exceeding 10 to 15%. Such fruit is naturally liable to decomposition unless the greater proportion of the water is removed and the percentage of sugar much increased. Jams and jellies are preserves containing about two-thirds their weight of sugar. All kinds of edible fruit can be made into jam but for the preparation of jellies only those fruits are suitable which contain a sufficient proportion of a chemical substance called pectin, on which the gelatinizing power of fruit depends. This substance is a carbohydrate of no feeding value but, being allied to the vegetable gums, after boiling has the property of solidifying to a gelatinous mass. It is present to some extent in all fresh fruit but to a larger extent in citrous fruits, red and black currants, gooseberries and apples, and certain other fruits which are capable of forming jellies. As some degree of gelatinization is aimed at in jams pectin is sometimes added in the case of strawberries, raspberries, and other fruits which do not contain sufficient pectin to make them set. Iceland moss, gelatine and agar-agar have sometimes been added to give the necessary gelatinizing power, but such additions are not desirable.

The art of jam-making, once entirely domestic, is now a large branch of manufacture. The pulped or sliced fruit, sometimes with the addition of a little water, is mixed with about an equal weight of sugar and rapidly boiled down to the required consistency. As the jellifying power of the pectin depends upon the acidity of the fruit, the consistency can often be improved by the addition of a small quantity (say one-half of 1%) of tartaric or citric acid. Manufacturers sometimes add small quantities of aniline dyes to improve the colour. Considerable experience is required to stop the boiling at the right point; too short boiling leaves an excess of water, which results in fermentation, while over-boiling may cause crystallization of the sugar. The finishing point is usually judged by rule of thumb, although in some factories it is regulated by accurate thermometric measurement. The addition of chemical preservatives, such as salicylic acid, was at one time common, but it is not now permitted in most countries. Although a jam or jelly containing 60 or 70% of sugar does not ferment or decompose it is still liable to the growth of mould on the surface, so in order to prevent this the pots into which the boiled jam is to be poured should be thoroughly cleaned and the jam or jelly sealed hermetically immediately, so that the spores of moulds may not fall upon the surface from the air.

Sometimes starch glucose and beet sugar are used to replace part of the cane sugar; the addition of glucose is not held to be an adulteration and is said to reduce the liability of the jam to crystallize and to aid gelatinization. A popular prejudice has it that beet sugar is not suitable for jam making; this is quite erroneous; large quantities of beet sugar are used and the product is indistinguishable from that made from cane sugar. The gross adulteration of jam is now a thing of the past, but sometimes there is the addition of apple-pulp, or the pulp of certain vegetables to give gelatinizing power, particularly when fruit pulp which has been long stored or which has been preserved with sulphur dioxide is used, as such is apt to be very deficient in pectin. (H. E. C.)

Jams and Jellies, Home-made.—Jellies. The gelatine must first be soaked about 20 minutes in water, and then melted with a small amount of water by stirring on top of a fire. Water should then be added in the proportion of about one pint to one ounce of gelatine, but certain fruits, such as the lemon, require more gelatine. The wine or other flavourings should be added while the mixture is hot; if fruit juice is to be added instead of whole fruits,

the fruit must be stewed until as much as possible of its body has gone into the juice. The mixture should be poured into a mould and left to cool.

To remove jelly from the mould, it is best to place the mould once in very hot water—not several times in lukewarm water. The jelly can then generally be removed with one sharp jerk.

In the United States jelly making from fruit is still a general home process, especially in rural communities and the smaller towns. The process is the same as for commercial jellies, cane or beet sugar being used. Paraffin is in common use for sealing. Of late years preparations of pectin have been marketed for use in the home, and these are being more and more employed.

For gelatine jellies, one pint of liquid requires about one tablespoon of the usual granulated gelatine. This is soaked five minutes in double its own quantity of cold water, and dissolved in a little hot liquid before stirring into the mixture. The use of manufactured gelatine jellies, already flavoured and needing only the addition of hot water, is wide and increasing.

Jam is made at home more generally than jelly, being easier, and if from marketed fruit, better.

Jams. Sugar should be provided in the proportion of anything from $\frac{1}{2}$ lb. to 1 lb. for each pound of fruit, according to taste. The sugar should first be melted over the fire in a small quantity of water, and the fruit then added. The whole should be boiled in a preserving pan from 20 to 60 minutes, according to the hardness of the fruit, being stirred regularly with a wooden spoon or stick, to prevent burning.

The jam must then immediately be placed in perfectly dry pots and sealed at once.

JAMSHEDPUR, a town in British India, in the Singhbhum district of Behar and Orissa. The town is situated in an angle of the Subarnarekha and Kharkhai rivers, with a station on the Bengal-Nagpur railway. With a population of 57,041, it is the third largest town in the province, though it is less than 20 years old. It owes its creation and development to the Tata Iron and Steel company. Land on a village site was acquired here for the erection of the company's works in 1907, the foundations were laid in 1909, and iron was first produced in 1911. Since then Jamshedpur has grown rapidly with the expansion of the company's business, especially during the World War. It is an industrial town with blast furnaces, steel works and rolling mills; the out-turn in 1925-26 was 573,000 tons of pig iron, 470,000 tons of steel and 139,000 tons of rails and beams.

JANÁČEK, LEOS (1854-1928), Czech composer, was born in Hukvaldy, Moravia, on June 3, 1854, and educated in the monastery of the Austrian Friars in Brno under the composer, Paul Křiváček. After studies in Prague, Leipzig and Vienna he returned to Brno, where, in 1881, he became director of the organ school, and later professor of composition in the master school of the State conservatoire, into which the organ school developed. Janáček followed in Křiváček's footsteps, as a collector of folk songs, especially of Moravia, but went deeper than his master into their psychology. Among his operas, which contain some of his most original work, are *Jönufa: Její pastorkyňa*, a psychological drama of Moravian village life, first produced in Prague (1916) and later heard in Berlin, Vienna and New York; and *Katya Kabanova* (1922), based on *The Storm*, a Russian drama by Ostrovsky. In lighter mood are *The Excursions of Mr. Brouček* (1920), an operatic satire, and *Liška bystrouška* (1925), an animal opera. Janáček's remaining works include a dramatic song cycle, *The Notebook of One who Vanished*; a symphonic poem, *The Fiddler's Child*; an orchestral rhapsody, *Taras Bulba*; a string quartet; a concertino for small orchestra; a sextet for wind instruments, *Youth*; and some fine choral works. Janáček died on Aug. 13, 1928.

See F. Bartoš and L. Janáček, *Kytice z rárodních písní moravských kterouž uvilil F. Bartoš a L. Janáček* (1800).

JANESVILLE, a city of southern Wisconsin, U.S.A., on the Rock river, 13m. from the Illinois state line; the county seat of Rock county. It is on Federal highway 51, and is served by the Chicago, Milwaukee, St. Paul and Pacific and the Chicago and North Western railways, and by inter-urban motor bus and trolley-

car lines. The population was 18,293 in 1920 (88% native white) and was estimated locally at 25,600 in 1928. The city is picturesquely situated on bluffs above the river, which furnishes abundant water-power. It has a large trade in tobacco and grain, and important manufactures, including automobiles, auto bodies and fountain pens. The aggregate output of the factories in 1925 was valued at \$48,093,105. The State school for the blind, opened here in 1849 as a private institution, and taken over by the State in 1850, is Wisconsin's oldest State charitable institution. Janesville was founded about 1834 and was chartered as a city in 1853, and named after Henry F. Janes, an early settler. Its daily paper, the *Gazette*, was established in 1845.

JANET, PIERRE (1859-), French psychologist, was born on May 30, 1859, in Paris, and educated at the Ecole Normale and the Ecole de Médecine in Paris. From 1881 to 1898 he lectured on philosophy at the lycées of Chateauroux and The Hague, at the College Rollin, and at the lycées Louis-le-Grand and Condorcet. During the period 1889-98 he was at the same time director of the psychological laboratory of la Salpêtrière. From 1898 to 1902 he lectured on psychology at the Sorbonne, and was then appointed *professeur suppléant* at the Collège de France, where he became professor of psychology in 1902. He is also the director of the *Journal de Psychologie normale et pathologique*.

His publications include: *L'Automatisme psychologique* (1889); *L'Etat mental des hystériques* (2 vols. 1893); *Névroses et idées fixes* (2 vols. 1898); *Les Obsessions et la Psychasténie* (2 vols. 1903); *Les Névroses* (1908); *The Major Symptoms of Hysteria* (1908); *Les Méditations psychologiques* (3 vols. 1920, Eng. trs. 2 vols.); *La Médecine psychologique* (1923, Eng. trs.); *De l'angoisse à l'extase* (vol. 1, 1926).

JANEWAY, THEODORE CALDWELL (1872-1917), American physician, was born in New York city Nov. 2, 1872. He was educated at the Sheffield Scientific School, Yale university, and the College of Physicians and Surgeons, Columbia university. From 1898 to 1906 he taught medical diagnosis in New York university. In 1907 he became associate in medicine in Columbia university, and two years later professor of medicine. In 1914 he was called to Johns Hopkins university as professor of medicine, and became physician-in-chief to Johns Hopkins hospital. His investigations in the phenomena of blood pressure opened up a hitherto unexplored field of medical research. During the World War, he became major in the Medical Officers' Reserve Corps and was engaged in research in Washington (D.C.). He died at Baltimore (Md.) Dec. 27, 1917. He was a member of the board of scientific directors of the Rockefeller Institute for Medical Research. He was the author of *The Clinical Study of Blood Pressure* (1904).

JANIN, JULES GABRIEL (1804-1874), French critic, was born at St. Etienne (Loire) on Feb. 16, 1804, and died near Paris on June 19, 1874. He worked on the *Figaro*, the *Quotidienne*, etc., until in 1830 he became the dramatic critic of the *Journal des Débats*. After many years of *feuilleton* writing he collected some of his articles in the work called *Histoire de la littérature dramatique en France* (6 vols., 1853-58). In 1870 he was admitted to the Academy. One of the best of his many books is *Fin d'un monde et du neveu de Rameau* (1861), in which, under the guise of a sequel to Diderot's masterpiece, he showed his great familiarity with the late 18th century. His *Oeuvres choisies* (12 vols., 1875-78) were edited by A. de la Fitzelière.

A study on Janin with a bibliography was published by A. Piédagnel in 1874. See also Sainte-Beuve, *Causeries du lundi*, ii. and v., and Gustave Planche, *Portraits littéraires*.

JANINA, a town of North Epirus in Greece. Pop. (1920) 20,765. The largest ethnical groups in the population are the Albanian and Greek. The position of Janina is strikingly picturesque. At the foot of the grey limestone mass of Mount Mitzekeli (1,500 ft.), which forms part of the fine range of hills running north from the Gulf of Arta, there lies a valley (the *Hellopia* of antiquity) partly occupied by a lake; and the city is built on the slopes of a slight eminence, stretching down to the western shore. It has greatly declined from the state of barbaric prosperity which it enjoyed from 1788 to 1822, when it was the

seat of Ali Pasha (*q.v.*), and was estimated to have from 30,000 to 50,000 inhabitants. The fortress—Demir Kule or Iron Castle, which, like the principal seraglio, was built on a promontory jutting into the lake—is now in ruins. But the city is the seat of a Greek archbishop, and still possesses many mosques and churches, besides synagogues, a Greek college (gymnasium), a library and a hospital. Sayades (opposite Corfu) and Arta are the places through which it receives its imports. The rich gold and silver embroidery for which the city has long been famous is still one of the notable articles in its bazaar.

The lake of Janina (perhaps to be identified with the Pambotis or Pambotis of antiquity) is 6 m. long, and has an area of 24 sq.m., with an extreme depth of less than 35 ft. In time of flood it is united with the smaller lake of Labchistas to the north. There are no affluents of any considerable size, and the only outlets are underground passages or *katavothrai* extending for many miles through the calcareous rocks.

As Anna Comnena, in describing the capture of the town by Bohemond in 1082, speaks of the walls as being dilapidated, it may be supposed that the place existed before the 11th century. It is mentioned from time to time in the Byzantine annals, and on the establishment of the lordship of Epirus by Michael Angelus Comnenus Ducas, it became his capital. In the middle ages it was successively attacked by Serbs, Macedonians and Albanians; but it was in possession of the successors of Michael when the forces of the Sultan Murad appeared before it in 1430 (*cf.* Hahn, *Alban. Studien*, Jena [1854], pp. 319–322). Since 1431 it remained under Turkish rule but was occupied by the Greeks early in 1913 in the first Balkan war. Since then it has been the principal town of Epirus. It uses as ports Prevoza, to the South, and Santi Quaranta in Albania. Janina is still (1928) notorious as a centre for the organization of brigandage, which is rendered more easy by the proximity of the Albanian border.

See Holland's *Travels* (1815); Hughes, *Travels in Greece*, etc. (1830); H. F. Tozer, *Researches in the Highlands of Turkey* (London, 1869). See also ALBANIA and the authorities there cited.

JANISSARIES, an organized military force constituting, until 1826, the standing army of the Ottoman empire. The word is a corruption of the Turkish *yeni chéri*, new troops. At first Turkey possessed no standing army. It was under Orkhan that a regular paid army was first organized; but the result was unsatisfactory, as the Turcomans, from whom these troops were recruited, were unaccustomed to fight on foot or to submit to military discipline. Accordingly, in 1330, on the advice of Chenderéli Kara Khalil, the system was adopted, whereby a certain number of Christian youths (at first 1,000) were every year taken from their parents and, after undergoing a period of apprenticeship, were enrolled as *yeni chéri* or new troops. The venerable saint Haji Bektash, founder of the Bektashi dervishes, blessed the corps and promised them victory; he remained ever after the patron saint of the janissaries.

At first the corps was exclusively recruited by the forced levy of Christian children, for which purpose the officer known as *tournaji-bashi*, or head-keeper of the cranes, made periodical tours in the provinces. The fixed organization of the corps dates only from Mohammed II., and its regulations were subsequently modified by Suleiman I. In early days all Christians were enrolled indiscriminately; later those from Albania, Bosnia and Bulgaria were preferred. The recruits, while serving their apprenticeship, were instructed in the principles of the faith. Until the accession of Murad III. (1574) the total effective of the janissaries, including the *ajami* or apprentices, did not exceed 20,000. In 1582 irregularities in the mode of admission to the ranks began. Soon parents themselves begged to have their children enrolled, so great were the privileges attaching to the corps; later the privilege of enlistment was restricted to the children or relatives of former janissaries; eventually the regulations were much relaxed, and any person was admitted, only negroes being excluded. In 1591 the whole corps (*ojak*) of janissaries numbered 48,688 men. Under Ibrahim (1640–48) they were reduced to 17,000, but from this time they continually increased until at the time of their destruction in 1826 they numbered 135,000. It would perhaps be

more correct to say that these are the numbers figuring on the pay-sheets. In time of peace the janissary received no pay. In time of war the commander (*aga*) of the janissaries and several of his subordinates received a percentage of the pay and allowance of the troops; they also inherited the property of deceased janissaries. Moreover, the officers profited largely by retaining the names of dead or fictitious janissaries on the pay-rolls. Rations of mutton, bread and candles were furnished by the Government, the supply of rice, butter and vegetables being at the charge of the commandant. The rations would have been entirely inadequate if the janissaries had not been allowed, contrary to the regulations, to pursue different callings, such as those of baker, butcher, boatman, etc. At first the janissaries bore no distinctive mark save the white felt cap. Soon the red cap with gold embroidery was substituted. Later a uniform was introduced, distinguished less by the colour than the cut of the coat and the shape of the head-dress. The only distinction in the costume of commanding officers was in their boots, those of the *beuluks* (who had the privilege of serving as the sultan's guard and keeping the sacred banner in their custody) being red while the others were yellow; subordinate officers wore black boots.

The fundamental laws of the janissaries, which were very early infringed, were implicit obedience to their officers; perfect accord among themselves; abstinence from luxury, extravagance and practices unseemly for a soldier and a brave man; observance of the rules of Haji Bektash and of the religious law; exclusion from the ranks of all save those properly levied; special rules for the infliction of the death-penalty; promotion to be by seniority; janissaries to be admonished or punished by their own officers only; the infirm and unfit to be pensioned. Janissaries were not to let their beards grow, not to marry, nor to leave their barracks, nor to engage in trade; but were to spend their time in drill and in practising the arts of war.

In time of peace the State supplied no arms, and the janissaries on service in the capital were armed only with clubs; they were forbidden to carry any arms save a cutlass, the only exception being at the frontier-posts. In time of war they provided their own arms, and these might be any which took their fancy. However, they were induced by rivalry to procure the best obtainable and to keep them in perfect order. The banner of the janissaries was of white silk, on which verses from the Koran were embroidered in gold. This banner was planted beside the *aga's* tent in camp, with four other flags in red cases, and his three horse-tails. Each unit (*orta*) had its flag, half-red and half-yellow, placed before the tent of its commander. Two or three great cauldrons used for boiling the soup and pilaw were under the guard of subordinate officers. A particular superstition attached to them: if they were lost in battle all the officers were disgraced, and the *orta* was no longer allowed to parade with its cauldrons in public ceremonies.

At first a source of strength to Turkey as being the only well-organized force in the country, the janissaries soon became its bane. One frequent means of exhibiting their discontent was to set fire to Constantinople; 140 such fires are said to have been caused during the 28 years of Ahmed III.'s reign. The janissaries were at all times distinguished for their want of respect towards the sultans; their outbreaks were never due to a real desire for reforms, but solely to obtain the downfall of some obnoxious minister. The first recorded revolt of the janissaries is in 1443, on the occasion of the second accession of Mohammed II., when they broke into rebellion at Adrianople. A similar revolt happened at his death, when Bayazid II. was forced to yield to their demands and thus the custom of the accession-bakshish was established. In the 17th century they had become a praetorian guard in the worst sense of the word. Sultan Selim III. in despair endeavoured to organize a properly drilled and disciplined force to take their place; whereupon the janissaries dethroned him and obtained the abolition of his force. But after the successful revolution of Bairakdar Pasha of Widdin, the new troops were re-established and drilled; the resentment of the janissaries rose to such a height that they attacked the grand

vizier's house, and after destroying it marched against the sultan's palace. They were repulsed by cannon, losing 600 men in the affair (1806). But such was the alarm caused at Constantinople that the new troops had to be suppressed. During the next 20 years the turbulence of the janissaries knew no bounds. Sultan Mahmud II., powerfully impressed by their violence and lawlessness at his accession, determined to rid the State of this scourge. In 1825 he decided to form a corps of regular drilled troops known as *eshkenjis*. A *fetva* was obtained from the Sheikh-ul-Islam to the effect that it was the duty of Muslims to acquire military science. The imperial decree announcing the formation of the new troops was promulgated at a grand council, and the high dignitaries present (including certain of the principal officers of the janissaries, who concurred) undertook to comply with its provisions. But the janissaries rose in revolt, and on June 10, 1826, began to collect on the Et Meidan square at Constantinople; at midnight they attacked the house of the *aga* of janissaries, and, finding he had made good his escape, proceeded to overturn the cauldrons of as many *ortas* as they could find, thus forcing the troops of those *ortas* to join the insurrection. Then they pillaged and robbed throughout the town. Meanwhile the Government was collecting its forces; the sacred standard of the prophet was unfurled, and war was formally declared against the rioters. Cannon were brought against the Et Meidan, which was surrounded by troops. Ibrahim Aga, the commander of the artillery, made a last appeal to the janissaries to surrender; they refused, and fire was opened upon them. Such as escaped were shot down as they fled; the barracks, where many found refuge, were burnt; those who were taken prisoner were brought before the grand vizier and hanged. Before many days were over the corps had ceased to exist.

See M. d'Ohsson, *Tableaux de l'empire ottoman* (Paris, 1787-1820); A. Djévad Bey, *État militaire ottoman* (1885).

JANIUAY, a municipality (with administration centre and 74 *barrios* or districts) of the province of Iloilo, island of Panay, Philippine islands, about 20 m. W.N.W. of Iloilo, the provincial capital. Pop. (1918), 24,641. Excellent motor roads connect it with other centres. The surrounding country, although hilly, is fertile and well cultivated, producing rice, sugar, tobacco, vegetables, abacá and corn. Fabrics of *piña*, silk, abacá and cotton are woven. In 1918, it had 92 household industry establishments with output valued at 25,400 pesos; and 19 sugar mills. Of the 17 schools 12 were public. The language spoken is a dialect of Bisayan. Janiuay was founded in 1578.

JANJIRA, a native state of India (Kolaba agency), in the Konkan division of Bombay, situated along the coast among the spurs of the Western Ghats, 40 m. S. of Bombay city. Area, 324 sq. m. Pop. (1921) 87,534. There is a small military force; no tribute. The chief, whose title is *nawab sahib*, is by descent a Sidi or Abyssinian Mohammedan; and his ancestors were for many generations admirals of the Mohammedan rulers of the Deccan. The *nawab* being a minor, the state was under British administration in 1927. The state, popularly known as Habsan (=Abyssinian), did not come under direct subordination to the British until 1870. It supplies firewood to Bombay, with which it is in regular communication by steamer. The capital is Murad: the name Janjira, apart from the state, is confined to an island fort.

The *nawab* of Janjira is also chief of the state of JAFARABAD (*q.v.*).

JAN MAYEN, an Arctic island between Greenland and the north of Norway, about 71° N., 8° W. It is 34 m. long and 9 m. in greatest breadth, and is divided into two parts by a low, narrow isthmus. The island is of quaternary volcanic formation and mountainous, the highest summit being the extinct volcano of Beerenberg (8,094 ft.). Eruptions of ashes and steam have been observed. Glaciers are fully developed. Henry Hudson discovered the island in 1607 and called it Hudson's Tutches. Thereafter it was several times observed by navigators who successively claimed its discovery and renamed it. Thus, in 1611 or 1612 Hull whalers named it Trinity Island; in 1612 Jean Vrolicq, a French whaler, called it Ile de Richelieu; and in 1614 Joris Carolus, mate

of the Dutch ship of Captain Jan May named it Joris Eylandt. The climate is cold and foggy. There is a little tundra and a few foxes exist on the island. The island has been frequently visited by explorers, sealers, trappers and whalers; and an Austrian observatory was maintained here for a year in 1882-83. J. M. Wordie and P. L. Mercanton completed the exploration in 1921. A Norwegian observatory, with wireless communication, has been working since 1921. Jan Mayen was annexed to Norway, May 8, 1929.

See E. von Wohlgemuth, *Osterreichische Polarstation Jan Mayen* (Vienna, 1886); J. M. Wordie, *Geographical Journal* (March 1912), and *Trans. Royal Soc. Edin.*, 54 (1926).

JANSEN, CORNELIUS (1585-1638), bishop of Ypres, and father of the religious revival known as Jansenism (*q.v.*), was born of humble Catholic parentage at Accoy in the province of Utrecht on Oct. 28, 1585. In 1602 he entered the university of Louvain, then in the throes of a violent conflict between the Jesuit, or scholastic, party and the Augustinians, followers of Michael Baius. Jansen joined the latter party. He made a momentous friendship with a like-minded fellow-student, Du Vergier de Hauranne, afterwards abbot of Saint Cyran. After taking his degree he went to Paris, partly to recruit his health by a change of scene, partly to study Greek. Eventually he joined Du Vergier at his country home near Bayonne, and spent some years teaching at the bishop's college. His spare time was spent in studying the early Fathers with Du Vergier, and laying plans for a reformation of the Church. In 1616 he returned to Louvain, to take charge of the college of St. Pulcheria, a hostel for Dutch students of theology. Pupils found him a somewhat choleric and exacting master and academic society a great recluse. He took part in the university's resistance to the Jesuits, who had established a theological school of their own in Louvain, which was a formidable rival to the official faculty of divinity. Jansen was sent twice to Madrid, in 1624 and 1626; the second time he narrowly escaped the Inquisition. He warmly supported the Catholic missionary bishop of Holland, Rovenius, in his contests with the Jesuits. He also crossed swords more than once with the Dutch Presbyterian champion, Voetius, still remembered for his attacks on Descartes.

Antipathy to the Jesuits brought Jansen no nearer Protestantism; he desired to prove to them that Catholics could interpret the Bible in a manner quite as mystical and pietistic as theirs. This became the great object of his lectures, when he was appointed regius professor of scriptural interpretation at Louvain in 1630. Still more was it the object of his *Augustinus*, a bulky treatise on the theology of St. Augustine, barely finished at the time of his death. Its preparation had been his chief occupation ever since he went back to Louvain. But Jansen, as he said, did not mean to be a school-pedant all his life; and there were moments when he dreamed political dreams. He looked forward to a time when Belgium should throw off the Spanish yoke and become an independent Catholic republic on the model of Protestant Holland. These ideas became known to his Spanish rulers, and to assuage them he wrote a philippic called the *Mars gallicus* (1635), a violent attack on French ambitions generally, and on Richelieu's indifference to international Catholic interests in particular. The *Mars gallicus* did not help Jansen's friends in France, but it appeased the wrath of Madrid against Jansen, and in 1636 he was appointed bishop of Ypres. He died on May 6, 1638; the *Augustinus*, the book of his life, was published posthumously in 1640.

Full details as to Jansen's career will be found in Reuchlin's *Geschichte von Port Royal* (Hamburg, 1839), vol. i. See also *Jansenismus* by the Abbés Callawaert and Nols (Louvain, 1893).

JANSENISM, the religious principles laid down by Cornelius Jansen in his *Augustinus*. This was simply a digest of the teaching of St. Augustine, drawn up with a special eye to the needs of the 17th century. In Jansen's opinion the church was suffering from three evils. The official scholastic theology was anything but evangelical. Having set out to embody the mysteries of faith in human language, it had fallen a victim to the excellence of its own methods; language proved too strong for mystery. Theology sank into a branch of dialectic; whatever would not fit

in with a logical formula was cast aside as useless. But average human nature does not take kindly to a syllogism, and theology had ceased to have any appreciable influence on popular religion. Simple souls found their spiritual pasture in little mincing "devotions"; while robuster minds built up for themselves a natural moralistic religion, quite as close to Epictetus as to Christianity. All these three evils were attacked by Jansen. As against the theologians, he urged that in a spiritual religion experience, not reason, must be our guide. As against the stoical self-sufficiency of the moralists, he dwelt on the helplessness of man and his dependence on his maker. As against the ceremonialists, he maintained that no amount of church-going will save a man, unless the love of God is in him. But this capacity for love no one can give himself. If he is born without the religious instinct, he can only receive it by going through a process of "conversion." And whether God converts this man or that depends on his good pleasure. Thus Jansen's theories of conversion melt into predestination; although, in doing so, they somewhat modify its grimness. Even for the worst miscreant there is hope—for who can say but that God may yet think fit to convert him?

Such doctrines have a marked analogy to those of Calvin; but in many ways Jansen differed widely from the Protestants. He vehemently rejected their doctrine of justification by faith; conversion might be instantaneous, but it was only the beginning of a long and gradual process of justification. Secondly, although the one thing necessary in religion was a personal relation of the human soul to its maker, Jansen held that that relation was only possible in and through the Roman Church. Nevertheless, Jansen's principles inevitably brought him into conflict with the Jesuits, whom he accused of giving absolution much too easily, without any serious inquiry into the dispositions of their penitent, and of excessive reliance on sacramental grace. His views were expounded at length by his disciple, Antoine Arnauld, in a book on *Frequent Communion* (1643). This book was the first manifestation of Jansenism to the general public in France, and raised a violent storm. With the support of the government, representations were made to Rome, and in 1653 Innocent X. declared heretical five propositions from Jansen's book. In 1656 Arnauld was deprived of his degree, in spite of Pascal's *Provincial Letters* (1656-1657), begun in an attempt to save him (see PASCAL; JESUITS). In 1661 a formulary, or solemn renunciation of Jansen, was imposed on all his suspected followers; those who would not sign it went into hiding, or to the Bastille.

The Jansenists had set out to reform the Church of Rome; they ended by having to fight hard for a doubtful foothold within it. Even that foothold soon gave way. Louis XIV. was a fanatic for uniformity, civil and religious. During the lifetime of his cousin, Madame de Longueville, the great protectress of the Jansenists, Louis stayed his hand; on her death (1679) the reign of severity began. That summer Arnauld, who had spent the greater part of his life in hiding, was forced to leave France for good. Six years later he was joined in exile by Pasquier Quesnel who succeeded him as leader of the party. Long before his flight from France Quesnel had published a devotional commentary—*Réflexions morales sur le Nouveau Testament*—which had gone through many editions without exciting official suspicion. But the Jesuits determined to make an end of Jansenism. They played upon the king's superstitions, and at their instigation he wrote to the pope asking for a bull that would tear up Jansenism by the roots. This was forthcoming in 1713, in the bull *Unigenitus*, anathematizing no less than 101 propositions from Quesnel's *Réflexions*. Indeed, in his zeal against the Jansenists the pope condemned various practices in no way peculiar to their party; thus, for instance, many orthodox Catholics were exasperated at the heavy blow he dealt at popular Bible reading. During the following 10 years, however, the opposition was slowly crushed, and in 1730 the *Unigenitus* was proclaimed part and parcel of the law of France. This led to a great quarrel with the judges, who were intensely Gallican in spirit (see GALLICANISM), and had always regarded the *Unigenitus* as a triumph of ultramontanism. The quarrel dragged indefinitely on through the 18th century, though the questions at issue were really constitutional and political

rather than religious.

Meanwhile the most ardent Jansenists had followed Quesnel to Holland. Here they met with a warm welcome from the Dutch Catholic body, which had always been in close sympathy with Jansenism, although without regarding itself as formally pledged to the *Augustinus*. But it had broken loose from Rome in 1702, and was now organizing itself into an independent church (see UTRECHT). The Jansenists who remained in France had meanwhile fallen on evil days. Persecution usually begets hysteria in its victims; and the more extravagant members of the party were far advanced on the road which leads to apocalyptic prophecy and "speaking with tongues." They were eventually disowned by the more reputable Jansenists, and were severely repressed by the police. Meanwhile genuine Jansenism survived in many quiet country parsonages and convents.

(St. C.; X.)

JANSSEN, JOHANNES (1829-1891), German historian, was born at Xanten on April 10, 1829, was ordained priest in 1860, became a member of the Prussian Chamber of Deputies in 1875, and in 1880 was made domestic prelate to the pope and apostolic pronotary. He died at Frankfort on Dec. 24, 1891. Janssen was a stout champion of the Ultramontane party in the Roman Catholic Church. His great work is his *Geschichte des deutschen Volkes seit dem Ausgang des Mittelalters* (8 vols., Freiburg, 1873-94), in which he attempts to prove that the Protestants were responsible for the general unrest in Germany during the 16th and 17th centuries.

The *Geschichte*, which reached its 20th ed. in 1926, has been continued and improved by Ludwig Pastor, and the greater part of it has been translated into English by M. A. Mitchell and A. M. Christie (1896, fol.). Of his other works perhaps the most important are: the editing of *Frankfurts Reichskorrespondenz, 1376-1519* (Freiburg, 1863-1872); and of the *Leben, Briefe und kleinere Schriften* of his friend J. F. Böhm (Leipzig, 1868); a monograph, *Schiller als Historiker* (Freiburg, 1863); and *Zeit- und Lebensbilder* (Freiburg, 1875).

JANSSEN, PIERRE JULES CESAR (1824-1907), French astronomer, was born in Paris on Feb. 22, 1824, and studied mathematics and physics at the faculty of sciences. Various scientific missions were entrusted to him. In 1857 he went to Peru in order to determine the magnetic equator; in 1861-62 and 1864, he studied telluric absorption in the solar spectrum in Italy and Switzerland; in 1867 he carried out optical and magnetic experiments at the Azores; he successfully observed both transits of Venus, that of 1874 in Japan, that of 1882 at Oran in Algeria; and he took part in a long series of solar eclipse-expeditions. At the great Indian eclipse of 1868 he demonstrated the gaseous nature of the red prominences, and devised a method of observing them spectroscopically under ordinary daylight conditions. One main purpose of his spectroscopic enquiries was to answer the question whether the sun contains oxygen or not. For this, he perceived the advantage of reducing the thickness of air through which observations have to be made, and established an observatory on Mont Blanc (1893). In 1875 he was appointed director of the new astrophysical observatory established by the French Government at Meudon, and set on foot there in 1876 the remarkable series of solar photographs collected in his great *Atlas de photographies solaires* (1904). The first volume of the *Annales de l'observatoire de Meudon* was published by him in 1896. He died at Paris on Dec. 23, 1907.

See A. M. Clerke, *Hist. of Astronomy during the 19th Century* (1903); H. Macpherson, *Astronomers of To-Day* (1905).

JANSSENS or JANSSENS, VICTOR HONORIUS (1658-1736), Flemish painter, was born at Brussels. After seven years in the studio of L. Volders, he spent four years in the household of the duke of Holstein. The next 11 years Janssens passed in Rome, where he studied the antique and the works of Raphael

and Albani. He painted a large number of cabinet historical scenes; but, on his return to Brussels, the claims of his increasing family restricted him almost entirely to the larger and more lucrative size of picture, of which very many of the churches and palaces of the Netherlands contain examples. In 1718 Janssens went to Vienna for three years, and was made painter to the emperor. The statement that he visited England is based upon the fact that certain fashionable interiors of the time in that country have been attributed to him. Janssens was a classicist in the style of Nicolas Poussin.

JANSSENS or JANSSENS, VAN NUYSSEN, ABRAHAM (c. 1575–1632), Flemish painter, was born at Antwerp. He studied under Jan Snellinck, was a "master" in 1601, and in 1607 was dean of the master-painters. Till the appearance of Rubens he was considered the best historical painter of his time. Janssens excelled in correctness of drawing, in bold composition and in treatment of the nude. A master of chiaroscuro, he gratified his taste for strong contrasts of light and shade in his torchlights and similar effects. Good examples of this master are to be seen in the Antwerp museum and the Vienna gallery. The stories of his jealousy of Rubens and of his dissolute life are unfounded. He died at Antwerp in 1632.

JANUARIUS, ST., or **SAN GENNARO**, the patron saint of Naples. According to the legend, he was bishop of Benevento, and flourished towards the close of the 3rd century. On the outbreak of the persecution by Diocletian and Maximian, he was taken to Nola and brought before Timotheus, governor of Campania, on account of his profession of the Christian religion. After various assaults upon his constancy, he passed through a fiery furnace unharmed, was thrown, in vain, to the wild beasts, healed his judge of blindness, and was finally despatched, by the same ungrateful judge, by the sword. The relics of the saint were cherished by the Neapolitans as a safeguard against the eruptions of Vesuvius. The cult of St. Januarius, bishop and martyr, is attested historically at Naples as early as the 5th century (*Biblioth. hagiog. latina*, No. 6558). Two phials preserved in the cathedral are believed to contain the blood of the martyr. The relic is shown twice a year—in May and September. On these occasions the substance contained in the phial liquefies, and the Neapolitans see in this phenomenon a supernatural manifestation. The "miracle of St. Januarius" did not occur before the middle of the 15th century.

Other saints of the name of Januarius are the Roman martyr (festival July 10), whose epitaph was written by Pope Damasus (De Rossi, *Bullettino*, p. 17, 1863), and the martyr of Cordova, who forms along with Faustus and Martial the group designated by Prudentius (*Peristephanon*, iv. 20) by the name of *tres coronae*. The festival of these martyrs is celebrated on Oct. 13.

Tagliatela, *Memorie storico-critiche del culto del sangue di S. Gennaro* (Naples, 1893), which contains many facts, but little criticism; G. Albini, *Sulla mobilità dei liquidi viscosi non omogenei* (*Società reale di Napoli, Rendiconti*, 2nd series, vol. iv., 1890); *Acta sanctorum*, October, vi. 187–193.

JANUARY, the first month in the modern calendar, consisting of 31 days. The name (Lat. *Januarius*) is derived from the two-faced Roman god Janus, to whose care the month was dedicated as looking both into the past and the future, and as the deity who busied himself with the beginnings of all enterprises. The consecration of the month took place by an offering of meal, salt, frankincense and wine, each of which was new. The Anglo-Saxons called January *Wulfmonath*, in allusion to the fact that hunger then made the wolves bold enough to come into the villages (see *CALENDAR*).

JANUS, in Roman cult, the god of doorways (*Ianuce*). See *ROMAN RELIGION*. The rationalists explained him as an old king of Latium, who built a citadel for himself on the Janiculum. It was believed that his worship, which existed as a local cult before the foundation of Rome, was introduced there by Romulus, and that the famous *Ianus geminus* facing east and west, at the north-east end of the forum, was dedicated by Numa. It was simply a double barbican gate, open during war and closed during peace

(Livy i. 19); it was shut only four times before the Christian era. Probably its use is connected with war-magic; it provided the outgoing and incoming armies with a lucky way in and out. (Cf. Warde Fowler, *Religious Experience*, p. 126; Rose, *Prim. Culture in Italy*, p. 48). There was also a Janus, i.e., an archway, near the theatre of Marcellus, in the forum holitorium, erected by Gaius Duilius (Tacitus, *Ann.*, ii. 49), if not earlier.

The beginning of the day (hence his epithet *Matutinus*), of the month, and of the year (January) was sacred to Janus; on Jan. 9, the festival called *Agonia* was celebrated in his honour. He was invoked before any other god at the beginning of any important undertaking; his priest was the *Rex Sacrorum*, the representative of the ancient king in his capacity as religious head of the State. All gateways, hosedoors, and entrances generally were under his protection; and indeed all beginnings; hence his title *Consivius*, "sower," that being the beginning of farm-work. He was worshipped on the Janiculum ("door hill"); his head is found on the *as*, together with the prow of a ship. He is usually represented on the earliest coins with two bearded faces, looking in opposite directions; in the time of Hadrian the number of faces is increased to four. In his capacity as porter or doorkeeper he holds a staff in his right hand, and a key (or keys) in his left; as such he is called *Patulcius* ("opener") and *Clusius* ("closer"). His titles *Curatius*, *Patricius*, *Quirinus* originate in his worship in the gentes, the curiae, and the State, and have no reference to any special functions or characteristics. In late times he is both bearded and unbearded; in place of the staff and keys the fingers of his right hand show the number 300 (CCC.), those of his left show the number of the remaining days of the year 65 (LXV.).

JAORA, an Indian State in the Malwa agency, Central India. It consists of two isolated tracts, between Ratlam and Neemuch. Area, with the dependencies of Piplauda and Pant Piplauda, 601 sq.m. Pop. (1921), 85,778. The chief, whose title is nawab and who enjoys a salute of 13 guns, is a Mohammedan of Afghan descent. The state was confirmed by the British government in 1818 by the Treaty of Mandsaur. The chief crops are millet, cotton and maize. The town of JAORA is on the Rajputana-Malwa railway, 20 m. N. of Ratlam. Pop. (1921), 17,151. It is well laid out, with many good modern buildings.

JAPAN, an empire of Eastern Asia, and one of the great powers of the world. The following article is divided for convenience into Sections as under: GEOGRAPHY; GEOLOGY; CLIMATE; FLORA; FAUNA; THE PEOPLE; COMMUNICATIONS; AGRICULTURE AND INDUSTRIES; GOVERNMENT AND ADMINISTRATION; DEFENCE; EDUCATION; RELIGION; HISTORY.

GEOGRAPHY

Position and Extent.—The continent of Asia stretches two arms into the Pacific Ocean, Kamtschatka in the north and Malacca in the south, between which lies a long cluster of islands constituting the Japanese empire, which covers 37° 14' of longitude and 29° 11' of latitude. On the extreme north are the Kuriles (called by the Japanese *Chishima*, or the "myriad isles"), which extend to 156° 32' E. and to 50° 56' N.; on the extreme south is Formosa (called by the Japanese *Taiwan*), which extends to 119° 18' E., and to 21° 45' N. There are six large islands, namely Sakhalin (called by the Japanese *Karafuto*); Yezo or Ezo (which, with the Kuriles, is designated *Hokkaidō*, or the north-sea district); Honshū or Hondo, the main island; Shikoku (the "four provinces"), Kyūshū (the "nine provinces") and Formosa, the most southerly link of the chain. Formosa and the Pescadores were ceded to Japan by China after the war of 1894–1895, and the southern half of Sakhalin—the part south of 50° N.—was

added to Japan by cession from Russia in 1905.

Area.—The following table, compiled from the "Résumé Statistique de l'Empire du Japon" for the year 1928, shows the area of the various parts of the Empire:—

	Number of islands adjacent	Area in square miles
Honshu	192	91,277.8
Shikoku	75	7,246.3
Kyūshū	213	14,718.7
Hokkaido	44	34,084.4
Total	524	147,327.2
Korea (annexed in 1910)	1,018	85,228.1
Formosa with Pescadores	77	13,889.8
Sakhalin	2	13,934.2
Total	1,621	260,379.3
Leased territory of the Liaotung Peninsula	123	1,435.6

This table does not include islands having a coast-line of less than 2.4 miles, unless they are inhabited or serve as guides to navigation.

The coast-line is very long in proportion to the area, the ratio being 1 m. of coast to every 9.5 m. of area. The Pacific Ocean, which washes the eastern shores, moulds their outline into much greater diversity than does the Sea of Japan which washes the western shores. Thus the Pacific sea-board measures 10,562 m. against 2,887 m. for that of the Japan sea. In depth of water, too, the advantage is on the Pacific side. There the bottom slopes very abruptly, descending precipitously at a point not far from the north-east coast of the main island, where soundings have shown 4,655 fathoms. This, the deepest sea-bed in the world, is called the Tuscarora Deep, after the name of the United States' man-of-war which made the survey. The configuration seems to point to a colossal crater under the ocean, and many of the earthquakes which visit Japan appear to have their origin in this submarine region. On the other hand, the average depth of the Japan sea is only 1,200 fathoms, and its maximum depth is 3,200. The east coast, from Cape Shiriya (Shiriyazaki) in the north to Cape Inuboye (Inuboesaki) near Tōkyō Bay, though abounding in small indentations, has only three large bays, those of Sendai, Matsushima and Yamada; but southward from Tōkyō Bay to Cape Satta (Satanomisaki) in Kyūshū there are many capacious inlets which offer excellent anchorage, as the Gulf of Sagami (Sagaminada), the Bays of Suruga (Surugawan), Ise (Isenumi) and Osaka, the Kii Channel, the Gulf of Tosa (Tosonada), etc. Opening into both the Pacific and the Sea of Japan and separating Shikoku and Kyūshū from the main island as well as from each other, is the celebrated Inland sea, one of the most picturesque sheets of water in the world. There are four narrow avenues connecting this remarkable body of water with the Pacific and the Japan sea, the Shimonoseki strait, the Hayamoto Strait and the Yura and Naruto Straits. It need scarcely be said that these restricted approaches give little access to the storms which disturb the seas outside. The western side of the island of Kyūshū is more indented than any other part of the coast of Japan. Between the coast of Kyūshū and the southern extremity of the Korean peninsula are situated the islands of Iki and Tsushima, the latter being only 30 m. distant from the peninsula. Passing farther north, the shoreline of the main island along the Japan Sea is found to be comparatively straight and monotonous, there being only one noteworthy indentation, that of Wakasa-wan, and one considerable projection, the Noto peninsula. From the harbour of Tsuruga, or Wakasa bay, to Osaka Japan's waist measures only 77 m. Yezo is not rich in anchorages. Uchiura (Volcano Bay), Nemuro (Walfisch) Bay and Ishikari Bay are the only remarkable inlets. As for Formosa, the peculiarity of its outline is that the eastern coast falls precipitously into deep water, while the western slopes slowly to shelving bottoms and shoals. The Pescadores islands afford the best anchorage in this part of Japan.

Mountains.—The Japanese islands are traversed from north to south by a range of mountains which sends out various lateral branches. Lofty summits are separated by comparatively low

passes, which lie at the level of crystalline rocks and schists constituting the original uplands upon which the summits have been piled by volcanic action. The scenery among the mountains except perhaps in some parts of Hida and Shinshū, is generally soft. Climatic agencies have smoothed and modified everything rugged or abrupt, until an impression of gentle undulation rather than of grandeur is suggested. Nowhere is the region of eternal snow

THE FORMER EMPEROR
TAISHO OF JAPAN

reached, and masses of foliage enhance the gentle aspect of the scenery and glorify it in autumn with tints of striking brilliancy. Mountain alternates with valley, so that not more than one-eighth of the country's entire area is cultivable. The king of Japanese mountains is Fuji-yama or Fuji-san, of which the highest point (Ken-ga-mine) is 12,395 ft. above sea-level. Great streams of lava flowed from the crater in ancient times. The course of one is still visible to a distance of 15 m. from the summit, but the rest are covered, for the most part, with deep deposits of ashes and scoriae. On the south Fuji slopes unbroken to the sea, but on the other three sides the plain from which it rises is surrounded by mountains, among which, on the north and west, a series of picturesque lakes has been formed in consequence of the rivers having been dammed by ashes ejected from Fuji's crater. To a height of some 1,500 ft. the slopes of the mountain are cultivated; a grassy moorland stretches up the next 2,500 ft.; then follows a forest, the upper edge of which climbs to an altitude of nearly 8,000 ft., and finally there is a wide area of ashes and scoriae. There is entire absence of the Alpine plants found abundantly on the summits of other high mountains in Japan, a fact due, doubtless, to the comparatively recent activity of the volcano. The ascent of Fuji presents no difficulties. A traveller can reach the usual point of departure, Gotemba, by rail from Yokohama, and thence the ascent and descent may be made in one day by a pedestrian.

The Japanese Alps.—The provinces of Hida and Etchū are bounded on the east by a chain of mountains including, or having in their immediate vicinity, the highest peaks in Japan after Fuji. Six of these summits rise to a height of 9,000 ft. or upwards, and constitute the most imposing assemblage of mountains in the country. The ridge runs due north and south through 60 to 70 m., and has a width of 5 to 10 m. It is mostly of granite, only two of the mountains—Norikura and Tateyama—showing clear traces of volcanic origin. Its lower flanks are clothed with forests of beech, conifers and oak. Farther south, in the same range, stands Ontake (10,450 ft.), the second highest mountain in Japan proper (as distinguished from Formosa); and other remarkable though not so lofty peaks mark the same regions. This group of mountains has been well called the "Alps of Japan," and a good account of them may be found in *The Japanese Alps* (1896) by the Rev. W. Weston.

Almost equally picturesque, though less lofty than the Alps of Japan, are the Nikko mountains. The highest of these are Shirane-san (7,422 ft.), Nantai-san (8,169 ft.), Nyohō-zan (8,100 ft.), and Omanago (7,546 ft.). They are clothed with magnificent vegetation, and everywhere they echo the voices of waterfalls and rivulets.

Mountains of North and Central Japan.—In the north of the main island there are no peaks of remarkable height. The best known are Chōkai-zan, a volcano 7,077 ft. high, which was active as late as 1861; Ganju-san (6,791 ft.), Iwaki-san (5,230 ft.) and the twin mountains Gassan (6,447 ft.) and Haguro-san (5,600 ft.). A little farther south, enclosing the fertile plain of Aizu, several important peaks are found, among them being Iide-san (6,332 ft.); Azuma-yama (7,733 ft.), which, after a long interval of quiescence, has given many evidences of volcanic activity during recent years; Nasu-dake (6,296 ft.), an active volcano; and Bandai-san (6,037 ft.). A terrible interest attaches

ASPECTS OF JAPANESE LIFE

1. A tea-bearing hillside and a plain chequered with rice fields. About two-thirds of the tea-crop of Japan is consumed in the country. Rice is cultivated extensively on irrigable ground

2. Japanese ladies travelling in 'Kago.' The bearers' wide straw hats are typical of Japanese dress as are the sandals, held by a cord between the great and second toe

to the last-named mountain, for, after having remained quiet so long as to lull the inhabitants of the neighbouring district into complete security, it suddenly burst into fierce activity on the 15th of July 1888, discharging a vast avalanche of earth and rock, which dashed down its slopes like an inundation, burying four hamlets, partially destroying seven villages, killing 461 people and devastating an area of 27 square miles.

In the province of Kotsuke, which belongs to the central part of the main island, the noteworthy mountains are Asama-yama (8,136 ft.), one of the best known and most violently active volcanoes of Japan; Akagi-san, a circular range of peaks surrounding the basin of an old crater and rising to a height of 6,210 ft.; the Haruna group, celebrated for scenic beauties; and Myogisan, a cluster of pinnacles which, though not rising higher than 3,880 ft., offer scenery reminiscent of the classical landscape paintings (bunjingwa) of China and Japan. Farther south, in the province of Kai (Kōshū), and separating two great rivers, the Fuji-kawa and the Tenryu-gawa, there lies a range of hills with peaks second only to those of the Japanese Alps spoken of above. The principal elevations in this range are Shiranesan—with three summits, Nōdori (9,970 ft.), Ai-no-take (10,200 ft.) and Kaigane (10,330 ft.)—and Hōōzan (9,550 ft.). It will be observed that all the highest mountains of Japan form a species of belt across the widest part of the main island, beginning on the west with the Alps of Etchū, Hida and Shinano, and ending on the east with Fuji-yama. In all the regions of the main island southward of this belt the only mountains of conspicuous altitude are Omine (6,169 ft.) and Odai-ga-hara (5,540 ft.) in Yamato and Daisen or Oyama (5,951 ft.) in Hōki.

The island of Shikoku has no mountains of notable magnitude. The highest is Ishizuchi-zan (7,727 ft.), but there are several peaks varying from 3,000 to 6,000 ft.

Kyūshū, though abounding in mountain chains, independent or connected, is not remarkable for lofty peaks. In the neighbourhood of Nagasaki, over the celebrated solfataras of Unzen-take (called also Onsen) stands an extinct volcano, whose summit, Fugen-dake, is 4,865 ft. high. More notable is Aso-take, some 20 m. from Kumamoto; for, though the highest of its five peaks has an altitude of only 5,545 ft., it boasts the largest crater in the world, with walls nearly 2,000 ft. high and a basin from 10 to 14 m. in diameter. Aso-take is still an active volcano, but its eruptions during recent years have been confined to ashes and dust. Only two other mountains in Kyūshū need be mentioned—a volcano (3,743 ft.) on the island Sakura-jima, in the harbour of Kagoshima, which erupted with great violence in 1914; and Kirishima-yama (5,538 ft.), on the boundary of Hyūga, a mountain specially sacred in Japanese eyes, because on its eastern peak (Takachiho-dake) the god Ninigi descended as the forerunner of the first Japanese sovereign, Jimmu.

Volcanoes.—Among the mountains of Japan there are three volcanic ranges, namely, that of the Kuriles, that of Fuji, and that of Kirishima. They contain about 200 volcanoes, of which about 50 are more or less active. Fuji is the most remarkable volcanic peak. The Japanese regard it as a sacred mountain, and numbers of pilgrims make the ascent in midsummer. From 500 to 600 ft. is supposed to be the depth of the crater. There are neither sulphuric exhalations nor escapes of steam at present, and it would seem that this great volcano is permanently extinct. But experience in other parts of Japan shows that a long quiescent crater may at any moment burst into disastrous activity. Within the period of Japan's written history several eruptions are recorded, the last having been in 1707, when the whole summit burst into flame, rocks were shattered, ashes fell to a depth of several inches even in Yedo (Tōkyō), 60 m. distant, and the crater poured forth streams of lava. Among still active volcanoes the following are the best known:—Tarumai (Yezo) 2,969 ft.; Noboribetsu (Yezo) 1,148 ft.; Komagatake (Yezo) 3,822 ft.; Esan (Yezo) 2,067 ft.; Agatsuma (Iwaki) 5,230 ft. (erupted in 1903); Bandai-san (Iwashiro) 6,037 ft. (erupted in 1888, devastating an area of over 27 sq.m. and causing the loss of 461 lives); Adzuma-yama (Fiekushima) 7,733 ft. (its last eruption was in 1900 when 82 sulphur-diggers were killed or injured); Nasu (Tochigi)

6,296 ft.; Shitane (Nikko district) 7,422 ft. (its last eruption was in 1889); Shirane (Kai) 10,330 ft. (erupted in 1905, when the main crater was enlarged to a length of 3,000 ft.); Unzen (Hizen) 4,865 ft. (this volcano is in the solfatar stage); Aso-san (Higo) 5,545 ft. (the crater of this volcano, which measures 10 by 15 m. and rises almost symmetrically to a height of about 2,000 ft., is the largest in the world); Kaimon (Kagoshima) 3,041 ft. (almost extinct); Sakurajima (Kagoshima) 3,743 ft. (erupted violently in 1914); Kirishima (Kagoshima) 5,538 ft.; Mihara (Vries Island) 2,461 ft. (continuously active); and Asama (Shinshū) 8,136 ft. (continuously active).

Earthquakes.—Japan is subject to marked displays of seismic violence. One steadily exercised influence is constantly at work, for the shores bordering the Pacific Ocean are slowly though appreciably rising, while on the side of the Japan Sea a corresponding subsidence is taking place. Japan also experiences a vast number of petty vibrations not perceptible without the aid of delicate instruments. But of earthquakes proper, large or small, she has an exceptional abundance. Thus in the thirteen years ending in 1897—that is to say, the first period when really scientific apparatus for recording purposes was available—she was visited by no fewer than 17,750 shocks, being an average of something over 3½ daily. The frequency of these phenomena is in some degree a source of security, for the minor vibrations are believed to exercise a binding effect by removing weak cleavages. Nevertheless the annals show that during the three centuries before 1897 there were 108 earthquakes sufficiently disastrous to merit historical mention. If the calculation be carried farther back—as has been done by the seismic disaster investigation committee of Japan, a body of scientists constantly engaged in studying these phenomena under government auspices,—it is found that, since the country's history began to be written in the 8th century A.D., there have been 2,006 major disturbances; but inasmuch as 1,489 of these occurred before the beginning of the Tokugawa administration (early in the 17th century, and therefore in an era when methods of recording were comparatively defective), exact details are naturally lacking. The following table gives particulars of the most serious earthquakes during the last two centuries:—

Date A.D.	Region	Houses destroyed	Deaths
1703 (30/12)	Tōkyō	29,162	5,233
1707 (28/10)	Pacific Coast of Kyūshū and Shikoku	29,000	4,900
1751 (20/5)	Echigo	9,100	1,700
1766 (8/3)	Hirosaki	7,500	1,335
1792 (10/2)	Hizen and Higo	12,000	15,000
1828 (18/2)	Echigo	11,750	1,443
1844 (8/5)	Echigo	34,000	12,000
1854 (6/7)	Yamato, Iga, Ise	5,000	2,400
1854 (23/12)	Tōkaidō (Shikoku)	60,000	3,000
1855 (11/11)	Yedo (Tōkyō)	50,000	6,700
1891 (28/10)	Mino, Owari	222,501	7,273
1894 (22/10)	Shōnai	8,403	726
1896 (15/6)	Sanriku	13,073	27,122
1896 (31/8)	Ugo, Rikuchu	8,996	209
1906 (12/2)	Formosa	5,556	1,228
1923 (1/9)	Sagami Bay	558,049	91,344*
1925 (23/5)	Tajima	3,668	381
1927 (7/3)	Tango	7,367	2,900

*Over a third of Tōkyō and the whole of Yokohama were destroyed either by the earthquake or by the fires which burst out in its wake. This is the most disastrous earthquake which has occurred since that of the Ansei era in 1855. Apart from the loss of life, which was exceedingly great, the damage to property and the destruction of works of art and antique treasures, which cannot be replaced, was enormous and cannot possibly be estimated correctly in terms of money.

The Pacific coast of the Japanese islands is more liable than the western shore to shocks disturbing a wide area. Apparent proof has been obtained that the shocks occurring in the Pacific districts originate at the bottom of the sea—the Tuscarora Deep is supposed to be the centre of seismic activity—and they are accompanied in most cases by tidal waves. It would seem that of late years Hida, Kotsuke and some other regions in central Japan have enjoyed the greatest immunity, while Musashi (in

which province Tōkyō is situated) and Sagami have been most subject to disturbance.

Plains.—Japan, though very mountainous, has many extensive plains. The northern island—Yezo—contains seven, and there are as many more in the main and southern islands, to say nothing of flat lands of minor dimensions. Those in the North Island, covering altogether an area of 3,373,000 ac. are:—Tokachi, Ishikari, Kushiro, Nemuro, Kitami, Hidaka and Teshio; in the Main Island—Echigo, Sendai, Kwantō (in which lies Tōkyō, the capital), Mino-Owari, Kinai (containing the cities of Osaka, Kyōtō, and Kobe), and Tsukushi in the island of Kyūshū. The most extensive plains are those of Kushiro, Tokachi and Ishikari, which have an area of 1,229,000, 744,000 and 480,000 ac., respectively.

Rivers.—Japan is abundantly watered. But the quantity of water carried seawards varies within wide limits; for whereas, during the rainy season in summer and while the snows of winter are melting in spring, great volumes of water sweep down from the mountains, these broad rivers dwindle at other times to petty rivulets trickling among a waste of pebbles and boulders. Nor are there any long rivers, and all are so broken by shallows and rapids that navigation is generally impossible except by means of flat-bottomed boats drawing only a few inches. The chief rivers are the Ishikari (275 m.), Teshio (192 m.) and Tokachi (120 m.) in the North Island; Shinano (229 m.), Tone (200 m.), Kitakami (152 m.), Kiso (144 m.), Tenryū (134 m.), Mogami (134 m.), Gono (124 m.), Abukuma (122 m.) and Agano (105 m.) in the Main Island, and the Yoshino (146 m.) in Shikoku.

Lakes and Waterfalls.—Japan has many lakes, remarkable for the beauty of their scenery rather than for their extent. Some are contained in alluvial depressions in the river valleys; others have been formed by volcanic eruptions, the ejecta damming the rivers until exits were found over cliffs or through gorges. Some of these lakes have become favourite summer resorts for foreigners. To that category belong especially the lakes of Hakone, Chūzenji, Shōji, Inawashiro (formed by the eruption of Bandaisan in 1888), Biwa, Nojiri and Yumoto. Of these the last is the highest. Next in altitude comes Lake Chūzenji which is 4,375 ft. above sea-level, has a maximum depth of 93 fathoms, and empties itself at one end over a fall (Kegon) 250 ft. high. The lakes about Mt. Fuji, of which Shōji is the best known, lie at a height of 3,160 ft., and their neighbourhood abounds in scenic charms. Lake Hakone is at a height of 2,428 ft.; Inawashiro, at a height of 1,920 ft. and Biwa at a height of 328 ft. The Japanese associate Lake Biwa (Omi) with eight views of special loveliness (*Omi-no-hakkei*). Lake Suwa, in Shinano, which is emptied by the Tenryugawa, has a height of 2,624 ft. In the vicinity of many of these mountain lakes thermal springs, with remarkable curative properties, are to be found. (F. By.)

GEOLOGY

It is a popular belief that the islands of Japan consist for the most part of volcanic rocks. But although this conception might reasonably be suggested by the presence of many active and extinct volcanoes, Professor J. Milne has pointed out that it is literally true of the Kuriles alone, partially true for the northern half of the Main Island and for Kyūshū, and quite incorrect as applied to the southern half of the Main Island and to Shikoku. This authority sums up the geology of Japan briefly and succinctly as follows (in *Things Japanese*; by Professor Chamberlain): "The backbone of the country consists of primitive gneiss and schists. Amongst the latter, in Shikoku, there is an extremely interesting rock consisting largely of piedmontite. Overlying these amongst the Palaeozoic rocks, we meet in many parts of Japan with slates and other rocks possibly of Cambrian or Silurian age. Trilobites have been discovered in Rikuzen. Carboniferous rocks are represented by mountain masses of *Fusulina* and other limestones. There is also amongst the Palaeozoic group an interesting series of red slates containing Radiolaria. Mesozoic rocks are represented by slates containing *Ammonites* and *Monotis*, evidently of Triassic age, rocks containing *Ammonites Bucklandi* of Liassic age, a series of beds rich in plants of Jurassic age, and beds of

Cretaceous age containing *Trigonia* and many other fossils.

The Cainozoic or Tertiary system forms a fringe round the coasts of many portions of the empire. It chiefly consists of stratified volcanic tuffs rich in coal, lignite fossilized plants and an invertebrate fauna. Diatomaceous earth exists at several places in Yezo. . . . The most common eruptive rock is andesite. Such rocks as basalt, diorite and trachyte are comparatively rare. Quartz porphyry, quartzless porphyry, and granite are largely developed." Drs. von Richthofen and Rein discuss the subject in greater detail. They have pointed out that in the mountain system of Japan there are three main lines. One runs from south-west to north-east; another from south-south-west to north-north-east, and the third is meridional. These they call respectively the "southern schist range," the "northern schist range," and the "snow range," the last consisting mainly of old crystalline massive rocks. The rocks predominating in Japan fall also into three groups. They are, first, plutonic rocks, especially granite; secondly, volcanic rocks, chiefly trachyte and dolerite; and thirdly, palaeozoic schists. On the other hand, limestone and sandstone, especially of the Mesozoic strata, are strikingly deficient. The strike of the old crystalline rocks follows, in general, the main direction of the islands (south-west to north-east). They are often overlain by schists and quartzites, or broken through by volcanic masses. The basis of the islands, according to Rein, consists of granite, syenite, diorite, diabase, and related kinds of rock. Porphyry appears comparatively rarely. Conditions suggest the presence of tertiary formations, yet only the younger groups of that formation appear to be developed. Nor is there any sign of moraines, glacier-scorings or other traces of the ice-age.

The oldest beds which have yielded fossils in any abundance belong to the Carboniferous System. The Trias proper is represented by truly marine deposits, while the Rhaetic beds contain plant remains. The Jurassic and Cretaceous beds are also in part marine and in part terrestrial. During the whole of the Mesozoic era Japan appears to have lain on or near the margin of the Asiatic continent, and the marine deposits are confined for the most part to the eastern side of the islands.

The igneous rocks occur at several geological horizons; but the great volcanic eruptions did not begin until the Tertiary period. The existing volcanoes belong to four separate arcs or chains. On the south is the arc of the Luchu islands, which penetrates into Kyūshū. In the centre is the arc of the islands of Idzu, which is continued into Hondo along the Fossa Magna. In North Hondo the great Bandai arc forms the axis of the island and stretches into Yezo (Hokkaidō). Finally in the east of Yezo rise the most westerly volcanoes of the Kurile chain. The lavas and ashes ejected by these consist of liparite, dacite, andesite and basalt.

Structurally Japan is divided into two regions by a depression (the "Fossa Magna" of Naumann) which stretches across the island of Hondo from Shimoda to Nagano. The depression is marked by a line of volcanoes, including Fuji, and is in part buried beneath the products of their eruptions. It is supposed to be due to a great fault along its western margin. South and west of the Fossa Magna the beds are thrown into folds which run approximately parallel to the general direction of the coast, and two zones may be recognized—an outer, consisting of Palaeozoic and Mesozoic beds, and an inner, consisting of Archaean and Palaeozoic rocks, with granitic intrusions. Nearly along the boundary between the two zones lie the inland seas of south Japan. Towards the Fossa Magna the folds bend northwards.

North and east of the Fossa Magna the structure is concealed, to a very large extent, by the outpourings of the volcanoes which form so marked a feature in the northern part of Hondo. But the foundation on which the volcanoes rest is exposed along the east coast of Hondo (in the Kwantō, Abukuma and Kitakami hills), and also in the island of Yezo. This foundation consists of Archaean, Palaeozoic and Mesozoic beds folded together, the direction of the folds being north by west to south by east, that is to say, slightly oblique to the general direction of this part of the island. Towards the Fossa Magna the folds bend sharply round until they are nearly parallel to the Fossa itself.

(P. LA.; X.)

CLIMATE

The large extension of the Japanese islands in a northerly and southerly direction causes great varieties of climate. General characteristics are hot and humid though short summers, and long, cold and clear winters. The equatorial currents produce conditions differing from those existing at corresponding latitudes on the neighbouring continent. In Kyūshū, Shikoku and the southern half of the main island, the months of July and August alone are marked by oppressive heat at the sea-level, while in elevated districts a cool and even bracing temperature may always be found, though the direct rays of the sun retain distressing power. Winter in these districts does not last more than two months, from the end of December to the beginning of March; for, although the latter month is not free from frost and even snow, the balminess of spring makes itself plainly perceptible. In the northern half of the main island, in Yezo and in the Kuriles, the cold is severe during the winter, which lasts for at least four months, and snow falls sometimes to great depths. Whereas in Tōkyō the number of frosty nights during a year does not average much over 60, the corresponding number in Sapporo on the north-west of Yezo is 145. But the variation of the thermometer in winter and summer being considerable—as much as 72° F in Tōkyō—the climate proves somewhat trying to persons of weak constitution. On the other hand, the mean daily variation is in general less than that in other countries having the same latitude: it is greatest in January, when it reaches 18° F, and least in July, when it barely exceeds 9° F. The monthly variation is very great in March, when it usually reaches 43° F.

Meteorology.—There are 19 meteorological stations in the Japanese dominions, including one at Dairen in South Manchuria and one at Paras in the mandated islands; and reports are constantly forwarded from them by telegraph to the central observatory in Tōkyō, which issues daily statements of the climatic conditions during the previous twenty-four hours, as well as forecasts for the next twenty-four. The whole country is divided into districts for meteorological purposes, and storm-warnings are issued when necessary. At the most important stations observations are taken every hour; at the less important, six observations daily; and at the least important, three observations. The following is a record of the mean annual temperature, which was in most cases a few fractions of a degree below the average, in 1926:—

	F°		F°
Nemuro (Hokkaidō)	40.8	Hiroshima (Main Island)	57.9
Sapporo (Hokkaidō)	44.3	Kōchi (Shikoku)	59.1
Aomori (Hokkaidō)	48.5	Nagasaki (Kyūshū)	59.3
Tōkyō (Main Island)	56.4	Naha (Luchu Is.)	60.7
Niigata (Main Island)	53.9	Seoul (Korea)	51.1
Nojano (Main Island)	50.0	Taipei (Formosa)	60.7
Nagoya (Main Island)	56.3	Odomari (Saghalin)	36.8
Kyōto (Main Island)	55.9	Dairen (S. Manchuria)	50.3
Osaka (Main Island)	58.4	Parao (Mandated Is.)	80.2
Sakai (Main Island)	56.8		

Rainfall and Wind.—There are three wet seasons in Japan: the first, from the middle of April to the beginning of May; the second, from the middle of June to the beginning of July; and the third, from early in September to early in October. The dog days (*doyō*) are from the middle of July till the second half of August. September is the wettest month; January the driest. During the four months from November to February, inclusive, only about 18% of the whole rain for the year falls. In the district on the east of the main island the snowfall is insignificant, seldom attaining a depth of more than four or five inches and generally melting in a few days, while bright, sunny skies are usual. But in the mountainous provinces of the interior and in those along the western coast, deep snow covers the ground throughout the whole winter, and the sky is usually wrapped in a veil of clouds. These differences are due to the action of the north-westerly wind that blows over Japan from Siberia. The intervening sea being comparatively warm, this wind arrives in Japan having its temperature increased and carrying moisture which it deposits as snow on the western faces of the Japanese mountains. Crossing the mountains and descending their eastern slopes, the wind becomes less saturated and warmer, so that the formation of

clouds ceases. Japan is emphatically a wet country so far as quantity of rainfall is concerned, the average for the whole country being 1,570 mm. per annum. Still there are about four sunny days for every three on which rain or snow falls, the actual figures being 150 days of snow or rain and 215 days of sunshine.

During the cold season, which begins in October and ends in April, northerly and westerly winds prevail throughout Japan. They come from the adjacent continent of Asia, and they develop considerable strength owing to the fact that there is an average difference of some 22 mm. between the atmospheric pressure (750 mm.) in the Pacific and that (772 mm.) in the Japanese islands. But during the warm season, from May to September, these conditions of atmospheric pressure are reversed, that in the Pacific rising to 767 mm. and that in Japan falling to 750 mm. Hence throughout this season the prevailing winds are light breezes from the west and south. A calamitous atmospheric feature is the periodical arrival of storms called "typhoons" (Japanese *tai-fu* or "great wind"). These have their origin, for the most part, in the China sea, especially in the vicinity of Luzon. Their season is from June to October, September being generally the month when they are most frequent. But they occur in other months also, and they develop a velocity of 5 to 75 m. an hour. It is particularly unfortunate that September should be the season of greatest typhoon frequency, for the earlier varieties of rice flower in that month and a heavy storm does much damage not only to crops but also to life and property.

FLORA

In actual wealth of blossom the Japanese islands cannot claim any special distinction. The spectacles most admired by all classes are the tints of the foliage in autumn and the glory of flowering trees in the spring. Oaks and wild prunus, wild vines and sumachs, various kinds of maple, the *dōdan* (*Enkianthus japonicus* Hook.), birches and other trees, all add multitudinous colours to the brilliancy of a spectacle which is further enriched by masses of feathery bamboo. The one defect is lack of green sward. The grass used for Japanese lawns loses its verdure in autumn and remains from November to March a greyish-brown blot upon the scene. Spring is supposed to begin in February; but the only flowers then in bloom are the *Camellia japonica*, the narcissus, and some kinds of daphne. The first—called by the Japanese *tsubaki*—may often be seen glowing fiery red amid snow, but the pink (*otome tsubaki*), white (*shiro-tsubaki*) and variegated (*shibori-no-tsubaki*) kinds do not bloom until March or April. The queen of spring flowers is the plum (*ume*), the pure white or rose-red blossoms of which are regarded with special favour and accounted the symbol of unassuming hardihood. The cherry (*sakura*) is even more esteemed. It will not suffer any training, nor does it, like the plum, improve by pruning; but the sunshine that attends its brief period of bloom in April, the magnificence of its flower-laden boughs and the picturesque flutter of its falling petals, inspired an ancient poet to liken it to the "soul of Yamato" (Japan), and it has ever since been thus regarded. The wild peach (*momo*) blooms at the same time, but attracts little attention. All these trees—the plum, the cherry and the peach—bear no fruit worthy of the name, nor do they excel their Occidental representatives in wealth of blossom; but the admiring affection they inspire in Japan is unique. Scarcely has the cherry season passed when that of the wistaria (*fujī*) comes, followed by the azalea (*tsutsuji*) and the iris (*shōbu*), the last being almost contemporaneous with the peony (*botan*), which is regarded by many Japanese as the king of flowers and is cultivated assiduously. Summer sees the lotus (*renga*) convert wide expanses of lake and river into sheets of white and red blossoms; a comparatively flowerless interval ensues until, in October and November the chrysanthemum arrives to furnish an excuse for fashionable gatherings. With the exception of the dog-days and the dead of winter, there is no season when flowers cease to be an object of attention to the Japanese, nor does any class fail to participate in the sentiment. There is similar enthusiasm in the matter of gardens. From the 10th century onwards the art of landscape gardening steadily grew into a science, with esoteric as well as

exoteric aspects and with a special vocabulary. The underlying principle is to reproduce nature's scenic beauties, all the features being drawn to scale, so that however restricted the space, there shall be no violation of proportion. But it has to be clearly understood that the flower-garden in the Occidental sense of the term scarcely exists in Japan. Flowers are cultivated, but for their own sakes, not as a feature of the landscape garden. If they are present, it is only as an incident. This of course does not apply to shrubs which blossom at their seasons and fall always into the general scheme of the landscape. There is another remarkable feature of the Japanese gardener's art. He dwarfs trees so that they remain measurable only by inches after their age has reached scores, even hundreds, of years, and the proportions of leaf, branch and stem are preserved with fidelity. The pots in which these wonders of patient skill are grown have to be themselves fine specimens of the keramist's craft, and hundreds of pounds are sometimes paid for a notably well trained tree.

There exists among many foreign observers an impression that Japan is comparatively poor in wild-flowers; an impression probably due to the fact that there are no flowery meadows or lanes. Besides, the flowers are curiously wanting in fragrance. Almost the only notable exceptions are the *mokusei* (*Osmanthus fragrans*), the daphne and the magnolia. But if some familiar European flowers are absent, they are replaced by others strange to Western eyes—a wealth of *Lеспедеза* and *Indigofera*; a vast variety of lilies; graceful grasses like the eulalia and the *ominameshi* (*Patrina scabioesaeifolia*); the richly-hued *Pyrus japonica*; azaleas, diervillas and deutzias; the *kikyo* (*Platycodon grandiflorum*), the *gibōshi* (*Funkia ovata*), and many another. The same is true of Japanese forests. It has been well said that "to enumerate the constituents and inhabitants of the Japanese mountain-forests would be to name at least half the entire flora." According to a statement in the Japan Year Book (1928) the flora of Japan consists of about 17,087 species, classified as follows:—Flowering plants (9,000); Ferns (700); Mosses (2,000); Fungi (3,500); Lichens (700); Marine algae (691); Fresh-water algae (323); and Mycetozoa (173).

While there can be no doubt that the luxuriance of Japan's flora is due to rich soil, to high temperature and to rainfall not only plentiful but well distributed over the whole year, the wealth and variety of her trees and shrubs must be largely the result of immigration. Japan has four insular chains which link her to the neighbouring continent. In the south, the Luchu Islands bring her within reach of Formosa and the Malayan archipelago; on the west, Oki, Iki, and Tsushima bridge the sea between her and Korea; on the north-west Sakhalin connects her with the Amur region; and on the north, the Kuriles form an almost continuous route to Kamtschatka. By these paths the germs of Asiatic plants were carried over to join the endemic flora of the country, and all found suitable homes amid greatly varying conditions of climate and physiography.

FAUNA

Japan is an exception to the general rule that continents are richer in fauna than are their neighbouring islands. It has been said with truth that "an industrious collector of beetles, butterflies, neuroptera, etc., finds a greater number of species in a circuit of some miles near Tōkyō than are exhibited by the whole British Isles."

Of mammals 50 species have been identified and catalogued. Neither the lion nor the tiger is found. The true Carnivora are three only, the bear, the dog and the marten. The wolf is now extinct. Three species of bears are scientifically recognized, but one of them, the ice-bear (*Ursus maritimus*), is only an accidental visitor, carried down by the Arctic current. In the main island the black bear (*kuma*, *Ursus japonicus*) alone has its habitation, but the island of Yezo has the great brown bear (called *shi-guma*, *oki-kuma* or *aka-kuma*), the "grizzly" of North America. The bear does not attract much popular interest in Japan. Tradition centres rather in the fox (*kitsune*) and the badger (*mujina*), which are credited with supernatural powers. Next to these comes the monkey (*saru*), which dwells equally among the snows of the north and in the mountainous regions of the south. There are

ten species of bat (*komori*) and seven of insect-eaters, and prominent in this class are the mole (*mugura*) and the hedgehog (*hari-nezumi*). There is a weasel (*itachi*), a river-otter (*kawauso*), and a sea-otter (*rakko*). The rodents are represented by an abundance of rats, with comparatively few mice, and by the ordinary squirrel (*ki-nezumi*), as well as the flying squirrel (*momodori*, or *bantori*). There are no rabbits, but hares (*usagi*) are to be found in very varying numbers, and those of one species put on a white coat during winter. The wild boar (*shishi* or *i-no-shishi*) does not differ appreciably from its European congener. A very beautiful stag (*shika*), with eight-branched antlers, inhabits the remote woodlands, and there is a species of antelope (*kamo-shika*) which is found in the highest and least accessible parts of the mountains. All the European domestic animals are also represented.

Although so-called singing birds exist in tolerable numbers, those worthy of the name of songster are few. Eminently first is a species of nightingale (*uguisu*), which, though smaller than its congener of the West, is gifted with exquisitely modulated flute-like notes of considerable range. A variety of the cuckoo called *hototogisu* (*Cuculus poliocephalus*) in imitation of the sound of its voice, is heard as an accompaniment of the *uguisu*, and there are also three other species, the *kakkōdori* (*Cuculus canorus*), the *tsutsu-dori* (*C. himalayanus*), and the *masuhakari*, or *juichi* (*C. hyperythrus*). To these the lark, *hibari* (*Alauda japonica*), joins its voice, and the cooing of the pigeon (*hato*) is supplemented by the twittering of the ubiquitous sparrow (*suzume*), while over all are heard the raucous caw of the raven (*karasu*) and the harsh scream of the kite (*tombi*). There are also several varieties of falcon; but the eagle is comparatively rare. Two English ornithologists, Blakiston and Pryer, are the recognized authorities on the birds of Japan, and in a contribution to the *Transactions of the Asiatic Society of Japan* (vol. x.) they have enumerated 359 species. Starlings (*muku-dori*) are numerous, and so are the wag-tail (*sekirei*), the swallow (*tsubame*) the martin (*ten*), the shrike (*mozu*) and the jay (*kakesu* or *kashi-dori*). Blackbirds and singing thrushes are absent; the other members of the species *Turdus* are common. So too are the wren (*miso-sazai*), various kinds of finches (*hiwa*), and warblers (*Kara*) as well as the water-ouzel (*kawagarasu*), the wood-pecker (*kitataki*), the kingfisher (*kawasemi*), and the brown-eared bulbul (*kiyodori*). Among game-birds there are the quail (*uzura*), the willow-grouse (*ezo-raichō*), the ptarmigan (*raichō*), the woodcock (*hodoshigi*), the snipe (*ta-shigi*)—with two special species, the solitary snipe (*yamashigi*) and the painted snipe (*tama-shigi*)—and the pheasant (*kiji*). Of the last there are two species, the *kiji* proper, a bird presenting no remarkable features, and the copper pheasant (*yamadori*), a magnificent bird with plumage of dazzling beauty. Of cranes there are seven species, the *Grus japonensis* (*tanchō* or *tanchō-zuru*), the demoiselle crane (*anewa-zuru*), the black crane (*kuro-zuru* or *nezumi-zuru*, i.e., *Grus cinerea*), the *Grus leucauchen* (*mana-zuru*), the *Grus monachus* (*nabe-zuru*), and the white crane (*shiro-zuru*). The little egret (*shira-sagi*) is a familiar feature of the Japanese landscape; so is the night-heron (*goi-sagi*). Besides these waders there are plover (*chidori*); golden (*muna-guro* or *aiguro*); gray (*daizen*); ringed (*shiro-chidori*); spur-winged (*keri*) and Harting's sand-plover (*ikaru-chidori*); sand-pipers—green (*ashiro-shigi*) and spoon-billed (*hera-shigi*)—and water-hens (*ban*). Among swimming birds the most numerous are the gull (*kamome*), of which many varieties are found; the cormorant (*u*)—which is trained by the Japanese for fishing purposes—and multitudinous flocks of wild-geese (*gan*) and wild-ducks (*kamo*), from the beautiful mandarin-duck (*oshi-dori*), to teal (*kogamo*), pintail (*ōnaga*); dusky mallard (*karugamo*), widgeon (*akagashira*) and sea-ducks of various species.

Of reptiles Japan has 90 species, and among them is included the marine turtle (*umi-game*) which is however seen only at rare intervals on the southern coast. Even rarer is the larger species (*shōgakubo*, i.e., *Chelonia cephalo*). Both are highly valued for the sake of the shell. Of the fresh-water tortoise there are two kinds, the *suppon* (*Trionyx japonica*) and the *kame-no-ko* (*Emys vulgaris japonica*), one of the Japanese emblems of longevity.

Sea-snakes occasionally make their way to Japan, being carried thither by the Black Current (Kuro Shiwo) and the monsoon, but they must be regarded as merely fortuitous visitors. There are 10 species of land-snakes (*hebi*), among which only two (the *namushi*, or *Trigonocephalus blomhoffi*) and the *Labu* are venomous reptiles. The largest snake is the *aodaisho* (*Elaphis virgatus*), which sometimes attains a length of 5 ft., but is quite harmless. Lizards (*tokage*), frogs (*kawazu* or *kaeru*), toads (*ebogayeru*) and newts (*imori*) are plentiful, and much curiosity attaches to a giant salamander (*sansho-uwo*, called also *hazekai* and other names according to localities), which reaches to a length of 5 ft., and (according to Rein) is closely related to the *Andrias scheuchzeri* of the Oeningen strata.

The seas surrounding the Japanese islands may be called a resort of fishes, for, in addition to numerous species which abide there permanently, there are migratory kinds, coming and going with the monsoons and with the great ocean streams that set to and from the shores. In winter, for example, when the northern monsoon begins to blow, numbers of denizens of the Sea of Okhotsk swim southward to the more genial waters of north Japan; and in summer the Indian Ocean and the Malayan archipelago send to her southern coasts a crowd of emigrants which turn homeward again at the approach of winter. It thus falls out that in spite of the enormous quantity of fish consumed as food or used as fertilizers year after year by the Japanese, the seas remain as richly stocked as ever. Nine orders of fishes have been distinguished as the piscifuna of Japanese waters. They may be found carefully catalogued with all their included species in Rein's *Japan*, and highly interesting researches by Japanese physiographers are recorded in the Journal of the College of Science of the Imperial University of Tōkyō. Briefly, the chief fish of Japan are the porgy (*tai*), the *suzuki* (*Percalabeax japonicus*), the mullet (*bora*), the rock-fish (*hatatate*), the grunter (*oni-o-koze*), the mackerel (*saba*), the goby (*kaze*), the sword-fish (*tachi-uwo*), the wrasse (*kusabi*), the cod-fish (*tara*), the flounder (*karei*), and its congeners the sole (*hirame*) and the turbot (*ishi-garei*), the shad (*namazu*), the salmon (*shake*), the *masu*, the carp (*koi*), the *funa* (*Carassius auratus*), the gold-fish (*kingyo*), the gold carp (*higo*), the loach (*dojō*), the herring (*nishin*), the sardine (*iwashi*), the eel (*unagi*), the conger eel (*anago*), the coffer-fish (*hako-uwo*), the *fugu* (*Tetrodon*), the *ayu* (*Plecoglossus altivelis*), the *sayori* (*Hemiramphus sayori*), the shark (*same*), the dogfish (*manuka-zame*), the ray (*e*), the bonito (*katsuo*), the *maguro* (*Thynnus sibi*) and two forms of trout, the *yamame* and the *iwana*. The American brook trout (*Salvelinus fontinalis*) and the rainbow trout have been introduced from the United States.

The insect life of Japan broadly corresponds with that of temperate regions in Europe. But there are also a number of tropical species, notably among butterflies and beetles. The latter—for which the generic term in Japan is *mushi* or *kaichū*—include some beautiful species, from the "jewel beetle" (*tamamushi*), the "gold beetle" (*kogane-mushi*) and the *Chrysochroa fulgidissima*, which glow and sparkle with the brilliancy of gold and precious stones, to the jet black *Melanauster chinensis*, which seems to have been fashioned out of lacquer spotted with white. There is also a giant nasicornous beetle. Among butterflies (*chōchō*) Rein gives prominence to the broad-winged kind (*Papilio*), which recall tropical brilliancy. One (*Papilio macilentus*) is peculiar to Japan. Many others seem to be practically identical with European species. That is especially true of the moths (*yachō*), 100 species of which have been identified with English types. There are seven large silk-moths, of which two only (*Bombyx mori* and *Antheraea yama-mai*) are employed in producing silk. Fishing lines are manufactured from the cocoons of the *genjiki-mushi* (*Caligula japonica*), which is one of the commonest moths in the islands. Wasps, bees and hornets, generically known as *hachi*, differ little from their European types, except that they are somewhat larger and more sluggish. The gad-fly (*abu*), the housefly (*hai*), the mosquito (*ka*), the flea (*nomi*) and occasionally the bedbug (called by the Japanese *kara-mushi* because it is believed to be imported from China), are all

fully represented, and the dragon-fly (*tombō*) presents itself in immense numbers at certain seasons. Grasshoppers (*batta*) are abundant, and one kind (*inago*), which frequent the rice-fields when the cereal is ripening are caught and fried in oil as an article of food. On the moors in late summer the mantis (*kamakiri-mushi*) is commonly met with, and the cricket (*kūrogi*), and the cockroach abound. Particularly obtrusive in the summer is the cicada (*semi*), of which there are many species. Spiders abound, from a giant species to one of the minutest dimensions, and ticks are very common in the long bamboo grass.

Japanese rivers and lakes are the habitation of several—seven or eight—species of freshwater crab (*kani*), which live in holes on the shore and emerge in the day-time, often moving to considerable distances from their homes. Cray-fish (*kawa-ebi*) also are found in the rivers and rice-fields. These, as well as a large species of crab—*mokuzō-gani*—serve the people as an article of food; but the small crabs which live in holes have no recognized *raison d'être*. In Japan, as elsewhere, the principal crustacea are found in the sea. Flocks of *lupa* and other species swim in the wake of the tropical fishes which move towards Japan at certain seasons. Naturally these migratory crabs are not limited to Japanese waters. Milne Edwards has identified ten species which occur in Australian seas also, and Rein mentions, as belonging to the same category, the "helmet-crab" or "horse-shoe crab" (*kabuto-gani*; *Limulus longispina* Hoeven). Very remarkable is the giant *Taka-ashi*—long legs (*Macrocheirus kaempferi*), which has legs $1\frac{1}{2}$ metres long and is found in the seas of Japan and the Malay archipelago. There is no lobster on the coasts of Japan, but there are various species of cray-fish (*Palinurus* and *Scyllarus*) the principal of which, under the names of *ise-ebi* (*Palinurus japonicus*) and *kuruma-ebi* (*Penaeus canaliculatus*) are greatly prized as an article of diet.

Already in 1882, Dunker in his *Index Molluscorum Maris Japonici* enumerated nearly 1,200 species of marine molluscs found in the Japanese archipelago, and several others have since been added to the list. As for the land and fresh-water molluscs, some 200 of which are known, they are mainly kindred with those of China and Siberia, tropical and Indian forms being exceptional. There are 57 species of *Helix* (*maimaitsuburi*, *dedemushi*, *katatsumuri* or *kwagyū*) and 25 of *Clausilia* (*kiseru-gai* or pipe-snail), including the two largest snails in Japan, namely the *Cl. martensi* and the *Cl. yokohamensis*, which attain to a length of 58 mm. and 44 mm. respectively. The mussel (*i-no-kai*) is well represented by the species *numa-gai* (marsh-mussel), *karasu-gai* (raven-mussel), *kamisori-gai* (razor-mussel), *shijimi-nokai* (*Corbicula*), of which there are nine species, etc. Unlike the land-molluscs, the great majority of Japanese sea-molluscs are akin to those of the Indian Ocean and the Malay archipelago. Some of them extend westward as far as the Red Sea. The best known and most frequent forms are the *asari* (*Tapes philippinarum*), the *hamaguri* (*Meretrix lusoria*), the *baka* (*Macra sulcataria*), the *aka-gai* (*Scapharca inflata*), the *kaki* (oyster), the *awabi* (*Haliotis japonica*), the *sazae* (*Turbo cornutus*), the *hora-gai* (*Tritonium tritonius*), etc. Among the cephalopods several are of great value as articles of food, e.g., the *surume* (*Onychoteuthis banksii*), the *tako* (octopus), the *shidako* (*Eledone*), the *ika* (*Sepia*), the *tako-fune* (*Argonauta*), and the *Opisthoteuthis* a remarkable flat octopus looking like a badly poached egg.

Greeff enumerates, as denizens of Japanese seas, 26 kinds of sea-urchins (*gaze* or *uni*) and 12 of starfish (*hitode* or *tako-nomakura*). These, like the mollusca, indicate the influence of the Kuro Shiwo and the south-west monsoon, for they have close affinity with species found in the Indian and Pacific Oceans. For edible purposes the most valuable of the Japanese echinoderms is the sea-slug or *bêche de mer* (*namako*), which is greatly appreciated and forms an important staple of export to China.

Japan is not rich in corals and sponges. Her most interesting contributions are crust-corals (*Gorgonidae*, *Corallium*, *Isis*, etc.), and especially flint-sponges, called by the Japanese *hoshi-gai* and known as "glass-coral" (*Hyalonema sieboldi*). These last have not been found anywhere except at the entrance of the Bay of Tōkyō at a depth of some 200 fathoms.

THE PEOPLE

Population.—The population of the Empire on the 1st of October, 1925, when the last census was taken, was as follows:—

Population	Males	Females	Total
Japan proper	30,013,109	29,723,713	59,736,822
Korea	10,020,943	9,502,002	19,522,945
Formosa	2,052,669	1,940,739	3,993,408
Saghalin	122,379	81,375	203,754
Total	42,209,100	41,247,829	83,456,929
Leased territory of the Liaotung Peninsula .	644,491	409,583	1,054,074

According to the "Japan Year Book" the density of population, as shown by the census of 1925 was 60.6 per sq. mile or 374.1 per sq. mile of cultivated area.

The following comparative tables may be of interest as showing the rate at which the population has increased in recent years. It should however be borne in mind that the term population in the case of Japan proper includes all persons having their registered domicile in Japan.

Year	Males	Females	Total
<i>Japan</i>			
1872	16,796,144	16,314,652	33,110,796
1893	20,906,465	20,481,848	41,388,313
1913	26,964,586	26,398,096	53,362,682
1923	30,445,661	29,812,281	60,257,942
<i>Korea</i>			
1910	6,862,650	6,071,632	12,934,282
1917	8,552,392	8,065,039	16,617,431
1924	9,045,641	8,573,899	17,619,540
<i>Formosa</i>			
1898	1,373,240	1,214,608	2,587,848
1908	1,596,282	1,440,573	3,036,855
1918	1,757,498	1,655,916	3,413,414

According to quasi-historical records, the population of the empire in the year A.D. 610 was 4,988,842, and in 736 it had grown to 8,631,770. It is impossible to say how much reliance may be placed on these figures, but from the 18th century, when the name of every subject had to be inscribed on the roll of a temple as a measure against his adoption of Christianity, a tolerably trustworthy census could always be taken. The returns thus obtained show that from the year 1723 until 1846 the population remained almost stationary, the figure in the former year being 26,065,422, and that in the latter year 26,907,625. But after 1872, when the census showed a total of 33,110,825, the population grew steadily, its increment between 1872 and 1898, inclusive, a period of 27 years, being 10,649,990. The annual rate of increase is now estimated at something over 700,000, a figure which naturally invests the question of subsistence with great importance. It was hoped at one time that colonization in Manchuria and Korea would materially help to solve the problem of over population; but the Japanese does not like extremes of climate, as is shown by the slowness with which the Hokkaido is being developed, nor does he thrive in countries, such as Manchuria, in which the standard of living is lower than his own. Colonization therefore will not solve the population problem, nor will emigration, for reasons which it is unnecessary to discuss here. It is true that in Japan itself there is still a certain amount of waste land, probably about 5,000,000 acres, of which about 1,700,000 acres can be used for the cultivation of rice. The size of the crops can also be increased by the intensive use of fertilizers, and by these two methods the difficulties attending overpopulation can be postponed for the moment. The question has already been the subject of discussion in many quarters, and Japanese authorities suggest three remedies,—(a) the expansion of industry, (b) the increase of the foreign trade, and (c) the advancement of agriculture. Birth-control is advocated in some quarters, but has not been seriously considered, nor is it likely to be. The birth-rate during the last 20 years has been about

3.05% of the population and the death-rate about 2.05%. Infant mortality is still heavy. The male birth-rate is about 4% in excess of the female. As compared with the inhabitants of Western Europe the Japanese are of low stature; but the rise in the standard of living and the cultivation of the physique in schools and colleges has resulted in a marked improvement in this direction in recent years.

Towns.—According to the "Japan Year Book" for 1928 there are in Japan 21 towns with a population of over 100,000 and 34 with a population of over 50,000. The only two cities with over a million inhabitants are: Osaka (2,114,804) and Tōkyō (1,995,567). Nagoya, Kyōto and Kobe come next with populations exceeding half a million. The number of households in Japan proper, when the last census was taken in 1925 was 11,999,609 and the average number in each household 5.0.

Physical Characteristics.—The best authorities are agreed that the Japanese people do not differ physically from their Korean and Chinese neighbours as much as the inhabitants of northern Europe differ from those of southern Europe. It is true that the Japanese are shorter in stature than either the Chinese or the Koreans. Thus the average height of the Japanese male is only 5 feet 3½ in., and that of the female 4 ft. 10½ in., whereas in the case of the Koreans and the northern Chinese the corresponding figures for males are 5 ft. 5½ in. and 5 ft. 7 in., respectively. Yet in other physical characteristics the Japanese, the Koreans and the Chinese resemble each other so closely that, under similar conditions as to costume and coiffure, no appreciable difference is apparent. The late Dr. E. Baelz (Emeritus Professor of Medicine in the Imperial University of Tōkyō), who made an exhaustive anthropological study of the Japanese, divides the race inhabiting the Japanese islands into three distinct types:—(a) Manchu-Korean, (b) Mongol, and (c) Malay or Indonesian.

The first is more common among the upper classes, and its characteristics are exceptional tallness combined with slenderness, a face somewhat long and having more or less oblique eyes, an aquiline nose, a slightly receding chin and delicately shaped hands. The most plausible hypothesis is that men of this type are descendants of Korean colonists who, in prehistoric times, settled in the province of Izumo, on the west coast of Japan, having made their way thither from the Korean peninsula by the island of Oki. The second type is the Mongol. It is not very frequently found in Japan, perhaps because, under favourable social conditions, it tends to pass into the Manchu-Korean type. Its representative has a broad face, with prominent cheek-bones, oblique eyes, a nose more or less flat and a wide mouth. The figure is strongly and square built; but this last characteristic can scarcely be called typical. There is no satisfactory theory as to the route by which the Mongols reached Japan, but it is scarcely possible to doubt that they found their way thither at one time. More important than either of these types as an element of the Japanese nation is the Malay or Indonesian. Small in stature, with a well-knit frame, the cheek-bones prominent, the face generally round, the nose and neck short, a marked tendency to prognathism, the chest broad and well developed, the trunk long, the hands small and delicate—this type is found in nearly all the islands along the east coast of the Asiatic continent as well as in southern China and in the extreme south-west of the Korean peninsula. Carried northward by the warm current known as the Kuro Shiwo, this type seems to have landed in Kyūshū—the most southerly of the main Japanese islands—whence it ultimately pushed northward and conquered its Manchu-Korean predecessors, the Izumo colonists. None of the above three, however, can be regarded as the earliest settlers in Japan. Before them all was a tribe of immigrants who appear to have crossed from north-eastern Asia at an epoch when the sea had not yet dug broad channels between the continent and the adjacent islands. These people—the Ainu—are usually spoken of as the aborigines of Japan. They once occupied the whole country, but were gradually driven northward by the Manchu-Koreans and the Malays or Indonesians, until only a mere handful of them survived in the northern island of Yezo. Like the second and third types they are short and

thickly built, but unlike either they have prominent brows, bushy locks, round deep-set eyes, long divergent lashes, straight noses and much hair on the face and the body. In short, the Ainu suggest much closer affinity with Europeans than does any other of the types that go to make up the population of Japan. It is not to be supposed, however, that these traces of different elements indicate any lack of homogeneity in the Japanese race. Amalgamation has been completely effected in the course of long centuries, and even the Ainu, though the small surviving remnant of them now live apart, have left distinct traces upon their conquerors.

The typical Japanese of the present day has certain marked physical peculiarities. In the first place, the ratio of the height of his head to the length of his body is greater than it is in Europeans. The Englishman's head is often one-eighth of the length of his body or even less, and in continental Europeans, as a rule, the ratio does not amount to one-seventh; but in the Japanese it exceeds the latter figure. Another striking feature is shortness of legs relatively to length of trunk. This special feature has been attributed to the Japanese habit of kneeling instead of sitting, but investigation shows that it is equally marked in the working classes who pass most of their time standing. In Europe the same physical traits—relative length of head and shortness of legs—distinguish the central race (Alpine) from the Teutonic, and seem to indicate an affinity between the former and the Mongols. It is in the face, however, that we find specially distinctive traits, namely, in the eyes, the eyelashes, the cheekbones and the beard. Not that the eyeball itself differs from that of an Occidental. The difference consists in the fact that "the socket of the eye is comparatively small and shallow, and the osseous ridges at the brows being little marked, the eye is less deeply set than in the European. In fact, seen in profile, forehead and upper lip often form an unbroken line." Then, again, the shape of the eye, as modelled by the lids, shows a striking peculiarity. For whereas the open eye is almost invariably horizontal in the European, it is often oblique in the Japanese on account of the higher level of the upper corner. "But even apart from obliqueness, the shape of the corners is peculiar in the Mongolian eye. The inner corner is partly or entirely covered by a fold of the upper lid continuing more or less into the lower lid. This fold often covers also the whole free rim of the upper lid, so that the insertion of the eyelashes is hidden" and the opening between the lids is so narrowed as to disappear altogether at the moment of laughter. As for the eye-lashes, not only are they comparatively short and sparse, but also they converge instead of diverging, so that whereas in a European the free ends of the lashes are further distant from each other than their roots, in a Japanese they are nearer together. Prominence of cheekbones is another special feature; but it is much commoner in the lower than in the upper classes. Finally, there is marked paucity of hair on the face of the average Japanese—apart from the Ainu—and what hair there is is nearly always straight.

Moral Characteristics.—The Japanese are essentially a kindly-hearted, laughter-loving people, taking life easily and not allowing its petty ills unnecessarily to disturb their equanimity. Suicide is, it is true, by no means uncommon; but by far its most frequent victims are students and lovers. The latter take refuge in it because circumstances prevent their being united in this world, and they go therefore to what they believe to be a union beyond the grave; in the case of the students the cause is generally to be found in the stress of modern conditions and the unduly heavy mental and physical strain imposed upon them by the existing system of education. Neither of these types, however, is normal; and the average Japanese, while lacking that sense of humour which is conspicuous among some other races, is nevertheless a light-hearted and buoyant individual. It is rare to see a grown-up person, particularly among the educated classes, indulge in displays of temper. The Japanese is imperturbable in the face of provocation or trouble and, as a rule, completely stoical in the face of pain or death. This faculty of self-control is in a sense hereditary, the result of long centuries of rigid training and example. It has also been driven into him that personal

cowardice is the most despicable of vices and loyalty, particularly loyalty to the Throne and to his country, the supreme virtue. The finished product of these teachings is a person imbued with a pride of race and a patriotism so intense that it not infrequently verges on fanaticism. There is a limit, too, to imperturbability, and when that limit is reached the resulting passion is correspondingly violent. It will therefore easily be realized from this description of the Japanese character how formidable are the potentialities of this people as an enemy. Kaempfer, that most acute of observers, wrote of the Japanese that "their pride and warlike humour being set aside," they are "as civil, as polite and as curious a nation as any in the world, naturally inclined to commerce and familiarity with foreigners, and desirous, to excess, to be informed of their histories, arts and sciences," and what Kaempfer wrote in the Dutch factory at Nagasaki more than 200 years ago is almost equally true to-day. Contact with a ruder outside world may perchance since have blunted a little the fine edge of the national courtesy; but, if so, it is hardly perceptible; the intellectual curiosity to which he refers remains as strong as ever. Pride of race can naturally be carried to excess, and there have not been wanting critics, not necessarily biased, to charge the Japanese with excessive self-confidence and self-esteem; others too have noted a certain fickleness of temperament, a tendency to quick enthusiasms easily dropped, and considerable secretiveness. But no nation is free from failings, and when due account has been taken of those of the Japanese, there still remains a people of remarkable energy and intelligence, of marvellous achievement, and of great attractiveness. It must not be inferred from the remark made above with regard to suicide among lovers that love as a prelude to marriage plays an important part in Japanese ethics. As a matter of fact in the vast majority of cases marriages are arranged by the parents or in the family councils of the parties concerned without any particular regard to the feelings of the two people most directly interested. It might be supposed that conjugal fidelity would suffer from such a custom, and in the case of the husband it undoubtedly does; but in the case of the wife it emphatically does not. Even though she be cognizant—as she often is—of her husband's extra-marital relations, she abates nothing of the duty which she has been taught to regard as the first canon of female ethics. From many points of view, indeed, there is no more beautiful type of character than that of the Japanese woman. She is entirely unselfish; exquisitely modest without being anything of a prude; abounding in intelligence which is never obscured by egoism; patient in the hour of suffering; strong in time of affliction; a faithful wife; a loving mother; a good daughter; and capable, as history shows, of heroism rivalling that of the stronger sex. As to the question of sexual virtue and morality in Japan, grounds for a conclusive verdict are hard to find. In the interests of hygiene prostitution is licensed, and that fact is by many critics construed as proof of tolerance; but licensing is associated with strict segregation, and the result is that the great cities are conspicuously free from evidences of vice. The ratio of marriages is approximately 8.31 per thousand units of the population, and the ratio of divorces is 0.83 per thousand. Divorces take place chiefly among the lower orders, who frequently treat marriage merely as a test of a couple's suitability to be helpmates in the struggles of life.

Concerning the virtues of truth and probity, extremely conflicting opinions have been expressed. The Japanese *samurai* always prided himself on having "no second word." He never drew his sword without using it; he never gave his word without keeping it. Yet it may be doubted whether the value attached in Japan to the abstract quality, truth, is as high as the value attached to it in England, or whether the consciousness of having told a falsehood weighs as heavily on the heart. Much depends upon the motive. Whatever may be said of the upper class, it is probably true that the average Japanese will not sacrifice expediency on the altar of truth. He will be veracious only so long as the consequences are not seriously injurious. In the matter of probity, however, it is possible to speak with more assurance. There are undoubtedly among the merchants and tradesmen a

large number of persons whose standard of commercial morality is defective. They are relics of the feudal days when the merchant and the tradesman, being despised, lost their self-respect. But this blemish is in gradual process of correction, and there are now many merchant houses in Japan which maintain as high a standard of probity as can be found anywhere.

COMMUNICATIONS

There is no reliable information regarding the state of communications in very early times in Japan; but in the Taika period (A.D. 645-650), the first great era of Japanese reform, a system of post-stations was established, provision was made for post-horses along the great roads, which doubtless has long been in existence in the more populous districts, and a system of bells and checks was devised for distinguishing official carriers. In those days ordinary travellers were required to carry passports, nor had they any share in the benefits of the official organization, which was entirely under the control of the minister of war. Great difficulties attended the movements of private persons. Even the task of transmitting to the central government provincial taxes paid in kind had to be discharged by specially organized parties, and this journey from the north-eastern districts to the capital generally occupied three months. Owing to the anarchy which prevailed during the 10th, 11th and 12th centuries, facilities of communication disappeared almost entirely; even for men of rank a long journey involved danger of starvation or fatal exposure, and the pains and perils of travel became a household word among the people. Not until the Tokugawa family obtained military control of the whole empire (1603), and, fixing its capital at Yedo, required the feudal chiefs to reside there every second year, did the problem of roads and post-stations force itself once more on official attention. Regulations were now strictly enforced, fixing the number of horses and carriers available at each station, the loads to be carried by them and their charges, as well as the transport services that each feudal chief was entitled to demand and the fees he had to pay in return. Tolerable hostelrys now came into existence; but they furnished only shelter, fuel and the coarsest kind of food. By degrees, however, the progresses of the feudal chiefs to and from Yedo, which at first were simple and economical, developed features of competitive magnificence, and the importance of good roads and suitable accommodation received increased attention.

It is not too much to say, indeed, that when Japan opened her doors to foreigners in the middle of the 19th century, she possessed a system of roads, some of which bore a striking testimony to her mediaeval greatness. The most remarkable was the Tōkaidō (eastern-sea way), so called because it ran eastward along the coast from Kiōto. This great highway, 345 m. long, connected Osaka and Kiōto with Yedo. The date of its construction is not recorded; but it certainly underwent signal improvement in the 12th and 13th centuries, and during the two and a half centuries of Tokugawa sway in Yedo. A wide, well-made and well-kept avenue, it was lined throughout the greater part of its length by giant pine-trees, rendering it the most picturesque highway in the world. Second only to the Tōkaidō is the Nakasendō (mid-mountain road), which also was constructed to join Kiōto with Yedo, but follows an inland course through the provinces of Yamashiro, Omi, Mino, Shinshū, Kōtzuke and Musashi. Its length is 340 m., and though not flanked by trees or possessing so good a bed as the Tōkaidō, it is nevertheless a sufficiently remarkable highway. A third road, the Oshūkaidō, runs northward from Yedo (now Tōkyō) to Aomori on the extreme north of the main island, a distance of 445 m., and several lesser highways give access to other regions.

Modern Superintendence of Roads.—The question of road superintendence received early attention from the government of the restoration. At a general assembly of local prefects held at Tōkyō in June 1875 it was decided to classify the different roads throughout the empire, and to determine the several sources from which the sums necessary for their maintenance and repair should be drawn. As a result of the discussions which then took place it was decided that all roads should be divided into three classes:

—national, prefectural and village—and that the first should be maintained at the national expense, the second by joint contributions from the government and the particular prefecture concerned, and the third by the districts through which the roads ran. The width of national roads was determined at 42 ft. for class 1, 36 ft. for class 2 and 30 ft. for class 3; the prefectural roads were to be from 24 to 30 ft., and the dimensions of the village roads were optional, according to the necessity of the case.

Vehicles.—The vehicles chiefly employed in ante-Meiji days were ox-carriages, *norimono*, *kago* and carts drawn by hand. Ox-carriages, beautifully made and decorated, were used only by people of the highest rank. The *norimono* resembled a miniature house slung by its roof-ridge from a massive pole which projected at either end sufficiently to admit the shoulders of a carrier. It, too, was frequently of very ornamental nature and served to carry aristocrats or officials of high position. The *kago* was the humblest of all conveyances recognized as usable by the upper classes. It was an open palanquin, V-shaped in cross section, slung from a pole which rested on the shoulders of two bearers. Extraordinary skill and endurance were shown by the men who carried the *norimono* and the *kago*; but none the less these vehicles were both profoundly uncomfortable. They have now been relegated to the warehouses of undertakers, where they serve as bearers for folks too poor to employ catafalques, their place on the roads and in the streets having been completely taken by the *jinrikisha*, a two-wheeled vehicle pulled by one or two men who think nothing of running 20 m. at the rate of 6 m. an hour. The *jinrikisha* is, however, fast disappearing and its place is being taken, both in the towns and in the country, by the motor-car, though it must be confessed that Japanese roads are not yet by any means suitable for motor traffic. Luggage, of course, could not be carried by *norimono* or *kago*. It was necessary to have recourse to packmen, packhorses or baggage-carts drawn by men or horses. All these still exist and are as useful as ever within certain limits. In the cities and towns horses used as beasts of burden are now shod with iron, but in rural or mountainous districts straw shoes are substituted, a device which enables the animals to traverse rocky or precipitous roads with safety.

Railways.—It is easy to understand that an enterprise like railway construction, requiring a great outlay of capital with returns long delayed, did not at first commend itself to the Japanese, who were almost entirely ignorant of co-operation as a factor of business organization. Moreover, long habituated to snail-like modes of travel, the people did not rapidly appreciate the celerity of the locomotive. Neither the ox-cart, the *norimono*, nor the *kago* covered a daily distance of over 20 m. on the average, and the packhorse was even slower. Amid such conditions the idea of railways would have been slow to germinate had not a catastrophe furnished some impetus. In 1869, a rice-famine occurred in the southern island, Kyūshū, and while the cereal was procurable abundantly in the northern provinces, people in the south perished of hunger owing to lack of transport facilities. Sir Harry Parkes, British representative in Tōkyō, seized this occasion to urge the construction of railways. Ito and Okuma, then influential members of the government, at once recognized the wisdom of his advice. Arrangements were made for a loan of a million sterling in London on the security of the customs revenue, and English engineers were engaged to lay a line between Tōkyō and Yokohama (18 m.) Vehement voices of opposition were at once raised in private and official circles alike, all persons engaged in transport business imagined themselves threatened with ruin, and conservative patriots detected loss of national independence in a foreign loan. So fierce was the antagonism that the military authorities refused to permit operations of survey in the southern suburb of Tōkyō, and the road had to be laid on an embankment constructed in the sea. Ito and Okuma, however, never flinched, and they were ably supported by Marquis M. Inouye and M. Mayejima.

September 1872 saw the first official opening of a railway (the Tōkyō-Yokohama line) in Japan, the ceremony being performed by the emperor himself, a measure which effectually silenced all further opposition. Eight years from the time of turning the first

sod saw 71 m. of road open to traffic, the northern section being that between Tōkyō and Yokohama, and the southern that between Kyōto and Kobe. A period of interruption now ensued, owing to domestic troubles and foreign complications, and when, in 1878, the government was able to devote attention once again to railway problems, it found the treasury empty. Then for the first time a public works loan was floated in the home market, and about £300,000 of the total thus obtained passed into the hands of the railway bureau, which at once undertook the building of a road from Kyōto to the shore of Lake Biwa, a work memorable as the first line built in Japan without foreign assistance, save for advisers. During all this time private enterprise had remained wholly inactive in the matter of railways, and it became a matter of importance to rouse the people from this apathetic attitude. For the ordinary process of organizing a joint-stock company and raising share-capital the nation was not yet prepared. But shortly after the abolition of feudalism there had come into the possession of the former feudatories state loan-bonds amounting to some 18 millions sterling, which represented the sum granted by the treasury in commutation of the revenues formerly accruing to these men from their fiefs. Already events had shown that the feudatories, quite devoid of business experience, were not unlikely to dispose of these bonds and devote the proceeds to unsound enterprises. Prince Iwakura, one of the leaders of the Meiji statesmen, persuaded the feudatories to employ a part of the bonds as capital for railway construction, and thus the first private railway company was formed in Japan under the name *Nippon tetsudo kaisha* (Japan railway company), the treasury guaranteeing 8% on the paid-up capital for a period of 15 years. Some time elapsed before this example found followers, but ultimately a programme was elaborated and carried out having for its basis a grand trunk line extending the whole length of the main island from Aomori on the north to Shimonoseki on the south, a distance of 1,153 m.; and a continuation of the same line throughout the length of the southern island of Kyūshū, from Moji on the north—which lies on the opposite side of the strait from Shimonoseki—to Kagoshima on the south, a distance of 232½ m.; as well as a line from Moji to Nagasaki, a distance of 163½ m. Of this main road the state undertook to build the central section (376 m.), between Tōkyō and Kōbe (via Kyōto); the Japan railway company undertook the portion (457 m.) northward of Tōkyō to Aomori; the Sanyō railway company undertook the portion (320 m.) southward of Tōkyō to Shimonoseki; and the Kyūshū railway company undertook the lines in Kyūshū. The first project was to carry the Tōkyō-Kyōto line through the interior of the island so as to secure it against enterprises on the part of a maritime enemy. Such engineering difficulties presented themselves, however, that the coast route was ultimately chosen, and though the line through the interior was subsequently constructed, strategical considerations were not allowed completely to govern its direction.

When this building of railways began in Japan, much discussion was taking place in England and India as to the relative advantages of the wide and narrow gauges, and so strongly did the arguments in favour of the latter appeal to the English advisers of the Japanese government that the metre gauge was chosen. Some fitful efforts made in later years to change the system proved unsuccessful. The lines are single, for the most part; and as the embankments, the cuttings, the culverts and the bridge-piers have not been constructed for a double line, any change now would be very costly. The average speed of passenger trains in Japan is 18 m. an hour, the corresponding figure over the metre-gauge roads in India being 16 m., and the figure for English parliamentary trains from 19 to 28 m. British engineers surveyed the routes for the first lines and superintended the work of construction, but within a few years the Japanese were able to dispense with foreign aid altogether, both in building and operating their railways. They also now construct carriages, wagons and locomotives, and therefore are entirely independent in the matter of railway construction.

Nationalization of Private Railways.—The total length of lines open for traffic in March 1906 was 4,746 m. Of these 1,470

m. had been built by the State at a cost of sixteen million pounds sterling, and 3,276 m. by private companies at a cost of twenty-five millions. The difference in cost is explained by the fact that the state lines frequently ran through very difficult country and that portions of them were built before experience indicated cheaper methods. Private companies, coming later into the field, naturally avoided districts presenting great engineering difficulties, and had the additional advantage of being able to profit from the experience bought at a price by the state. When the fiscal year 1906-07 opened, the number of private companies was no less than 36, owning and operating 3,276 m. of railway. Anything like efficient co-operation, an important matter in time of war, was impossible in such circumstances, and constant complaints were heard about delays in transit and undue expense. The defects of divided ownership had long suggested the expediency of nationalization; but not until 1906 could the Diet be induced to give its consent. On March 31 of that year, a railway nationalization law was promulgated. It enacted that, within a period of 10 years from 1906 to 1915, the state should purchase the 17 principal private roads, which had a length of 2,812 m., and whose cost of construction and equipment had been 23½ millions sterling. The original scheme included 15 other railways, with an aggregate mileage of only 353 m.; but these were eliminated as being lines of local interest only. The actual purchase price of the 17 lines was calculated at 43 millions sterling (about double their cost price), and the Government agreed to hand over the purchase money within 5 years from the date of the acquisition of the lines, in public loan-bonds bearing 5% interest calculated at their face value; the bonds to be redeemed out of the net profits accruing from the purchased railways. The accounts for the state railways figure as a separate account independent of the budget.

South Manchuria Railways.—As a result of the war of 1904-05 Japan, with the acquiescence of China, took over from Russia the lease of the portion of the Chinese Eastern Railway between Kwang-cheng-tzu (Changchun) in the north and Dairen (Dalny), Port Arthur and Newchwang in the south. China at the same time agreed to lease to Japan the line between Mukden and Antung, which the latter had laid temporarily for military purposes during the war, but now proposed to convert into an ordinary commercial railway. A company called the South Manchuria Railway was formed with a capital of 20 million yen, half of which was contributed by the Japanese Government in the shape of the road itself and its associated properties, the other half thrown open for subscription to Japanese and Chinese subjects, and to it the railway was handed over. Debentures, the interest on which was guaranteed by the Japanese Government, were also issued in London to the amount of 8 million pounds sterling. The capital has since been raised to 44 million pounds and the amount of debentures increased till they now stand at 22 million. The total length of the railway with its various branches is 693 miles. The company's activities are not limited to its lines only. It works extensive coal mines at Fushun and Yentai, has a line of steamers plying between Dairen and Shanghai and an iron foundry at Anshan, and engages in enterprises connected with warehousing, electricity, hotels, hospitals, schools and the general management of houses and lands within the railway zone. Under the terms of a treaty made with China in 1915 the lease of the Changchun-Dairen section has been extended to A.D. 2002 and that of the Mukden-Antung section to A.D. 2007. Construction work has been well maintained since 1907 when nationalization took place. In 1917 the total railway mileage was 7,690 m., of which 5,856 m. represented State railways and 1,834 m. private lines. In 1927 the total was 10,884 m., of which 7,837 m. were state-owned and 3,047 m. the property of private companies. No recent figures are available of the cost of construction of state lines; but the total given in 1927 for the private lines was close on 40 million pounds sterling. The total receipts in that year for both state and private lines from passenger traffic was over 26 million pounds and from freight 22 millions.

Electric Railways.—The first electric railway in Japan was a short one, 8 miles long, built in Kyōto for the purposes of a

domestic exhibition held in that city. This class of enterprise has since rapidly grown in favour, and in 1926 108, belonging either to municipalities or private companies, were in operation. Their total authorized capital is estimated at about 168 million pounds, their net earnings in 1926 about 14 million pounds, and the number of passengers carried about 18 hundred millions. Dividends varied from 7 to 14 per cent.

Maritime Communications.—The traditional story of pre-historic Japan indicates that the first recorded emperor was an over-sea invader, whose followers must therefore have possessed some knowledge of ship-building and navigation, and historical records in fact show that the Japanese of the earliest era navigated the high sea with some skill. At later dates down to mediaeval times they are found occasionally sending forces to Korea and constantly visiting China in vessels which seem to have experienced no difficulty in making the voyage, while in the 16th century maritime activity was so marked that, had not artificial checks been applied, the Japanese, in all probability, would have obtained partial command of Far-Eastern waters. They invaded Korea; their corsairs harried the coast of China; two hundred of their vessels, sailing under authority of the Taikō's vermilion seal, visited Siam, Luzon, Cochin China and Annam, and they built ships in European style which crossed the Pacific to Acapulco. But this spirit of adventure was chilled at the close of the 16th century and early in the 17th, when events connected with the propagation of Christianity taught the Japanese to believe that national safety could not be secured without international isolation. In 1638 the ports were closed to all foreign ships except those flying the flag of Holland or of China, and a strictly enforced edict forbade the building of any vessel having a capacity of more than 500 *koku* (150 tons) or constructed for purposes of ocean navigation. Thenceforth, with rare exceptions, Japanese craft confined themselves to the coastwise trade. Ocean-going enterprise ceased altogether.

Things remained thus until the middle of the 19th century, when a growing knowledge of the conditions existing in the West warned the Tokugawa administration that continued isolation would be suicidal. In 1853 the law prohibiting the construction of sea-going ships was revoked and the Yedo government built at Uraga a sailing vessel of European type aptly called the "Phoenix" ("Hōo Maru"). In the same year Commodore Perry made his appearance, and thenceforth everything conspired to push Japan along the new path. The Dutch, who had been proximately responsible for the adoption of the seclusion policy in the 17th century, now took a prominent part in promoting a liberal view. They sent to the Tokugawa a present of a man-of-war and urged the vital necessity of equipping the country with a navy. Then followed the establishment of a naval college at Tsukiji in Yedo, the building of iron-works at Nagasaki, and the construction at Yokosuka of a dockyard destined to become one of the greatest enterprises of its kind in the East. The policy thus initiated by the Tokugawa was continued with increased energy after their downfall in 1867 and the restoration of the emperor to real power.

The various maritime carriers which had come into existence were made to amalgamate into one association called the *Nippon-koku yubin jōkisen kaisha* (Mail SS. Company of Japan), to which were transferred, free of charge, the steamers, previously the property of the Tokugawa or the feudatories, and a substantial subsidy was granted by the state. This, the first steamship company ever organized in Japan remained in existence only four years. Defective management and incapacity to compete with foreign-owned vessels plying between the open ports caused its downfall (1875). Already, however, an independent company had appeared upon the scene. Organized and controlled by a man (Iwasaki Yataro) of exceptional enterprise and business faculty, this *Mitsubishi kaisha* (three diamonds company, so called from the design on its flag), working with steamers chartered from the former feudatory of Tosa, to which clan Iwasaki belonged, proved a success from the outset, and grew with each vicissitude of the state. For when (1874) the Meiji government's first complications with a foreign country necessitated the des-

patch of a military expedition to Formosa, the administration had to purchase 63 foreign steamers for transport purposes, and these were subsequently transferred to the Mitsubishi company together with all the vessels (17) hitherto in the possession of the Mail SS. Company, the Treasury further granting to the Mitsubishi a subsidy of £50,000 annually. Shortly afterwards it was decided to purchase a service maintained by the Pacific Mail SS. Company with 4 steamers between Yokohama and Shanghai, and money for the purpose having been lent by the state to the Mitsubishi, Japan's first line of steamers to a foreign country was firmly established, just 20 years after the law interdicting the construction of ocean-going vessels had been rescinded.

A further purchase of foreign steamers was made in 1877 in connection with the suppression of the Satsuma rebellion, and these vessels, 10 in number, were handed over to the Mitsubishi, which, in 1880, found itself possessed of 32 ships aggregating 25,600 tons, whereas all the other vessels of foreign type in the country totalled only 27 with a tonnage of 6,500. In the following year the formation of a new company was officially promoted. It had the name of the *kyōdō unyu kaisha* (Union Transport Company); its capital was about a million sterling; it received a large subsidy from the state, and its chief purpose was to provide vessels for military uses and as commerce-carriers. Japan had now definitely embraced the policy of entrusting to private companies rather than to the state the duty of acquiring a fleet of vessels capable of serving as transports or auxiliary cruisers in time of war. But there was now seen the curious spectacle of two companies (the Mitsubishi and the Union Transport) competing in the same waters and both subsidized by the treasury. After this had gone on for four years, the two companies were amalgamated (1885) into the *Nippon yusen kaisha* (Japan Mail SS. Company) with a capital of £1,100,000 and an annual subsidy of £88,000, fixed on the basis of 8% of the capital. Another company had come into existence a few months earlier. Its fleet consisted of 100 small steamers, totalling 10,000 tons, which had hitherto been competing in the Inland Sea.

Japan now possessed a substantial mercantile marine, the rate of whose development is indicated by the following figures:—

Year	Steamers		Sailing vessels		Totals	
	Number	Tons	Number	Tons	Number	Tons
1870 . .	35	15,498	11	2,454	46	17,952
1892 . .	642	122,300	780	46,065	1,422	168,365

Nevertheless, only 23% of the exports and imports was transported in Japanese bottoms in 1892, whereas foreign steamers took 77%. This discrepancy was one of the subjects discussed in the first session of the Diet, but a bill presented by the government for encouraging navigation failed to obtain parliamentary consent, and in 1893 the Japan Mail SS. Company, without waiting for state assistance, opened a regular service to Bombay mainly for the purpose of carrying raw cotton from India to supply the spinning industry which had now assumed great importance in Japan. Thus the rising sun flag flew for the first time outside Far-Eastern waters. Almost immediately after the establishment of this line, Japan had to engage in war with China, which entailed the despatch of some two hundred thousand men to the neighbouring continent and their maintenance there for more than a year. All the country's available shipping resources did not suffice for this task. Additional vessels had to be purchased or chartered, and thus, by the beginning of 1896, the mercantile marine of Japan had grown to 899 steamers of 373,588 tons, while the sailing vessels had diminished to 644 of 44,000 tons. In the same year the Government, awake to the increasing menace of conflict with Russia on the mainland of Asia and determined in that event to be adequately supplied with transport facilities, passed, with the consent of the Diet, laws for the liberal encouragement of ship-building and navigation. The law for the encouragement of ship-building was abolished in 1920; that for navigation, after having been twice amended, still exists. According to this certain Japanese steamship companies are given mail

subsidies for maintaining regular services to various parts of the world on a 5 year contract. Ships entitled to this subsidy must be of over 3,000 tons, with a speed of 12 knots or more, and not over 15 years old. The subsidy itself is at the rate of a maximum of 50 sen (1s.) per 1,000 miles for a vessel of 12 knots speed and an additional 10% for every knot in excess of that limit. The effect of the legislation alluded to above was marked. In the period of six years ended 1902, no less than 835 vessels of 455,000 tons were added to the mercantile marine, and the treasury found itself paying encouragement money which totalled six hundred thousand pounds annually. Ship-building underwent remarkable development. Thus, while in 1870 only 2 steamers aggregating 57 tons had been constructed in Japanese yards, 53 steamers totalling 5,380 tons and 193 sailing vessels of 17,873 tons were launched in 1900. By the year 1907 Japan had 216 private shipyards and 42 private docks, and while the government yards were able to build first-class line-of-battle ships of the largest size, the private docks were turning out steamers of 9,000 tons burden. When war broke out with Russia in 1904, Japan had 567,000 tons of steam shipping, but that stupendous struggle obliged her to materially augment even this great total. In operations connected with the war she lost 71,000 tons, but on the other hand, she built 27,000 tons at home and bought 177,000 abroad, so that the net increase to her mercantile fleet of steamers was 133,000 tons. At that time Japan was practically still in her infancy as a maritime carrying power; but she has since then made great strides, and in 1927 the gross total of her steamer tonnage was well over 3 million tons and that of her sailing-ship tonnage over a million tons. During the Great War her shipping was able, thanks to her remoteness from the scene of conflict and to the preoccupation of the Allied Powers, to reap a very rich harvest. The following table shows the growth of the mercantile marine during the last 20 years:—

Year	Steamers		Sailing vessels		Total	
	No.	Gross tonnage	No.	Gross tonnage	No.	Gross tonnage
1905 . .	1,988	939,749	4,132	336,571	6,120	1,276,320
1925 . .	7,323	3,546,941	40,679	1,369,560	48,002	4,916,501

These figures do not include steam-vessels which are not registered or sailing-ships of "koku" burden.

The principal shipping companies are the Nippon Yusen Kaisha (605,548 tons gross), the Ōsaka Shōsen Kaisha (459,588 tons gross), the Kikusui Kisen Kaisha (259,850 tons gross), the Tōyō Kisen Kaisha (58,367 tons gross), now run by the Nippon Yusen Kaisha, the Kawasaki Steamship Co. (211,166 tons gross), the Mitsui Bussan Kaisha (101,844 tons gross) and the Kinkai Yusen Kaisha (104,415 tons gross).

The total number of seamen in 1925 was 4,379,615, of whom 3,496,066 were employed on steamships and 883,549 on sailing vessels. The number of Japanese qualified officers in the same year was 56,813. Originally quite a number of foreigners, mostly British subjects, were employed by Japanese steamship companies either as navigating officers or engineers; but in 1925 there were only 132—all engineers.

In accordance with a resolution passed at the International Labour Congress of 1926 a Japan Shipping Union was established in the winter of that year to act as a seamen's employment agency and generally to attend to their interests. This took the place of the former Japan Seamen's Relief Society, and the expense of its maintenance is borne in suitable proportions by the Government, shipowners and seamen themselves.

Maritime Administration.—The duty of overseeing all matters relating to the maritime carrying trade devolves on the Ministry of State for Communications, and is delegated by the latter to one of its bureaux (the *Kwansen-kyoku*, or ships superintendence bureau), which, again, is divided into three sections: one for inspecting vessels, one for examining mariners and one for the general control of all shipping in Japanese waters. For the better discharge of its duties this bureau parcels out the empire into 4 districts, having their headquarters at Tōkyō, Ōsaka, Nagasaki and Hakodate; and these four districts are in

turn subdivided into 18 sections, each having an office of marine affairs (*kwaiji-kyoku*).

Japan now stands third on the list of the principal maritime countries of the world.

Open Ports.—There are 41 ports in Japan open as places of call for foreign ships. The principal of these (with the dates of their opening in brackets) are Yokohama (1859), Kobe (1868), Ōsaka (1899), Dairen (1906), Nagasaki (1859), Shimonoseki (1899), Moji (1899), Ōtaru (1899), Muroran (1899), Hakodate (1865), Yokkaichi (1899), Tsuruga (1899), Karatsu (1899), Kuchinotsu (1899), Keelung (1899), Tamsui (1899), Niigata (1867), Aomori (1906), Kushiro (1899), Takow (1899), and Anping (1899), Chemulpho (1883), and Fusan (1883).

Emigration.—Although the Japanese are by nature an adventurous race it can hardly be said that they make perfect material as colonists. There are wide spaces in their own North Island which have long been awaiting development; but it appears singularly difficult to find settlers to migrate to them. Hopes too were expressed after the Russo-Japanese war that South Manchuria would become an attractive field for the colonist. But this has not proved to be the case. Small traders have certainly flocked there in numbers; but agriculturists practically not at all. There are various explanations for this phenomenon. In the first place while the Japanese thrives in countries in which the standard of living is higher than his own he cannot do so in countries in which it is lower. In Manchuria in consequence he is quite unable to compete with the hardy Northern Chinese. Again, to the vast majority of Japanese farming means the cultivation of rice,—a cereal for which neither Manchuria nor the Hokkaido is really suited. Moreover, the Japanese does not like extremes of temperature, for which reason neither the bitter cold of the Hokkaido and Manchuria in the north nor the moist heat of Formosa in the south is really to his taste. He flourishes best in temperature of moderately warm regions,—North America for instance. But in such places a disposition to exclude him frequently manifests itself, in the form of legislation or otherwise. For this racial prejudice is partly responsible, the Japanese being for various reasons not easily assimilable; but economic causes are an equally important factor. Native labour looks at him with an unfriendly eye because it fears that his superior industry and his lower standard of living will work to its own prejudice. Whatever the causes, there is no question that the result is a blow to Japanese pride; but since one nation cannot force its society on another at the point of the sword, this anti-Asiatic prejudice has to be respected.

The following figures show the number of Japanese living abroad in 1926:—

Liaotung leased territory	93,354
China	147,263
Straits Settlements	6,964
Philippine Islands	9,807
Dutch East Indies	4,533
Europe	3,360
United States	133,605
Canada	19,885
Mexico	4,018
Brazil	55,481
Peru	11,786
Argentina	2,731
Australia	3,752
Sandwich Islands	127,951
Other countries	15,609
Total	640,099

Foreign Residents.—The total number of foreigners residing in Japan in 1926 was 31,140, of whom 22,272 were Chinese. The chief other nationalities represented were:—

British (including British Indians)	2,460
U.S. citizens	2,134
Germans	1,139
French	461

There are also small numbers of Dutch, Swiss, Italians, Danes, Portuguese, Norwegians, etc.

Posts and Telegraphs.—The government of the Restoration did not wait for the complete abolition of feudalism before

organizing a new system of posts in accordance with modern needs. At first, letters only were carried, but before the close of 1871 the service was extended so as to include newspapers, printed matter, books and commercial samples, while the area was extended so as to embrace all important towns between Hakodate in the northern island of Yezo and Nagasaki in the southern island of Kyūshū. Two years later this field was closed to private enterprise, the state assuming sole charge of the business. A few years later saw Japan in possession of an organization comparable in every respect with the systems existing in Europe. In 1892 a foreign service was added. In 1871 the number of post-offices throughout the empire was only 179; but by 1927 it had increased to 8,784. In that year the number of letters distributed was over 3,906 millions, of parcels nearly 56,000,000, and of telegrams delivered nearly 70 millions. The number of paid postal officials was 56,317. Japan labours under special difficulties for postal purposes, owing to the great number of islands included in the empire, the exceptionally mountainous nature of the country, and the wide areas covered by the cities in proportion to the number of their inhabitants. It is not surprising to find, therefore, that the means of distribution are varied. The gross revenue from postal, telegraph and telephone services in 1926 was about 23 million pounds.

Postal Savings Banks.—The Postal Savings Bank came into existence in 1875. The minimum deposit was fixed at 10 sen ($2\frac{1}{2}$ d) and the maximum at 50 sen (1s), ridiculously small amounts. Nevertheless about £1,500 were deposited during the first year. Subsequently deposits were taken in postage stamps, and arrangements were made enabling depositors to pay money to distant creditors by merely stating the destination and the amount to the nearest post-office. In 1908 the number of depositors in the Postal Savings Bank was 8,217, with deposits exceeding 10 millions sterling, but in 1926 the system had become so popular that the number of depositors had increased to over 31 millions and the deposits to about 114 million pounds. At present the limit for individual deposits is 2,000 yen (£200). Should this amount be exceeded the post-office may, at the request of the depositor purchase Government stock or bonds with the excess and keep them in custody for him. Close on a third of the depositors are farmers; school children comprise about one-sixth, then come tradesfolk, and last members of the labouring classes.

Rapid communication by means of beacons was not unknown in ancient Japan, but code-signalling by the aid of flags was not introduced until the 17th century and was probably suggested by observing the practice of foreign merchantmen. Its use however, was peculiar. The central office stood at Osaka, between which city and many of the principal provincial towns rudely constructed towers were placed at long distances, and from one to another of these intelligence as to the market price of rice was flashed by flag-shaking, the signals being read with telescopes. The Japanese saw a telegraph for the first time in 1854, when Commodore Perry presented a set of apparatus to the Shōgun, and four years later the feudal chief of Satsuma caused wires to be erected within the enclosure of his castle. The true value of electric telegraphy was first demonstrated to the Japanese in connection with the Satsuma Rebellion in 1877. Before that time, however, a line of telegraph had been put up between Tōkyō and Yokohama (18 m.) and a code of regulations had been enacted; but, when, in 1886, the postal and telegraph offices were amalgamated both systems underwent large development. In 1907, a network of 95,623 miles of telegraph wires were laid, and the messages carried over them in that year numbered 25 millions. In 1927 the cables had increased to 124,065 miles and the number of messages transmitted to over 138 millions. Wireless telegraphy is in general use. At present 12 government and 3 private shore installations are in operation, besides stations in the Liaotung leased territory, Formosa, Saghalin, Korea and 7 in the mandated islands. The Iwaki wireless station, with antennae poles 660 ft. high, a capacity of 400 k.w. and a transmission power of over 4,000 miles, claims to be the largest installation in the Far East. All Japanese vessels of over 2,000 tons gross and a crew exceeding 50 are obliged by law to be equipped with wireless apparatus.

Telephones.—The introduction of the telephone into Japan took place in 1877, but it served official purposes solely during 13 years, and even when (1890) it was placed at the disposal of the general public its utilities found at first few appreciators. But this apathy soon yielded to a mood of eager employment, and the resources of the government (which monopolized the enterprise) proved, and still prove, entirely inadequate to satisfy public demand. Automatic telephones were ultimately set up at many places in the principal towns and along the most frequented highways. The longest distance covered was from Tōkyō to Osaka (348 m.). In 1927 Japan had 2,189,000 miles of telephone wires, 2,262 telephone exchanges, while the number of telephone subscribers was 552,557 and the approximate number of messages sent nearly 2,000 millions.

AGRICULTURE AND INDUSTRY

Agriculture.—The gross area of land in Japan proper, that is, excluding Korea, Formosa, Saghalin and the Pescadores is about 96,289,000 acres, three-fifths of which represents Crown, State and commune property and the rest that of private individuals. Of this total a little over 14 million acres are arable land, 7,268,634 acres being devoted to the cultivation of rice and 6,765,430 acres to other crops. It is estimated that of the waste land which forms so large a proportion of the total area of Japan another 5,000,000 acres could be brought under cultivation and that of this at least 1,700,000 acres could be devoted to rice. It is believed also that by the judicious use of fertilizers, etc.,

BY COURTESY OF THE YOUNG WOMEN'S CHRISTIAN ASSOCIATION

WHEEL BY WHICH THE JAPANESE FARMER IRRIGATES HIS RICE LANDS
the crop could be raised from 36 bushels the acre to 40, and, as the average annual consumption per head of this cereal is about 5 bushels, that in one way and another an additional population of 13,000,000 could be supported. As things now are the production of rice is insufficient for the national requirements and considerable quantities are imported from abroad, though it must be added that the Japanese do not take kindly to any grains but their own.

Rice.—Paddy fields are to be seen in every valley or dell where farming is practicable; they are divided into square, oblong or

triangular plots by grass-grown ridges a few inches in height and on an average a foot in breadth—the rice being planted in the soft mud thus enclosed. Narrow pathways intersect these rice-valleys at intervals, and rivulets (generally flowing between low banks covered with clumps of bamboo) feed ditches cut for purposes of irrigation. The fields are generally kept under water to a depth of a few inches while the crops are young, but are drained immediately before harvesting. They are then dug up, and again flooded before the second crop is planted out. The rising grounds which skirt the rice-land are tilled by the hoe, and produce Indian corn, millet and edible roots. The well-wooded slopes supply the peasants with timber and firewood. Thirty-six per cent. of the rice-fields yield two crops yearly. The seed is sown in small beds, and the seedlings are planted out in the fields after attaining the height of about 4 in. The finest rice is produced in the fertile plains watered by the Tonegawa in the province of Shimōsa, but the grain of Kaga and of the two central provinces of Settsu and Harima is also very good. The price of rice was about 7s. 4d. the bushel in 1927.

Not only does rice form the chief food of the Japanese but also the national beverage, called sake, is brewed from it. In colour the best sake resembles very pale sherry; the taste is rather acid. There are many varieties, from the best quality down to *shiro-sake* or "white sake," and the turbid sort, drunk only in the poorer districts, known as *nigori-sake*; there is also a sweet sort, called *mirin*.

The various cereal and other crops cultivated in Japan, the areas devoted to them and the annual production in 1906 and 1926, twenty years later, are shown in the following table:—

	1906	1926
	Acres	Acres
Rice	7,246,982	7,268,634
Barley	1,674,595	1,096,743
Rye	1,752,095	1,333,828
Wheat	1,107,967	1,145,538
Millet	594,280	317,773
Beans	1,478,345	1,290,694
Buckwheat	402,575	281,019
Rape-seed	352,807	185,218
Potatoes	140,197	238,459
Sweet Potatoes	717,620	700,313
Cotton	24,165	4,089
Hemp	34,845	22,290
Indigo (leaf)	40,910	3,324
Sugar Cane	45,087	64,630

Silk and Tea.—Scarcely less important to Japan than the cereals she raises are her silk and tea, both of which find markets abroad. The only foreign consumer of Japanese tea, however, is the United States. The amount exported in 1906 was about 58 million lb. and in 1926, twenty years later, 84 million pounds. The increase is due to the development of the export from Formosa.

Sericulture, on the contrary, shows steady development year by year. The demand of European and American markets has very elastic limits, and if Japanese growers are content with moderate, but still substantial, gains they can find an almost unrestricted sale in the West. The following figures will show how great the development has been during the last decade.

	Raw silk (lb.)
1916	37,288,000
1926	68,345,000

The chief silk-producing prefectures in Japan, according to the order of production, are Nagano, Gumma, Yamanashi, Fukushima, Aichi and Saitama. At the close of 1925 there were 3,223 filatures throughout the country, and the number of families engaged in sericulture was 185,361.

Lacquer, vegetable wax and tobacco are also important staples of production. While the quantity of certain products increases, the number of filatures and factories diminishes, the inference being that industries are coming to be conducted on a larger

scale than was formerly the case. The number of silk filatures, for instance, has decreased from 4,723 in 1897 to 3,009 in 1925. The same phenomenon is noticeable in other industries.

It is generally said that whereas about 60% of Japan's population is engaged in sericulture, she remains far behind the progressive nations of Europe in the application of scientific principles to farming. Nevertheless, thanks to the industry of the people themselves and to state encouragement in various forms, the average yield per hectare of land still remains considerably higher in Japan than in most other countries. The state has indeed been most active in its encouragement of agriculture,—by making known the use of artificial fertilizers, by furnishing capital for the establishment of agricultural banks, by the promotion of co-operative societies, by the establishment of agricultural experimental stations and of sericultural training stations, and in numerous other ways. The Agrarian problem in Japan has caused some anxiety to the authorities in recent years. The majority of the holdings are farmed by small peasant proprietors or by tenant farmers, and the conditions of life, even with the general rise in the standard of living, are very hard. How hard they are can be seen on reference to *The Foundations of Japan*, an illuminating book written by W. J. L. Robertson Scott some years ago. These conditions on the growth of industrialism and the unhappy relations which frequently exist between landlord and tenant, have caused a considerable migration of rural population to the towns, with the result that landlords are experiencing increasing difficulty in finding tenants. Tenancy disputes in fact are becoming of such frequent occurrence,—there were 2,713 in 1926 involving over 39,000 landlords and 150,000 tenants,—that a special commission has been appointed to elaborate legislation to deal with the situation.

Notwithstanding the growing taste for beef, stock-breeding makes slow progress. In 1897 the total number of cattle was 1,214,163 and in 1926 it had only increased to 1,465,149. In the case of sheep, goats and pigs the increase is more perceptible; but the goat is kept only for milking purposes, and, although pork is becoming more popular as an article of diet, mutton is disliked because of its flavour. Moreover, lack of proper pasturage practically makes the acclimatization of the sheep an impossibility. The government has done much towards the improvement of cattle and horses by importing bulls and sires, and there are three cattle farms under the control of the Ministry of Agriculture and Forestry which either lend or sell stud animals to livestock guilds and private persons for breeding purposes. The experience of the Russo-Japanese War proved that the mixed breed of horses then used by the Japanese army was not heavy enough, and large importations of Australian, American and European horses are in consequence now made. The organization of race-clubs is also encouraged.

Forests.—Forests occupy an area of over 45 million acres, and of that expanse a little more than 26 million acres belong to the Crown, the State, public bodies, and temples, and 19 million to private individuals. It cannot be said that any very practical attempt has yet been made to develop this source of wealth; but it must also be admitted that many of the forests are very difficult of access for development purposes. The gross revenue from State forests in 1925 was estimated at close on 4 million pounds and from those owned by private individuals at a little over one and a half million pounds. It is impossible to ascertain what the net revenue amounted to in the latter case; but in the former it was estimated at rather less than two millions. The more important trees are the *Cryptomeria japonica*, the *Chamaecyparis obtusa*, pine, fir, silver fir, oak and the *Tsuga Sieboldii*. The administration is empowered by law to prevent the destruction of forests and to cause the planting of plains or waste lands or the replanting of denuded areas, and plans have long been in existence for systematically turning the state forests to valuable account, while, at the same time, providing for their conservation.

Fisheries.—From ancient times the Japanese have been great fishermen. The seas that encircle their many-coasted islands teem with fish and aquatic products, which have always constituted an essential article of diet. Early in the 18th century, the Tokugawa

administration, in pursuance of a policy of isolation, interdicted the construction of ocean-going ships, and the people's enterprise in the matter of deep-sea fishing suffered a severe check. But shortly after the Restoration in 1867, not only was this veto rescinded, but also the government, organizing a marine bureau and a marine products examination office, took vigorous measures to promote pelagic industry. Then followed the formation of the marine products association under the presidency of an imperial prince. Fishery training schools were the next step; then periodical exhibitions of fishery and marine products; then the introduction and improvement of fishing implements; and then by rapid strides the area of operations widened until Japanese fishing boats of improved types came to be seen in Australasia, in Canada, in the seas of Sakhalin, the Maritime Province, Korea and China; in the waters of Kamchatka and in the Sea of Okhotsk. Considerable progress has also been made in the artificial rearing of eels, shellfish, snapping turtles, and salmonidae. Pelagic fishing is encouraged by the grant of small subsidies to owners of fishing craft of the type approved under the Pelagic Fishery Encouragement Law. The fishing population in 1925 numbered close on 1,200,000, of whom 620,000 were regular fishermen by calling and over 490,000 what is called "occasional" fishermen, that is persons having some other calling in addition to fishing. In 1893, the total value of Japanese marine products and fish captured did not exceed 1¼ millions sterling, whereas in 1925 the figure had grown to over 18 millions. Fourteen kinds of fish represent more than 50% of the whole catch, namely (in the order of their importance) bonito (*katsuo*), sardines (*iwashi*), pagrus (*tai*), cuttle-fish and squid (*tako* and *ika*), mackerel (*saba*), yellow tail (*bur*i), tunny-fish (*maguro*), prawns (*ebi*), sole (*karei*), grey mullet (*bora*), eels (*unagi*), salmon (*shake*), sea-ear (*awabi*) and carp (*koi*). Altogether 700 kinds of aquatic products are known in Japan, and 400 of them constitute articles of diet. Among manufactured aquatic products the chief are dried bonito, fish guano, dried cuttle-fish, dried and boiled sardines, dried herring, salt and smoked salmon and dried prawns. The export of marine products amounted in 1926 to 23 million pounds in value as against nine hundred thousand in 1906. China is the chief market. With the extension of the fisheries in the north, particularly along the Siberian littoral, where the Japanese hold valuable fishing rights from the Soviet Government, there has been of recent years a great development in the fishing industry, particularly as regards various forms of salmonidae. Considerable quantities of shellfish are caught and tinned, and Japanese tinned crab is now well known in the markets of Europe and the United States.

Minerals.—Crystalline schists form the axis of Japan. They run in a general direction from south-west to north-east, with chains starting east and west from Shikoku. On these schists rocks of every age are superimposed, and amid these somewhat complicated geological conditions numerous minerals occur. Precious stones, however, are not found, though crystals of quartz and antimony as well as good specimens of topaz and agate are not infrequent.

Gold occurs in quartz veins among schists, paleozoic or volcanic rocks and in placers; but the quantity obtained is not large. Its value for 1926 was about £1,200,000.

The value of the silver mined is approximately equal to that of the gold. It is found chiefly in volcanic rocks (especially tuff), in the form of sulphide, and it is usually associated with gold, copper, lead or zinc.

Much more important in Japan's economics than either of the precious metals is copper. Veins often showing a thickness of from 70 to 80 ft., though of poor quality (2 to 8%), are found bedded in crystalline schists or paleozoic sedimentary rocks, but the richest (10 to 30%) occur in tuff and other volcanic rocks.

Notwithstanding careful and prolonged search no evidences have been found that Japan is rich in iron ores. Her largest known deposit (magnetite) occurs at Kamaishi in Iwate prefecture, but the quantity of pig-iron produced from the ore mined there does not exceed 37,000 tons annually, and Japan is obliged to import from the neighbouring continent the greater part of the

iron needed by her for ship-building and armaments. Of recent years the Government has done its best in various ways to protect and encourage the iron industry; but notwithstanding the big demand in the country for pig-iron and steel, the native product is still unable to compete with that coming from India and the United States. Considerable deposits of coal, mainly bituminous are found in Kyūshū, the Hokkaido, and in the provinces of Iwaki and Hitachi in the Main Island. There were in existence in 1925 ninety-one coal mining companies with a paid-up capital of about 26 million pounds; mines in actual operation numbered 573, and the quantity of coal produced was over 31 million metric tons. Large quantities are also mined yearly in the coal-fields about Fushur in Manchuria, which came into Japan's possession after the war with Russia in 1905.

Petroleum.—Petroleum, but not of a very high quality, is found in the provinces of Echigo and Akita, on the coast of the Sea of Japan. It was not, however, till 1900 that these deposits attracted much attention, and fears are now expressed that they are being exhausted. There is certainly a steady diminution in the annual output. In 1922 this amounted to over 71 million Imperial gallons; but in 1926 it had decreased to about 50 million gallons.

Mines.—The total number of mines in operation at the end of 1926 was 1,195, coal and petroleum representing nearly two-thirds, the number of miners employed was 293,562, and the value of the minerals and metals produced close on 43 million pounds.

The following table shows the progress of the mining industry during the last 20 years:

	1906		1926	
	Quantity	Value	Quantity	Value
		£		£
Gold . . . oz.	90,842	363,715	202,290	1,303,314

†Metric tons.

Industries.—In the beginning of the Meiji era Japan was practically without any manufacturing industries, as the term is understood in the Occident, and she had not so much as one joint-stock company. At the end of 1925, her joint-stock companies and partnerships totalled 34,345, their paid up capital exceeded 1,115 millions sterling, and their reserves totalled over 249 millions. The number of co-operative societies in existence in the same year was 14,517. It is not to be inferred, however, from the absence of manufacturing organizations 50 years ago that such pursuits were deliberately eschewed or despised in Japan. On the contrary, at the very dawn of the historical epoch we find that sections of the people took their names from the work carried on by them, and that specimens of expert industry were preserved in the sovereign's palace side by side with the imperial insignia. Further, skilled artisans from the neighbouring continent always found a welcome in Japan, and when Korea was successfully invaded in early times, one of the uses which the victors made of their conquest was to import Korean weavers and dyers. Subsequently the advent of Buddhism, with its demand for images, temples, gorgeous vestments and rich paraphernalia, gave a marked impulse to the development of artistic industry, which at the outset took its models from China, India and Greece. From the 9th century luxurious habits prevailed in Kyōto under the sway of the Fujiwara regents, and the imperial city's munificent patronage drew to its precincts a crowd of artisans. But these were not

industrials, in the Western sense of the term, and, further, their organization was essentially domestic, each family selecting its own pursuit and following it from generation to generation without co-operation or partnership with any outsider. The establishment of military feudalism in the 12th century brought a reaction from the effeminate luxury of the metropolis, and during nearly 300 years no industry enjoyed large popularity except that of the armourer and the sword-smith. No sooner, however, did the prowess of Oda Nobunaga and, above all, of Hideyoshi, bring within sight a cessation of civil war and the unification of the country, than the taste for beautiful objects and artistic utensils recovered vitality. By degrees there grew up among the feudal barons a keen rivalry in art industry, and the Shōgun's court in Yedo set a standard which the feudatories constantly strove to attain. Ultimately, in the days immediately antecedent to its fall, the Shōgun's administration sought to induce a more logical system by encouraging local manufacturers to supply local needs only, leaving to Kyōto and Yedo the duty of catering to general wants.

But before this reform had approached maturity, the second advent of Western nations introduced to Japan the products of an industrial civilization centuries in advance of her own from the point of view of utility, though nowise superior in the application of art. Immediately the nation became alive to the necessity of correcting its own inferiority in this respect. But the people being entirely without models for organization, without financial machinery and without the idea of joint stock enterprise, the government had to choose between entering the field as an instructor, and leaving the nation to struggle along an arduous and expensive way to tardy development. There could be no question as to which course would conduce more to the general advantage, and thus, in days immediately subsequent to the resumption of administrative power by the Emperor, the spectacle was seen of official excursions into the domains of silk-reeling, cement-making, cotton and silk spinning, brick-burning, printing and book-binding, soap-boiling, type-casting and ceramic decoration, to say nothing of their establishing colleges and schools where all branches of applied science were taught. Domestic exhibitions also were organized, and specimens of the country's products and manufactures were sent under government auspices to exhibitions abroad. Steps were also taken for training women as artisans, and the government printing bureau set the example of employing female labour, an innovation which soon developed large dimensions. In short, the authorities applied themselves to educate an industrial disposition throughout the country, and as soon as success seemed to be in sight, they gradually transferred from official to private direction the various model enterprises, retaining only such as were required to supply the needs of the state.

The result of all this effort was that, whereas at the beginning of the Meiji era, Japan had virtually no industries worthy of the name, she possessed in 1896,—that is to say, after an interval of 25 years of effort,—no less than 4,595 industrial and commercial companies with a paid-up capital of 40 millions sterling. To-day, as has already been said, her companies number over 34,000 with a paid-up capital of 1,115 millions sterling. What effect this development has exercised on the country's over-seas trade may be inferred from the fact that, whereas in 1870 there were no manufactured goods to export, in 1901 8 million pounds worth were sent abroad, and that in 1925 the total value of the export trade amounted to over 230 million pounds, of which over 41% represented fully manufactured goods and about 50% goods partly manufactured.

The following table gives the values of some of the more important manufactured articles exported in 1926:

	£
Marine Products	2,314,124
Sugar and Sweetmeats	3,731,928
Beverages and Comestibles	4,033,715
Drugs, Chemicals, etc.	4,787,800
Silk Tissues, Yarns, etc.	90,831,594
Cotton Tissues, Yarns, etc.	50,993,903
Porcelain, Earthenware, Glass	4,842,943
Clothing	6,537,365

Japan's chief markets at present are in the Far East, and it is her proximity to them, the abundance of cheap and comparatively efficient labour she possesses, and in certain directions, particularly the cotton trade, better organization in marketing her goods, which give her an advantage over Occidental competitors. It has been said that the advantage derived from cheap labour is not likely to be permanent owing to the continuous increase in the price of labour and the cost of living. There is force in this contention. In 1890 the average daily wage of an ordinary labourer was about 6d, in 1900 it was a little over a shilling, in 1921 it was about 1s. 10d., and in 1926 it was about 2s. 3d. The cost of living has also increased enormously, but not in the same proportion. Another disquieting feature is that labour is becoming more articulate and less disposed to allow itself to be exploited. On the other hand it must be remembered that if wages and the cost of living have increased enormously in Japan, the same thing has happened in other countries since the Great War and also that as far as the cotton industry is concerned, the majority of the operatives are women, whose scale of wages is still very low and probably less likely to increase at the same rate as that of male operatives. That conditions, however, are become less inviting, for the manufacture of cotton goods, would seem fairly clear from the fact that a tendency is now manifest to transfer spinning enterprises to China, where labour is still really cheap. In 1926 there were, for instance, nearly a million and a half spindles working in Japanese-owned mills in that country. Nevertheless on the whole Japanese industries seem to have a promising future before them. The nation is full of energy and determination, there are abundant supplies of coal, and steps are being taken to utilize the excellent opportunities which the country offers for developing electricity by water power.

The official returns for 1925 show that the total number of factories in Japan was 49,161, and the number of operatives employed in them 1,808,381, of whom 852,554 were male hands and 955,827 female. By far the largest number were to be found in textile factories, where 972,631 were employed. Machine and tool factories followed next with 224,177. The mean average daily wages for operatives in that year were yen 1.94 (3s. 10d.) for male hands and yen 0.96 (10d.) for female, while the mean average working hours were 10.34 during the second half of the year.

Commerce in Tokugawa Times.—The conditions existing in Japan during the two hundred and fifty years prefatory to the modern opening of the country were unfavourable to the development alike of national and of international trade. As to the former, the system of feudal government exercised a crippling influence, for each feudal chief endeavoured to check the exit of any kind of property from his fief, and free interchange of commodities was thus prevented so effectually that cases are recorded of one feudatory's subjects dying of starvation while those of an adjoining fief enjoyed abundance. International commerce, on the other hand, lay under the veto of the central government, which punished with death anyone attempting to hold intercourse with foreigners. Thus the fiefs practised a policy of mutual seclusion at home, and united to maintain a policy of general seclusion abroad. Yet it was under the feudal system that the most signal development of Japanese trade took place, and since the processes of that development have much historical interest they invite close attention.

As the bulk of a feudal chief's income was paid in rice, arrangements had to be made for sending the grain to market and transmitting its proceeds. This was effected originally by establishing in Osaka stores (*kura-yashiki*), under the charge of samurai, who received the rice, sold it to merchants in that city and remitted the proceeds by official carriers. But from the middle of the 17th century these stores were placed in the charge of tradesmen to whom was given the name of *kake-ya* (agent). They disposed of the products entrusted to them by a fief and held the money, sending it by monthly instalments to an appointed place, rendering yearly accounts and receiving commission at the rate of from 2 to 4%. They had no special licence, but they were honourably regarded and often distinguished by an official title or an hereditary pension. In fact a *kake-ya*, of such standing as the Mitsui and the

Konoike families, was, in effect, a banker charged with the finances of several fiefs. In Osaka the method of sale was uniform. Tenders were invited, and these having been opened in the presence of all the store officials and *kake-ya*, the successful tenderers had to deposit bargain-money, paying the remainder within ten days, and thereafter becoming entitled to take delivery of the rice in whole or by instalments within a certain time, no fee being charged for storage. A similar system existed in Yedo, the shōgun's capital. Out of the custom of deferred delivery developed the establishment of exchanges where advances were made against sale certificates, and purely speculative transactions came into vogue. There followed an experience common enough in the West at one time: public opinion rebelled against these transactions in margins on the ground that they tended to enhance the price of rice. Several of the brokers were arrested and brought to trial; marginal dealings were thenceforth forbidden, and a system of licences was inaugurated in Yedo, the number of licensed dealers being restricted to 108.

The system of organized trading companies had its origin in the 12th century, when, the number of merchants admitted within the confines of Yedo being restricted, it became necessary for those not obtaining that privilege to establish some mode of co-operation, and there resulted the formation of companies with representatives stationed in the feudal capital and share-holding members in the provinces. The Ashikaga shōguns developed this restriction by selling to the highest bidder the exclusive right of engaging in a particular trade, and the Tokugawa administration had recourse to the same practice. But whereas the monopolies instituted by the Ashikaga had for sole object the enrichment of the exchequer, the Tokugawa regarded it chiefly as a means of obtaining worthy representatives in each branch of trade. The first licences were issued in Yedo to keepers of bath-houses in the middle of the 17th century. As the city grew in dimensions these licences increased in value, so that pawnbrokers willingly accepted them in pledge for loans. Subsequently almanack-sellers were obliged to take out licences, and the system was afterwards extended to money-changers.

It was to the fishmongers, however, that the advantages of commercial organization first presented themselves vividly. Early in the 17th century one Sukegoro of Yamato province went to Yedo, where the greatest fish market in Japan exists, and organized the fishmongers of the city into a great guild. He contracted for the sale of all the fish obtained in the neighbouring seas, advanced money to the fishermen on the security of their catch, constructed preserves for keeping the fish alive until they were exposed in the market, and enrolled all the dealers in a confederation which ultimately consisted of 391 wholesale merchants and 246 brokers. The main purpose of Sukegoro's system was to prevent the consumer from dealing direct with the producer. Thus in return for the pecuniary accommodation granted to fishermen to buy boats and nets they were required to give every fish they caught to the wholesale merchant from whom they had received the advance; and the latter, on his side, had to sell in the open market at prices fixed by the confederation. A somewhat similar system applied to vegetables, though in this case the monopoly was never so close.

It will be observed that this federation of fishmongers approximated closely to a trust, as the term is now understood; that is to say, an association of merchants engaged in the same branch of trade and pledged to observe certain rules in the conduct of their business as well as to adhere to fixed rates. The idea was extended to nearly every trade, 10 monster confederations being organized in Yedo and 24 in Osaka. These received official recognition, and contributed a sum to the exchequer under the euphonious name of "benefit money," amounting to nearly £20,000 annually. They attained a high state of prosperity, the whole of the cities' supplies passing through their hands. The guild system extended to maritime enterprise also. In the beginning of the 17th century a merchant of Sakai (near Osaka) established a junk service between Osaka and Yedo, but this kind of business did not attain any considerable development until the close of that century, when 10 guilds of Yedo and 24 of Osaka combined to organize a marine-transport company for the purpose of conveying their own

merchandise. Here also the principle of monopoly was strictly observed, no goods being shipped for unaffiliated merchants. This carrying trade rapidly assumed large dimensions, and the number of junks entering Yedo rose to over 1,500 yearly.

Operations relating to the currency also were brought under the control of guilds. The business of money-changing was originally in the hands of pedlars; but in the early part of the 17th century exchanges were opened in Yedo, and in 1718 the men engaged in this business formed a guild, six hundred of them receiving licences, and no unlicensed person being permitted to purchase the avocation. The rates of exchange were fixed daily by representatives of the guild in consultation with, or with the approval of, the shōgun's officials.

The exchanges in their ultimate form approximated very closely to the Occidental idea of banks. They not only bought gold, silver and copper coins, but they also received money on deposit, made loans and issued vouchers which played a very important part in commercial transactions. The voucher system did not, however, obtain official recognition until 1636, when the third Tokugawa shōgun selected 30 substantial merchants and divided them into 3 guilds, each authorized to issue vouchers, provided that a certain sum was deposited by way of security. Such vouchers were obviously a form of bank-note, and the advantages of the system were so obvious that ultimately it was adopted by the Tokugawa Government, which appointed a number of the members of the guild to act as its bankers subject to certain specified conditions and with certain privileges. A similar state of affairs ruled in Osaka, a city which has always exhibited a remarkable aptitude for trade. In this way a regular system of banking was gradually evolved, with the result that in the middle of the 18th century in Osaka bills of exchange, promissory notes, storage delivery orders, deposit notes redeemable on the demand or order of an indicated person, and various descriptions of money orders were being issued. Storage delivery orders passed current as readily as coin and advances could always be obtained against them from pawn brokers.

All these documents, indicating a well-developed system of credit, were duly protected by law, severe penalties being inflicted for any failure to implement the pledges they embodied. This system, which in its various ramifications was practically a trust in favour of the more important merchants in Yedo and Osaka, resulted, as was inevitable, in the acquisition of great wealth by those interested in it. This in its turn led to habits of gross extravagance and luxury, and popular feeling against the so-called "official merchants" who, under government auspices, monopolized every branch of trade, ultimately became so strong that finally, in 1841 the guilds were dissolved, the trading privileges which "official merchants" had enjoyed withdrawn, and it was declared that henceforth every person should be free to engage in commerce without let or hindrance.

This recklessly drastic measure, vividly illustrating the arbitrariness of feudal officialdom, not only included the commercial guilds, the shipping guilds, the exchange guilds and the land transport guilds, but was also carried to the length of forbidding any company to confine itself to wholesale dealings. The authorities further declared that in times of scarcity wholesale transactions must be abandoned altogether and retail business alone carried on, their purpose being to bring retail and wholesale prices to the same level. The custom of advancing money to fishermen or to producers in the provincial districts was interdicted, and even the bath-house keepers and hairdressers were forbidden to combine for the purpose of adopting uniform rates of charges. But this ill-judged interference produced evils greater than those it was intended to remedy, and ten years' experience showed that a modified form of the old system would conduce to public interests. The guilds accordingly were reestablished; but licence fees were abolished, and no limit was set to the number of firms in a guild. Things remained thus until the beginning of the Meiji era (1867), when the guilds shared the cataclysm that overtook all the country's old institutions.

It will be apparent from the above that commercial transactions on a large scale in pre-Meiji days were practically limited to the

NATURAL SCENERY IN JAPAN

1. Amanohashidate or "The Bridge of Heaven," a sand bar nearly two miles in length, covered with pine trees, at the mouth of Maidzura Bay on the west coast of Japan. It is one of the "Scenic Trio of Japan," the others being Matsushima and Miyajima (fig. 9). 2. Tomonoura, a small fishing port of Seto Island on the Inland Sea. 3. The shore of Setonaikai, the Inland Sea of Japan, near the city of Tomonutsu. A shrine or small temple is situated at the edge of the cliff. 4. Poling the rapids on the Kiso River. 5. Fujiyama, the most celebrated of Japanese volcanic peaks, rising to a height of 12,595 ft., with a crater from 500 to 600 ft. deep. The last recorded eruption was in the latter part of 18th century. It is regarded as a sacred mountain, and many pilgrims make the ascent each year. 6. Ranzan, near Kyoto, as it appears in spring time with cherry trees in full bloom (background). 7. Herds of tame deer in the temple park at Nara, near Osaka. 8. Hakone Lake, a resort near Yokohama, famous for its hot springs. 9. Shrine Island on the Inland Sea (see fig. 3). The pavilions, in which dancing festivals are held, are built at the level of high tide, so that they appear to be floating on surfaces of the water.

two great cities of Yedo and Osaka, the people in the provincial fiefs having no direct association with the guild system, confining themselves, for the most part, to domestic industries on a small scale, and not being allowed to extend their business beyond the boundaries of the fief to which they belonged.

Foreign Commerce During the Meiji Era.—If Japan's industrial development in modern times has been remarkable, the same may be said even more emphatically about the development of her over-sea commerce. This was checked at first not only by the unpopularity attaching to all intercourse with outside nations, but also by embarrassments resulting from the difference between the silver price of gold in Japan and its silver price in Europe, the precious metals being connected in Japan by a ratio of 1 to 8, and in Europe by a ratio of 1 to 15. This latter fact was the cause of a sudden and violent appreciation of values; for the government, seeing the country threatened with loss of all its gold, tried to avert the catastrophe by altering and reducing the weights of the silver coins without altering their denominations, and a corresponding difference exhibited itself, as a matter of course, in the silver quotations of commodities. Another difficulty was the attitude of officialdom. During several centuries Japan's over-sea trade had been under the control of officialdom, to whose coffers it contributed a substantial revenue. But when the foreign exporter entered the field under the conditions created by the new system, he diverted to his own pocket the handsome profit previously accruing to the government; and since the latter could not easily become reconciled to this loss of revenue, or wean itself from its traditional habit of interference in affairs of foreign commerce, and since the foreigner, on his side, not only desired secrecy in order to prevent competition, but was also tormented by inveterate suspicions of Oriental espionage, not a little friction occurred from time to time. Thus the scanty records of that early epoch suggest that trade was beset with great difficulties, and that the foreigner had to contend against most adverse circumstances, though in truth his gains amounted to 40 or 50%.

Japan is not a country rich in natural resources or in mineral wealth, if coal and copper are excepted, and such articles as she manufactured in the days of her seclusion were not of a nature to command a market abroad. Her position, therefore, when she reentered the comity of nations, was not promising. She was dependent on foreign countries for practically all manufactured goods, such, for instance, as flour, sugar, leather, medicines, dyes, paints, hardware, drapery, machinery, etc.—and all she had to offer in exchange was some silk, tea, porcelain, curios, copper and marine products. The last found a ready market in China; tea was equally successful in the United States, and a keen demand sprang up immediately in Europe for her raw silk, which happened to be available for export at a moment when the production of that article in France and Italy had been considerably curtailed by the appearance of disease in the European silkworm. These articles and copper were practically all the foreign merchant wanted to buy. But the statesmen in charge of Japan's destinies were farsighted and ambitious for the progress of their country, and, seeing the disadvantage under which Japanese merchants were labouring, they started manufacturing enterprises and commercial undertakings under official management, handing them over to private enterprise when a satisfactory advance had been made. Progress was naturally slow at first, as may be seen from the fact that the export trade of the country, which amounted to only about 1½ million pounds sterling in 1870 had increased to little more than 5½ millions in 1890. There were two main reasons for this tardy advance. Several years necessarily elapsed before the nation's material condition began to respond perceptibly to the improvements effected by the Restoration government in matters of taxation, administration, and transport facilities. Financial burdens had been reduced and security of property and life obtained; but railway building and road-making, harbour construction, the growth of posts, telegraphs, exchanges and banks, and the development of a mercantile marine did not begin to exercise a sensible influence on the nation's prosperity till about 1885. It was then that a period of steadily growing prosperity began, and it was then that private enterprise may be said to have started

finally upon a career of independent activity. How enormous has been the progress made since then may be seen on reference to the values of the export trade in 1910 and 1920, which were respectively 46 and 195 million pounds sterling. The articles Japan imported in 1870,—flour, sugar, leather, dyes, paints, hardware, clothing, etc.—she now exports herself, and, whereas, 30 years ago she was a good customer for Lancashire cotton piece goods and the like, she now not only does not import them but is competing with them vigorously in the Chinese market and with Indian cotton goods in that of India. The same is true of many other commodities, and although her products may frequently be inferior to those of Europe or America, their greater cheapness appeals to customers to whom price is of more importance than quality. The phenomenal difference between the figures for 1910 and 1920 is partly accounted for by the appreciation in values and by the fact that during the World War Japan was able, owing to the preoccupation of the other nations more directly engaged in the conflict, to extend her markets enormously. But this advantage she has not been able to maintain in peace, and she herself has for some years past been suffering from severe commercial depression and from financial crisis, with the result that the value of her export trade in 1926 was only about 9 million pounds sterling higher than it was in 1920. Nevertheless an increase from 46 millions in 1910 to 205 millions in 1926 is remarkable. *Pari passu* with this increase in the export trade there has been a corresponding increase in the import, a fact which causes considerable anxiety in many quarters. But reference to official statistics will show that a very large proportion of these imports is represented by raw material, partly manufactured goods or machinery,—the last to be used itself for productive purposes. The following figures show the periods during which either imports or exports have been in excess:—

1868–82. Imports: material was being purchased for industrial development.

1883–95. Exports: home industries were developing, and silver had fallen in value.

1896–1913. Imports: this was a period of inflation and of national extravagance after the war with China.

1914–18. Exports: this was the period of the World War.

1919–27. Imports: the war markets had been lost; the period was one of general commercial depression; and the nation had suffered enormous losses owing to the earthquake of 1923.

It is estimated that the total excess of imports over exports for 60 years amounts to over 261 million pounds sterling. In connection with the phenomenal commercial and industrial progress of Japan the following comments, taken from a Report prepared at the British Embassy in Tōkyō on economic conditions in Japan, are worthy of attention:—

"By external circumstances and by the ambitious temperament of her own people, Japan has been obliged to attempt to compress into a few decades an economic development which most other industrialized countries have spread over at least a century. This late and concentrated development has been of advantage to her in some respects, because she has been able to profit by knowledge gained by her rivals in long and often painful processes of trial and error. In other respects it has operated to her disadvantage, because there is certain necessary knowledge which can be acquired only by experience. The economic history of Japan in the past few years provides a striking illustration of this truth. Where the prime essentials are energy and technical knowledge she has made rapid progress, as is evident to anybody who compares the volume and range of her manufactures to-day and 20 years ago. But where advance depends not only upon the skill and knowledge of the leaders, but also on such imponderable elements as the commercial and financial experience of the community as a whole, success has not been so uniform; and this is only too plainly apparent from the series of financial upheavals which have marked the period from 1920 to the present time."

Japan's trade with the outer world was built up chiefly by the energy and enterprise of the foreign middleman. He acted the part of an almost ideal agent. As an exporter, his command of cheap capital, his experience, his knowledge of foreign markets, and his connections enabled him to secure sales such as must have

been beyond reach of the Japanese working independently. Moreover, he paid to native consumers ready cash for their staples, taking upon his own shoulders all the risks of finding markets abroad. As an importer, he enjoyed, in centres of supply, credit which the Japanese lacked, and he offered to native consumers foreign produce brought to their doors with a minimum of responsibility on their part. Finally, whether as exporters or importers, foreign middlemen always competed with each other so keenly that their Japanese clients obtained the best possible terms from them. It has, however, always been the aim of the Japanese to dispense with his help and to deal directly themselves with the foreign producer, and they have worked hard for the attainment of this object during many years. It must be admitted that a great measure of success has attended their efforts and that the middleman, so familiar a figure in the open ports in the early days of Japan's intercourse with foreign countries, is now slowly but surely disappearing.

Trade with Various Countries.—The following is a list of the countries most interested in trade with Japan, with the values in round numbers of her exports to and imports from them in 1926.

	Exports	Imports
	£	£
United States . . .	87,880,000	69,436,000
China . . .	43,060,000	24,440,000

Kobe has now the first place in the matter of foreign trade; Osaka the second, and Yokohama the third.

The total tonnage of the steamships which entered the various ports of Japan from abroad during 1926 was 49,186,029 tons, of which 31,873,523 tons represented Japanese shipping, 9,363,245 British and 3,960,342 American.

According to the "Financial and Economic Annual of Japan" the invisible trade of Japan for the years 1923-25 is estimated to be as follows:—

	1923	1924	1925
	£	£	£
Invisible exports (assets) .	95,300,000	120,800,000	81,100,000
Invisible imports (liabilities)	56,800,000	78,900,000	60,000,000

National Debt.—The total amount of the National Debt of Japan in March 1927 was a little over 503 million pounds sterling, of which about 354 million pounds represented internal loans and 149 million external loans.

The Labour Movement.—The earliest labour organization in Japan is believed to have come into existence in 1890, when the printers formed an association called the Doshikwai (Community of Sentiment Society). This was followed in 1898 by a somewhat similar organization among railway employees. In each case the objects aimed at were the improvement of working conditions and wages and the securing of a greater measure of freedom. But both were small and of no importance, and it was not till the Yuaikwai (Labourers' Friendly Society) was formed in 1912 that the Labour movement can be said really to have started in Japan. Even the Yuaikwai was only a fore-runner of the real trade-union. Its membership, compared with the numerical strength of the class it was supposed to represent, was paltry,—not more than 50,000, and, although its President, Mr. Bunji Suzuki, was a genuine representative of Labour, capitalists also lent the society their support and patronage, hoping, apparently, that by adopting a conciliatory attitude they might succeed in guiding the move-

ment into moderate channels. The Yuaikwai had been in existence hardly two years when the World War broke out, and it was from this moment that Labour became truly articulate in Japan. As has been said elsewhere, the greater part of the rest of the world was, or eventually became, so preoccupied with the conflict that it had neither leisure nor means to attend to the ordinary affairs of commerce, with the result that an extraordinary demand was made on Japan,—more fortunately situated, by reason of her remoteness,—for manufactured goods of all descriptions. This gave Labour an opportunity of which it was quick to avail itself. Higher wages were demanded, and if they were not granted a strike promptly followed. In the great majority of cases these strikes were successful; but as the price of commodities also rose out of proportion to the increase in wages, Labour was still discontented. In 1918, just before the conclusion of the Armistice, there were serious rice riots in Tōkyō, and similar disturbances with strikes took place in other parts of the country. It is true that they were stopped without difficulty because the Authorities were too strong; but they nevertheless gave a strong impetus to the Labour movement, and the Government, which had hitherto frowned on anything in the nature of serious organization on the part of Labour, decided that the moment had arrived when this attitude demanded some modification. Accordingly, while still refusing officially to recognize trade-unions, it began to wink at their existence, thinking possibly that open organization was better on the whole than an underground movement. A large increase in the number of labour associations at once took place. The capitalists on their side organized a society called the Rōshi-Kyōchōkwai (Society for the Harmonization of Labour and Capital) and withdrew their support from the Yuaikwai; but the society was not a success because Labour viewed it with suspicion. In the meanwhile the Yuaikwai changed its name to Nihon-Rōdō-Sōdōmei (Japan Federation of Labour) and became a regular federation of trade and industrial unions with Mr. Bunji Suzuki as its President and a Board of Control under him to prevent his exercising the powers of a dictator. Its platform was much like that of a moderate labour organization in the West,—an eight-hour day, a six-day week and universal suffrage. Japan was at the moment preparing to select her delegates to the International Labour Conference at Washington (1919); but the Government so manipulated matters that Labour had no voice in the choice of its own representative, an official nominee being sent instead. Loud protests followed; but they were of no avail. Similar methods were followed at the second, third, and fourth Conferences; but the attitude of Labour became at last so hostile and the protests so vociferous that the Authorities were forced to give way, and at the later Conferences real representatives attended (Mr. Suzuki of the Japan Labour Federation or Mr. Narazaki of the Seamen's Union). It will thus be seen that the movement is growing steadily in strength, and, although Trades Unions are still not officially recognized by law, recognition cannot long be delayed. Attempts have also been made to form a regular party for parliamentary purposes; but owing to the continual dissension between the moderate and the extreme elements in the labour organizations, no success has yet attended them. In 1925 matters had, it is true, so far advanced that a meeting for the formal inauguration of a party actually took place in Tōkyō. Delegates from the various labour and agricultural associations, for the tenant farmers and small holders are also now forming unions, were present; but in the course of the proceedings the representatives of the Japan Labour Federation and of the other moderate and conservative elements seceded, and, although the extremists left behind proceeded to form a party of their own called the Nōmin-Rōdō-tō (Farmer-Labour party) it was promptly suppressed the same evening by the Authorities on the ground that its programme contained items regarded as dangerous to the State. Labour is, however, now represented in the Diet, 8 "proletarians," representing various labour associations, having been successful in obtaining seats in the first Diet elected under the new Manhood Suffrage Law in 1928.

In 1926 the number of labour associations in Japan was 408 and their membership 260,348. The three bodies numerically

strongest are the Naval Workers' Union (42,513), the Japan Seamen's Union (37,000), and the Japan Labour Federation (23,305). (The above information is drawn mainly from the Japan Year Book.)

Labour Legislation.—Japan is now falling into line with other countries in labour legislation. A Factory Law was passed in 1911 and came into operation in 1916; but as a result of the First International Labour Conference held at Washington in 1919 it was revised in 1923 and, finally, after further amendment, put into force in 1926. Its principal features are as follows:—

1. With certain exceptions it applies to all factories employing 10 or more operatives and to those engaged in industries which are regarded as dangerous or injurious to health.

2. While containing no restrictions as to the hours of work of adult male operatives, it fixes a maximum of 11 hours' work a day for boys under 16 or female operatives, and, in the latter case, further prescribes that a recess (varying from half an hour to an hour) must be allowed and that at least two days' holiday must be given to the operatives every month.

3. Boys under 16 and female operatives may not be employed on night-work (10 P.M. to 5 A.M.).

4. Female operatives may not be employed 4 weeks before and 6 weeks after child-birth; but the latter period may be reduced to 4 at the request of the operative and with the consent of a doctor.

5. Operatives who fall ill or are injured while working are entitled to compensation in the shape of medical treatment and allowances for temporary disablement. In the latter case the amount is fixed at a minimum of 60% of the operative's daily wages for a period of 180 days and not less than 40% after that.

6. Should the accident or illness result in permanent disablement the operative is entitled to a gratuity varying in amount from 180 to 540 times the rate of his (or her) daily wages.

7. Should an operative die as the result of an accident or illness while working a compensation allowance of not less than 360 times the amount of his (or her) daily wages must be paid to the family or dependents of the deceased.

8. In addition an allowance must be paid for funeral expenses. This is fixed at a maximum of 20 times the operative's daily wages with a minimum of not less than 20 yen (about £2).

The Government has also established a Bureau of Social Affairs under the control of the Ministry of the Interior to deal with matters relating to labour and social undertakings, and in 1926 the Health Insurance Law was passed, the Law for the settling of Labour Disputes enforced, and Art. 17 of the Police Regulations for the maintenance of Public Safety and Order, which made the organization of strikes a penal offence, abolished. The Health Insurance Law prescribes for two forms of insurance,—compulsory, applicable to all workers to whom the Factory Law or the Mining Law are applicable and voluntary, applicable to workers who at the request of employers and with the consent of the Authorities are allowed to benefit by the terms of the law. The insurers are the Government and the Labour Associations organized as juridical persons by the employers and workers concerned. The revenue for the administration of the law comes from State subsidies and premia, and in principle the latter are payable in equal shares by employers and employed. The number of persons insured in 1927 was about 1,927,000, of whom some 27,000 were voluntary, and further it was estimated that the total receipts from premia and subsidies during the year would amount to a little over 5 million pounds sterling, while the benefits payable would be about 3 million.

GOVERNMENT AND ADMINISTRATION

Emperor and Princes.—At the head of the Japanese State stands the Emperor, who is called by his own subjects *tenshi* (son of heaven) or *tenmō* (heavenly king). The emperor Hirohito is the 124th of his line, according to Japanese history, which reckons from 660 B.C., when Jimmu ascended the throne. But as written records do not carry us back farther than A.D. 712, the reigns and periods of the very early monarchs are more or less apocryphal. There are 3 families of princes of the blood, from

any one of which a successor to the throne may be taken in default of a direct heir: Princes Fushimi, Kanin and Higashi Fushimi. These families are all direct descendants of emperors, and their heads have the title of *shinnō* (prince of the blood), whereas the other imperial princes, of whom there are ten, have only the second syllable of *shinnō* (pronounced *wō* when separated from *shin*). Second and younger sons of a *shinnō* are all *wō*, and eldest sons lose the title *shin* and become *wō* from the fifth generation. The Imperial prerogatives are specified in the Law of the constitution (1889). The Emperor's person is "sacred and inviolable," he combines "in himself the rights of sovereignty and exercises them according to the provisions of the Constitution," he "exercises the legislative power with the consent of the Diet," he "gives sanctions to laws and orders them to be promulgated and executed," he "has the supreme command of the Army and the Navy," he "declares war, makes peace and concludes treaties," he "convokes the Imperial Diet, opens, closes and prorogues it, and dissolves the House of Representatives" and his ministers are appointed by him and are individually responsible to him. In times of emergency the Emperor also issues Imperial ordinances in the place of law, but they must receive the approval of the Diet in the following session.

The Peerage.—In former times there were no Japanese titles of nobility, as the term is understood in the Occident. Nobles they were, however, namely, *kuge*, or court nobles, descendants of younger sons of emperors, and *daimyō* (great name), some of whom could trace their lineage to former Emperors, but owed their exalted position as feudal chiefs to military prowess. The Meiji restoration of 1867 led to the abolition of the *daimyō* as feudal chiefs, and they, together with the *kuge*, were merged into one class called *kwazoku* (flower families), a term corresponding to aristocracy, all inferior persons being *heimin* (ordinary folk). In 1884, however, the five Chinese titles of *ki* (prince), *kō* (marquis), *haku* (count), *shi* (viscount) and *dan* (baron) were introduced, and patents were not only granted to the ancient nobility but also conferred on men who had rendered conspicuous public service. The titles are all hereditary, but they descend to the firstborn only, younger children having no distinguishing appellation. The first list in 1884 showed 11 Princes, 24 Marquises, 76 Counts, 324 Viscounts and 74 Barons. After the war with China (1894-95) the total grew to 716, and the war with Russia (1904-5) increased the number to 912, namely, 15 Princes, 39 Marquises, 100 Counts, 376 Viscounts and 382 Barons. The number is now 953, 19 Princes, 39 Marquises, 105 Counts, 381 Viscounts, and 409 Barons.

Household Department.—The Imperial household department is completely differentiated from the administration of state affairs. It includes bureaux of treasury, forests, peerage, poetry, Imperial tombs, archives, Imperial mews, architecture and medical and culinary affairs, as well as boards of ceremonies and chamberlains, officials of the Empress's household and officials of the Crown Prince's household. The annual allowance made to the throne is £450,000, and the Imperial estate comprised in 1920 about 3,800,000 ac. of building land, forests and ordinary land, with buildings, furniture, live stock and other effects, the whole valued at about £73,000,000. Some of this has, however, since been disposed of. The Court in addition holds shares in various banks and industrial companies. Out of the income accruing from these various sources the households of the Crown Prince and all the Imperial princes are supported; allowances are granted at the time of conferring titles of nobility; a long list of charities receive liberal contributions, and considerable sums are paid to encourage art and education.

Departments of State.—There are 11 departments of state presided over by ministers—Foreign Affairs, the Interior, Finance, War, Navy, Justice, Education, Agriculture and Forestry, Communications, Commerce and Industry and Railways. These ministers form the Cabinet, which is presided over by the minister president of state, so that its members number 12 in all. Ministers of state are appointed by the Emperor and are responsible to him alone. There stood until recently between the Cabinet and the Crown a small body of men, "elder statesmen" (*genrō*)

who, though possessing no official status were by reason of their former distinguished services invariably consulted in a crisis and who had much to say in the making and unmaking of ministries. But of these men only one now survives. There is also a Privy Council, which consists of a variable number of distinguished men—in 1927 there were 24—whose duty it is to debate and advise upon all matters referred to them by the Emperor. There is no mention anywhere of the "Cabinet" in the Law of the Constitution and although that body meets under the presidency of the Prime Minister to discuss and decide matters of state, its members have no joint responsibility.

The total number of civil officials in 1925 was 338,498. The annual salaries of the principal officials are as follows:—Prime Minister £1,200; Ministers of State £800; Governor-General of Korea £800; Governor-General of Formosa £750; President of the Privy Council £750; Judges and Procurators £750 (mat.); Ambassadors £750 (with allowances varying from £2,600 to £4,500 yearly); Ministers Plenipotentiary £520 to £650 (with allowances varying from £1,500 to £2,200); Governors of Prefectures from £520 to £600 (with small allowances in certain cases). Pensions are small, ranging from $\frac{1}{3}$ to $\frac{1}{2}$ of the annual salary according to the period of service.

Legislature.—The first Japanese Diet was convoked the 29th of November, 1890. There are two chambers, a House of Peers (*kizoku-in*) and a House of Representatives (*shugi-in*). Each is invested with the same legislative power.

The upper chamber consists of four classes of members. They are, first, hereditary members, namely Princes of the Blood, Princes and Marquises, who are entitled to sit when they reach the age of 30; secondly, Counts, Viscounts and Barons, elected—after they have attained their 30th year—by their respective orders in the ratio of 18 Counts, 66 Viscounts and 66 Barons; thirdly, men of education or distinguished service who are nominated by the Emperor, and whose number must not exceed 125; fourthly, representatives of the taxpayers, elected, two for each prefecture, by their own class, and, fifthly, 4 members of the Imperial Academy elected by that body and nominated by the Emperor. The minimum age limit for non-titled members is 30. The House was composed in 1926 of 20 Princes of the Blood, 15 Princes, 31 Marquises, 18 Counts, 66 Viscounts, 65 Barons, 120 Imperial nominees and 66 representatives of the highest taxpayers—that is to say, 405 altogether.

The Lower House consists of elected members only. Originally the property qualification was fixed at a minimum annual payment of 30s. in direct taxes (*i.e.*, taxes imposed by the central government), but this has been altered from time to time, and by the Manhood Suffrage Law of 1925 the property qualification for electors was abolished entirely. There is no property qualification for candidates; but they must deposit £200 in cash or public bonds as security. Members are of two kinds, namely, those returned by incorporated cities and those returned by prefectures. In each case the ratio is one member for every 120,000 electors (3 to 5 for each electoral district) and the number of electoral districts is fixed at 122. Under the new law paid canvassers are not recognized; only election commissioners and election committees (not exceeding 50 persons) may take part in the election campaign. They however may receive payment for their services. The expenditure incurred by a candidate, which is now estimated at a maximum of £1,500, is in the charge of the election commissioners, and if the maximum is exceeded the candidate's election, should he secure a seat, is void.

Voting is by secret ballot, one man one vote, and a general election must take place once in 4 years for the House of Representatives, and once in 7 years for the House of Peers. The House of Representatives, however, is liable to be dissolved by order of the sovereign as a disciplinary measure, in which event a general election must be held within 30 days from the date of dissolution, whereas the House of Peers is not liable to any such treatment. Otherwise the two Houses enjoy equal rights and privileges, except that the budget must first be submitted to the representatives. Each member receives a salary of £300, with travelling allowances; the president receives £750, and the vice-president

£450. The presidents are nominated by the sovereign from three names submitted by each house, but the appointment of a vice-president is within the independent right of each chamber. The lower house consists of 466 members, of whom 112 are returned by the urban population and 354 by the rural. Under the original property qualification the number of franchise-holders was only 453,474, or 11.5 to every 1,000 of the nation, but now that the Manhood Suffrage Law is in force the number must be a little over nine millions. By the constitution which created the Diet freedom of conscience, of speech and of public meeting, inviolability of domicile and correspondence, security from arrest or punishment, except by due process of law, permanence of judicial appointments and all the other essential elements of civil liberty were granted. In the Diet full legislative authority is vested; without its consent no tax can be imposed, increased or remitted; nor can any public money be paid out except the salaries of officials, which the sovereign reserves the right to fix at will. The Diet must be convoked every year, and a session is supposed to last three months. The regular time of sitting is from the end of December to the end of March. While a session lasts members are, save in certain specified cases, free from arrest, and they are not responsible outside the Diet for opinions entered in it. It will thus be seen that the powers of the Diet are limited, for, while it has control over legislation and finance, it has none over the "Cabinet," the members of which are not responsible to it but to the Emperor. Moreover, by appealing to the Throne the Government is in a position to procure the prorogation or even the dissolution of the House of Representatives when relations become too strained, and this is a weapon which it has not failed to use. In the circumstances it could scarcely be expected that an assembly which had many grievances to ventilate, abuses to redress, and wrongs, real or fancied, to avenge should always behave with perfect decorum and never lose its temper. As a matter of fact the early history of the Diet is one of perpetual and noisy strife between an almost powerless House and an experienced, determined and strongly entrenched bureaucracy, in the course of which prorogations and dissolutions were of by no means infrequent occurrence. But gradually the various "Cabinets" found means, not always very reputable, of effecting understandings with the leaders or with individual members of the various political factions in the House, so that the position became a little less acute and intervals of comparative quiet intervened. Eventually that astute statesman, the late Prince Ito, who, as Prime Minister in three Cabinets had had ample experience of parliamentary opposition, decided to form a party of his own, mainly, it has been asserted, with the object of fighting the growing power of the militarists. As a result the Seiyūkwaï (Friends of the Government) came into existence in 1900, and with its support he formed his fourth ministry. He did not remain in power for more than a few months; but his successor, Prince Katsura, a soldier, followed the example he had set and organized another party, the Dōshikwaï, subsequently changed to Kenseikwaï, and again recently to Minseitō (Democrats). From Prince Ito the succession to the leadership of the Seiyūkwaï passed, through Prince Saionji, to the late Mr. Hara, and when the latter formed a Cabinet in 1918 it was generally considered that the era of party government had at last begun. But the original and the fundamental obstacle to party government in the full sense of the word still remains,—the Cabinet is not responsible to the Diet. For this reason and for others there is still an atmosphere of unreality and irresponsibility about the proceedings in the Lower House, and noisy and violent scenes still disfigure its sittings.

Procedure of the Diet.—The official opening of the Diet takes place towards the end of December; but the Houses immediately go into recess for the New Year holidays, and the real business of the session does not commence till the latter part of January, when the Houses reassemble and the Prime Minister, the Minister for Foreign Affairs, and the Minister for Finance, respectively, address them in set speeches. The Budget, which by the Law of the Constitution must be laid before the Lower House first, is presented at the same time and referred at once to committee. This system of referring to committee applies to all

measures of importance, and is a useful device because no debate can take place on a measure till the committee concerned has reported on it, and, as in the vast majority of cases the report in question determines the attitude of the House, much time, which would otherwise be spent in debate, is thus saved. In the Chambers themselves the seats of members are designated by numbers, and permission to speak is obtained not by catching the President's eye but by members calling out their numbers,—a method not always conducive to order. Speeches are made from a regular rostrum, and, while members rarely, if ever display self-consciousness or awkwardness, eloquence is equally rare. Orators there have been, Mr. Yukio Ozaki and the late Mr. Saburo Shimada, for example, but the structure of the Japanese language is not conducive to clear and concise expression, and the great majority of the speeches made are verbose and confused. From the outset the proceedings of the Diet have been recorded verbatim, and Japan has thus, almost alone among the countries of the world, an exact record of all that has been said in the two Chambers from the day they first sat. The proceedings, both in committees and in the Chambers themselves, are printed and circulated among the members; but the general public is not allowed access to those relating to committees. The result is that garbled statements of what has happened at these meetings get into the press and are frequently telegraphed abroad. When committees are meeting the House does not sit.

Political Parties.—There is little to distinguish one party from another in Japan. It is true that during the last three or four years the Seiyūkai, of which General Baron Tanaka is head, has been associated with a "forward" policy in China and the Minseitō with one of *laissez faire*; but, speaking in general terms, there is practically no difference between the platforms of the various groups, big or small, in the Diet. In a word parties follow men rather than principles. Apart therefore from the struggle for the establishment of real party government there is little of real interest in their history; but it is generally agreed that they are very corrupt.

The distribution of the various parties and factions in the Lower House in the autumn of 1928 was as follows:—

Seiyūkai	218
Minseitō	192
Shinto Club	24
Proletarians	8
Meiseikwai	5
Business Men's Club	3
Kakushinto	1
Independents	11
Total	462

Divisions of the Empire.—The earliest traditional divisions of Japan into provinces was made by the emperor Seimu (131-190), in whose time the sway of the throne did not extend farther north than a line curving from Sendai Bay, on the north-east coast of the main island, to the vicinity of Niigata on the north-west coast. The region northward of this line was then occupied by barbarous tribes, of whom the Ainu (still to be found in Yezo) are probably the remaining descendants. The whole country was then divided into thirty-two provinces. In the 3rd century the empress Jingō, on her return from her victorious expedition against Korea, portioned out the empire into five home provinces and seven circuits, in imitation of the Korean system. By the emperor Mommu (696-707) some of the provinces were subdivided so as to increase the whole number to sixty-six, and the boundaries then fixed by him were re-surveyed in the reign of the emperor Shōmu (723-756). The old division of Japan is as follows:—

I. The *Go-kinai* or "five home provinces," *i.e.*, those lying immediately around Kyōto, the capital, viz.:—Yamashiro, Yamato, Kawachi, Idzumi and Settsu.

II. The seven circuits, as follow:—

1. The *Tōkaidō*, or "eastern-sea circuit," which comprised 15 provinces, viz.:—Iga, Isé, Shima, Owari, Mikawa, Tōtōmi, Suruga, Idzu, Kai, Sagami, Musashi, Awa, Kadzusa, Shimōsa and Hitachi.

2. The *Tōsandō*, or "eastern-mountain circuit," which comprised 8 provinces, viz.:—Omi, Mino, Hida, Shinano, Kōdzuke, Shimotsuke, Mutsu and Dewa.
3. The *Hokurikudō*, or "northern-land circuit," which comprised 7 provinces, viz.:—Wakasa, Echizen, Kaga, Noto, Etchū, Echigo and Sado (island).
4. The *Sanindō*, or "mountain-back circuit," which comprised 8 provinces, viz.:—Tamba, Tango, Tajima, Inaba, Hōki, Idzumo, Iwami and Ōki (a group of islands).
5. The *Sanyōdō*, or "mountain-front circuit," which comprised eight provinces, viz.:—Harima, Mimasaka, Bizen, Bitchū, Bingo, Aki, Suwō and Nagato.
6. The *Nankaidō*, or "southern-sea circuit," which comprised 6 provinces, viz.:—Kii, Awaji (island), Awa, Sanuki, Iyo and Tosa.
7. The *Saikaidō*, or "western-sea circuit," which comprised 9 provinces, viz.:—Chikuzen, Chikugo, Buzen, Bungo, Hizen, Higo, Hyuga, Ōsumi and Satsuma.

III. The two islands, Tsushima and Iki.

In 1868, when the rebellious nobles of Ōshū and Dewa, in the Tōsandō, had submitted to the emperor, those two provinces were subdivided, Dewa into Uzen and Ugo, and Ōshū into Iwaki, Iwashiro, Rikuzen, Rikuchū and Michinoku (usually called Mutsu). This increased the old number of provinces from sixty-six to seventy-one. At the same time there was created a new circuit, called the *Hokkaidō*, or "northern-sea circuit," which comprised the eleven provinces into which the large island of Yezo was then divided (viz., Oshima, Shiribeshi, Ishikari, Teshibo, Kitami, Iburi, Hiaka, Tokachi, Kushiro and Nemuro) and the Kurile Islands (Chishima).

The term Kwantō (east of the barrier) is applied to the eight provinces of Musashi, Sagami, Kōdzuke, Shimotsuke, Kazusa, Shimōsa, Awa and Hitachi,—all lying immediately to the east of the old barrier of Hakone, in Sagami.

The following is a list of the prefectures with their respective areas:—

Central Japan			
	Area in sq.m.		Area in sq.m.
Tōkyō	749·76	Shidzuoka	3,002·76
Kanagawa	927·79	Aichi	1,864·17
Saitama	1,585·30	Miye	2,196·56
Chiba	1,943·85	Gifu	4,001·84
Ibaraki	2,235·67	Shiga	1,540·30
Tochigi	2,854·14	Fukui	1,621·50
Gumma	2,427·21	Ishikawa	1,611·59
Nagano	5,088·41	Toyama	1,587·80
Yamanashi	1,727·50		
Northern Japan			
Niigata	4,914·55	Akita	4,493·84
Fukushima	5,042·57	Iwate	5,359·17
Miyagi	3,223·11	Aomori	3,617·89
Yamagata	3,576·89		
Southern Japan			
Kyōto	1,767·43	Okayama	2,509·04
Osaka	689·69	Hiroshima	3,103·84
Nara	1,200·46	Yamaguchi	1,324·34
Wakayama	1,851·29	Shimane	2,597·48
Hyōgo	3,318·31	Tottori	1,335·99
Shikoku			
Tokushima	1,616·82	Ehime	2,033·57

Hokkaidō			36,328·34

Local Administrative Divisions.—For purposes of local administration Japan is divided into 3 urban prefectures (*fu*), 43 rural prefectures (*ken*), and 3 special dominions (*chō*), namely Formosa, Hokkaidō and South Sakhalin. Korea, which was annexed to Japan in 1910, is dealt with in a separate article (*q.v.*). Formosa, which is under a governor-general is divided into 5 prefectures; and the Hokkaidō and Sakhalin are under civil governors. The former, however, has its own assembly and is thus not unlike a prefectural government. The prefectures are divided again into 636 sub-prefectures (*gun* or *kōri*); 101 towns (*shi*), 1,536 towns (*chō*) and 10,368 rural districts (*son*). The three urban prefectures are Tōkyō, Osaka and Kyōto. Each prefecture is named after its chief town, with the exception of Okinawa, which is the appellation of a group of islands called also Ryūkyū (Luchu). The chief administrator of a prefecture, whether urban or rural, is called a *chiji* (prefect).

Local Administrative System.—In feudal times the domains of the Shōgun were administered by Governors (*daikwan*) and those of the various clans by the clan rulers themselves; but a general supervision of affairs on behalf of the Shogunate was exercised by a class of officials called *Métsuké*. Although there was no such thing as popular representation an effective chain of responsibility was forged by dividing the people,—apart from the *samurai*,—into groups of five households or families,—each under the direction of a headman,—which were held jointly accountable for offences committed by any of their members. But after the Restoration, when the administrative system was remodelled on Western lines, steps were gradually taken in the direction of the introduction of the principle of representation in local administration. Beginning with the establishment of prefectural assemblies in 1880, the principle was later extended to the lesser administrative units, so that eventually every prefecture, rural district or county, city, town or village had its own local assembly. Owing, however, to the imposition of substantial restrictions in the way of property qualifications both on the voters and on the candidates for election representation was very limited; but, gradually, as the country advanced these restrictions were modified, always in the direction of the extension of the franchise, until in 1926 property qualifications were entirely abolished and every native-born Japanese of the age of 25 or over who had resided in any particular district for more than two years was accorded the right to vote or, if he chose, to stand for election to the prefectural, city, town, or village assembly of the locality in which he lived. The number of members of these various assemblies is fixed more or less in proportion to the population. In the case of a prefectural assembly there is no maximum limit; but the minimum is 30; for a city the maximum is 60 and the minimum 30, and for a village the minimum is 8. District assemblies no longer exist, the district system having been abolished in 1926 and its place taken by 25 branch prefectural offices. The duties of the head of the district or county were at the same time delegated either to the prefectural office itself or to the headmen of towns and villages. Members of assembly are not paid. For prefectural assemblies the term is four years; for town and district assemblies, six years, with the provision that one-half of the members must be elected every third year. The prefectural assemblies hold one session of 30 days yearly; but those of towns and districts have no fixed session; they are summoned by the mayor or the head-man when their deliberations appear necessary, and they continue in session till their business is concluded.

The assemblies are mainly advisory and their chief function is to deal with all questions of local finance. They discuss and vote the yearly budgets; they pass the settled accounts; they fix the local taxes within a maximum limit which bears a certain ratio to the national taxes; they make representations to the Minister for the Interior; they deal with the fixed property of the locality; they raise loans, and so on. It is necessary, however, that they should obtain the consent of the Minister for the Interior, and sometimes of the Minister of Finance also, before disturbing any objects of scientific, artistic or historical importance; before contracting loans; before imposing special taxes or passing the normal limits of taxation; before enacting new local

regulations or changing the old; before dealing with grants in aid made by the central treasury, etc. The governor of a prefecture, who is appointed by the central administration, is invested with considerable power. He oversees the carrying out of all works undertaken at the public expense; he causes bills to be drafted for discussion by an assembly; he is responsible for the administration of the funds and property of the prefecture; he orders payments and receipts; he directs the machinery for collecting taxes and fees; he summons a prefectural assembly, opens it and closes it, and has competence to suspend its session should such a course seem necessary. The mayor of a city is nominated by the Minister for the Interior from three men chosen by the city assembly. Cities enjoy a greater measure of self-government than other local administrative bodies, for, in addition to being able to impose taxation, within certain limits they are empowered to own or control municipal undertakings,—such as water, gas, electric light and power, sewerage, sanitation, elementary education, etc. Their activities, however, are subject to strict supervision by the prefectural or central Authorities. Over the governors stands the Minister for the Interior, who discharges general duties of superintendence and sanction, has competence to delete any item of a local budget, and may, with the emperor's consent, order the dissolution of a local assembly, provided that steps are taken to elect and convene another within three months. The first elections for prefectural assemblies after the franchise revision of 1926 took place, in the case of 39 prefectures, in the following year. The candidates for election exceeded 2,000, the number elected was 1,489 and the total votes cast were over 6 million. A significant feature of the introduction of universal suffrage is the great increase in the activities of labour bodies and farmers' associations. Under the old system the candidates invariably belonged to the comparatively well-to-do classes; but in the elections of 1927 over 200 were members of labour organizations of some kind or other. Twenty-four of these candidates succeeded in obtaining seats. Political parties in the prefectural assemblies correspond with those in the Diet, the two most powerful in 1927 being the Seiyūkai, with 716 seats, and the Minseitō, with 577.

DEFENCE

The Japanese—as distinguished from the aboriginal inhabitants of Japan—having fought their way into the country, are naturally described in their annals as a nation of soldiers. The sovereign is said to have been the commander-in-chief and his captains were known as *o-omi* and *o-muraji*, while the duty of serving in the ranks devolved on all subjects alike. This information is indeed derived from tradition only, since the first written record goes back no further than 712.

Historical.—We are justified, however, in believing that at the close of the 7th century of the Christian era, when the empress Jito sat upon the throne, the social system of the Tang dynasty of China commended itself for adoption; the distinction of civil and military is said to have been then established for the first time, though it probably concerned officials only. Certain officers received definitely military commissions, and each important district throughout the empire had its military division (*gundan*). One-third—some say one-fourth—of the nation's able-bodied males constituted the army. Tactically there was a complete organization, from the squad of 5 men to the division of 600 horse and 400 foot. Service was for a defined period, during which taxes were remitted, so that military duties always found men ready to discharge them. Thus the hereditary soldier—afterwards known as the *samurai* or *bushi*—did not yet exist, nor was there any such thing as an exclusive right to carry arms. Weapons of war, the property of the state, were served out when required for fighting or for training purposes.

At the close of the 8th century stubborn insurrections on the part of the aborigines gave new importance to the soldier. The conscription list had to be greatly increased, and it came to be a recognized principle that every stalwart man should bear arms, every weakling become a bread-winner. Thus, for the first time, the distinction between "soldier" and "working man" received official recognition, and in consequence of the circumstances

attending the distinction a measure of contempt attached to the latter. The next stage of development had its origin in the assumption of high offices of state by great families, who appropriated as hereditary perquisites posts which should have remained in the gift of the sovereign. The Fujiwara clan, taking all the civil offices, resided in the capital, whereas the military posts fell to the lot of the Taira and the Minamoto, who, settling in the provinces and being thus required to guard and police the outlying districts, found it expedient to surround themselves with men who made soldiering a profession. These transmitted their functions to their sons, so that from the middle of the 10th century the terms *samurai* and *bushi* acquired a special significance, being applied to themselves and their hereditary followers by the local magnates, whose power tended more and more to eclipse even that of the throne. Finally, in the 12th century, when the Minamoto brought the whole country under the sway of military organization, the privilege of bearing arms was restricted to the samurai, who entered upon a period of administrative and social superiority which lasted, without serious interruption, until the middle of the 19th century. But it is to be observed that the distinction between soldier and civilian, samurai and commoner, was not of ancient existence, nor did it arise from any question of race or caste, victor or vanquished, as is often supposed and stated. It was an outcome wholly of ambitious usurpations, which, relying for success on force of arms, gave practical importance to the soldier, and invested his profession with factitious honour.

Weapons.—The bow was always the chief weapon of the fighting-man in Japan. "War" and "bow-and-arrow" were synonymous terms. Tradition tells how Tametomo shot an arrow through the crest of his brother's helmet, in order to recall the youth's allegiance without injuring him; how Nasuno Michitaka discharged a shaft that severed the stem of a fan swayed by the wind. Still better authenticated were the feats performed at the "thirty-three-span halls" in Kyōto and Yedo, where the archer had to shoot an arrow through the whole length of a corridor 128 yards long and only 16ft. high. Wada Daihachi, in the 17th century, succeeded in sending 8,133 arrows from end to end of the corridor in 24 consecutive hours, being an average of over 5 shafts per minute; and Masatoki, in 1852, made 5,383 successful shots in 20 hours, more than 4 a minute. The lengths of the bow and arrow were determined with reference to the capacity of the archer. In the case of the bow, the unit of measurement was the distance between the tips of the thumb and the little finger with the hand fully stretched. Fifteen of these units gave the length of the bow—the maximum being about 7½ft. The unit for the arrow was from 12 to 15 hand-breadths, or from 3ft. to 3½ft. Originally the bow was of unvarnished boxwood or *zelkova*; but subsequently bamboo alone came to be employed. Binding with cord or rattan served to strengthen the bow, and for precision of flight the arrow had three feathers, an eagle's wing being most esteemed for that purpose.

Next in importance to the bow came the sword, which is spoken of as the samurai's chief weapon, though often during long ages it ranked after the bow. It was a single-edged weapon remarkable for its three exactly similar curves—edge, face-line and back; its almost imperceptibly convex blade; its admirable tempering; its cunning distribution of weight, giving a maximum efficiency of stroke. The 10th century saw this weapon carried to perfection, and in every age numbers of men devoted their whole lives to acquiring novel skill in swordsmanship. Many of them invented systems of their own, differing from one another in some subtle details unknown to any save the master himself and his favourite pupils. Not merely the method of handling the weapon had to be studied. Associated with sword-play was an art variously known as *shinobi*, *yawara* and *jujutsu*, names which imply the exertion of muscular force in such a manner as to produce a maximum of effect with a minimum of effort, by directing an adversary's strength so as to become auxiliary to one's own. It was an essential element of the expert's art not only that he should be competent to defend himself with any object that happened to be within reach, but also that without an orthodox weapon he should be capable of inflicting fatal or disabling injury on an assailant.

Were he caught weaponless by a number of assailants, his art of *yawara* was supposed to supply him with expedients for emerging unscathed. Nothing counted save the issue. The methods of gaining victory or the circumstances attending defeat were scarcely taken into consideration. Out of this perpetual effort to discover and perfect novel developments of swordsmanship, there grew a habit which held its vogue down to modern times, namely, that when a man had mastered one style of sword-play in the school of a teacher; he set himself to study all others, and for that purpose undertook a tour throughout the provinces, challenging every expert, and, in the event of defeat, constituting himself the victor's pupil.

The sword exercised a very potent influence on the life of the Japanese nation. The distinction of wearing it, the rights that it conferred, the deeds wrought with it, the fame attaching to special skill in its use, the superstitions connected with it, the incredible value set upon a fine blade, the honours bestowed on an expert sword-smith, the profound study needed to be a competent judge of a sword's qualities—all these things conspired to give the katana an importance beyond the limits of ordinary comprehension. A samurai carried at least two swords, a long and a short. Their scabbards of lacquered wood were thrust into his girdle, not slung from it, being fastened in their place by cords of plaited silk. The short sword was not employed in the actual combat. Its use was to cut off an enemy's head after overthrowing him, and it also served a defeated soldier in his last resort—suicide. In general the long sword did not measure more than 3ft., including the hilt; but some were 5ft. long, and some 7. Considering that the scabbard, being fastened to the girdle, had no play, the feat of drawing one of these very long swords demanded extraordinary aptitude.

Spear and glaive were also ancient Japanese weapons. The glaive (*naginata*, long sword) was a scimitar-like blade, some 3ft. in length, fixed on a slightly longer haft. Originally the warlike monks alone employed this weapon, but from the 12th century it found much favour among military men. Ultimately, however, its use may be said to have been limited to women and priests. The spear, however, formed a useful adjunct of the sword, for whereas the latter could not be used except by troops in very loose formation, the former served for close-order fighting.

Armour.—Japanese armour (*gusoku*) may be broadly described as plate armour, but the essential difference between it and the European type was that, whereas the latter took its shape from the body, the former neither resembled nor was intended to resemble ordinary garments. Perhaps the easiest way of describing the difference is to say that whereas a European knight seemed to be clad in a suit of metal clothes, a Japanese samurai looked as if he wore protective curtains. The Japanese armour was, in fact, suspended from, rather than fitted to the person. Iron and leather were the chief materials, and as the laminae were strung together with a vast number of coloured cords—silk or leather—an appearance of considerable brilliancy was produced. Ornamentation did not stop there. Plating and inlaying with gold and silver, and finely wrought decoration were freely applied. On the whole, however, despite the highly artistic character of its ornamentation, the loose, pendulous nature of Japanese armour detracted greatly from its workmanlike aspect, especially when the *horo* was added—a curious appendage in the shape of a curtain of fine transparent silk, which was either stretched in front between the horns of the helmet and the tip of the bow, or worn on the shoulders and back, the purpose in either case being to turn the point of an arrow. A true samurai observed strict rules of etiquette with regard even to the garments worn under his armour, and it was part of his soldierly capacity to be able to bear the great weight of the whole without loss of activity, a feat impossible to any untrained man of modern days. Common soldiers were generally content with a comparatively light helmet and a corselet.

The Japanese never had a war-horse worthy to be so called. The misshapen ponies which carried them to battle showed qualities of hardiness and endurance, but were so deficient in stature and massiveness that when mounted by a man in voluminous

armour they looked painfully puny. Both stirrups and the wooden saddle-frame were often of beautiful workmanship, the former covered with rich gold lacquer, the latter inlaid with gold or silver. In the latter part of the military epoch chain-armour was adopted for the horse, and its head was protected by a monster-faced mask of iron.

Early Strategy and Tactics.—Flags were used in battle as well as on ceremonial occasions. Some were monochrome, as the red and white flags of the Taira and the Minamoto clans in their celebrated struggle during the 12th century; and some were streamers emblazoned with figures of the sun, the moon, a dragon, a tiger and so forth, or with religious legends. Fans with iron ribs were carried by commanding officers, and signals to advance or retreat were given by beating drums and metal gongs and blowing conches. During the military epoch a campaign was opened or a contest preluded by a human sacrifice to the god of war, the victim at this rite of blood (*chi-matsuri*) being generally a prisoner or a condemned criminal. Although ambushes and surprises played a large part in all strategy, pitched battles were the general rule, and it was essential that notice of an intention to attack should be given by discharging a singing arrow. Thereafter the assaulting army, taking the word from its commander, raised a shout of "Ei! Ei!" to which the other side replied, and the formalities having been thus satisfied, the fight commenced. In early mediaeval days tactics were of the crudest description. An army consisted of a congeries of little bands, each under the order of a chief who considered himself independent, and instead of subordinating his movements to a general plan, struck a blow whenever he pleased. From time immemorial a romantic value has attached in Japan to the first of anything: the first snow of winter; the first water drawn from the well on New Year's Day; the first blossom of the spring; the first note of the nightingale. So in war the first to ride up to the foe or the wielder of the first spear was held in high honour, and a samurai strove for that distinction as his principal duty. It necessarily resulted, too, not only from the nature of the weapons employed, but also from the immense labour devoted by the true samurai to perfecting himself in their use, that displays of individual prowess were deemed the chief object in a battle. Prior to the 15th and 16th centuries a battle resembled a gigantic fencing match. It was the samurai's habit to proclaim his name and titles in the presence of the enemy, sometimes adding from his own record or his father's any details that might tend to dispirit his hearers. Then some one advancing to cross weapons with him would perform the same ceremony of self-introduction, and if either found anything to upbraid in the other's antecedents or family history, he did not fail to make loud reference to it, such a device being counted efficacious as a means of disturbing an adversary's *sang-froid*, though the principle underlying the mutual introduction was courtesy. The duellists could reckon on finishing their fight undisturbed, but the victor frequently had to endure the combined assault of a number of the comrades or retainers of the vanquished. When the fighting had ceased, each samurai proceeded to the tent of the commanding officer and submitted for inspection the heads of those whom he had killed. A tent was simply a space enclosed with strips of cloth or silk, on which was emblazoned the crest of the commander. It had no covering.

Change of Tactics.—The disadvantage of such a mode of fighting was demonstrated for the first time when the Mongols invaded Japan in 1274. The invaders moved in phalanx, guarding themselves with pavises, and covering their advance with a host of archers shooting clouds of poisoned arrows. The Japanese never at any time of their history used poisoned arrows; they despised them as depraved and inhuman weapons. When a Japanese samurai advanced singly and challenged one of the Mongols to combat, they opened their ranks, enclosed the challenger and cut him to pieces. Many Japanese were thus slain, and it was not until they made a concerted movement of attack that they produced any effect upon the enemy. But although the advantage of massing strength seems to have been recognized, the Japanese themselves did not adopt the formation which the Mongols had shown to be so formidable. The great captains Takeda Shingen

and Uyesugi Kenshin are supposed to have been Japan's pioneer tacticians. They certainly appreciated the value of a formation in which the action of the individual should be subordinated to the unity of the whole. But when it is remembered that firearms had already been in the hands of the Japanese for several years, and that they had means of acquainting themselves with the tactics of Europe through their intercourse with the Dutch, it is remarkable that the changes attributed to Takeda and Uyesugi were not more drastic. Speaking broadly, what they did was to organize a column with the musqueteers and archers in front; the spearmen and swordsmen in the second line; the cavalry in the third line; the commanding officer in the rear, and the drums and standards in the centre. In the days of Hideyoshi (1536-1598) combined flank and front attacks by bands of spearmen became a favourite device. But not until the close of the 17th century did the doctrine of strictly disciplined action obtain practical vogue. Yamaga Soko is said to have been the successful inculcator of this principle, and from his time the most approved tactical formation was known as the *Yamagaryū* (Yamaga style), though it showed no other innovation than strict subordination of each unit to the general plan.

Military Principles.—Although, tactically speaking, the samurai was everything and the system nothing before the second half of the 17th century, and although strategy was chiefly a matter of deception, surprises and ambushes, it must not be supposed that there were no classical principles. The student of European military history searches in vain for the rules and maxims of war so often invoked by glib critics, but the student of Japanese history is more successful. Here, as in virtually every field of things Japanese, retrospect discovers the ubiquitous Chinaman. The treatises of Sung and 'Ng (called in Japan Son and Go), Chinese generals of the third century after Christ, were the classics of Far-Eastern captains through all generations. (See *The Book of War*, tr. E. F. Calthrop, 1908.) These treatises came into the hands of the Japanese in the 8th century, when the celebrated Kibi no Mabi went to study civilization in China, just as his successors of the 19th century went to study a new civilization in Europe and America. Thenceforth Son and Go became household words among Japanese soldiers. Their volumes were to the samurai what the *Mahayana* was to the Buddhist. They were believed to have collected whatever of good had preceded them, and to have forecast whatever of good the future might produce. The character of their strategic methods, somewhat analogous to those of 18th-century Europe, may be gathered from the following:—"An army undertaking an offensive campaign must be twice as numerous as the enemy. A force investing a fortress should be numerically ten times the garrison. When the adversary holds high ground, turn his flank; do not deliver a frontal attack. When he has a mountain or a river behind him, cut his lines of communication. If he deliberately assumes a position from which victory is his only escape, hold him there, but do not molest him. If you can surround him, leave one route open for his escape, since desperate men fight fiercely. When you have to cross a river, put your advance-guard and your rear-guard at a distance from the banks. When the enemy has to cross a river, let him get well engaged in the operation before you strike at him. In a march, make celerity your first object. Pass no copse, enter no ravine, nor approach any thicket until your scouts have explored it fully."

The basis of their tactics is *The Book of Changes*. This treats of the positive and the negative principles; the sympathetic and the antipathetic elements; cosmos growing out of chaos; chaos re-absorbing cosmos—on such conceptions they founded their tactical system. The result was a phalanx of complicated organization, difficult to manoeuvre and liable to be easily thrown into confusion. Yet when Yamaga in the 17th century interpreted these ancient Chinese treatises, he detected in them suggestions for a very shrewd use of the principle of *échelon*, and applied it to devise formations which combined much of the frontal expansion of the line with the solidity of the column. More than that cannot be said for Japanese tactical genius. The samurai was the best fighting unit in the Orient—probably one of the best

fighting units the world ever produced. It was perhaps because of that excellence that his captains remained indifferent tacticians.

Ethics of the Samurai.—In estimating the military capacity of the Japanese, it is essential to know something of the ethical code of the samurai, the *bushido* (way of the warrior) as it was called. A typical example of the rules of conduct prescribed by feudal chieftains is furnished in the code of Kato Kiyomasa, a celebrated general of the 16th century:—

Regulations for Samurai of every Rank; the Highest and Lowest alike.

1. The routine of service must be strictly observed. From 6 a.m. military exercises shall be practised. Archery, gunnery and horsemanship must not be neglected. If any man shows exceptional proficiency he shall receive extra pay.

2. Those that desire recreation may engage in hawking, deer-hunting or wrestling.

3. With regard to dress, garments of cotton or pongee shall be worn. Any man incurring debts owing to extravagance of costume or living shall be considered a law-breaker. If, however, being zealous in the practice of military arts suitable to his rank, he desires to hire instructors, an allowance may be granted to him for that purpose.

4. The staple of diet shall be unhulled rice. At social entertainments one guest for one host is the proper limit. Only when men are assembled for military exercises shall many dine together.

5. It is the duty of every samurai to make himself acquainted with the principles of his craft. Extravagant displays of adornment are forbidden in battle.

6. Dancing or organizing dances is unlawful; it is likely to betray sword-carrying men into acts of violence. Whatever a man does should be done with his heart. Therefore for the soldier military amusements alone are suitable. The penalty for violating this provision is death by suicide.

7. Learning shall be encouraged. Military books must be read. The spirit of loyalty and filial piety must be educated before all things. Poem-composing pastimes are not to be engaged in by samurai. To be addicted to such amusements is to resemble a woman. A man born a samurai should live and die sword in hand. Unless he is thus trained in time of peace, he will be useless in the hour of stress. To be brave and warlike must be his invariable condition.

8. Whosoever finds these rules too severe shall be relieved from service. Should investigation show that any one is so unfortunate as to lack manly qualities, he shall be singled out and dismissed forthwith. The imperative character of these instructions must not be doubted.

Frugality, fealty and filial piety—these may be called the fundamental virtues of the samurai. Owing to the circumstances out of which his caste had grown, he regarded all bread-winning pursuits with contempt, and despised money. To be swayed in the smallest degree by mercenary motives was despicable in his eyes. Essentially a stoic, he made self-control the ideal of his existence, and practised the courageous endurance of suffering so thoroughly that he could without hesitation inflict on his own body pain of the most horrible description. Nor can the courage of the samurai justly be ascribed to bluntness of moral sensibility resulting from semi-savage conditions of life. From the 8th century onwards the current of existence in Japan set with general steadiness in the direction of artistic refinement and voluptuous luxury, amidst which men could scarcely fail to acquire habits and tastes inconsistent with acts of high courage and great endurance. The samurai's mood was not a product of semi-barbarism, but rather a protest against emasculating civilization. He schooled himself to regard death by his own hand as a normal eventuality. The story of other nations shows epochs when death was welcomed as a relief and deliberately invited as a refuge from the mere weariness of living.

Harakiri.—But wherever there has been liberty to choose, and leisure to employ, a painless mode of exit from the world, men have invariably selected it. The samurai, however, adopted in *harakiri* (disembowelment) a mode of suicide so painful and so shocking that to school the mind to regard it with indifference and perform it without flinching was a feat not easy to conceive. Assistance was often rendered by a friend who stood ready to decapitate the victim immediately after the stomach had been gashed; but there were innumerable examples of men who consummated the tragedy without aid, especially when the sacrifice of life was by way of protest against the excesses of a feudal chief or the crimes of a ruler, or when some motive for secrecy existed. It must be observed that the suicide of the samurai

was never inspired by any doctrine like that of Hegesias. Death did not present itself to him as a legitimate means of escaping from the cares and disappointments of life. Self-destruction had only one consolatory aspect, that it was the soldier's privilege to expiate a crime with his own sword, not under the hand of the executioner. It rested with his feudal chief to determine his guilt, and his peremptory duty was never to question the justice of an order to commit suicide, but to obey without murmur or protest. For the rest, the general motives for suicide were to escape falling into the hands of a victorious enemy, to remonstrate against some official abuse which no ordinary complaint could reach, or, by means of a dying protest, to turn a liege lord from pursuing courses injurious to his reputation and his fortune. This last was the noblest and by no means the most infrequent reason for suicide. Thus the samurai rose to a remarkable height of moral nobility. He had no assurance that his death might not be wholly fruitless, as indeed it often proved. If the sacrifice achieved its purpose, if it turned a liege lord from evil courses, the samurai could hope that his memory would be honoured. But if the lord resented such a violent and conspicuous mode of reproving his excesses, then the faithful vassal's retribution would be an execrated memory and, perhaps, suffering for his family and relatives. Yet the deed was performed again and again. It remains to be noted that the samurai entertained a high respect for the obligations of truth; "A bushi has no second word," was one of his favourite mottoes. However, a reservation is necessary here. The samurai's doctrine was not truth for truth's sake, but truth for the sake of the spirit of uncompromising manliness on which he based all his code of morality. A pledge or a promise must never be broken, but the duty of veracity did not override the interests or the welfare of others. Generosity to a defeated foe was also one of the tenets of the samurai's ethics.

Something more, however, than a profound conception of duty was needed to nerve the samurai for sacrifices such as he seems to have been always ready to make. It is true that Japanese parents of the military class took pains to familiarize their children of both sexes from very tender years with the idea of self-destruction at any time. But superadded to the force of education and the incentive of tradition there was a transcendental influence. Buddhism supplied it. The tenets of that creed divided themselves, broadly speaking, into two doctrines, salvation by faith and salvation by works, and the chief exponent of the latter principle is the sect which prescribes meditation as the vehicle of enlightenment. Whatever be the mental processes induced by this rite, those who have practised it insist that it leads finally to a state of absorption, in which the mind is flooded by an illumination revealing the universe in a new aspect, absolutely free from all traces of passion, interest or affection, and showing, written across everything in flaming letters, the truth that for him who has found Buddha there is neither birth nor death, growth nor decay. Lifted high above his surroundings, he is prepared to meet every fate with indifference. The attainment of that state seems to have been a fact in the case both of the samurai of the military epoch and of the Japanese soldier to-day.

Abolition of the Samurai.—The policy of seclusion adopted by the Tokugawa administration after the Shimabara insurrection included an order that no samurai should acquire foreign learning. Nevertheless some knowledge could not fail to filter in through the Dutch factory at Deshima, and thus, a few years before the advent of the American ships, Takashima Shūhan, governor of Nagasaki, becoming persuaded of the fate his country must invite if she remained oblivious of the world's progress, obtained small arms and field-guns of modern type from Holland, and, repairing to Yedo with a company of men trained according to the new tactics, he offered an object lesson for the consideration of the conservative officials. They answered by throwing him into prison. But Egawa, one of his retainers, proved a still more zealous reformer, and his foresight being vindicated by the appearance of the American war-vessels in 1853, he won the government's confidence. At Egawa's instance rifles and cannon were imported largely from Europe, and their manufacture was commenced in Japan. Finally, in 1862, the shōgun's

government adopted the military system of the West, and organized three divisions of all arms, with a total strength of 13,600 officers and men. Disbanded at the fall of the shōgunate in 1867, this force nevertheless served as a model for a similar organization under the imperial government, and in the meanwhile the principal fiefs had not been idle, some—as Satsuma—adopting English tactics, others following France or Germany, and a few choosing Dutch. Then Ōmura Masujiro, a samurai of the Chōshū clan attempted to substitute for the hereditary soldier conscripts taken from all classes of the people, but was assassinated. In 1870 Yamagata Aritomo (afterwards Field-Marshal Prince Yamagata) and Saigō Tsugumichi (afterwards Field-Marshal Marquis Saigō) returned from a tour of military inspection in Europe, and organized a corps of Imperial guards, taken from the three clans which had been conspicuous in the work of restoring the administrative power to the sovereign, namely, the clans of Satsuma, Chōshū and Tosa. In 1873, an imperial decree substituted universal conscription for the system of hereditary militarism. Many persons viewed this experiment with deep misgiving, but it was dispelled a few years later. One of the serious difficulties encountered at the outset was that samurai conscripts were too proud to stand in the ranks with common rustics or artisans, and above all to obey the commands of plebeian officers.

But patriotism overcame this obstacle. To find competent officers was a problem, but the new military school turned out graduates at high pressure, and private soldiers who showed any special aptitude were rapidly promoted to positions of command. French military instructors were engaged. In 1877, this new army of conscripts had to endure a crucial test: it had to take the field against the Satsuma samurai, the very flower of their class, who in that year openly rebelled against the Tōkyō government. The campaign lasted eight months; as the Imperial forces were reduced by casualties in the field and by disease, it became necessary to have recourse to volunteers, but as these were for the most part samurai, the expectation was that their hereditary instinct of fighting would compensate for lack of training. That expectation was not fulfilled. Serving side by side in the field, the samurai volunteer and the heimin¹ regular were found to differ by precisely the degree of their respective training. The fact was thus finally established that the fighting qualities of the farmer and artisan reached as high a standard as those of the bushi.

Thenceforth the story of the Japanese army is one of steady progress and development.

In 1883, the total period of colour and reserve service was extended to 12 years, and substitution was no longer allowed. In 1888 the seven divisions of the army first found themselves prepared to take the field, and, in 1893, a revised system of mobilization was sanctioned, to be put into operation the following year, for the Chino-Japanese War (*q.v.*). The infantry were armed with the Murata single-loader rifle, but the field artillery was inferior, and the only two divisions equipped with magazine rifles and smokeless powder never came into action. The experiences gained in this war bore large fruit. The total term of service was slightly increased; new divisions were added, bringing the whole number of divisions to 13 (including the guards); with the aid of a German military mission strenuous efforts were made to improve the education of officers and men; and Japan became gradually independent of foreign aid so far as arms are concerned. In 1900, she sent a force to North China to assist in the campaign for the relief of the foreign legations in Peking, and on that occasion her troops were able to observe at first hand the qualities and methods of European soldiers. In 1904 took place the great war with Russia (*see* RUSSO-JAPANESE WAR). After the war important changes were made in the direction of augmenting and improving the armed forces. The number of divisions was increased to 19 (including the guards), of which one was for service in Korea and one for service in Manchuria. The term of service with the colours was shortened to 2 years for the infantry, 3 years remaining the rule for other arms, while the period of service with the reserves was extended to 14½ years, which greatly augmented the potential war strength. (X.)

¹The general term for commoners as distinguished from samurai.

MODERN

All males between 17 and 40 are liable for military service, though normally those conscripted are not called up till the age of 20. About 600,000 attain military age each year. After undergoing a medical examination they are divided into five main categories according to their degree of physical fitness. As the annual colour quota is only about 100,000, those in the highest category are generally more than sufficient for the active army and selection is therefore made by ballot. The remainder, other than those who are definitely rejected as physically unfit, or whose service has been postponed for family, educational, or other such reasons, are similarly divided by ballot among the conscript reserve and 2nd levy of the national army.

Formerly those selected for the active army served three years with the colours, 4½ years with the 1st reserve (*Yobi*), and ten years with the 2nd reserve (*Kobi*); but, since 1905, successive changes have brought it down to 22½ months with the colours, 5½ years with the 1st reserve, and 10 years with the 2nd reserve, after which they are drafted into the 1st levy of the national army and do no more training. Those in the 1st reserve serve to fill up gaps in the active army on mobilisation, while the 2nd reserve is used to form reserve units on the outbreak of war. In point of fact, most infantrymen have, since 1927, had their colour service reduced to 18 months as a result of a scheme inaugurated two years previously. Under this system (*Seimen Kunren*) a man who, prior to conscription, passes a satisfactory course of military instruction, either at school or in a Young Men's Training Centre, is entitled to this reduction in service, provided he is selected for the infantry. In the schools and colleges, this preliminary training is supervised by regular officers on the active list, about 1,200 having been specially appointed for this purpose.

Conscript Reserve.—Men allotted to the conscript reserve (*Hoju*, equivalent to *Ersatz*) nominally undergo 150 days' training during their service in it, but in practice only a few thousand of the yearly contingent receive any training. They may, however, be drawn upon to replace casualties in the active army contingent in peace time, and in time of war they are called up to form depot units, which supply drafts to replace casualties in the field armies. At the end of 12½ years they are drafted to the 1st levy of the national army, where they merge with those who have passed through the active army. The 2nd levy of the national army absorbs considerably more than half of those passed medically fit, and entails no training, though its members are liable to be called up for service in wartime as a last resort.

Though the ordinary conscript may rise to the rank of "superior soldier" (equivalent to Lance-Corporal) during his service with the colours, all other N.C.O.s. and W.O.s. in the active army are recruited from conscripts who extend their service voluntarily. The commissioned ranks are recruited from men who, taking up the army as a profession, have passed through the officers' school (*see* section, "Education"). Men with certain educational qualifications are permitted to serve with the colours as volunteer cadets (*Kambu Kōhosei*), formerly known as "one year volunteers" (*Ichinen Shūganhei*). Those from universities and other educational establishments of high standing serve only ten months, others for one year. At the end of that period (during which they receive special training), they undergo an examination. If successful, they are appointed to the 1st reserve as 2nd lieutenants. If they fail, they receive the rank of corporal or sergeant in the same reserve. Graduates of normal schools, in which teachers for Government schools are trained, receive only five months' training with the colours and then pass direct to the National Army. There are, in addition, certain men of inferior physique who are sent to commissariat units for two months' training in the care of horses under military discipline. In wartime these men would be called up to assist the fully-trained men of the commissariat.

Peace and War Strength.—On completion of demobilisation after her war with Russia, Japan was left with a peace-time army of 17 infantry divisions, two cavalry brigades and two artillery brigades, together with the independent garrisons of Formosa, North China, and of various fortresses, as well as certain guards

in Korea. The total personnel numbered about 210,000. As a result of subsequent additions, the strength was gradually increased to 21 divisions, four cavalry brigades, three field artillery brigades and two heavy artillery brigades, together with a number of smaller independent units, the total personnel amounting to 272,000 according to a statement made by the War Minister in the 1919-1920 session of the Diet.

The formation of another four divisions was contemplated, but the plans never materialised. Instead, in accordance with public wishes, steps were taken soon after to reduce the size of the army. By means of a re-organisation scheme drawn up in 1922, a number of smaller units were disbanded and other economies in man-power effected. A second and more drastic cut took place in 1925, when four whole divisions were disbanded, though this loss was partly offset by the decision to create a tank unit and an anti-aircraft regiment, and to carry out various improvements in the matter of arms and military equipment generally. At the same time, the Army Air Force, which had been made an independent arm in April 1923 (up to which time it had been merely a branch of the engineers), was expanded from six battalions (*daitai*) to eight regiments (*rentai*).

As a result of the reorganization and reduction¹, the peace strength, according to figures supplied by the Japanese War Department, in May 1928 stood at 220,000, the main units of the Japanese Army being as follows,—17 divisions, four cavalry brigades, four heavy field artillery brigades, three regiments and eight battalions of heavy artillery, eight air regiments and one anti-aircraft regiment. There are also certain smaller independent units.

Approximate Statistics.—Full details of both peace and war strength and organisation are kept strictly secret. The figures given below, therefore, can only be taken as approximate. Speaking generally, however, a division is normally composed of two infantry brigades (each of two regiments, each of three battalions), one regiment of cavalry (two squadrons), one regiment of field artillery (three battalions, each of two 4-gun batteries), one battalion of engineers (three companies) and one battalion of commissariat (two companies). Two of the existing 17 divisions (9th and 11th) have each a mountain artillery regiment instead of field artillery, and the two divisions in Korea (19th and 20th) are without commissariat units. In peace-time an infantry battalion is about 600 strong, a cavalry regiment about 300-400, an artillery regiment 500, an engineer battalion about 450 and a commissariat battalion about 300 men. An infantry battalion on peace footing has only three companies, but a fourth is added on mobilisation. An extra battery is likewise added to each artillery battalion. As each infantry company has six light machine-guns, it follows that a battalion at peace strength has 18 light machine-guns and at war strength 24. In addition, each infantry battalion and each cavalry regiment on mobilisation has four heavy machine-guns on pack transport, and a 37 mm. infantry gun and a mortar are added to each infantry regiment. A peace-time division may therefore be said to be from 5,000-5,500 strong with 24 field guns and 216 light machine-guns. On mobilisation it is expanded to about 20,000 with 36 field guns, 288 light machine-guns, 52 heavy machine-guns, four infantry (37 mm.) guns and four mortars.

Of units other than those included in the divisional organisation, the four heavy field artillery brigades each consist of two regiments, armed with both guns and howitzers. Each of the four cavalry brigades has two regiments, each of four ordinary and one machine-gun squadrons, the peace strength of a brigade being about 1,200. Mountain artillery regiments, the horse artillery battalion and the heavy artillery units, have the same organisation as field artillery. The anti-aircraft regiment, which is still in process of organisation, will probably be on a similar basis. The tank unit is understood to be the nucleus of a bat-

¹According to semi-official announcements made at the time the two cuts took place, the first involved a reduction of about 56,000 and the second effected a further net cut of about 27,000. These figures, however, are not compatible with the present total strength of 220,000, as now given out by the War Department, and with the 272,000 quoted by the War Minister in 1920.

alion with 25 tanks and may later be expanded still further. The strength of the air regiments is as uncertain as the organisation. At present there appear to be from 1-3 companies each of from 8-12 machines, the number varying according to type, per regiment, or 18 companies in all, while another eight are in process of formation. By 1931 there should be a total of 26 companies with from 2-4 companies per regiment.

The present peace strength of the Japanese Army may therefore be classified as follows—infantry 70 regiments and four battalions; cavalry 25 regiments; field artillery 15 regiments; mountain artillery four regiments and one battalion; horse artillery one battalion; heavy field artillery eight regiments; heavy artillery three regiments and eight battalions; engineers 17 battalions; railway corps two regiments; telegraph corps two regiments; air corps eight regiments; balloon corps two companies; commissariat 15 battalions; motor transport one battalion; anti-aircraft one regiment; tank corps one battalion.

War Strength.—Japan's war strength is kept even more jealously guarded than her peace strength. In her war with Russia Japan sprang a surprise upon her opponents by putting a *kobi* (2nd Reserve) brigade in the field simultaneously with each infantry division. There are reasons to believe that, in the event of another first-class war, Japan is capable of placing one, and later on possibly a second, reserve division in the field for every division of her peace-time standing army, thus giving a total of 34 or, if trebled, 51 divisions as her war-time strength. The large proportion of officers and W.Os. on her peace establishment, and her large reserves of man-power, appear to make this quite feasible, even without drawing upon the "indispensables" required for work in munition factories and other necessary industries.

The exact number of reserves available is unknown, but rough estimates indicate that she has well over a million and a half trained reserves, more than half a million partially trained, and seven or eight million untrained men fit for service. Under the newly instituted system of preliminary training for youths (see section below, "Education"), the number of part-trained reserves will be greatly increased. Fully trained reserves will likewise increase to some extent as a result of the recent reduction in colour service for infantry.

Command and Distribution.—According to the Japanese Constitution, the Emperor is in supreme command of both army and navy. As advisory bodies on naval and military affairs he has the Board of Marshals (*Gensuifu*) and the Military Council (*Gunji Sangin*). The former is composed solely of marshals and fleet admirals. The latter includes all the members of the former, together with the Ministers of War and Marine, the Chiefs of the General and Naval Staffs (all these being ex-officio members) and certain high officers specially nominated by the Emperor. The Military Council can initiate and decide on policies to be adopted. The Board of Marshals cannot initiate policies, but can give final decisions, subject to the Emperor's consent, to policies submitted to them for approval. The Army is controlled by the War Minister, Chief of General Staff, and Inspector-General of Military Education ("I.G.M.E."). Each is co-equal with the others and is responsible to the Emperor alone. The War Minister, though he is a member of the Cabinet, has direct access to the Throne like the other two and is therefore virtually independent of the Premier so far as purely military administrative matters are concerned. Although the question of making civilians eligible for the post of War Minister has frequently been mooted in recent years, the present regulations lay down that the appointment must be held by a general officer on the active list. He is responsible for administration and execution of policy, and presides over the War Office. Under him are a Vice-Minister (also a general officer) and the directors of 7 main bureaux.

The Chief of the General Staff ("C.G.S.") initiates plans, etc., and has a Vice-Chief and 6 bureaux directors immediately under him. The Commandant of the Staff College is likewise under his direct control. Like the C.G.S., the I.G.M.E. is also independent of the War Minister. A Vice-Inspector-General and Inspectors-General of the various arms are his immediate sub-

ordinates. Next in importance to the C.G.S., War Minister, and I.G.M.E. are the commanders of the Korean, Formosan (including Pescadores), and South Manchurian garrisons, the Commander of the Tokyo Garrison (all Generals or Lt. generals) and the 17 divisional commanders (Lt. generals). All these officers are appointed by, and are responsible to the Emperor, though they are under the orders of the War Minister for administration, C.G.S. for operations and I.G.M.E. for training. Other important posts are those of Chief of Military Police and Commander of North China garrison (directly under the War Minister), commandants of the various military schools (under I.G.M.E.), and commanders of fortresses and of independent brigades and other independent units generally (responsible to the commanders of the divisions in whose areas they are located). Brigades are commanded by major-generals, regiments by colonels and battalions by majors.

The main force of the Japanese Army, as is only natural, is concentrated in the four main islands of Japan. Of the 17 infantry divisions, 2 are stationed permanently in Korea and normally 14 are kept in Japan—2 in Kyushu, 1 in Shikoku, 1 in Hokkaido and 10 (including the Guards) in the main island of Honshu. Actually there are 11 divisional districts in Honshu, but 1 division is always absent in S. Manchuria, this division being relieved every 2 years by a fresh one from the Homeland. In the overseas garrisons the distribution is as under—*Korea* 2 divisions, 1 air regiment, 1 heavy artillery battalion. *S. Manchuria* 1 division, 4 independent infantry battalions for guarding the railway, 1 heavy artillery battalion. *N. China* (Peking and Tientsin) 2 battalions (supplied from Home units) *Formosa and Pescadores* 2 independent infantry regiments, 2 heavy artillery battalions, 1 mountain artillery battalion and 1 air regiment. *Tsushima* 1 heavy artillery battalion. The 4 cavalry brigades, the 4 artillery brigades, and all other units not specifically mentioned above are kept permanently in Japan in peace-time.

Education.—Education in Japan is compulsory up to the age of 13. After this, those who desire to become army officers either enter a middle school for 4 years or else, after a year at a middle or higher primary school, pass into the military preparatory school (*Yōnen Gakkō*). They then enter the Officers' School (*Shikwan Gakkō*), the number of vacancies for such applicants being fixed each year. There are also a few allotted (a) to conscripts between the ages of 17 and 21 who, after service with the colours, elect to try for commissions, and (b) to selected N.C.Os. of under 26, who have been recommended by their commanding officers. Formerly, successful candidates from the military preparatory and middle schools did 6 months and 12 months regimental training respectively in the ranks before entering the Officers' School, where they remained 1½ years and then became probationary officers for 6 months.

Under the new system, however, all candidates for commissioned rank carry out a 2-year preparatory course at the Officers' School and each one is then attached to a military unit for 6 months. The branch of the service to which a cadet is sent depends partly on individual choice and partly on the arm for which this preliminary course has shown him to be best fitted. On completion of his regimental attachment, the cadet returns to the school for a further course of a year and 10 months, during which he specialises in the particular arm to which he has been allotted. Then follows two months as a probationary officer in the unit to which he was formerly attached, after which he is gazetted 2nd lieutenant, provided the C.O. and other officers signify their approval.

For those who have obtained commissions, a large number of military educational establishments are available for specialising or increasing their knowledge generally. Of these the most important is the Staff College, aspirants for which must be under the rank of captain at the time of entry. A 3-years' course, both practical and theoretical, is provided. Successful graduates generally receive accelerated promotion, though no extra pay accrues to staff appointments. Other existing educational establishments for officers are the infantry school and schools of cavalry, heavy artillery, field artillery, artillery and engineering, military en-

gineering, aviation (3), physical training, mechanical transport, signalling and communications, and gendarmerie. Some of these schools include courses for N.C.Os, and there are, in addition, 3 N.C.O's Schools. There are also schools of instruction for the medical and veterinary services and for intendants and bandsmen. Apart from those who pass through the Staff College, rise in commissioned rank in the earlier stages takes place automatically without recourse to promotion examinations, though an officer who has shown himself inefficient may be passed over.

Morale and Tactics.—Taken generally, the outstanding points in Japanese military education are the immense importance attached to training in *morale* (*Seishin Kyōiku*) and in tactics. The former includes instruction in the "seven duties of the soldier"—loyalty, valour, patriotism, obedience, humility, morality and honour—and insistence on frugality, simplicity and spartan existence generally. Tactics, both practical and theoretical, are given far more attention than any other subject in most of the military schools and in barracks too. The encouragement of foreign language study is another noteworthy feature. Military history, on the other hand, finds little space as a separate subject in the curriculum of an officer's training, though examples are frequently quoted in tactical instruction.

Fortifications.—Rather than spend large sums on powerful fortresses, Japan prefers to maintain a number of fortified zones which permit of manoeuvre and mobility, and co-operation with naval units. Being an island country with no land frontiers, other than the mountainous northern border line of Korea, such permanent fortifications as exist within these zones are coastal. Just how much these zones are fortified is unknown, as extreme secrecy is observed and every precaution taken to prevent unauthorised persons obtaining any clue. The probability is that permanent fortifications are few in number and that very little in the way of fixed defence works exist, though it is safe to assume that all necessary steps have been taken in regard to the siting and construction of gun emplacements and field works for use in time of war. All that is known for certain is that the localities marked off as fortified areas are centred round strategic points, such as the entrances to the Inland Sea, the Sea of Japan and Tōkyō Bay, and the districts adjacent to naval bases. Formerly such forts as existed were manned by fortress artillery units, whose strength and organisation differed according to local requirements. Fixed fortifications and fixed armaments were the rule. Little or nothing in the way of mobile armaments existed. As a result of lessons learned in and since the Russo-Japanese War, however, the whole system has been altered. The organisation has been unified, lighter guns have been added, and the heavy artillery (which has now replaced the old-style fortress artillery) has been given a mobility which permits far greater freedom of action, both for offence and defence, than ever it had before.

Forts and fortified areas appear to be divided into three kinds in peace-time, according to their degree of importance. The 3 most important—Yokosuka, Miyama (eastern entrance of Inland Sea), and Shimonoseki—each have a regiment of heavy artillery stationed nearby. To each of the next 8, in order of importance, a battalion of heavy artillery is allotted. These are Hakodate, Maizuru, Sasebo, Keichi (island of Tsushima), Masan (southern Korea), Port Arthur, Keelung (northern Formosa), and Maho (Pescadores). After these come Nagasaki, Hoyo (the strait between Kyushu and Shikoku), the coastline facing Hakodate, Eiko (eastern Korea), and the Bonin islands, which, in peace time, have nothing but small maintenance parties for their upkeep.

In so far as the Korean frontier is concerned, nothing in the way of strong permanent fortifications exist, so far as is known, as the natural features of the local terrain help to provide all the protection needed throughout the greater part of the border line. There are believed, however, to be a number of light defence works at certain points.

(M. D. K.)

AIR

The air services in Japan are definite branches of the army and navy, though co-ordination is effected by two service councils, the board of Marshals and the Supreme Military Council. In estimat-

ing the present position of aviation in Japan it must be remembered that during the World War other nations were compelled by military necessity to develop their air arms with great rapidity. At the conclusion of peace Japan found herself, one of the great powers, considerably inferior to her allies in both branches of aviation. With characteristic energy she proceeded to build up the nucleus of powerful and efficient air services which, had not the disastrous earthquake of 1923 intervened, would by now be even stronger than they are.

The Military Air Service.—The Japanese military air service is part of the army and has been since 1925 a separate arm equal in status to the infantry, cavalry and artillery. The air service is controlled by a military aviation directorate which is divided into four departments (a) General Affairs. (b) Research and Investigation. (c) Aircraft Inspection. (d) Supply.

The air service largely based on the French model consists of 8 wings, 3 schools and 1 balloon company. A wing somewhat similar to a French air regiment is made up of two or more squadrons, an operational and training section, an equipment section, an *intendance* section and a medical section. It is considered that elasticity and easy expansion can be attained by this organization. Pilots are appointed from both commissioned and non-commissioned ranks, the proportion being roughly $\frac{2}{3}$ officer and $\frac{1}{3}$ N.C.O. pilots. The Military Air Service having modelled itself on its French counterpart and having been trained largely by French personnel has naturally turned to France for its equipment, and has bought machines and engines in that country or alternatively their manufacturing rights. The following are approximate strengths: officers (including some 300 pilots) 700, other ranks (including some 150 pilots) 4,000, aircraft, 200.

Naval Air Service.—The naval air service is an integral part of the navy and is concentrated at the five stations and in the three aircraft carriers. After the World War the services of a British air mission were employed to lay the foundations of an efficient naval air arm and as a result a considerable amount of British material was bought. Aircraft are now being efficiently manufactured in Japan for the naval air service and generally speaking it is the policy to purchase manufacturing rights and to build up an efficient national industry. There are believed to be four operational stations and one training station, but the organization of each station is not definitely known. There are three aircraft carriers in commission, or about to be commissioned, capable of carrying approximately 100 aircraft, namely, "Hosho" (9,500 tons displacement), "Akagi" 30,000 tons displacement, "Kaga" 27,000 tons displacement. The semi-rigid type of airship is favoured, but one which was recently purchased from Italy was destroyed in 1927. Pilots are appointed from both commissioned and non-commissioned ranks and are stated to be most efficient and energetic. The following are approximate strengths: officers (including some 150 pilots) 300; other ranks (including some 90 pilots) 3,000; aircraft 200; airships, 1 small in commission, 1 under construction. (A. R. B.)

NAVY

Japan's geographical position, analogous as it is to Great Britain as an island outpost of a great continent, inevitably caused her to evolve into a sea power of very considerable importance; but, unlike Britain, the people of Japan were slow to appreciate the importance, in fact the vital necessity, for a fleet. In consequence, she suffered severely at the hands of a more enterprising neighbour when, in the 13th century, a Mongol fleet came to Kiūshiū and found her with no warcraft capable of opposing the invaders. Again, at the close of the 16th century, military operations in Korea were brought to an untimely end through the defeat of Japan's weak forces afloat by Korean war-junks. It was not as if, at this time, the Japanese were without models for sizeable ships, for the waters of the Far East, in the second half of the 16th century, were visited by the great galleons of Spain, Portugal, Holland and England.

In the early part of the 17th century, however, Japan first called in foreign aid to assist her in shipbuilding in the shape of a castaway English pilot, one Will Adams, under whose supervision two ships were built to the order of Iyeyasu; but a severe

check to her maritime ambitions was received when, in 1636, an edict was issued vetoing the construction of seagoing vessels as part of the Tokugawa policy of isolation.

Modern Beginnings.—It was not until over 200 years later that a naval policy was initiated, and it was to the Dutch that Japan then went for assistance. In 1855 a seaman's training station was opened at Nagasaki with Dutch instructors. At the same place a building slip was constructed and an iron factory established. A naval school was organised at Tsukiji in Yedo, and the Dutch presented a small warship, the "Kwanko Maru," for training cadets. Two other vessels were purchased from the Dutch in 1857 and 1858, and these, with a third given by Queen Victoria, formed the nucleus of Japan's Navy.

The dockyard at Yokosuka was planned and its construction supervised by Monsieur Betin, a Frenchman, but it was not long before the shōguns (government) sought British naval assistance, and Captain Tracey R.N., with a small mission of naval officers, was engaged to run the school at Tsukiji. Unfortunately they arrived just as the Tokugawa shogunate fell and the new administration did not desire their services. Eventually, however, such fleet as Japan possessed was taken over by the Imperial government and in 1873 the British government, by request, sent out a second and much larger naval mission under Commander (afterwards Admiral Sir) Archibald Douglas. The Japanese navy in embryo had already had some experience when in 1868 a naval force was sent to Yezo to attack a revolutionary squadron. In 1874 a fleet of transports was convoyed to Formosa and in 1877 the navy took part in crushing a serious rebellion at Satsuma. With the aid of Commander Douglas and his assistants the Japanese navy steadily improved and increased.

The first steam warship constructed in Japan was a gunboat of 388 tons, launched in 1866 from a building yard at Ishikawajima on the island at the mouth of the Sumida river on which Tokyo stands. Two larger vessels of 897 tons and 1,450 tons respectively followed in 1875 and 1876. Japan acquired her first ironclad from England in 1878. This was the "Fusō," a ship of 3,717 tons. Then came the "Kongo" and "Hiei," steel-framed cruisers of 2,248 tons. In 1878 the Japanese flag was seen for the first time in European waters, when the cruiser "Seiki" (1,897 tons), built in Japan and navigated solely by Japanese, appeared there. In 1882 a programme of construction of 30 cruisers and 12 torpedo boats was approved, and in 1886 this was extended, funds being obtained by issuing naval loan-bonds. It was not until 1892, however, that political opposition was overcome and money was voted for the construction of two battleships. These latter, however, were not available at the outbreak of war with China in 1894. On paper Japan's naval position gave cause for considerable anxiety. She could only muster 28 fighting craft with an aggregate of 57,800 tons and 24 torpedo boats, the most powerful of the former being a belted cruiser of 4,300 tons, whereas China had two ironclads of nearly 8,000 tons each. Nevertheless the superior training and leadership of the Japanese navy stood them in good stead and the Chinese were severely defeated off the Yalu and at Wei Hai Wei (*see* CHINO-JAPANESE WAR).

Superiority in Orient Attained.—From now onwards the fleet was rapidly augmented with battleships and cruisers, mostly built in England, so that when the Russo-Japanese War (*q.v.*) came, Japan was able to assert her sea superiority in no unmis-takable fashion. The Japanese fleet and army together made Port Arthur practically untenable as a Russian naval base and combined to bring about its downfall, while the war at sea ended in the crushing defeat of the Russian naval forces at Tsushima. As the outcome of this war the Japanese naval authorities set out to acquire a fleet consisting of eight battleships, eight battle-cruisers and the necessary complement of auxiliary vessels, but the World War intervened before this standard was reached.

Meanwhile naval conditions in the Pacific had undergone considerable change. Great Britain had withdrawn practically the whole of her battleships from eastern waters, and an Anglo-Japanese alliance had been formed and was relied on to preserve the status quo in that ocean. The United States on the other hand

had gradually attained a more prominent position in the Far East. In her desire to preserve the balance of power, it was rather to her trans-Pacific neighbour than to her ally on the opposite side of the world that Japan turned a critical eye in reviewing the naval position. In 1917 the Imperial Diet formally approved, in principle, the "eight eight" policy in capital ships.

The World War and After.—Japan entered the World War in August 1914, when the strength of her fleet was as follows:—

Battleships	16 (+6 building)
Cruisers, Armoured { 12 in. gun ships	4
{ Older ships	9
" Light	14
Destroyers	54 (+2 building)
Torpedo boats	55
Submarines	15 (+2 building)

The Japanese fleet co-operated with the Allied naval forces in the considerable combined operations against Tsingtau, which surrendered on Nov. 7, 1914. Japanese ships throughout the war also assisted the Allies in escort work in the Pacific and Mediterranean. Her losses consisted of one battleship, the "Kawachi" and one battle-cruiser, the "Tsukuba," both destroyed by internal explosion; two light cruisers and one destroyer wrecked; one old coast defence ship torpedoed, and one torpedo boat mined.

After the war, Japan, in company with other of the great Powers, found herself faced with the expense of considerable naval construction if she was to hold her own in the arena of naval affairs, whilst financial stringency made itself more and more felt. Relief came in the shape of the Washington Treaty (*q.v.*). As the result of this Japan accepted a ratio of three as against five for Great Britain and the United States in capital ship tonnage, with the result that four old battleships, two old battle-cruisers and four capital ships building were broken up. Two more battleships were sunk, one converted to a target ship and two others to aircraft carriers. The Japanese fleet of 1928 consisted of:—6 Battleships, 4 Battle-cruisers, 35 Cruisers, plus 6 building, 3 Cruiser minelayers, 4 Aircraft carriers, plus one building, 114 Destroyers, plus 12 building, 65 submarines, plus 12 building, 5 Gunboats and despatch vessels, 8 River gunboats, 4 Mine-sweepers, plus 2 building.

Administration.—The Japanese Navy is administered by a Minister, who is an Admiral, and one parliamentary and one permanent Vice-Minister (a Vice-Admiral). The bureaux of the Japanese Admiralty are divided into personnel, supplies, construction, education, engineering, medical, finance, law, technical board, and geographical. There is an Admiral's council consisting of five members. The naval staff board consists of two Admirals.

Naval Commands.—The coast of Japan is divided into three naval districts, each having its naval port, *i.e.*, Yokosuka, Sasebo and Kure. At each of these ports there is an arsenal, marine corps and the general equipment of a naval base. There are the "strategic ports" Maizuru, Ominato and Chinhaï (Korea). There are also private shipyards approved for naval use. These latter include the Mitsubishi shipyard at Nagasaki, Kawasaki shipyard at Kobe and six others. The first two are capable of building the largest type of warships.

Personnel.—The executive officers, engineers and paymasters are trained respectively at a naval academy, engineering academy and paymasters' school. Other non-combatant officers, such as surgeons, pharmacists, hydrographers and construction officers are appointed from candidates who would otherwise be graduates of universities or other schools of similar standing. Warrant officers promoted from the lower deck are eligible for commissions and may rise to the rank of lieutenant commander or even higher. The ships' companies are composed of volunteers supplemented by conscription, in the proportion of approximately half and half.

Naval Air Service.—The navy has its own air service with shore bases at Yokosuka, Kosumigaura and Sasebo, to which is to be added one at Omura. When the approved programme is completed the navy will have seventeen fleets (flights) with 136 aeroplanes. A small semi-rigid airship is being built to replace the "N3" which was lost in a gale in 1927.

(E. A.)

EDUCATION

There is no room to doubt that the literature and learning of China and Korea were transported to Japan in very ancient times, but tradition is the sole authority for current statements that in the 3rd century a Korean immigrant was appointed historiographer to the Imperial court of Japan and another learned man from the same country introduced the Japanese to the treasures of Chinese literature. About the end of the 6th century the Japanese court began to send civilians and religionists direct to China, there to study Confucianism and Buddhism, and among these travellers there were some who passed as much as 25 or 30 years beyond the sea. The knowledge acquired by these students was crystallized into a body of laws and ordinances based on the administrative and legal systems of the Sui dynasty in China, and in the middle of the 7th century the first Japanese school seems to have been established by the emperor Tenchi, followed some 50 years later by the first university. Nara was the site of the latter, and the subjects of study were ethics, law, history and mathematics.

Not until 794, the date of the transfer of the capital to Kyōto, however, is there any evidence of educational organization on a considerable scale. A university was then opened in the capital, with affiliated colleges; and local schools were built and endowed by noble families, to whose scions admittance was restricted; but for general education one institution only appears to have been provided. In this Kyōto university the curriculum included the Chinese classics, calligraphy, history, law, etiquette, arithmetic and composition; while in the affiliated colleges special subjects were taught, as medicine, herbalism, acupuncture, shampooing, divination, the almanac and languages. Admission was limited to youths of high social grade; the students aggregated some 400, from 13 to 16 years of age; the faculty included professors and teachers, who were known by the same titles (*hakase* and *shi*) as those applied to their successors to-day; and the government supplied food and clothing as well as books. The family schools numbered five, and their patrons were the Wage, the Fujiwara, the Tachibana (one school each) and the Minamoto (two). At the one institution—opened in 828—where youths in general might receive instruction, the course embraced only calligraphy and the precepts of Buddhism and Confucianism. Great academic importance attached to proficiency in literary composition, which demanded close study of the ideographic script, endlessly perplexing in form and infinitely delicate in sense. To be able to compose and indite graceful couplets constituted a passport to high office as well as to the favour of great ladies, for women vied with men in this accomplishment. But it is to be observed that all this refinement was limited virtually to the noble families residing in Kyōto, and that the first object of education in that era was to fit men for office and for society.

Education in the Middle Ages.—Meanwhile, beyond the precincts of the capital there were fast growing to maturity numerous powerful military magnates who despised every form of learning that did not contribute to martial excellence. An illiterate era ensued which reached its climax with the establishment of feudalism at the close of the 12th century. It is recorded that, about that time, only one man out of a force of five thousand could decipher an Imperial mandate addressed to them. Kama-kura, then the seat of feudal government, was at first distinguished for absence of all intellectual training; but subsequently the course of political events brought thither from Kyōto a number of court nobles whose erudition and refinement acted as a potent leaven. Buddhism, too, had been from the outset a strong educating influence. Under its auspices the first great public library was established (1270) at the temple Shōmyō-ji in Kanazawa. It is said to have contained practically all the Chinese and Japanese books then existing, and they were open for perusal by every class of reader. To Buddhist priests, also, Japan owed during many years all the machinery she possessed for popular education. They organized schools at the temples scattered about in almost every part of the empire, and at these *tera-koya*, as they were called, lessons in ethics, calligraphy, reading and etiquette were given to the sons of samurai and even to youths of the mer-

cantile and manufacturing classes.

Education in the Pre-Meiji Era.—When, at the beginning of the 17th century, administrative supremacy fell into the hands of the Tokugawa, the illustrious founder of that dynasty of shōguns, Iyeyasu, showed himself an earnest promoter of erudition. He employed a number of priests to make copies of Chinese and Japanese books; he patronized men of learning and he endowed schools. It does not appear to have occurred to him, however, that the spread of knowledge was hampered by a restriction which, emanating originally from the Imperial court in Kyōto, forbade any one outside the ranks of the Buddhist priesthood to become a public teacher. To his fifth successor Tsunayoshi (1680–1709) was reserved the honour of abolishing this veto. Tsunayoshi, whatever his faults, was profoundly attached to literature. By his command a pocket edition of the Chinese classics was prepared, and the example he himself set in reading and expounding rare books to audiences of feudatories and their vassals produced something like a mania for erudition, so that feudal chiefs competed in engaging teachers and founding schools. The eighth shōgun, Yoshimūnē (1716–1749), was an even more enlightened ruler. He caused a geography to be compiled and an astronomical observatory to be constructed; he revoked the veto on the study of foreign books; he conceived and carried out the idea of imparting moral education through the medium of calligraphy by preparing ethical primers whose precepts were embodied in the head-lines of copy-books, and he encouraged private schools. Iyenari (1787–1838), the eleventh shōgun, and his immediate successor, Iyeyoshi (1838–1853), patronized learning no less ardently, and it was under the auspices of the latter that Japan acquired her five classics, the primers of *True Words*, of *Great Learning*, of *Lesser Learning*, of *Female Ethics* and of *Women's Filial Piety*.

Thus it may be said that the system of education progressed steadily throughout the Tokugawa era. From the days of Tsunayoshi the number of fief schools steadily increased, and as students were admitted free of all charges, a duty of grateful fealty as well as the impulse of interfief competition drew thither the sons of all samurai. Ultimately the number of such schools rose to over 240, and being supported entirely at the expense of the feudal chiefs, they did no little honour to the spirit of the era. From 7 to 15 years of age lads attended as day scholars, being thereafter admitted as boarders, and twice a year examinations were held in the presence of high officials of the fief. There were also several private schools where the curriculum consisted chiefly of moral philosophy, and there were many temple schools, where ethics, calligraphy, arithmetic, etiquette and, sometimes, commercial matters were taught. A prominent feature of the system was the bond of reverential affection uniting teacher and student. Before entering school a boy was conducted by his father or elder brother to the home of his future teacher, and there the visitors, kneeling before the teacher, pledged themselves to obey him in all things and to submit unquestioningly to any discipline he might impose. Thus the teacher came to be regarded as a parent, and the veneration paid to him was embodied in a precept: "Let not the pupil tread within three feet of his teacher's shadow." It may be remarked here that this wholesome spirit of respect can hardly be said to exist to-day.

Unfortunately, however, the policy of national seclusion prevented for a long time all access to the stores of European knowledge. Not until the beginning of the 18th century did any authorized account of the great world of the West pass into the hands of the people. A celebrated scholar (Arai Hakuseki) then compiled two works—*Saiyō kibun* (*Record of Occidental Hearsay*), and *Sairan igen* (*Renderings of Foreign Languages*)—which embodied much information, obtained from Dutch sources, about Europe, its conditions and its customs. But of course the light thus furnished had very restricted influence. It was not extinguished, however. Thenceforth men's interest centred more and more on the astronomical, geographical and medical sciences of the West, though such subjects were not included in academical studies until the renewal of foreign intercourse in modern times. Then (1857), almost immediately, the nation turned to Western

learning, as it had turned to Chinese thirteen centuries earlier. The Tokugawa government established in Yedo an institution called *Bansho-shirabe-dokoro* (place for studying foreign books), where Occidental languages were learned and Occidental works translated. Simultaneously a school for acquiring foreign medical art (*Seiyo igaku-sho*) was opened, and, a little later (1862), the *Kaisei-jo* (place of liberal culture), a college for studying European sciences, was added to the list of new institutions. Thus the eve of the Restoration saw the Japanese people already appreciative of the stores of learning rendered accessible to them by contact with the Occident. Commercial education was comparatively neglected in the schools. Sons of merchants occasionally attended the *tera-koya*, but the instruction they received there had seldom any bearing upon the conduct of trade, and mercantile knowledge had to be acquired by a system of apprenticeship.

Education in Modern Japan.—Shortly after the government of the Restoration came into power, the Emperor solemnly announced that "henceforward education shall be so diffused that there may not be a village with an ignorant family nor a family with an ignorant member." But so long as the feudal system survived, even in part, no general scheme of education could be thoroughly enforced, and thus it was not until the conversion of the fiefs into prefectures in 1871 that the government saw itself in a position to take drastic steps. A commission of investigation was sent to Europe and America, and on its return a very elaborate and extensive plan was drawn up in accordance with French models, which the commissioners had found conspicuously complete and symmetrical. This plan subsequently underwent great modifications. It will be sufficient to say that in consideration of the free education hitherto provided by the feudatories in their various fiefs, the government of the restoration resolved not only that the state should henceforth shoulder the main part of this burden, but also that the benefits of the system should be extended equally to all classes of the population, and that the attendance at primary schools should be compulsory. At the outset the sum to be paid by the treasury was fixed at 2,000,000 yen, that having been approximately the expenditure incurred by the feudatories. But the financial arrangements suffered many changes from time to time, and finally, in 1877, the cost of maintaining the schools became a charge on the local taxes, the central treasury granting only sums in aid. These grants now amount to four million pounds sterling annually; but the sums spent on account of education by the various provincial and communal treasuries in 1923 were close to thirty-five millions.

Every child, on attaining the age of six, must attend a common elementary school, where, during a six years' course, instruction is given in morals, reading, arithmetic, the rudiments of technical work, gymnastics and poetry. Year by year the attendance at these schools has increased. Thus, whereas in the year 1900, only 81.67% of the school-age children of both sexes received the prescribed elementary instruction, the figure in 1905 was 94.93%. Now there is practically no illiteracy. The desire for instruction used to be keener among boys than among girls, as was natural in view of the difference of inducement; but ultimately this discrepancy disappeared almost completely. Thus, whereas the percentage of girls attending school was 75.90 in 1900, it rose to 91.46 in 1905, and the corresponding figures for boys were 90.55 and 97.10 respectively. In 1924 the number of boys attending elementary schools was a little over 4,800,000 and of girls 4,300,000; so that now the proportion is almost the same in both sexes. The tuition fee paid at a common elementary school in the rural districts must not exceed 5s. yearly, and in the urban districts, 10s.; but in practice it is much smaller, for these elementary schools form part of the communal system, and such portion of their expenses as is not covered by tuition fees, income from school property and miscellaneous sources, must be defrayed out of the proceeds of local taxation. Including public and private institutions there were in 1924 altogether 8,708 ordinary elementary schools with 183 higher elementary schools, and 16,571 combined ordinary and higher, that is to say schools classed as elementary but having sections where, subsequently to the completion of the regular curriculum, a special supplementary course of study might be

pursued in agriculture, commerce or industry (needle-work in the case of girls). The time devoted to these special courses is two or three years, according to the degree of proficiency contemplated, and the maximum fees are 15d. per month in urban districts and one-half of that amount in rural districts.

There were also in 1924 801 kindergartens, with an attendance of 66,687 infants of ages varying from 3 to 7. In general the kindergartens are connected with elementary schools or with normal schools.

If a child, after graduation at a common elementary school, desires to extend its education, it passes into a common middle school, where training is given for practical pursuits or for admission to higher educational institutions. The ordinary curriculum at a common middle school includes moral philosophy, English language, history, geography, mathematics, natural history, natural philosophy, chemistry, drawing and the Japanese language. Five years are required to graduate, and from the fourth year the student may take up a special technical course as well as the main course; or, in accordance with local requirements, technical subjects may be taught conjointly with the regular curriculum throughout the whole time. The law provides that there must be at least one common middle school in each prefecture. The actual number in 1924 was 491.

Great inducements attract attendance at a common middle school. Not only does the graduation certificate carry considerable weight as a general qualification, but it also entitles a young man to volunteer for one year's service with the colours, thus escaping one of the two years he would have to serve as an ordinary conscript. Demand is, however, far short of supply, and so great is the number of applicants for admission that candidates are obliged to undergo a competitive examination for entry. It is said that only about 10% of the qualified applicants succeed in getting in. The maximum number of boys in a middle school is at present 800; but this is to be increased to 1,200.

The graduate of a common middle school can claim admittance, without examination, to a high school, where he spends three years preparing to pass to a university, or four years studying a special subject, as law, engineering or medicine. By following the course in a high school, a youth obtains exemption from conscription until the age of 28, when one year as a volunteer will free him from all service with the colours. A high-school certificate of graduation entitles its holder to enter a university without examination, and qualifies him for all public posts; 28 of these schools were in existence in 1924 with an attendance of 15,343 pupils. The complete course covers seven years—four for the ordinary course and three for the higher.

For girls also high schools are provided, the object being to give a general education of higher standard. Candidates for admission must be over 12 years of age, and must have completed the second-year course of a higher elementary school. The regular course of study requires four years, and supplementary courses as well as special art courses may be taken. There were 746 of these schools (including private) in 1924, with 271,375 pupils.

In addition to the schools already enumerated, which may be said to constitute the machinery of general education, there are special schools, generally private, and a considerable number of commercial and technical schools (including a few private), where instruction is given in medicine and surgery, agriculture, commerce, mechanics, applied chemistry, navigation, electrical engineering, art (pictorial and applied), veterinary science, sericulture and various other branches of industry. There are also apprentices' schools, classed under the heading of elementary, where a course of not less than six months, and not more than four years, may be taken in dyeing and weaving, embroidery, the making of artificial flowers, tobacco manufacture, sericulture, reeling silk, pottery, lacquer, woodwork, metal-work or brewing. There are also schools—nearly all supported by private enterprise—for the blind and the dumb.

Normal and higher normal schools are maintained for the purpose of training teachers, a class of persons not plentiful in Japan, doubtless because of an exceptionally low scale of emoluments. The number of these institutions in 1924 was 98.

There are six Imperial Universities,—in Tōkyō, Kyōto, Sendai, Fukuoka, Sapporo, and Seoul (Korea). The most important is that in Tōkyō, with a faculty of 598 professors and lecturers and with over 7,000 students. Its colleges number seven: law, medicine, engineering, literature, science, agriculture and economics. It has a university hall where post-graduate courses are studied, and it publishes a quarterly journal giving accounts of scientific researches, which indicate not only large erudition, but also original talent. The University of Kyōto is a comparatively new institution. It has the same number of colleges as the Tōkyō University; but its teaching staff numbers only 374 and the students number only a little over 4,000. The remaining Imperial Universities are much smaller. There are in addition four government and four prefectural universities at which medical degrees only are given; there is a University of Commerce in Tōkyō; and there are 16 private universities which enjoy the same status as similar government institutions. Of these the most famous are the Keio University, founded by the late W. Fukugawa, and the Waseda University, the patron of which was Marquis Okuma.

By a reform effected in 1916 public and private schools are given practically the same status; but notwithstanding this the latter are still in a somewhat disadvantageous position because unless a private school brings its curriculum into exact accord with that prescribed for public institutions of corresponding grade, its students are denied the valuable privilege of partial exemption from conscription, as well as other advantages attaching to state recognition.

Public education in Japan is strictly secular: no religious teaching of any kind is permitted in the schools. The total number of libraries publicly or privately owned in 1926 was 3,904. Of these the most important is that of the Imperial University of Tōkyō. This was unfortunately totally destroyed in the earthquake of 1923, but is now in course of rapid restoration.

Owing to the disproportion between the number of persons anxious to enter educational institutions and the accommodation which those institutions are at present able to provide, entrance into practically all public schools or colleges, from the secondary schools upwards, is now a matter of competitive examination, in which the candidates are greatly in excess of the vacancies. The large majority of competitors therefore cannot possibly hope to be successful, although theoretically the certificates they may possess entitle them to admission into the school or college in question without examination. They are in consequence obliged to shift for themselves as best they can. For instance, the proportion of successful candidates in 1926 for admission into the Technical and Mining schools was 46%, into the Agricultural, Forestry and Sericultural schools 37%, and into the Higher Commercial schools 48%. In the case of the High schools, out of 25,012 candidates in 1925 only 2,538 were successful in obtaining admission.

RELIGION

Shintō.—The primitive religion of Japan is known by the name of Shintō, which signifies "the way of the Gods," but this term is of comparatively modern application. The term Shintō being obviously of Chinese origin and acquaintance with the Chinese language in Japan having preceded the arrival of Buddhism by only a century, it is reasonable to conclude that the primitive religion of Japan had no name, and that it did not begin to be called Shintō until Buddhism had entered the field. Shintō was ultimately practically absorbed into Buddhism, a fate which would probably have been inevitable in any circumstances, for a religion without a theory as to a future state and without any code of moral duties could scarcely hope to survive contact with a faith so well equipped as Buddhism in these respects. But though absorbed it was not obliterated. Its beliefs survived; its shrines survived; its festivals survived, and something of its rites survived also.

Shintō, indeed, may be said to be entwined about the roots of Japan's national existence. Its scripture—as the *Kojiki* must be considered—resembles the Bible in that both begin with the cosmogony. But it represents the gods as peopling the newly created earth with their own offspring instead of with human beings

IRON AND STEEL WORKS, HYDRO-ELECTRIC AND SHIPBUILDING PLANTS IN JAPAN

1. Hydraulic press forging a large steel ingot, Muroran works
2. View of two converters in Yawata steel works; converter at left is being emptied at the end of the "blow" or steel-making process
3. Large hydro-electric plant at Shinetsu, showing generating plant (below) and flumes or conduits leading up the mountainside to reservoirs from which the water supply is obtained for the plant
4. An ocean liner almost completed in Mitsubishi dockyard, Nagasaki
5. A modern blast furnace in the government iron foundry at Yawata; inclined skip hoist carries coke and ore to furnace
6. Battery of four blast furnaces at Yawata works (see fig. 5)
7. Large castings (right) and some small steel forgings (foreground) in the foundry of the great iron and steel works at Osaka

expressly made for the purpose. The actual work of creation was done by a male deity, Izanagi, and a female deity, Izanami. From the right eye of the former was born Amaterasu, who became goddess of the sun; from his left eye, the god of the moon; and from his nose, a species of Lucifer. The grandson of the sun goddess was the first sovereign of Japan, and his descendants have ruled the land in unbroken succession ever since, the 123rd ascending the throne in 1928. Thus it is to Amaterasu (the heaven-illuminating goddess) that the Japanese pay reverence above all other deities, and it is to her shrine at Ise that pilgrims chiefly flock.

"Shintō," to quote Sir Charles Eliot, "makes no appeal to reason or emotion . . . it has no moral code; its prayers and sacrifices aim at obtaining temporal prosperity and indicate no desire for moral or spiritual blessings. Yet these strange lacunae are somehow filled by its intensely patriotic spirit. For it Japan is the land of the Gods; the greater preside over the Empire, the lesser over towns and hamlets; the noble or humble dead have their due place in the cult of the state, city, or family." It regards human nature as naturally virtuous, and while believing in an existence after death, holds no theory as to its pleasures or pains. The dead become disembodied spirits and possess power to bring sorrow or joy into the lives of their survivors, which is why they were first worshipped or propitiated. Purity and simplicity being essential characteristics of the cult, its shrines are built of white wood, entirely without ornament and fashioned on the model of the dwellings of the first Japanese settlers. There are no images—a fact attributed by some critics to ignorance of the glyptic art on the part of the original worshippers—but there is an emblem of the deity, which generally takes the form of a sword, a mirror, or a so-called jewel (*magatama*), these being the insignia handed by the sun-goddess to her grandson, the first ruler of Japan. The emblem is not exposed to public view. The mirror sometimes seen in temples is a Buddhist innovation and has nothing to do with the true emblem of the creed. Worship takes the form of offerings and the recital of rituals (*norito*). Twenty-seven of the latter were reduced to writing and embodied many centuries ago in the *Engishiki*. Couched in antique language, these liturgies are designed for the dedication of shrines, the averting of evil, for entreating blessings on the harvest, for purification, for obtaining household security, for bespeaking protection on a journey, and so forth. But they contain no reference to a future state of reward or punishment or to assistance in the path of virtue. One ceremonial only is designed to avert the consequences of sin or crime; this is the rite of purification, which, by washing with water and by the sacrifice of valuables, removes the pollution resulting from wrong-doing. Originally performed on behalf of individuals, this *ōbarai* (great driving away) ultimately came to be a semi-annual ceremony for sweeping away the sins of all the people. The adherents of Shintō numbered 16,038,437 in 1927.

Buddhism.—Buddhism reached Japan from China by way of Korea in A.D. 552, when the King of Pakché sent the Emperor of Japan an image of the Buddha with several sūtras and a letter in which he extolled Buddhism as the most excellent of doctrines. Hostility to the new creed was manifested by some of the Shintō court officials, and its arrival was unluckily followed by an outbreak of pestilence, the result being that the reception accorded to it at first was not encouraging. Nevertheless after some vicissitudes it succeeded in obtaining a foothold of a kind; but it was not till the Prince-Regent Shōtoku Taishi (572–621) appeared upon the scene that its position became really secure. This brilliant statesman, warrior and scholar was throughout his life its ardent supporter, and laboured to such effect on its behalf that when he died it was more than strong enough to stand alone. The struggle between it and Shintō persisted for a number of years, but was ultimately composed towards the end of the century by means of a compromise by which the Shintō deities were recognized as Bodhisattvas and their shrines handed over to the custody of the Buddhist priesthood. In this manner Buddhism became practically the established church of the land. Thenceforward its history was one

of steadily growing influence and power. There can be no doubt that in the earlier stages of its history in Japan it exercised a powerful civilizing influence over a nation then admittedly in a state of barbarism. Much of the best in the literature and art of the Nara and later periods is due to the inspiration of Buddhism or was the work of Buddhist priests themselves, and even in the darkest days of the Ashikaga regency art and literature still found a home within the monastery walls. But as the influence and the power of the Buddhist church increased its aims became more and more temporal. It began to interfere in political affairs; its abbots built in and around the capital or in the provinces great monasteries such as Hieiizan, Kōyasan, Miidera and others and filled them with armed monks; its prelates were involved in intrigues about the throne (it is possible that the removal of the capital from Nara to Kyōto may have been due to imperial fear of priestly statecraft); it even made attempts to establish direct ecclesiastical control over the state. The various sects too began to quarrel among themselves and were as ready to appeal to the arbitrament of arms as the warring factions outside. It was at this stage of Japanese history that the sovereign began to lose his hold of the reins of state and to become the shadowy figure he was fated to remain till the Restoration of 1868. As a result the control of affairs passed into the hands of a succession of powerful families of regents or of soldiers of fortune, and, save for a brief interval of peace in the Ashikaga regency, the country was for nearly two hundred years in a state of continual civil war. Rival houses strove for the reins of government in the capital; in the provinces the territorial nobility were a law to themselves; the common people suffered untold miseries. Into this welter of strife the Buddhist priesthood plunged readily. Monastery fought monastery; sect fought sect; while the monks of Hieiizan and other priestly strongholds trooped down so often in their thousands to overawe the capital that the Emperor Shirakawa once exclaimed: "Three things there are which I cannot control,—the river Kamo in flood, the fall of the dice, and the monks of Hieiizan." On the other hand it was in this black period that the Jōdo and other reforming sects made their appearance. Buddhism reached the zenith of its power and influence in the years following the Mongol invasions (1275 and 1281), in the defeat of which the prayers of its priesthood were believed to have been mainly instrumental; its political eclipse dates from the rise to power of Nobunaga and Hideyoshi, which synchronized with the introduction of Christianity by the Portuguese missionaries. Nobunaga hated and feared the Buddhist church, and was resolved to humble it. For this reason and because he hoped to use Christianity as a counterpoise, he encouraged the new religion; simultaneously he had recourse to arms to enforce his will. In the prolonged struggle which ensued he was ultimately successful. Hieiizan and its three thousand monasteries were utterly destroyed, the greater part of the inmates massacred, and the rest driven into exile. A similar fate befell other priestly strongholds. From these blows the monasteries never recovered, while the church itself never regained its political influence. But for the folly of the missionaries themselves in indulging in political intrigue and for the intemperance of their attacks on the adherents of the native religion it is possible that Buddhism might have been completely annihilated; their actions however drew on them the suspicions of the regents, and eventually the missionaries themselves were banished or put to death and the Christian faith proscribed under the severest penalties. The political power of Buddhism being effectively destroyed, the next line of regents, the Tokugawa, could afford to regard it with friendly eyes. Iyeyasu, the first of his line, was a member of the Jōdo sect, Iyemitsu, the second regent, was a staunch supporter of Buddhism, and Tsunayoshi, the fifth, was almost a fanatic. Its position too was assured by a decree in 1614 which obliged everyone to become a parishioner of the temple of the district in which he lived, to be entered on its registers, and to be buried according to its rites. It could reckon also on the solid and generous piety of the merchant and farming classes, a constant mainstay through all vicissitudes. Therefore although the church was shorn of political power the outlook was by no means hopeless. But from the 17th century

onwards it had new foes to meet,—the hostile influences of Confucianism and of the Shintō revival, the one pseudo-religious, the other political; and in the long struggle which ensued Shintoism ultimately triumphed. In 1868, when the Restoration took place, the Buddhist church was disestablished and partly disendowed and Shintō declared the state religion. Buddhist emblems were removed from the Ryōbu-Shintō temples and from the palace, the temples themselves were handed over to Shintō priests, and Buddhist monks were forbidden to beg for alms. Thenceforward till 1875 the Government was openly hostile to Buddhism. Nevertheless it still remained a living force. But from 1875 onwards this hostility gradually relaxed, and, finally, in 1884, when freedom of religious belief was granted to all, the restrictions placed upon it were entirely removed. Since then popular interest in Buddhism has revived, and at the present moment its temples and shrines number over 71,000, its priesthood about 54,000, and its adherents nearly 46 millions.

Japanese Buddhism is sometimes defined as a form of Mahayana; but this definition is, in the opinion of Sir Charles Eliot, inadequate. "Whatever its pedigree may be," he says, "whatever the doctrines it accepts in theory, its various phases, not only to-day but in some thousand odd years of history, smack of the soil." "Its most salient feature," he adds, "is its intimate connection in all periods with the general condition of the nation, both political and social."

Buddhist Sects.—There are at present 12 recognized Buddhist sects in Japan,—the Hossō, Kegon, Tendai, Shingon, Yūzū-Nembutsu, Jōdo, Rinzaï, Sodo, Obaku, Shin, Nichiren, and the Ji. The first eight are old and imported from China; the last four came into existence at the end of the 12th century and were all remodelled, if not actually created, in Japan. The Tendai, which was introduced by Dengyō-Daishi, and the Shingon, which was introduced by that most celebrated of Japanese saints and hero of countless legends, Kōbō-Daishi, are closely connected and came to Japan almost simultaneously. They had their centres in the two great monasteries of Hieiizan and Kōyasan, which have already been referred to above. Their theology is somewhat abstruse. The former preaches that all known forms of Buddhism are phases of true doctrine but that the Lotus Sūtra is its crown and quintessence; the latter is the Mantrayāna, a late form of Indian Buddhism which was carried to China, Japan and Thibet. But their rich mythology appeals to the popular taste. Their combined priesthoods number at present about ten thousand and their adherents five million. Of the last four sects mentioned above the oldest is the Jōdo; but this was overshadowed by the later Jōdo-Shinshū, or Shin, which claims to present the Jōdo teaching in a simpler form. The main doctrine of both is that by faith in Amida (Amitabha) the believer, when he dies, enters the Paradise of the West, or as it is known in the Far East, Jōdo (the pure land). It is in fact the doctrine of faith not works. The founder of the Jōdo sect was Genku (Hōnen-Shōnin) and of the Jōdo Shinshū his disciple, Shinran Shōnin. This sect is marked by a distinctly popular and progressive spirit and by the fact that its priests are allowed to marry, a privilege which in the middle ages resulted in its hierarchy becoming hereditary and practically feudal barons. The Nichiren sect was founded in the 13th century by the priest of that name. There are two salient features in the doctrines preached by Nichiren. The first is his identification of religion with the national life, the second is his protest against the worship of Amitabha. Nichiren divided the history of Buddhism into three millenniums, the last of which he called Mappō (the period of the destruction of the law), a dark age full of trouble in both the political and the religious world. Salvation from this was to be found in the teaching of the Lotus sūtra, concentrated in the invocation "Nammyō-hō rengēkyō" (Reverence to the sūtra of the Lotus of the Good Law), and the essence of the teaching itself is that Sakyamuni, not as the man but as the eternal omnipresent Buddha mind, is one with all reason and all nature. It is therefore not Amitabha but Sakyamuni whom men should worship. The sect, like its founder, has always been noted for its aggressiveness and intolerance. The Rinzaï, Sōdō, and Obaku sects are subdivisions of the Zen sect,

which was introduced into Japan in the twelfth century. The Zen rejects scripture as a medium for communicating truth and prescribes meditation as a substitute for revelation. It met with little success when first introduced into Japan, but ultimately became the creed of the military caste, probably because of its insistence on simplicity of life, discipline of mind and body, and concentration of thought. It is still very influential, and its influence on art has been deep and enduring. (The above section is based on information contained in a manuscript lent by Sir Charles Eliot.)

Christianity in Modern Japan.—The story of the first Christian missionaries to Japan is told elsewhere. Their work suffered an interruption for more than 200 years until, in 1858, almost simultaneously with the conclusion of the treaties, a small band of Catholic fathers entered Japan from the Luchu islands, where they had carried on their ministrations since 1846. They found that, in the neighbourhood of Nagasaki, there were some small communities where Christian worship was still carried on. It would seem that these communities had not been subjected to any severe official scrutiny. But the arrival of the fathers revived the old question, and the native Christians, or such of them as refused to apostatize, were removed from their homes and sent into banishment. This was the last example of religious intolerance in Japan. At the instance of the foreign representatives in Tōkyō the exiles were set at liberty in 1873, and from that time complete freedom of conscience existed in fact, though it was not declared by law until the promulgation of the constitution in 1889. The following figures taken from the *Résumé Statistique de l'Empire du Japon*, show the numbers of the clergy, teachers, congregations, and adherents of the various Christian denominations in Japan:—

	Priests, preachers, etc.			Churches, chapels, etc.	Adherents (in 1,000s)
	Japanese	Foreign	Total		
Roman Catholic . . .	61	157	218	193	77
Greek Church . . .	151	1	152	102	74
Presbyterian . . .	303	75	378	271	..
Congregationalist . . .	124	28	152	132	21
Episcopal Church . . .	246	114	360	209	20
Baptist . . .	94	28	122	76	5
Methodist . . .	204	146	440	231	23
Lutheran . . .	16	8	24	19	..
Salvation Army . . .	103	4	107	78	9
Church of Christ . . .	71	30	101	31	31
Other . . .	204	98	302	163	..
Total . . .	1,667	689	2,356	1,505	..

The total number of converts of all denominations is about 220,000. The Roman Catholic Church, which is presided over by an archbishop with five bishops, of whom one is Japanese, resumed its labours in Japan in 1859. In addition to its regular missionaries it is assisted by about a thousand male and female workers belonging to various orders. There are, further, seven male and female orders engaged in charitable and educational work, three entirely Japanese sisterhoods, two leper hospitals, a number of dispensaries, day nurseries, orphanages, schools for children of both sexes, and a university. An Apostolic Delegate is now stationed in Tōkyō. The Greek Church is served entirely by Japanese clergy. Its fine cathedral, once a famous landmark in Tōkyō, was destroyed in the earthquake of 1923. The Episcopal Church was established in 1859 by two American clergymen in Nagasaki and now, in conjunction with the Episcopal Churches of the United States and Canada, it has missions collectively designed as the Nihon Seikōkwai. All the more important Protestant denominations maintain schools, seminaries, and hospitals, and the Congregationalists, Methodists, and Episcopalians have in addition educational establishments which are practically universities,—as, for instance, the Dōshisha, the Aoyama Gakuin, and St. Paul's University at Ikebukuro near Tōkyō. The work carried on by the Salvation Army is much the same in form in Japan as in England,—shelters, rescue homes, social settlements, slum posts, etc. In

addition it publishes a fortnightly paper,—the *Toki no Koe* (War Cry). Other religious associations engaged in Christian propaganda work are the Society of Friends, the American and London Religious Tract Societies, the Young Men's Christian Association, the Young Women's Christian Association, the Japan Women's Christian Temperance Union, etc. The translation of the Old Testament into Japanese was completed in 1879, that of the New Testament in 1876. Japanese Christians concern themselves little with the subtleties of dogma which divide European Christianity, and for this reason there is practically no sectarian strife. Their tendency is to consider only the practical aspects of the faith as a moral and ethical guide, and to adapt the creed to their own requirements. This genius for adaptation has been from the earliest times a marked national characteristic and is not confined to religion only. There is, however, a strong movement among the Protestant bodies in the direction of home-rule in matters of finance and general administration, and it is believed to have been accelerated by the recent anti-Japanese immigration legislation in the United States. Outwardly Christianity makes little progress in Japan; but its doctrines have undoubtedly secured a deep hold on the modern culture of the country. For the Anthropology of Japan see *ASIA, Anthropology and Ethnology (North and East Asia)*. (X.)

HISTORY

The early history of Japan is indistinguishable from mythology and consists of legends collected in the two chronicles called *Kojiki* and *Nihongi* or *Nihonshoki*. Both were composed in the 8th century: the first ends about 500, but the second closes with the year A.D. 697, and the latter portion of it is more or less historical, though the chronology is not trustworthy. The legends contained in these works are so nebulous and disconnected that they cannot be summarized in a coherent narrative but they tell how the land and people of Japan were produced by the Gods among whom the Sun goddess *Amaterasu* and her brother *Susanoo* play a principal part. It is noticeable that in the earliest stories there are two centres. *Susanoo* descends to *Silla* in Korea and sails thence to *Izumo* in Japan where his posterity rule, but the child sent by the Sun goddess to rule Japan descends, after negotiations with the rulers of *Izumo*, to the province of *Hyūga* in *Kyushu*. This confirms the theory, which is probable for other reasons, that the Japanese are a mixed race. The oldest known stratum of population is represented by the *Ainus*, whose bones are said to show some of the characteristics found in European prehistoric skeletons. There is no record, even legendary, of their arrival in Japan, but the evidence of place-names shows that they once occupied the entire country, including *Kyushu*. They were gradually driven to the north by invaders who came partly from Korea, and perhaps ultimately from Central Asia, and partly from the south. Recent discussions tend to emphasize the importance of a Malay-Polynesian element in the Japanese language and customs and the legend also dwells on the activity of the descendants of the Sun goddess who reigned in *Kyushu* rather than on the doings of the rulers of *Izumo*.

According to the chronicles the first human sovereign of Japan was *Jimmu Tennō* who, starting from *Kyushu*, proceeded to conquer the east. He halted on the northern shores of the Inland sea and then, after much fighting, established his rule in the province of *Yamato*, which now becomes the centre of Japan. It is doubtless true that at some period before the Christian era there was a movement of population from the west to *Yamato*, but the details seem entirely legendary. *Jimmu* was not really the ancient name of the leader (*Kami Yamato Ihare-biko*) but a posthumous title invented by scholars in the 8th century, and the date of his accession, February 11, 660 B.C., is a similar invention. But in 1889 the leaders of Japan wished the nation to believe in the continuity of Japanese history and the antiquity of the imperial lineage, and with this object promulgated the new constitution on the supposed date of *Jimmu's* accession and made it a public holiday. In the same spirit they erected in 1890 a mausoleum on the plains of *Yamato* near a tumulus where he is said to have been buried. The chronicles give the names of *Jimmu's* successors, but ascribe to

them impossibly long reigns, and there also appears to be an error in chronology by which the dates are 120 years too remote. Although the record is mainly genealogical it contains points of interest: (1) Women hold an important position and are the heroines of many tales. (2) Irrigation works are mentioned and the Emperor *Suinin* is said to have constructed more than 800 ponds and channels. (3) The imperial harem was large. Thus the *Nihongi*

TENNOJI PAGODA, AT OSAKA, A TYPICAL EXAMPLE OF THE FIVE-STOURED TEMPLE BUILT OF WOOD TO BE RESILIENT TO EARTHQUAKE SHOCKS

tells us that the Emperor *Keikō* gave "fiefs of provinces and districts" to 77 of his children and each child proceeded to his own province. In this way, no doubt, arose the territorial nobility which plays such a conspicuous part in subsequent history. (4) In an edict ascribed to 81 B.C. ships are stated to be of cardinal importance, because of the difficulty of land transport, and every province is ordered to build them. (5) About the time of our era the practice of burying men alive with princes was discontinued and clay figures were substituted. (6) Several expeditions against savages, that is, probably, *Ainus*, are mentioned, the principal being ascribed to *Yamato-takeru*, son of the Emperor *Keikō* and first of the picturesque young heroes of Japan. He subdued first the land of *Kumaso* in *Kyushu* (so called from the *Kuma* and *So*, two tribes which inhabited it) and then successfully attacked the north and east, penetrating as far as *Shimosa* and *Shinano*. But he fell ill and died at the age of 30 on "the moor of *Nobo*," regretting in his last words that he could not report his victories to the emperor. "Alone I lay me down on the waste moor with none to say a word to me. But why should I regret the loss of this body? My only grief is that I cannot meet thee." His son or descendant, *Chūai*, became emperor and sent another expedition against the *Kumaso*, but it was not victorious.

Invasion of Korea.—We now come to an important legend, the conquest of Korea by the Empress *Jingō*, for which the traditional date is A.D. 200. Apparently it did not belong to the *Yamato* cycle, for the *Kojiki* transfers the scene abruptly to *Kyūshū*. The *Nihongi* makes a more coherent though still very strange story by telling how the court removed to *Kyushu* and how the empress, after invading Korea, regained possession of *Yamato* which had revolted during her absence. But it is fairly clear that there were two cycles of legends, one having *Kyushu* the other *Yamato* as its centre. After this period *Yamato* definitely becomes the seat of the emperor and of government. The Empress *Jingō* appears to have been a real person, for the Chinese annals, though they do not mention her name, say that Japan was ruled by a woman at this period. The *Nihongi* recounts how she invaded

Silla, how the neighbouring kings of Koryo (or Koguryo) and Pakche spontaneously tendered submission, and how during many years tributary missions were sent at intervals to Japan and occasionally punitive expeditions despatched to Korea. Whether at this period the Japanese subdued any considerable part of Korea may be doubted, but the Korean annals mention many incursions of Japanese pirates and also the exchange of missions. There must have been considerable intercourse, both peaceful and hostile, between the two countries. In A.D. 284 the Emperor Ōjin summoned from Pakche a learned man called Wang-in, who became tutor of the heir apparent and the ancestor of "the chiefs of writing." Ōjin was succeeded by Nintoku who is one of the romantic figures in Japanese history. The throne remained vacant for three years because he wished his brother to occupy it. The latter refused and at last solved the question by committing suicide. Nintoku made Naniwa, the modern Osaka, his capital. A celebrated story relates how he ascended a tower and looking over his country observed that no smoke was rising from the houses. Inferring that his people were poor and had no rice to cook, he abolished forced labour for three years. His palace fell into disrepair, but "the people had plenty, the praise of his virtues filled the land and the smoke of cooking was also thick." The Nihongi states that in this reign an official named "Kino Tsuno was the first to distinguish the boundaries of provinces and districts and to commit to writing in detail the products of the soil in each locality." We also hear that it became the custom to store ice in ice-houses for use during the summer.

Beginning of History.—The first date given by the Nihongi which is confirmed by external evidence is equivalent to A.D. 461 and the reign of the Emperor Richu, which is reckoned as beginning in A.D. 400, is generally considered to mark the commencement of the historical period. The appearances of deities become less frequent, but the chronology is still confused, but, as few important events are recorded, this defect is not of much moment. The Government is represented as a monarchy inherent in one family of divine descent but with somewhat irregular succession and subject to frequent usurpation. The emperors are generally represented as beneficent and beloved of their subjects, with two exceptions Yuriaku (456-471) and Buretsu (498-506) who are described as monsters of cruelty and injustice. The nobles are called Omi and Muraji, the former apparently claiming divine, that is remote imperial lineage, and the latter content with a merely human pedigree and probably descended from the old nobles of Kyushu and Izumo. At the beginning of each reign a great Omi and a great Muraji were appointed who seem to have corresponded to a chancellor and a commander-in-chief. Besides these there were personages, Kuni-no-Miyakko or chiefs of provinces, who were heads of clans owning the territory in which they resided. There were also numerous corporations called *Be*, such as the *Bes* of the mountain warders, seamen and carpenters. It is not clear how these corporations fitted into the clan system, but they included many immigrants from Korea. The most important feature of the period from A.D. 400-550 is the growth of relations with this country. The chronicles contain many admissions that the Japanese learned from it various arts of life and, on the other hand, if the language used about conquest and tribute is unduly patriotic, it is clear that they had some sort of special sphere in the peninsula. Between the two little kingdoms of Silla (or Shiragi) on the coast facing Japan and Pakche (Kudara) to the west, lay a territory called Imna or Mimana, to the west of the modern Fusan. Here the Japanese had a settlement and we hear from time to time of a Japanese garrison and Japanese governors or perhaps residents, for a king of Imna is also mentioned. The relations of Imna and Pakche were generally friendly but the rulers of Silla were from the Japanese point of view unsatisfactory and insubordinate. With the aid of the northern kingdom of Koryo they invaded Pakche and in 562 they "destroyed the Miyake of Imna."

Introduction of Buddhism.—But meanwhile an event of the utmost importance occurred. A mission from the king of Pakche asking for armed assistance recommended Buddhism to the attention of the emperor of Japan as the religion of the civilized

world, and presented an image of the Buddha and sacred books. This incident is justly selected by historians as marking the introduction of Buddhism and Chinese civilization, for the Japanese Government were confronted with the immediate problem of what to do with the presents, but naturally the ground had been prepared by immigration and intercourse. In 540 we read that the men of Ts'in (China) and Han, etc., were "assembled and enrolled in the registers of population": that the men of Ts'in alone numbered 7,053 houses and that one of them was made director of the Treasury. The emperor and his court were probably not wholly ignorant of Buddhism, and Soga, perhaps the greatest personage in the aristocracy, is represented as asking whether Japan was to be alone among the nations in not worshipping the Buddha. Other councillors objected, but at last it was agreed that the Soga family should worship the image as an experiment. A pestilence which broke out at this time was regarded as a sign of the anger of the native gods and Buddhism was forbidden but, as the pestilence then grew worse, this was with equally good reason interpreted as the anger of the Buddha. As a compromise Buddhism was tolerated as the family cult of the Sogas, but since that family was very much to the fore and rising in importance it became the established church in a few decades. On the death of the Emperor Yomei there was a dispute as to the succession which led to war between the Sogas and their rivals, the Mononobe, opponents of Buddhism who championed the institutions of old Japan. The Sogas were completely victorious and after further dynastic troubles in which the Emperor Sujun was assassinated Soga no Numako's niece, known as the Empress Suiko (593-628), was summoned to the throne in her own right, although there was no lack of male heirs. At the same time Shōtoku Taishi, a son of the Emperor Yōmei who had fought with Soga against the Mononobe, was declared heir apparent and though he did not live to reign himself became one of the best known figures in all Japanese history. He was also called Umayado, or Prince Stable-door, because he was born unexpectedly while his mother was inspecting the imperial stables. He was entrusted with the government from 593 to 621 and when he died, says the Nihongi, the old wept as if they had lost a child, the young as if they had lost a parent. His name is associated with the establishment of Buddhism in Japan and he built the temple of Hōryūji which still exists. He was a lover of art and the greatest scholar of his time, the author of commentaries on several Buddhist scriptures and of a history of his country. But more than this; he seems to have introduced good administration and humane customs into a land which sadly needed them. The Nihongi, speaking of the year 562, observes "at this time between father and child, husband and wife, there was no mutual commiseration." Shōtoku Taishi "prepared for the first time laws." They consist of 17 clauses which are moral maxims rather than legal enactments and are inspired by Confucianism, though Buddhism is held up for admiration as the universal religion. The power of the throne is emphasized, the duties of ministers defined, the provincial authorities are forbidden to levy exactions and forced labour is to be required only at seasonable times. Japan had now official relations with China as well as Korea. In 607 an envoy was sent to the Emperor Yang-Ti of the Sui dynasty and next year a return mission arrived. The two potentates were not quite agreed as to their respective rank, for while the Chinese despatch began "The Emperor greets the sovereign of Wa" (the old name of Japan), the reply said "the emperor of the east respectfully greets the emperor of the west." But there was no doubt that Japan wished to learn from China all that was useful.

The Sogas.—Shōtoku Taishi, as practical ruler of Japan, had maintained good relations with the great Soga family, but after his death their power and arrogance became excessive and provoked the suspicion that they intended to usurp the throne. The story of their downfall is one of the best known episodes in early Japanese history. They had placed on the throne the Empress Kōgyoku, widow of the Emperor Jomei, but Soga no Iruka governed the country and kept almost imperial state. There was at that time a certain young man called Kamatari, who afterwards received the name of Fujiwara and became the founder of that illustrious house. He belonged to the family of Nakatomi, heredi-

tary guardians of the great Shinto shrines and rivals of the Soga. "He was indignant with Soga no Iruka," says the Nihongi, "for breaking down the order of prince and vassal, senior and junior and for cherishing veiled designs on the State." He was offered the post of head of the Shinto religion but refused it and, keeping away from court, entered into a conspiracy with the empress's brother, Prince Karu, and also secured the friendship and assistance of Prince Naka, her son, by his politeness in a game of football. As Soga was always guarded when out of doors it was decided to kill him at court in the presence of the empress. When the critical moment arrived the swordsmen appointed to strike the blow were afraid and Prince Naka himself cut Soga down. He fell at the feet of the empress, who was greatly shocked, but Naka said to her—"He wished to destroy utterly the Heavenly House and subvert the Solar Dignity. Is he to take the place of the Heavenly House?" This ended the pre-eminence of the Soga family. The empress thought it prudent to abdicate. Naka was content to be prince imperial and Karu succeeded her in 645 under the name of Kōtoku.

The Reforms of Taikwa.—He decided that the beginning of his reign should be known as Taikwa, great civilization or development, and the changes he introduced are spoken of as the Reforms of Taikwa. This is the first instance of the use of a *nengō* or year name, which became the regular method for fixing dates in Japan. Instead of using an era which covers many centuries, a special name is given to a few years. In quite modern times this period coincides with an emperor's reign; thus 1904 was the 37th year of Meiji and 1927 the second year of Showa. But formerly any remarkable event was considered a sufficient reason for a new *nengō*. In later Japanese history events are commonly referred to in terms of *nengō*, as for instance the Wars of Ōnin (1467-9), the Code of Kemmu (1334-6), where Ōnin and Kemmu are names not of people or places but of periods. From Taikwa down to the present Showa there have been 247 *nengō*. Kōtoku was not a personality like Shōtoku Taishi, but he was assisted by Kamatari, who proved one of the ablest statesmen that Japan has produced. Under his guidance the Government was reorganized and Chinese institutions were adopted on a scale which can only be paralleled by the deliberate imitation of European methods under the Emperor Meiji. The Nihongi says that "he honoured the religion of Buddha and despised the way of the Gods," that is, Shintoism or the ancient worship of Japan. The development of Japanese religion does not come within the province of this article, but it may be mentioned that though there was naturally a struggle between the imported faith and old institutions, the contest was comparatively gentle and had little of the violence which attended the Reformation in Europe. It is only occasionally and mostly quite late in history that we hear of troubles arising between the two creeds. At the time of which we are treating the triumphal progress of Buddhism was remarkable; we hear continually how images were cast and temples built in a magnificent style unknown to Shinto, which favoured simplicity; how teachers and priests arrived from Korea and China; how Japanese eagerly received ordination as monks and nuns and how an important precedent was set by a prince who retired to a monastery to avoid political complications. But all this did not mean merely an influx of foreign piety or superstition. Kōtoku and his advisers saw that the existing system of government and society was radically wrong and set themselves to reform it, taking China as their model. The central power was weak and had no machinery by which it could exert its authority far from the capital; the great mass of the people were ignorant peasants, victims of the tyranny of numerous local magnates, who were not appointed by the crown but owed their position either to birth or, very often, to their unscrupulous use of their opportunities. The system of forced labour was abused; the administration of justice and the collection of taxes were both purely local and corrupt; the families of serfs were distributed as their masters chose and provincial chiefs appropriated both lands belonging to private persons and the estates of the crown. To remedy such abuses the regulations of Taikwa appointed three great officials styled ministers of the left, right and interior; provincial governors were ordered to prepare registers showing the

number of free men and serfs and the area of cultivated land in their jurisdiction. It was further ordained that the common people should have equal share in the advantages of irrigation: that the acceptance of bribes should be punished; that a box for receiving petitions should be placed in the imperial court and a bell be hung for the use of those who had complaints to make: that the absorption of land into great estates should cease: that officials should receive by way of emolument "sustenance fiefs," that is to say, the taxes of a certain number of homesteads: that in cities and townships (defined as 50 houses) aldermen should be appointed for "the superintendence of the population and the examination of criminal matters": that officials should have as assistants "men of solid capacity, skilled in writing and arithmetic." Also the whole soil of the empire was supposed to be surrendered to the central Government and was theoretically at least distributed among peasants in equal holdings of a few acres, subject to a six-yearly redistribution. The old taxes and forced labour were abolished and a system of commuted taxes instituted. Many matters of detail which cannot be here enumerated, are dealt with at length. For instance, the practice of constructing enormous tombs diverted labour from more profitable work. It was now enacted that the tomb of a prince must not require the labour of more than 1,000 men for a week, and that the grave of an ordinary official must be completed by 50 men in one day. In 649 the emperor ordered the establishment of eight departments of State, though perhaps this central organization was not really completed until somewhat later. Of these eight ministries which were modelled on the six boards of the Tang dynasty, four were concerned with the court, but their province included questions which we should now call education and public worship. The other four were the Home Office (Minbushō), the War Office (Hyōbushō), the Treasury (Ōkurashō) and the Ministry of Justice. The intention of Kōtoku's reforms was evidently to arrest feudalism, but in this they were not successful, though they did much for the improvement and civilization of his country. In China there were few great families and public opinion found selection by merit and even by public examinations natural. But the subsequent history of Japan shows that the tendency to consider office and influence as hereditary was not easily eradicated.

On the death of the Emperor Kōtoku, Prince Naka, though recognized as the heir apparent, again stood aside and allowed his mother to have a second reign under the style of Saimei. It was not till her decease in 661 that he at last came to the throne as Tenchi. At this period an important change occurred in Korea: with the assistance of the Chinese, Silla conquered the other States of the peninsula. The Japanese sent a force to help their old ally Pakche but it was annihilated by the Chinese fleet in 663, and until the time of Hideyoshi at the end of the 16th century Japan had to keep her hands off Korea. But after the fall of Pakche and Koguryu large numbers of Koreans emigrated to Japan and were hospitably received by Tenchi. He was an able and enlightened monarch but on his premature death in 671 the country was thrown into confusion by civil war between his son Ohotomo, who had been set aside, and his younger brother who had been named prince imperial. The latter won and ruled till 686 as the Emperor Temmu. The Kojiki and Nihongi which were compiled by his orders, though not completed until after his death, give a long and sometimes imaginative account of the struggle.

When he died there was again a difficulty about the succession: his son Ohotsu was put to death and his widow came to the throne as the Empress Jitō. She abdicated in 697 and for the first time in Japanese history a minor was made emperor, a practice which afterwards became very frequent. He was known as the Emperor Mommu and was both grandson and nephew of the late empress. Coming to the throne when only fourteen he died at the age of twenty and was succeeded by his own mother the Empress Gemmei. In 697 the Nihongi comes to an end, but the chronicles of old Japan are continued in the Shokunihongi, Nihon-Kōki and other official histories. The Civil Code of Taiho also throws much light on the condition of Japan at this period. It is the oldest extant body of Japanese law, but what has come down to us is not the original text which was published in the year of 702

but the edition of 833, in which a commentary is incorporated.

THE NARA PERIOD

Up to this time there had never been a fixed metropolis. The court had moved about from one town to another in the five home provinces (Gokinai), the provinces of Yamato, Yamashiro, Settsu, Kawachi and Izumi) or to Otsu on Lake Biwa, the capital being always changed on the death of the sovereign and often at other times. This habit had many inconveniences and caused great hardship to the labouring classes who were called upon to construct new palaces at frequent intervals. So in 710, in the reign of the Empress Gemmei, Nara was selected as a fixed capital and with brief intervals continued to be the imperial residence for three-quarters of a century. Except for a campaign in the north conducted by a Fujiwara general against the Ainu, the Nara period was eminently peaceful and marks an epoch in the history of art, literature and religion. The city was laid out on the plan of the Chinese capital and was visited by learned men and artists not only from China and Korea but from India, Cambodia and Central Asia. Many Japanese also went to China to study. It was the fashion to imitate everything Chinese, in art and letters, in costume and amusements; but in many religious carvings and ornaments, Indian influence is also apparent. But though this cultivated society had not much originality, it was not wanting in force and power of expression, for the Nara sculpture is remarkable for its vigour and beauty. It was at this time that the first anthology of poems (the *Manyōshū*) was compiled and the poets Hitomaru and Akahito wrote. Nara was pre-eminently a Buddhist centre. There were seven monasteries in or near the city and, as ecclesiastical property paid no taxes, it tended to increase, for the peasants were quite ready to surrender their land to the church and then hold it as tenants in return for a rent smaller than the imposts levied by the Government. At this period the private ownership of land began to be recognized, for it was found that the uncertain tenure and frequent redistributions prescribed by the regulations of Taikwa deterred improvements. In 708 copper was discovered and a mint established, but its operations were seriously impeded because so much of the new metal was required for the casting of bells and images. The greatest of these was the Daibutsu in the Tōdai-ji of Nara, a gigantic image weighing more than 550 tons. It was dedicated in 749 by the Emperor Shōmu who appeared before it with all his Court and declared himself the servant of the Three Treasures—the Buddha, the Law and the Church. In fervour of devotion he may rank with the Indian emperor Asoka, and like him he constructed hospitals and almshouses, roads and bridges. In all these enterprises, whether appertaining to religion or public works, he was assisted by the eminent Korean priest, Gyōgi Bosatsu, who was made head of the hierarchy. Shōmu took the tonsure and abdicated in favour of his daughter Kōken, who was also a zealous Buddhist and followed her father's example by becoming a nun in 752, a young prince succeeding her as the Emperor Junnin. But she continued to control the more important affairs of the empire and there was thus a dual monarchy consisting of a retired and a reigning sovereign, a position which often reappears in Japanese history.

The emperor's chief adviser was Emi no Oshikatsu, of the Fujiwara family, which was growing powerful, and the empress was under the influence of a handsome and ambitious monk called Dōkyō. Oshikatsu attempted to make away with him, but the empress took vigorous action in her favorite's defence and civil war broke out. Oshikatsu had many enemies on account of his sudden rise to eminence at court and was overpowered and executed. The empress then banished the young emperor to the island of Awaji where he was strangled and, emerging from her retirement, again ascended the throne in 756, changing her name to Shōtoku. Dōkyō became chancellor and practically ruler of the empire, but his ambition knew no bounds and he spread a report that the God of War wished him to be made emperor. Even his devoted mistress raised objection to this and insisted that the oracle must be consulted officially. When this was done, his enemies arranged that the divine reply should be a decided negative. Dōkyō, however, did not fall at once and even had time to

take personal vengeance on his opponents. But, when the empress died in 769, he was banished. Nothing remarkable happened for the moment, but it is significant that no empress was allowed to reign again until 1630. An elderly prince came to the throne and ruled for twelve years as Kōnin Tennō, under the guidance of Fujiwara Momokawa and was then succeeded by a really able emperor, Kwammu (782–805).

THE FUJIWARA PERIOD AND WARS OF GEMPEI

Kwammu removed the court to Nagaoka, Yamashiro; then in 794 to the new city of Kyōto, which continued to be the imperial residence until 1869. The chief reason for the change was no doubt the fear that at Nara the Government might be made subservient to the Buddhist church, and the incident of Dōkyō shows that there were ambitious prelates who dreamt of a state analogous to the Papacy or the Lamaist hierarchy of Tibet. At Kyōto the Government was for the time being at any rate not exposed to undue ecclesiastical influence. Not that Kwammu in any way quarrelled with the Buddhist church: he built many temples himself, but he made an enactment that imperial sanction was necessary for the construction of new ones. Kwammu also tried to abolish, though without permanent success, the hereditary tenure of office enjoyed by provincial governors. These officials owned large tax-free estates called *shōen* which, like those of the monasteries, continually increased by absorbing the neighbouring land owned by peasants. This system had two most important consequences: first it created a class of quasi-independent territorial magnates and secondly it impoverished the exchequer by increasing the extent of areas which paid no taxes. Kwammu's reign was also remarkable for a long campaign against the Ainu. At this time the extreme outpost of the Japanese empire was the fortress of Taga about 50 miles to the north of Sendai. The Ainu seized it in 780 and it was not till 802 that the fighting was over. The hero of these wars was Sakanoe Tamuramaro, whom Japanese romances represent as the ideal soldier, most terrible to his enemies but gentle and unassuming among his friends. He was the first to receive the title of *Sei-i-tai-Shōgun*, or Barbarian-subduing-Generalissimo, which was the name by which the later rulers of Japan were known.

The sovereigns who immediately succeeded Kwammu were not without ability and have been called the learned emperors. But from this point onward a most remarkable and persistent feature makes its appearance in Japanese history. This is the constant tendency to separate titular and real authority, to preserve a venerable hereditary office but to set up beside it a recognized and efficient power which was also generally hereditary. Not only was the Government during many centuries administered by a Shōgun but the effective power of the Shōgun sometimes passed to a deputy and at other times an emperor who had nominally abdicated in favour of a minor retained the real control of the State. The history of Japan from Kwammu to Meiji is not a history of emperors but of certain great families of whom the Fujiwaras were the first. Yet the really remarkable fact is the continued existence of the imperial house and the veneration in which it was held through all these vicissitudes. The period from the beginning of the 9th century to the middle of the 11th is commonly known as the period of the Fujiwaras. They were not like the later Shōguns, a military power which brought pressure to bear on the court: they ruled by identifying themselves with the imperial family. For instance, Fujiwara Michinaga (966–1027) who governed the country for thirty years, was the father-in-law of three emperors and the grandfather of four more. The emperors married Fujiwara ladies and their children were educated in Fujiwara palaces. Very often the emperor was a minor and in that case his maternal grandfather acted as regent. If he was of full age, a Fujiwara filled the office of Kwambaku, a sort of chancellor. If the emperor showed any inclination to assert himself, he generally had to retire to a monastery. During 200 years of Fujiwara rule there were fifteen emperors, of whom seven were minors and eight abdicated.

The Fujiwara or Heian period as it is sometimes called (Heian-kyō, or capital of peace, being another name of Kyōto) was a

peaceful time. There were, indeed, some disturbances, such as piracy and the short-lived attempt of Masakado (939) to make himself emperor in the Kwantō and there was in the north some fighting with the Ainu and with the Japanese family of Abe which had established itself there. But such distant troubles did not much affect the court at Kyōto. Literature, art and gallantry flourished. Buddhism also flourished and the great monasteries on Mount Hieizan began to acquire a dangerous importance in politics, as those of Nara had done before. Scholars like Kōbō Daishi and Dengyō Daishi visited China and brought back with them novelties in art and religion. As at Nara, everything Chinese was fashionable. The fault of this pleasant and cultured society was that being engrossed with its own refined amusements, it neglected the provinces where great estates continued to grow and attract the military spirit of the country.

Tenjin.—A picturesque figure of this period is Sugawara no Michizane, known to every Japanese as Tenjin. Though not of the Fujiwara stock, his talents and learning gained him high office early in life and the confidence of the Emperor Uda, who however retired to a monastery in 897 and abdicated in favour of his son Daigo, aged fifteen. He entrusted the youth's education to Michizane and intended to retain control of the Government with his assistance. This was more than the Fujiwaras could stand: the young Emperor had to sign an edict appointing Michizane viceroy of Kyushu, then regarded as a remote province, and the ex-Emperor protested in vain. But after Michizane's death at his distant post some years afterwards the country was visited with droughts, fires, floods and other calamities, in which popular imagination saw the vengeance of his indignant spirit. He was canonized as Tenjin Sama, the god of calligraphy, and his temples, marked by plum trees, of which he was specially fond, are to be found in most Japanese towns.

The first check to the power of the Fujiwara family was the reign of the Emperor Go-sanjō (1068–1072) who came to the throne because the Fujiwara bride selected as Empress for his predecessor was childless and who ruled with considerable independence. He seriously attacked the evils of provincial administration, ordered that no governor should hold office for more than one term and confiscated many *shōen* which could produce no title deeds. Unfortunately he reigned only four years. The next period, 1073–1156, is sometimes called the rule of the Cloistered Emperors, because the two sovereigns Shirakawa and Toba, though they became monks and nominally retired from the world, managed to keep the real power with a court and a council of their own, whereas the Fujiwara could only control the titular emperor, who was a minor. But the system did not work well. There was a natural conflict of authority between the two courts and the Cloistered Emperors, having become nominal monks, allowed the church to acquire great temporal power. Enormous sums were spent on building and adorning temples, and the monasteries of Hieizan, which had established the practice of keeping mercenaries, became veritable fortresses whence, if any ecclesiastical interest was at stake, armed forces used to descend into Kyōto to over-awe the Government. Even Shirakawa complained that, though he was emperor, there were three things he could not control: the inundations of the river Kamo, the hazards of the dice and the monks of Hieizan. The evils of provincial administration increased, for the court stultified its own edicts. It prohibited the extension of *shōen* but at the same time, being in need of money, it sold appointments and prolongation of office.

Taira and Minamoto.—Two great clans came specially to the front, the Taira and Minamoto: both were of imperial descent but both rose to power through the military services which they rendered, the first in western Japan, the second in the extreme north against the Ainu. Also the Cloistered Emperors established for their own protection a new body of guards in which both clans were employed, though special confidence was placed in the Taira. The contest between the two clans is often called the wars of Gempei.

Troubles about the succession in 1156 and a conspiracy in 1160, for taking part in which many Minamoto lost their lives, made the Taira supreme and Kiyomori, the head of the house,

was practically a dictator until his death in 1181. The brief rule of the Taira does not seem to have been inspired by any original policy or to have had any special consequences for the history of Japan and it was unpopular. Kiyomori was haughty and exacting: he distributed all the great offices of state among his kinsmen: he made enemies of the Buddhist clergy, although when he was ill he took the tonsure according to the custom of the time and, strange to say, recovered: at great expense and inconvenience to both nobles and commoners he made the court remove for a time to Fukuwara near the modern Kobe where he had his private residence. Besides this, evils for which he was not responsible, pestilence, fire and famine ravaged Kyōto and though he died in peace himself, the rule of the Taira came to an end four years after his death and gave way to the Minamoto, led by Yoritomo.

Yoritomo.—Though the issue at stake was the supremacy of one or other family, Yoritomo began by having the support of many of the Taira, for Kiyomori had favoured only his own section of the clan and had made enemies of others. His first attempts during the life of Kiyomori were unsuccessful. He was captured and narrowly escaped being killed but was banished to Izu. Subsequently in the battle of Ichi-no-tani near Suma (1184) and the great sea-fight of Dan-no-ura (1185), the power of the Taira was completely crushed. These victories were mainly due to the genius of Yoshitsune, Yoritomo's younger half brother, and it is melancholy to relate that when Yoritomo's power was established he was not merely ungrateful but determined to remove his brother as a dangerous rival. Yoshitsune fled to northern Japan and when pursued by Yoritomo's assassins committed hara-kiri. But he lives in military history as one of the greatest Japanese strategists, and in art and romance he and his faithful henchman Benkei are still among the most popular heroes of the Japanese public.

THE KAMAKURA PERIOD

Instead of trying to rule the court at Kyōto as the Fujiwara and Taira had done, Yoritomo with the help of his celebrated counsellor, Oye Hiromoto, set up at Kamakura a new military government called the Bakufu with a council, home office, treasury and supreme law court of its own. The owners of *Shōen* were no longer allowed to appoint their own stewards. In each province was placed a High Constable (*Shugo*) whose duty was to raise troops and keep order, and a Land Steward (*Jito*) who collected taxes and superintended the administration of justice. Both officers were responsible to the Bakufu and not to the emperor or the owners of estates. Unlike Kiyomori, Yoritomo was careful to conciliate the Buddhist clergy and to show due deference to the emperor and court. The titles and property of the Kyōto nobles—called *kuge* or courtly houses as distinguished from *buke* or military houses—were duly respected and he himself obtained from the emperor the title of Sei-i-tai-Shōgun, which was equivalent to giving him a permanent commission to see to the defence and tranquillity of the empire. The title had been granted before to Tamuramaro (as mentioned above) and to others, but hitherto it had been limited in time and place whereas Yoritomo's mandate was permanent and for the whole empire. It is difficult to exaggerate the importance of the changes introduced by Yoritomo. Before his time, Japan means Kyōto and the neighbouring provinces. We hear of the west and the north-east as regions in which rebellions occasionally occurred and to which troublesome persons were banished. But now the size of the country seems more than doubled and the Kwantō emerges as an integral part of the empire, a civilized land with a great capital. Secondly, the Japanese character has at least two sides—one artistic and one military. The civilization of Nara and Kyōto and the open imitation of Chinese culture developed the former, not without danger of encouraging effeminacy. There was plenty of turbulence, it is true, even among the clergy but in reading the earlier chronicles one does not receive the impression that the Japanese were a nation of soldiers. But under the institutions of Yoritomo they became so. Except at the Court of Kyōto, the administration and social life were controlled by the military class. Yoritomo died in 1199. Though he founded a system of government, he did not found a

dynasty. It is true that the Minamotos remained prominent in Japanese history, for both the Ashikagas and Tokugawas were branches of that family, but his own descendants did not rule.

Rule of the Hōjō.—The real power passed into the hands of the house of Hōjō, to which his wife belonged. They assumed the title of *Shikken*, constable or regent, and for about a century governed in the name of puppet Shōguns, much as the Fujiwaras had governed in the name of the emperor.

Yoritomo's two sons and nephew were allowed to succeed but after that the Shōguns were generally minors and chosen from among imperial princes. For some time the court at Kyōto had a certain independence. The chief power was in the hands of the ex-emperor Go-Toba, a man of ambition and some talent, who realizing that it was very hard for a titular sovereign to have much influence in Japan, had abdicated and was allowed to manipulate the succession among his sons as he pleased. In 1221 he made an attempt, in which he relied to a considerable extent on the military strength of the great monasteries, to break the power of the Kamakura Government. The attempt seems to have been premature and the exceedingly prompt action of the Hōjōs had no difficulty in crushing it immediately but it had important consequences. Go-Toba was banished, the Hōjōs took charge of the court and the imperial succession as the Fujiwaras had done and two of them were installed in Kyōto as military governors. More than this, 3,000 estates belonging to Go-Toba's adherents were confiscated and distributed among the supporters of the Bakufu, which materially strengthened the feudal system.

Mongol Invasion.—The most remarkable and creditable event in the Hōjō administration was the repulse of the Mongol invasion. In the 13th century the Yüan or Mongol dynasty seized the throne of China and also subdued Korea. This conquest brought them almost into contact with Japan and Khublai Khan came to the conclusion that it ought to accept his authority. So in 1268 he sent a patronizing letter addressed to the "King" of Japan, pointing out what had happened in Korea and asking that a mission might be sent to China. No answer was sent and in 1274 an attempt of the Mongols to land at Hakozaki in Kyushu was repulsed. Further envoys sent by Khublai were executed, so in 1281 he decided to despatch a really great expedition and chastise the Japanese. This aroused an outburst of patriotism in which the Buddhist Church took part. The forces of nature aided the Japanese: a great typhoon destroyed Khublai's armada and no more was heard of the Mongol peril.

But, in spite of this success, the Government of Kamakura became unpopular and inefficient. Takatoki, the ninth Hōjō Regent, was conspicuously debauched and extravagant. The central administration lost its hold on the provinces, and the old evil of independent fiefs, large and small, against which Yoritomo had legislated, reappeared. The military class were sinking deeper and deeper into penury and debt and their only hope was a successful war.

Go-Daigo.—Bad harvests and pestilence had brought the peasantry close to starvation. It had been the custom of the earlier Hōjōs to store grain and distribute it in times of need at low prices, but their successors, instead of following this wise custom, endeavoured to make money by selling it to the highest bidder. At Kyōto the practice of putting on the throne minors who abdicated early became increasingly frequent and at one time (1298–1304) there were no less than five ex-emperors alive. Go-Daigo, however, who succeeded in 1318, was of mature age and in a few years' time quarrelled with the Government of Kamakura because they refused to recognize his son as Prince Imperial on the ground that he was ineligible by the terms of a will made by the Emperor Go-Saga (1272). In the dispute which ensued the emperor was banished to the island of Oki but it was soon clear that the Hōjōs could not rely on the support of the country or even of their own nominal adherents.

Go-Daigo managed to escape from Oki in 1333: Ashikaga Takauchi who was sent against him went over to his side and in the east Nitta Yoshisada, another eminent general of the Bakufu, turned against them and burnt Kamakura. With the suicide of Hōjō Takatoki and 300 followers the rule of the Hōjō came to

an end. The interesting events of the stormy half century which followed form the theme of many historical romances but are so complicated that they can only be summarized here very briefly. The period 1334–35 is often called the Restoration of Kemmu and it may seem that Go-Daigo, being left master of the situation, could have permanently restored the ancient imperial régime, especially as his own son was named titular Shōgun. But he evidently lacked the ability to do this, and he refused to follow the wise and cautious advice of his devoted follower Kutsunoki Masashige, celebrated as a model of self-sacrificing loyalty. The man who emerged as victor was Ashikaga Takauji. He proclaimed himself Shōgun in 1335. Go-Daigo refused to recognize him and fled with the regalia. On this Takauji deposed Go-Daigo and appointed to the throne an imperial prince who reigned as the Emperor Kōmyō and in return recognized him as Shōgun.

THE ASHIKAGA PERIOD

Thus began the Ashikaga line of Shōguns (1338–1565) and also a period of divided sovereignty which lasted 56 years, the Emperor Go-Daigo and his descendants reigning at Yoshino as the southern court and the Emperor Kōmyō and his descendants at Kyōto as the northern court. Though the former court is generally considered as legitimate, it ultimately had to yield and handed over the regalia to the court of Kyōto in 1392, when the double sovereignty ceased.

This arrangement was effected by Yoshimitsu, the third and ablest Shōgun (1367–1395) of the Ashikaga house, for he saw that the struggle between the rival courts was demoralizing authority, ruining the peasantry and giving over the whole country to lawlessness and brigandage. During most of the Ashikaga period the imperial dignity descended regularly from father to son: few sovereigns abdicated and the country was not distracted by ex-emperors ruling *de facto* without any constitutional warrant. The Shōguns resided in Kyōto but did not attempt to govern by making matrimonial alliances with the imperial family. The court simply subsided into the second place, chiefly because hardly any revenue reached it. Yoshimitsu also checked piracy and restored some sort of order in Kyushu. He re-established commercial and diplomatic relations with China and the results were lucrative, though he had incurred much censure from patriotic Japanese because in his official correspondence with the Ming emperor he tolerated and even used phrases which implied that Japan was a vassal state. Towards the end of his life he retired and became a monk, but continued to govern the country from his palace Kinkakuji (the golden temple) in Kyōto. After Yoshimitsu's death and especially from the rule of Yoshimasa the eighth Shōgun (1443–1474) onward, things went from bad to worse, but in reading the melancholy annals of the Ashikaga—one long catalogue of individual debauchery and tragedies and of ruinous wars between the great feudal houses—we must not forget that this was also the golden age of Japanese painting, when some of the best literature was produced and the Nō drama was invented. Art, it is true, flourished chiefly in monasteries and its inspiration, largely Chinese, was due to the intercourse with China promoted by Yoshimitsu's policy. Still, this art was by no means devoid of vigour and originality and the monasteries could not have produced such talent had the general intelligence of the age been stagnant. Disastrous as was the strife of noble houses, it at least stimulated the spirit of adventure and offered a career to men of ability, regardless of birth. The system of serfdom which had prevailed for more than a thousand years was broken up, and no chieftain could hope to hold his own unless he could attract men to his service and maintain a moderately just and efficient administration within his own domains.

Nevertheless, it is impossible to give a favourable account of either the capital or the provinces during the Ashikaga rule of 15 Shōguns. Eleven were minors at their accession, nine abdicated, five died in exile, and at least two came to violent ends. Just as the Hōjō regents had ruled instead of the Minamoto Shōguns, so officials called wardens (*Kwanryō*) took the power from the Ashikaga Shōguns and fought for it among themselves. This arrangement became so much a matter of course that the

three houses (Shiba, Hosokawa and Hatakeyama) who claimed the right to hold the office were called Sankwan, or the three warden families. By the middle of the 15th century Kyōto was in ruins and reduced to a population of 22,000.

Nor were things any better in the provinces. Taxation is said to have amounted to 70% and the unfortunate cultivators had to pay not only regular imposts but also extraordinary taxes called Dansen levied for special purposes sometimes more than once in a year. This resulted in frequent popular tumults demanding a Tokusei or benevolent act of the Government, that is, cancellation of debts. In the time of Yoshimasa alone there were 13 such Tokusei. The Kwantō was governed by regents taken from another branch of the Ashikaga family, but after about 1440 their authority became precarious. The whole region was practically independent of Kyōto and the chief power was in the hands of the Iyeyasu family. Disastrous dissensions in the great houses of Shiba and Hatakeyama known as the wars of Ōnin (from the name of the period when they began in 1467) wasted the country for ten years. Soon afterwards another war broke out, occasioned by internal jealousies of the Hosokawa family. But, long as the struggle lasted, it ended in nothing: the antagonists wore themselves out and in the 16th century both Ashikagas and Hosokawas disappeared. In this century, one of the most eventful in the history of Japan, two features are specially remarkable. The first is the almost simultaneous rise of three great men, Nobunaga (1534-1582), Hideyoshi (1536-1598) and Iyeyasu (1542-1616) whose successive efforts, though they consisted of little but war, ended by giving their country unity and peace. The second feature is the discovery of Japan by the Portuguese in 1542 and the arrival of European merchants and missionaries.

NOBUNAGA, HIDEYOSHI AND IYEYASU

It now becomes comparatively easy to follow one main thread in the history of Japan. An account of Nobunaga's conquests is an account of the successive withdrawal of various territories from chaotic feudalism to form the basis of a new Japanese empire. At the time that he was born, there was no central government. Though the emperors remained the fount of honour, they did not make a single public appearance between 1521 and 1587: the Shōguns were puppets in the hands of contending chieftains: the provinces ceased to be administrative areas and the only effective government was that exercised by the heads of the principal feudal houses in the lands—often comprising several provinces—which they had acquired by force of arms. The free city of Sakai near Osaka was an interesting but unique phenomenon. It had expelled its feudal lord, and the Jesuit Vilela says it was "governed by its own laws and customs in the fashion of Venice." An important factor in the situation was the temporal power of the Buddhist Church. Even more than before the larger monasteries became fortresses with lands, troops and secular ambitions. In spite of this worldly tendency Buddhism had shown itself in the preceding centuries by no means deficient in religious vigour. The preaching of Nichiren stimulated patriotism in the time of the Mongol invasions and out of the monasteries of Kyōto, wealthy foundations devoted to art and political intrigue, there arose in the 12th century sects analogous to Protestantism which preached with signal success simple doctrines intelligible to the masses. One of these sects called Shinshū allowed the clergy to marry, with the result that abbots became hereditary and even more like feudal lords than celibate prelates had been. In Echizen, Echigo, Kwantō and Kaga, the vast tracts ruled by religious establishments of this sect were hardly distinguishable from ordinary baronies, and Kennyō, the eleventh abbot, was accused of wishing to supplant the emperor.

Nobunaga.—Oda Nobunaga belonged to the Taira family and inherited a small fief in the province of Owari. He was a brilliant military genius and at that time the natural career for a man of his calibre was to extend his lands by conquest and, if possible, penetrate to Kyōto and get the Shōgun into his power. In executing this programme he had the assistance of Hideyoshi, a simple peasant said to have been remarkably ugly, who entered his

service as a groom, and after his death surpassed his achievements and ended by administering the whole empire. Nobunaga also acted in concert with Iyeyasu, a rising young warrior of the Tokugawa family which was a branch of the Minamoto. By 1568 Nobunaga had taken possession of all Owari with the neighbouring provinces of Mino, Ise and Omi, had entered Kyōto and installed Yoshiaki, the last of the Ashikaga Shōguns.

Arrival of Portuguese and Jesuits.—It was in 1572 that Nobunaga first made the acquaintance of the Jesuits, to whose doings we must now turn. Thirty years earlier the hazard of a storm had driven a Portuguese ship which was bound for Macao to the coast of Tanegashima, an island lying off the extreme south of Kyushu. They were well received, and when the news of the discovery spread among the Portuguese establishments in the East seven expeditions were equipped in the next few years to exploit the new market. They traded in the ports of Kyushu and even visited Kyōto. In 1549 the first missionary, Xavier (*see article XAVIER*), landed at Kagoshima, accompanied by two Portuguese priests, and by a Japanese called Anjiro or Yajiro who had somehow found his way to Malacca. He was most favourably received by the Daimyō of Satsuma, who saw in his arrival a prospect of opening a lucrative trade with foreign markets. But the ships which were expected at Kagoshima, went to Hirado instead. In 1550 the disappointed Daimyō issued an edict in which he forbade Christianity, and the missionaries thereupon moved to Hirado. Here they were well received by the Portuguese merchants, who recommended them to the Japanese, and their preaching had some success. Xavier paid a fruitless visit to Kyōto, but his stay at Yamaguchi in western Japan and in the province of Bungo in Kyushu had more result. When he left, after spending about two years in Japan, it is said that he had baptized 760 persons. In the year following Xavier's departure more Jesuits arrived in Bungo, which was for some time the principal Christian centre. It was from there that they began to send to the General of their order in Rome the series of reports called *Annual Letters* which give a most valuable picture of contemporary Japan. The head of the Otomo family, the ruling house in the province, assisted them not only by encouragement in his own territories but by his influence among his neighbours. In Hirado the fortunes of Christianity varied: sometimes the desire to encourage trade at any price prevailed, but sometimes indignation at aggressive propaganda, and such outrages as burning temples, provoked restrictive legislation. Sumitada, chieftain of Omura, a fief near Hirado, became a most zealous Christian. He gave land and residences to the Jesuits, forced Christianity on his vassals by drastic means, and in 1567 built a church at Nagasaki, then an obscure fishing village. His object was to provide a centre for Portuguese trade and religion and he succeeded so well that in five years Nagasaki grew into a town of 30,000 inhabitants, while he himself became one of the most important feudal lords of Kyushu. His neighbour, the chieftain of Arima, thought it well to follow this example and became known to the Portuguese as Prince Andrew. In Arima and other places there were many vicissitudes, but on the whole the progress of Christianity was astonishing. The *Annual Letter* of 1582, only thirty-two years after the landing of Xavier, reports that there were 150,000 converts. In this year, too, at the suggestion of the Jesuit Valegnani, an embassy of four Japanese youths was despatched from Kyushu to the Pope and also visited Lisbon and Madrid. The vast majority of the conversions mentioned took place in Kyushu, but the propaganda of a Jesuit called Vilela had considerable results in Kyōto, and its success is interesting because his converts cannot have been actuated by commercial motives. In 1564 a chieftain called Takayama Yushō challenged Vilela to a public disputation and, admitting that he was vanquished, embraced Christianity with all his household and vassals. But in Kyōto too, the aggressiveness of the missionaries irritated the Buddhist clergy, who as early as 1565 and 1568 induced the emperor to issue two anti-Christian edicts, and it would probably have fared ill with the new religion but for the constant support of Nobunaga, who was now the most powerful man in Japan and who ruled 30 out of the 66 provinces. He

assisted and protected the Jesuits in every way he could and even built a house and church for them in the new city of Azuchi which he constructed on the shores of Lake Biwa. Nobunaga never showed the slightest sign of becoming a Christian himself but, like many Japanese, he was anxious to learn all he could from Europeans, and he was also actuated by violent hatred of the Buddhist priesthood. In his early struggles they had taken sides against him and in 1570 they were a menace to his rule in Kyōto. In that year the Miyoshi family threatened the city in conjunction with the Shinshū priests of Osaka, whose temple there was one of the strongest fortresses in Japan, and while he was occupied with them his enemies, the nobles of Echizen and Omi, planned another attack with the help of the monasteries of Hieiizan. As soon as he had disposed of his lay enemies Nobunaga made a sudden attack on this holy mountain and, after perpetrating an appalling massacre, burnt the monasteries of which there are said to have been 3,000. He was not quite so successful in dealing with the temple fortress of Osaka which, under the command of the abbot Kennyō, a most capable soldier, withstood a long siege until both parties agreed to accept the mediation of the emperor, who evidently regarded this open war with a religious body as a public scandal. Nobunaga's stormy career now came to an unexpected close. He had sent Hideyoshi to the west in order to subdue the powerful Daimyō of Chōshū near the straits of Shimonoseki. In June 1582 a body of troops under Akechi Mitsuhide which was meant to reinforce this expedition suddenly turned on Kyōto. The motives of Mitsuhide, who was killed in the struggle, have never been satisfactorily explained. Possibly he was avenging some ancient insult. At any rate he attacked Nobunaga's house and the latter, being unable to escape, committed suicide.

Hideyoshi.—Nobunaga was a considerable military genius but not of any administrative ability. He had, however, made his age familiar with the idea that supreme authority under the emperor was vested in one man, and Hideyoshi, the peasant who had been his groom, who had become his trusted lieutenant, and who now took his place, made the most of this idea and in eight years' time became both military and civil master of the whole country. At first the question of succession presented some difficulty. Hideyoshi supported the claims of the child of Nobunaga's deceased eldest son and constituted himself the infant's guardian. Nobunaga's other sons objected and one of them, Nobuo, ultimately took the field and had the support of Iyeyasu. But when Iyeyasu and Hideyoshi, who had formerly worked together, found themselves pitted against one another, they thought that the question at issue was not worth a conflict and made a compact which they confirmed by a matrimonial alliance. None of Nobunaga's descendants ultimately played any political rôle of importance and Nobuo subsequently fought for Hideyoshi. In the first years of his rule Hideyoshi conducted a vigorous and successful campaign against Echizen and, as a result, four provinces on the Sea of Japan submitted to him. He also subdued the island of Shikoku which had become a practically independent principality under Chōsokabe of Tosa. But, more than this, he began to organize an efficient system of central government supervised by five ministers called Bugyō, and to reform the administration of justice and the coinage. In 1585 he received from the court the title of Kwampaku and was master of all Japan except Kyushu and the Kwantō with the provinces to the north of it. He now turned his attention to these two regions, beginning with Kyushu. The warlike Shimazus of Satsuma had been advancing towards the north and threatened Bungo among other provinces. The chieftain of Bungo asked Hideyoshi to intervene. He gladly did so and when he received a defiant answer to his representations from Satsuma, he invaded the island and reduced it to submission, but was careful to show a wise clemency to the powerful house of Shimazu.

Christianity.—This expedition brought Hideyoshi into contact with Christianity as a political power and led to the restrictive edicts which caused the Jesuits to execrate his name. Up to this time he had shown no animus against them and he certainly was not prejudiced in favour of Buddhism, for he had an old quarrel

with the monastery of Negoro, which he burnt in 1584. In the main island the Jesuits had confined their activity to religious matters, but what Hideyoshi saw and heard in Kyushu evidently convinced him that they were not merely a new sect but that they aimed at establishing an *imperium in imperio* and were a danger to the State. He was careful to complete his campaign before making new enemies, but when on his return journey he reached Hakata in the north of the island he unexpectedly caused five

JAPANESE GIRLS IN NATIVE GARB

questions to be put to the vice-provincial of an order which sufficiently indicate the nature of his suspicions. On what authority, he asked, do the Jesuits constrain Japanese subjects to become Christians? Why do they incite their disciples to destroy temples? Why do they persecute Buddhist priests? Why do they eat animals useful to men, such as cattle? Why do they allow Portuguese to carry off Japanese and make slaves of them in the Indies? The answers to these questions were not considered satisfactory and an edict was immediately published (1587) ordering foreign priests to leave the country within 20 days on pain of death. Portuguese merchants, however, were allowed to remain. But this ordinance

was not put into force. A certain number of churches were destroyed, but Hideyoshi was clement by nature and desirous to reap the advantages of foreign trade. He winked at the infractions of his edict and in the years following it, though the Christians were obliged to behave with more moderation, their numbers seem to have increased, for in 1595 we are told there were 137 Jesuits in Japan and 300,000 converts. But in 1597 he became uncompromisingly severe, the reason for this change of attitude being apparently the arrival of Spaniards.

Spaniards.—In virtue of a papal bull, accepted by both Spain and Portugal, the latter enjoyed a monopoly of religious propaganda and trade in Japan. But in 1593 a party of Franciscans, describing themselves as envoys, arrived from Manila and were well received. They quarrelled with the Jesuits, against whom they made accusations to the Japanese authorities. About the same time a Spanish ship was stranded on the coast of Tosa and, according to the story, the pilot being anxious to impress the Japanese, dilated on the Spanish conquests and when asked how they had been made replied that "the Catholic king first sent ministers of the Gospel to convert the natives, who afterwards uniting with the captains of his majesty made their work of conquest easier." This remark, whether historical or not, is no doubt a correct epitome of Hideyoshi's suspicions. He was seized with a fury against missionaries: 26 Christians, native and foreign, were executed, many churches were destroyed: feudal chiefs were forbidden to become Christians, and all Jesuits were commanded to leave the country. But they managed to evade the order for some time and before it could be rigorously enforced Hideyoshi died. We must now return to his other doings.

After his successful expedition to Kyushu, only the east and north remained to be subdued. The northern districts were not in a position to offer much resistance but the provinces called Kwantō were practically a powerful independent kingdom ruled by Hōjō Ujimasa. This family of Hōjōs had nothing to do with the great but now extinct house of Kamakura. They had come from Ise about a century before and established themselves at Odawara in a strong position. As they refused to come to Kyōto and do homage to the emperor, who was still recognized as the nominal sovereign, Hideyoshi, Iyeyasu and Nobuo marched against them in 1590 with an army of 250,000 men and received their submission before the end of the year. The castle of Odawara

had to surrender in 1590. The Daimyōs of the north also tendered their submission. This time Hideyoshi treated his vanquished enemies with unusual severity. The Hōjōs were ordered to commit suicide and their provinces were given to Iyeyasu who was recognized as ruler of the Kwantō. Hideyoshi's return to Kyōto was a veritable triumph. Custom would not allow him to become Shōgun, for the office was restricted by tradition to those of Minamoto lineage, but in 1591 he received at his own request the title of Taikō by which he is generally known. This title, which had fallen out of use, had formerly been used by the Fujiwara, when they retired from the office of Kwampaku. Hideyoshi was now master of the whole country and has been called the Napoleon of Japan. There is some truth in this name, for he began to show signs of overweening ambition.

Korean War.—Hitherto his objects had been eminently reasonable—for who can doubt that Japan needed unification?—but he now aimed at the conquest not merely of Korea, but of China. His motives are unknown. The Jesuits assert that his prime object was to acquire land outside Japan where he could settle all the Christian nobles and Samurai, and keep them out of mischief. But though he sent 20,000 Christian troops to Korea, and may have thought it a good plan to leave them there, this is not likely to have been his chief reason for embarking on so great and dangerous an enterprise. Remarks attributed to him earlier in his career suggest that he had long cherished the scheme: he was undoubtedly impressed with the value of foreign commerce, and acquaintance with the Spaniards and Portuguese may have opened his eyes to the advantage of foreign conquests. Also he probably found it easier to subdue Japan than to rule it in peace. Though he had broken the power of the ancient great houses so completely that only five of them were left, the country was full of new military leaders who were ready enough to follow him in any profitable adventure but who, he may have felt, were likely to grow restless in peace and quiet. At any rate as early as 1587 he complained to the Korean court of their failure to send embassies to Kyōto. The diplomatic correspondence which ensued was not altogether amicable and it is noticeable that in writing to the king of Korea (as also to the Spanish governors of the Indies and Philippines) Hideyoshi expressed himself as if he were sovereign of Japan and made no allusion to the emperor. Finally he informed the king of his intention to invade China and called for his co-operation. The king of Korea refused and is said to have remarked that the idea of conquering China was like "a bee trying to sting a tortoise through its armour." However, an army of some 300,000 men was prepared and despatched against Korea in May, 1592, from Nagoya in Hizen where Hideyoshi spent more than a year superintending the preparations. He did not go to Korea himself and Ukida Hideiye was named commander-in-chief. Transport was, of course, the great difficulty but every feudatory was ordered to furnish ships in proportion to his revenue. The plan of campaign was to divide the invading force into three parts. The van, consisting of three army corps, was to land at Fusan and advance at once on Seoul by three routes, eastern, central and western. Then four more corps together with the troops under the direct orders of the commander-in-chief were to cross and effectually subdue the regions through which the van had passed. Finally two more corps were to be sent by sea up the western coast to Phyong-Yang (Heijo) and there join the van, which by that time would be preparing to march into China across the Yalu river. The first part of this programme was duly executed. Before autumn the first and second parts of the expedition occupied Seoul and Phyong-Yang, but disasters at sea prevented the third portion from reinforcing the troops which were to advance into China. At this period the Japanese had nothing which could be called men-of-war, but merely open transports propelled by rowing. The Koreans, however, who had been taught by experience in fighting pirates, had "turtle-shell" ships, which, being covered and protected, gave them a great advantage. The Japanese flotilla was practically destroyed and thus the troops already in Korea were isolated from their base. In October the Chinese awoke to the fact that their territory was threatened with invasion, but with their usual

self-confidence thought it sufficient to send 5,000 men across the Yalu. The Japanese had no difficulty in routing this small force, but then the tide turned. The Government of Peking at last realized the danger and despatched a considerable army. The Japanese troops had to evacuate Phyong-Yang and fall back on Seoul and to evacuate that city in turn in May 1593. Though after this the Chinese gained no more victories, and though the war continued until 1598 not wholly unsuccessfully for the Japanese, yet from this point onwards it ceased to be an attempt at conquest. The Japanese held a line of forts along the southern coasts of Korea and took the fortress of Chinju with a terrific slaughter of Koreans but Hideyoshi devoted his attention chiefly to obtaining honourable terms of peace. The negotiations were slow, for though the Chinese seem to have been willing to make terms, the Koreans were not. At last, in 1596, a Chinese embassy was received by Hideyoshi at Osaka, but when the envoys handed him a patronizing missive from the Ming emperor recognizing him as king of Japan he flew into a passion and sent them back. Large reinforcements were despatched to Korea next year and this time the Japanese were successful in a naval engagement, which secured their communications. The Chinese also sent reinforcements and the struggle recommenced. In October 1598 the Satsuma detachment of Japanese troops gained a victory of which a gruesome memorial still survives in the Mimizuka or Ear mound at Kyōto. It is said that 38,000 of the enemy fell. Their ears were cut off, packed in barrels and sent to the capital where they were buried under this tumulus. This was followed by a brilliant Japanese victory at Junten, but meanwhile, though it was not known in Korea at the time, Hideyoshi had died on September 16th. It is said that before his death he requested Iyeyasu to arrange for the immediate termination of hostilities. At any rate, a general withdrawal of troops from the peninsula was at once begun, though not without difficulty, since, in spite of the armistice, the Chinese and Koreans attacked the transports. The exact date when diplomatic relations were resumed is uncertain but it was soon after 1600.

Iyeyasu and Hideyori.—The question of Hideyoshi's successor now became all important. His son had died and in 1598 he handed over the office of Kwampaku to his nephew Hidetsugu, a man of some ability but of an extremely cruel disposition, whom he intended to make his heir. But in the same year one of his wives bore him another son who received the name of Hideyori. Hideyoshi then quarrelled with his nephew, who was finally ordered to commit suicide, and the infant Hideyori was recognized as heir apparent. At the time of Hideyoshi's death Iyeyasu was the most important Daimyō in Japan. He ruled the Kwantō and his new fortress town of Yedo was rapidly growing. The dying Taikō asked him to become the guardian of his son. Iyeyasu was unwilling to do this, but by the Taikō's last instructions he was installed as chief of a board of five regents and Hideyori with his mother resided in the great castle which his father had built at Osaka. The board of five ministers appointed in 1585 was retained to administer the country under the direction of the five regents who collectively acted as Taikō, yet another board, called middle counsellors, being appointed to arrange all difficulties which might arise between the two bodies. But this complicated arrangement did not work well, and the divergences of opinion between the two boards gradually took the form of a more personal quarrel between Iyeyasu and Ishida Mitsunari, a man of great ability who had been easily first among the ministers and now found himself overshadowed by the regents. He formed a powerful combination against Iyeyasu, charged him with disobeying the Taikō's last instructions and practically declared war. Iyeyasu, however, showed even greater ability in forming a counter-combination and in inducing Ishida's confederates not to give him effective support. The issue was decided at the great battle of Sekigahara in the province of Mino on Oct. 21, 1600, one of the most important dates in Japanese history as it practically inaugurated the Tokugawa régime. Iyeyasu, however, for the moment took no steps against Hideyori but absolved him and his mother of all complicity and proceeded to consolidate his own power. As the Tokugawa family were a branch of the Minamoto,

he was eligible as Shōgun and he obtained this title from the emperor. Strictly speaking, it had been in abeyance for only six years, as the last of the Ashikagas lived on in obscurity until 1597, and Iyeyasu himself held it for only two years for, following the inveterate Japanese habit of abdicating while retaining the real power, he ceded the title to his son Hidetada in 1605. He fixed his residence at Shizuoka and for some time kept on friendly terms with the young Hideyori, who was encouraged (perhaps in order to get rid of some of his great wealth), to re-erect the temple of Hokoji in Kyōto and a colossal image which had been set up by his father but destroyed in the earthquake of 1596. When the building was ready, Iyeyasu objected to the inscription placed on a bell and forbade the dedication ceremony. Subsequent explanations did not remove the misunderstanding—if indeed there really was one—and a breach became inevitable. Hideyori and his advisers invited to Osaka all who had suffered by the general redistribution of fiefs which took place after the battle of Sekigahara and finally Iyeyasu besieged the castle at the end of 1614. The resistance was stubborn and in Jan. 1615 a peace was arranged, one of the terms being that the moats should be filled in and the outer ramparts demolished. This considerably reduced the strength of the defences and Iyeyasu found a pretext to renew the siege in May. The fortress was stormed at last. Hideyori committed suicide: his cause collapsed and Iyeyasu's rule was undisputed.

THE TOKUGAWA PERIOD

The Dutch.—It was at this time that the Dutch first landed in Japan. In 1600 the "Liefde" was towed into the harbour of Funai in Bungo after a terrible voyage. On board was the "pilot major" of the expedition, an Englishman, Will Adams of Kent, whom Iyeyasu summoned to Osaka and honoured with his confidence. Adams was made master ship-builder to the Yedo Government, was employed as adviser and diplomatic agent in dealing with foreigners and received a substantial estate. He died in Japan in 1620. In 1605 the Shōgun gave the Dutch a licence to trade and four years later the Dutch East India Company established a factory in Hirado.

Adams, Saris and Cocks.—In 1613 an English factory was established there by Capt. John Saris of the "Clove." Saris received from Iyeyasu a most liberal charter which stated that "ground in Yedo in the place which they may desire shall be given to the English and they may erect houses and reside and trade there." Adams, who entered the service of the company, strongly advised that Uraga in the neighbourhood of Yedo was a better site than Hirado, but Saris would not listen. The enterprise was not successful, possibly because Iyeyasu's wish that Yedo should be its headquarters was disregarded. Saris departed in 1613 leaving Richard Cocks behind him as chief merchant. Cocks kept a diary which contains interesting information, but he was apparently not a good man of business: the "English House" came to an end after a troubled existence of ten years and was dissolved with a loss.

Christianity.—Iyeyasu seems, like Hideyoshi, to have started with no prejudice against Christianity but, like him, to have come to the conclusion that the Church as administered by Spanish and Portuguese priests was a dangerous political machine. Will Adams explained to him the difference between Roman Catholics and Protestants and how in Europe Catholic priests had been expelled from Protestant countries. The Portuguese Jesuits did all they could to calumniate the Spanish Franciscans and urged the Government to expel them. More than once the Spaniards advised the expulsion of the Dutch, and in 1611 an envoy sent by the viceroy of New Spain actually proposed to send Spanish men-of-war to burn all Dutch ships found in Japanese ports. Some incidents in Japan also roused Iyeyasu's suspicions. The Christian Prince of Arima endeavoured to obtain some disputed territory by means of forged documents and was most severely punished. All Christians holding offices at court were at the same time dismissed. The Spaniards had obtained permission to survey the Japanese coast, the Government seeing no harm in what was then a novel request, but when a Franciscan friar called Sotelo hastened to take an active part in the survey, suspicions were aroused. Although

Hideyoshi's edict of 1593 was in force, Sotelo opened an oratory in Yedo and held services. He himself was merely imprisoned for a short time but his converts were executed. Some Christians were also executed in Nagasaki, and Iyeyasu was much annoyed because their remains were worshipped as relics. On Jan. 27, 1614, a proclamation was issued suppressing Christianity. It directed that all foreign priests should be collected at Nagasaki and then removed: that all churches should be destroyed and that Japanese converts should be compelled to renounce their faith. As on previous occasions the priests refused to comply and either hid in Japan or returned after a short absence. The siege of Osaka distracted Iyeyasu's attention but did not mollify his severity, for there were many Christians on Hideyori's side.

A somewhat perplexing incident of this period is the despatch of an embassy to the pope and the king of Spain by Date Masamune, Daimyō of Sendai. He was a patron of art and literature as well as a most successful warrior and may well have been in favour of foreign trade and interested in Christianity. But it is not clear why he should have thus taken the initiative in approaching European powers. Perhaps at this moment Iyeyasu, who was cognizant of the whole business, may have been glad to have more information about Europe and have thought it a good thing to send a mission which could not be represented as coming from the Japanese Government if its credentials were seriously examined. Date obtained the release of the Father Sotelo mentioned above and despatched him in 1613 with one of his retainers called Hasekura and 60 persons to Mexico and thence to Spain and Rome. Hasekura was solemnly baptized in the presence of Philip III. and received with great pomp by the pope. When the mission returned in 1620, Date's views on religion and foreign policy had apparently changed. Its members were ordered to renounce Christianity, but Hasekura refused to do so and was not persecuted. Sotelo was less fortunate. On his way back he was detained two years in Manila and when he at last reached Japan he was imprisoned and ultimately burned.

Iyeyasu.—Iyeyasu died in 1616 and next year his remains were transferred with great pomp to Nikko. A well-known caricature represents Nobunaga as grinding flour, Hideyoshi as baking, and Iyeyasu as eating the cake. It may, perhaps, be said that he snatched it from Hideyoshi's heir and certainly statesman-like—a non-moral adjective—is the gentlest term that can be used to describe the proceedings by which he removed Hideyori. But it is hardly doubtful that the removal was for the good of Japan, for had Hideyori remained, Japan seemed likely to relapse into its previous woeful condition of internecine war. Iyeyasu had not perhaps the genius of Hideyoshi. On the other hand he avoided such perilous ventures as the Korean war and with admirable sagacity so consolidated and organized the system of Government that it remained almost unchanged in the hands of his descendants for two centuries and a half. Although he inaugurated the Tokugawa era, yet he was not responsible for the best known feature of it, namely, the seclusion of Japan and the almost complete expulsion of foreigners. Had he lived longer he might, like his grandson, have found this policy necessary, but up to the end of his life he drew a distinction between foreign trade and missionary enterprise. The former he wished to encourage: the latter he considered a political danger as preparing the way for foreign aggression and tending to draw Japanese away from their natural allegiance. But under his rule there were no executions of foreign missionaries. Before describing the conditions of Japan in the Tokugawa period it will be well to recount how in the next few decades the comparatively liberal principles of Iyeyasu gave way to the exclusion policy of Iyemitsu.

Exclusion Policy.—In 1616 Iyeyasu was succeeded by his son Hidetada who had already been nominal Shōgun for 11 years. A few months after his father's death he issued an edict against Christianity severer than any which had preceded it, although its enforcement was postponed until the next year on account of the obsequies of Iyeyasu. It again ordered the expulsion of all foreign Christian priests, and for the first time it was now declared a capital offence for any Japanese to become a Christian or have any connection with Christian missionaries, the punish-

ment being death by burning and confiscation of property. Moreover, Daimyōs were forbidden to keep Christians in their service or on their estates.

The Government probably thought that Christianity could be stamped out without much bloodshed, for in many districts Japanese had been forcibly converted wholesale by order of their feudal lords. But, as on previous occasions, the missionaries refused to leave. Japanese Christians, too, who, apart from religious convictions, had learnt from feudal warfare that loyalty to a cause is the first of human duties, showed extraordinary fortitude. There seem to be no accurate statistics of the number of native victims but it must have been very large. Japanese records speak of 200,000 persons being "punished," but this does not mean executed. The Jesuit Father Cardim gives a list of between 1,400 and 1,500 martyrs. Several foreigners perished. Two priests, de l'Assumpcion and Machado, who had been deported returned in 1617 and were decapitated. Instead of inspiring terror their execution gave new courage: thousands flocked to their tomb, which was believed to work miracles, and the two vice-provincials of Augustinians and Dominicans came out of hiding and started open propaganda. They were beheaded secretly. After some isolated executions of foreigners, there occurred in 1622 what was known as "the great martyrdom of Nagasaki," when 25 persons (including nine foreign priests) were burnt alive and 30 others were beheaded.

Iyemitsu.—Hidetada nominally abdicated in 1623 in favour of his son Iyemitsu and died in 1632. On becoming Shōgun Iyemitsu reissued the existing anti-Christian decrees, and 300 persons were executed in the immediate domains of the Tokugawa family, where hitherto there had not been much persecution. But it now continued uninterruptedly throughout Japan, being most violent in Kyushu because there were more Christians in that island than elsewhere, and the governors of Nagasaki were exceptionally rigorous.

Shimabara.—The last act of this tragedy is known as the Shimabara revolt. This district is a peninsula to the east of Nagasaki and opposite to it is the large island of Amakusa. In both Christianity had taken root earlier and more thoroughly than anywhere else in Japan and both had been the scene of severe persecutions. At the end of 1637 they rose in open rebellion. The old Dutch and Portuguese historians are disposed to regard this rising as mainly an agrarian revolt due to economic causes, especially over-taxation, whereas Japanese authorities treat it as a religious and political insurrection. Both causes were probably operative but it seems certain that for a long time the most stubborn and militant Christians had been collecting in this district, prepared to make a last stand. At the beginning of 1638 the insurgents withdrew from the island and fortified the ruined castle of Hara, where they defended themselves—some 37,000 men, women and children—for about three months against the forces sent to subdue them. Dutch ships assisted the Shōgun's troops in the siege and fired on the castle. When it was at last stormed an appalling massacre took place. Only 105 prisoners were taken and Christianity in Japan was practically suppressed. After this we hear of comparatively few martyrs. In Nagasaki and the neighbourhood the practice of Efumi, that is, trampling on pictures of Christ or the Virgin and Child, was enforced in the first month of each year. All the inhabitants, even children, were required to perform this ceremony to show that they did not belong to what was called the "wicked sect." The assertion that the Dutch complied with this regulation in order to ingratiate themselves with the authorities, though often made, seems not to be proved. The ceremony was not officially abolished until 1856. Yet it is said that Christianity was not entirely exterminated and that when the country was thrown open to foreigners in 1858, Roman Catholic priests found some of their co-religionists in Kyushu and Sado who had maintained their worship in secret.

Anti-foreign Legislation.—But the political consequences of the insurrection were most important. It is clear that the Tokugawa court were obsessed with the idea that foreigners were planning some sort of aggressive action. Hidetada had already got rid of the Spaniards, being moved chiefly by the

reports of an investigator, Ibi Masayoshi, whom he had sent to make confidential enquiries in Europe. Whereas his father had sent envoys to Manila, he refused to receive a Philippine embassy in 1624, and an edict was published ordering all Spaniards to be deported. Thus intercourse between the Japanese and Spaniards came to an end after lasting 32 years (1592–1624) but the Portuguese were allowed to trade at Nagasaki for 15 years longer. In this period the Tokugawa government clearly became more and more anti-foreign. In 1636 it was enacted that no Japanese vessel and no Japanese subject should go abroad under pain of death; that all descendants of Spaniards should be expelled; and that no ships large enough to cross the ocean should be constructed. At the same time many restrictions were placed on the Portuguese and in Nagasaki the artificial island of Deshima was constructed for their reception in front of the former Portuguese factory. In 1638 an edict was issued saying that since the Portuguese had continued to bring missionaries into Japan in spite of previous edicts, and since they had instigated the Shimabara rebellion, from that time onwards every Portuguese ship coming to Japan should be burnt with all her cargo and that all on board her should be executed. The Portuguese were most unwilling to abandon their profitable commerce. Four elderly and respected citizens of Macao were sent to Nagasaki on a special vessel carrying presents but no cargo, with instructions to explain that the Portuguese had no connection with the late rebellion and that the cessation of trade would injure Japan as much as Portugal. Their reception showed that the Japanese were in earnest. By order of the Shōgun to whom their arrival was reported the envoys and 57 of their companions were beheaded, 13 being sent back to Macao to tell the tale with a message which bade the Portuguese "think no more of us just as if we were no longer in the world." In spite of this very decided answer the Portuguese made one more attempt. For some years they had been subject to Spain. When they recovered their independence, Don Gonzalo di Siqueira was sent in 1647 with two vessels to explain that Portugal was now actually at war with Spain, and to urge that commercial relations with Japan should be reopened. But the reception was not much better than before. There was, indeed, no bloodshed but the Portuguese were surrounded by armed men and were glad to escape with their lives.

Now came the turn of the Dutch. Though they lost no opportunity of explaining to the Japanese that they did not belong to the same religion as the Spaniards and Portuguese and though they showed their animosity to Catholicism on many occasions, notably at the siege of Hara mentioned above, they did not escape suspicion and evidently there was a strong party against them at the Shōgun's court. Their factory was at Hirado and, apart from foreign politics, the authorities of Yedo were not disposed to see the Daimyōs of Kyushu, always ready to become semi-independent, strengthened by overseas trade. The governor of Ft. Zelandia in Formosa was badly received when he visited Yedo in 1627 and he subsequently quarrelled with a Japanese vessel in his own territory. As a result the Dutch factory at Hirado was suspended for four years and when it re-opened irksome restrictions on the sale of goods were imposed and there was much vexatious interference. The governor of Batavia sent an envoy to remonstrate and appeal to Iyeyasu's charter. But he was merely informed that the Japanese Government attached no importance to foreign trade and that the Dutch might remain only on condition of leaving Hirado and living in Nagasaki.

Dutch at Deshima.—Here their residence was restricted to Deshima, the artificial island which had been constructed for the reception of the Portuguese. It was not more than 300 paces in any direction and lay close to the shore with which it was connected by a bridge. Within these narrow limits and under almost intolerable conditions, the Dutch factory existed for more than two centuries. Communication with the shore and even domestic life on the island were subject to rigorous police surveillance and, though as time went on this severity was somewhat relaxed, the existence of the Dutch merchants was always humiliating. Their only outing was an annual mission to Yedo to offer

presents to the Shōgun and his court. We have a picture of one of these missions and of the life at Deshima from the pen of Kaempfer, a Westphalian who entered the service of the Dutch East India Company and arriving in Japan in 1690 spent two years there. According to his account the mission was on the whole well treated though subjected to disagreeable espionage, and he gives a strange description of how they appeared before the Shōgun and were obliged to dance, jump, pretend to be drunk, and perform other antics supposed to be illustrative of European life.

The question of allowing the British to trade in Japan never arose, because the British factory in Hirado, not being a financial success, was voluntarily closed in 1623 before serious friction between the Japanese Government and foreigners had begun. In 1673 the English East India Company attempted to reopen its trade and sent to Nagasaki a ship called the "Return" with a copy of the privileges granted to the former factory at Hirado, asking for their renewal. The vessel was not roughly treated but the crew were not allowed to land and the only reply vouchsafed was "that since our King (Charles II.) was married with the daughter of Portugal, their enemy, they could not admit us to have any trade and for no other reason." The seclusion of Japan was thus complete.

No Japanese might go abroad and no foreigner might come to Japan except a limited number of Dutch under special conditions as described. This state of things continued until American ships under Commodore Perry arrived in 1853.

Tokugawa Social System.—Iyemitsu, the third Shōgun, who ruled without abdicating until his death in 1631, is justly regarded as the chief author of the singular social system which prevailed in the Tokugawa period. But though he was of a haughty and imperious disposition, it is clear that his counsellors and the general opinion of the country saw no objection to his institutions. Japan of this time is well described in a document called the *Legacy of Iyeyasu*, which may contain some principles of its reputed author but was certainly not completed in its present form until the reign of Iyemitsu. But, though it may be called a forgery, it is a purely Japanese production and good evidence of custom and sentiment in the middle of the 17th century. In a hundred short sections it describes the constitution of society and the proper working of government. The Japanese were familiar with the division of society into three classes, the court nobles (*Kuge*), the military class (*Buke* or *Samurai*) and the common people (*Heimin*). This division was maintained theoretically by the Tokugawas but they also sanctioned the change which had gradually grown up in the period of internal war, namely the practical pre-eminence of the great feudal houses. The *Kuge* of Kyōto, of whom 138 houses survive, all claimed descent from ancient emperors or from deities. They ranked high above the military class and had a hereditary right to many great offices of state. Practically, having lost their estates and being reduced to poverty, they merely filled court sinecures in Kyōto and spent most of their time in artistic pursuits. The emperor, strictly guarded by the Shōgun's troops, was invisible and unapproachable for all except his court and high officials, his duty being not to govern but to mediate between his heavenly ancestors and his subjects. An exceedingly curious passage of the *Legacy* (sections XXIX. and XXX.) describes how an imperial prince is to be installed as chief abbot of the Tōyeizan temple at Tokyo, and that in the event of the emperor at Kyōto being "assailed by inimical barbarians" this princely abbot is to be elevated to the throne and receive the armed support of the Shōgun. In other words, if the emperor is so unwise as to make friends with the enemies of the Shōgun, the latter may depose him and has ready at hand a substitute whom he can immediately appoint in his place. There was actually an attempt to put this procedure in force in 1868 when the opponents of the emperor Meiji carried off the princely abbot to the north and proclaimed him as emperor there. Under the Hōjō and Ashikaga Shōguns great estates frequently changed hands according to the fortunes of war, but under the Tokugawas, though redistributions of fiefs occurred, a nobility grew up, each Daimyō enjoying considerable independence, provided that he conformed strictly to the general principles of government as laid down

at Yedo. The extraordinary ability of Iyeyasu is shown by the way in which he consolidated and arranged his conquests. The estates of those whom he vanquished formed an immense territory which passed into his hands and was so redistributed that all important strategic positions were held by nobles of undoubted loyalty, while every feudatory who was open to suspicion had for his near neighbours partisans of the Tokugawa family. Moreover, great Daimyōs were not allowed to remain too long on their estates, lest they might become too important as local potentates and independent of the central administration. They were obliged to have mansions in Yedo where their wives and children under age resided permanently, while they themselves had to visit the capital in alternate years.

No Daimyō might intermarry with the court nobility without the consent of the Shōgun or make any application to the emperor or build a new castle on his own estate. The Daimyōs were divided into two classes: *Fudai* or hereditary vassals of the Tokugawa, defined in the *Legacy* as those who followed Iyeyasu and proffered their fealty before the siege of Osaka, and *Tozama*, or outside lords, those who submitted after its downfall. The *Fudai* were more directly dependent on the good-will of the Shōgun than the others, for he could alter their revenues or transfer them from one fief to another, but they only (with rare and late exceptions) were eligible as members of the *Gorōjū*, or Shōgun's council of State, and as governors of the great castles of Osaka, Fushimi and the Nijō in Kyōto. The last was practically charged with the custody of the emperor. Owing to their position the *Tozama* Daimyōs of the north and west enjoyed considerable independence. The Shōguns, for instance, were exceedingly cautious in interfering in the affairs of Satsuma.

The wealth of a Daimyō was estimated in terms of *Koku* of rice, the value of one *Koku* being about £1. About half the amount went to the Daimyō himself, the other half to the tillers of the soil. The richest was Mayeda of Kaga, who had more than a million *Koku*. The Tokugawa family itself was divided into the three houses of Mito, Kii and Owari (the fiefs bestowed by Iyeyasu on three of his sons), and in event of the Shōgun having no direct issue it was from these that the heir was chosen. The general body of Samurai or retainers lived frugally on stipends calculated in terms of *Koku*. In theory they paid no taxes, but in practice the presents which they were obliged to present to their superiors at stated intervals were a heavy impost. Comparatively few owned land, which was usually bestowed as a reward of conspicuous merit. An important class of small landowners was formed by the Hatamoto (under the flag) who were supposed to be immediate retainers of the Shōgun and ranked immediately after the Daimyōs. The Rōnin (wavemen), who play some part in history and a greater one in Japanese romance, were homeless and lordless Samurai, who had left their master's service for some reason, it may be for misconduct or it may be because they proposed to do something—e.g., to take revenge—which, though regarded as a moral duty, might bring their master's house into trouble if performed by his retainers. In Yedo there were two distinct classes of population between whom little love was lost, the townsmen subject to the civil magistrates, and the Samurai under the direction of their feudal chiefs, who were guided by the *Buke Shohatto*, or regulations for the military class, supposed to be issued at the beginning of each Shōgun's reign. The feudal chiefs resided in mansions called *Yashikis* near the palace, often with grounds of considerable extent and surrounded by a labyrinth of tortuous streets and small dwellings assigned to their retainers.

The Heimin, or commoners, were divided into three classes, husbandmen, artisans and traders. Of these the first were the most respected, and a farmer on his own land might wear one sword, but never two, that being the privilege of the Samurai. Artisans were also esteemed, particularly as they were often artists in our sense of the word and were in the permanent service of feudal lords from whom they received fixed salaries. But throughout the Tokugawa period traders were regarded with disdain and stood lowest in the social scale, though still more contemptible were the outcasts, *Eta* and *Hinin* who were regarded as being outside the community and performed such disagreeable duties as

slaughtering animals and executing criminals. The Eta lived in separate villages and could not eat or intermarry with others. In spite of many hypotheses, no certain account can be given of their origin. They were officially enfranchised in 1871, but the popular prejudice against them is still strong and gives rise to occasional riots.

The Government of Yedo, like the Chinese, had a great dislike of litigation: every attempt was made to discourage it and to settle disputes by arbitration or conciliation. The various classes of magistrates had also other functions such as municipal duties and the collection of revenue. It was some time before a Supreme Court was evolved and even then it was not quite independent of the administration, for members of the council of State could be present unseen and supervise its proceedings behind a curtain.

Iyetsuna.—Iyemitsu died rather suddenly in 1651 and was succeeded by his young son Iyetsuna, whose guardianship he entrusted to Hoshina of Aizu. The situation was not without danger but was saved by the heads of the houses of Kii and Mito, who were younger sons of Iyeyasu and supported the new Shōgun. In the same year there was a formidable conspiracy of Rōnin, led by Yui and Marubashi. The former was the son of a dyer who had formed the dangerous ambition of emulating Hideyoshi: the latter was the son of the dispossessed Daimyō of Tosa who had fought against Iyeyasu at Osaka. The plot was discovered. Yui had time to commit suicide, but his partner and accomplice with many of their wives and children were either crucified or beheaded. It was part of the conspirators' design to set fire to Yedo, and the events of 1657 showed what awful proportions such a conflagration might assume and how easy it would have been for a band of desperadoes with their plans prepared to take possession of the city. In that year a fire broke out during a hurricane: Yedo was almost literally reduced to a heap of ashes and the loss of life was appalling. Waegener, who was there at the head of the annual Dutch mission, estimated it at 100,000. Fortunately the Government granaries were defended by thick mud walls which withstood the flames and, as in 1923, the administration dealt ably and energetically with the work of relief and reconstruction.

In 1669-70 occurred what is called the Great Ainu Revolt, a last attempt of the aborigines to assert their independence. It had important consequences, for Mutsu and Dewa, the distant provinces of the north, were now utilized as granaries of the empire. The legislation of 1635 had made it illegal to build sea-going vessels, but this drastic legislation was now modified and a regular service of rice-transports was organized to provision Yedo and Osaka. Under the rule of Iyetsuna an attempt was also made to render the laws of Japan more humane. Cruel punishments were somewhat mitigated and the relatives of criminals were less severely treated. *Junshi*, the suicide of retainers in order to follow their master in death, was forbidden and accessories were punished. Iyemitsu had actually ordered some of his counsellors and attendants to "follow him on the dark path," and how deeply rooted this idea is in Japan may be seen by the fact that Gen. Nogi and his wife killed themselves on the occasion of the emperor Meiji's funeral in 1912, and for having done so are held up as an example to the youth of Japan and almost deified.

Iyetsuna, who had never taken an active part in the business of government, became an invalid in 1675 and left everything in the hands of Sakai Tadakiyo, who filled the office of Tairo. Five years later he died without issue. Sakai proposed to revert to the practice of the old Kamakura administration and to appoint an imperial prince as Shōgun, remaining regent himself. But the council refused to accept this proposal. Sakai had to retire and Iyemitsu's fourth son Tsunayoshi (1680-1709) succeeded.

Tsunayoshi.—He became known to the populace by the nickname of the Shōgun of dogs. Though he was an ardent student of Confucian literature, he was also a devout Buddhist and carried to an extreme length the beautiful Buddhist precepts forbidding cruelty to animals. He made it a crime not only to kill but even to maim animals, and by his orders a page was beheaded for having accidentally killed a bird. The first of these decrees was published in 1687 and from that time to Tsunayoshi's death hardly a year passed without the issue of edicts re-affirming

or supplementing this unusual legislation. It is interesting to see that the Shōgun's position was so strong that he was able to make his subjects submit to what most of them must have regarded as a craze, for though the eating of meat was not common at this period, the Samurais' code attached little value to the life of men, let alone animals. The chief reason for this obedience was no doubt the extreme efficiency of the Tokugawa despotic system. Even if a Daimyō was not in Yedo himself his family were obliged to be in his mansion there and could be made answerable for any act of disobedience on his part.

Tsunayoshi had also a passion for the *Nō* drama and appeared on the stage himself, for it was a peculiarity of these plays that the aristocratic amateurs could take part in them without losing caste, whereas other kinds of acting were considered disgraceful. Theatres of all kinds flourished in Yedo, and life was not only gay but artistic. The products of the Genroku epoch (1688-1704) are of remarkable excellence, especially the lacquer. The provinces were impoverished because the Daimyōs were continually imposing new taxes on the cultivators to pay for their own town amusements, but there was plenty of money in the capital. The coinage was depreciated but as the Samurai received their stipends mostly in kind and had more rice than they required for their household needs, they sold the surplus and cash was abundant. Ultimately the money squandered on actors and geishas passed into the pockets of the mercantile class, for none of it went abroad. Though they were still theoretically the lowest grade of the social scale, merchants amassed such large fortunes that it was impossible to ignore them. Many of the commercial magnates of modern Japan, such as the Mitsui and Sumitomo, were already flourishing at this time. Another side of life is illustrated by the story of the Forty-Seven Rōnin, the most celebrated of Japanese romances. A certain nobleman was insulted in the Shōgun's palace in the year 1701 and drew his sword within the sacred precincts. For this unpardonable outrage he was obliged to commit *harakiri* at once, his family was declared extinct and his retainers were disbanded. They accepted their position without hesitation: the code of military honour obliged them to slay the man who had insulted their master, although the Civil Code threatened them with capital punishment for doing so. They spent two years in every kind of adventure, and having at last surprised and killed their adversary, they deposited his head on their lord's grave amidst the applause of admiring crowds, and all disembowelled themselves. The temple in Tokyo where they are buried is still a resort for popular pilgrimages and incense is kept continually burning before their tombs. In 1703 and 1708 the life of Yedo was disturbed by disastrous earthquakes and there was also an eruption of Mount Fuji. As he grew older, the Shōgun devoted himself more and more to art and literature and let his favourite Yanagisawa manage all public business. After the death of his mother in 1705 he secluded himself entirely under plea of mourning. Four years later he died somewhat mysteriously but apparently the story that he was murdered by his wife does not merit credence. He was succeeded by his nephew Iyenobu, who promised to be a competent ruler but unfortunately died in 1712 three years after his accession. The people went into voluntary mourning for him, a compliment which had been paid to no previous Tokugawa. He was succeeded by his infant son, Iyetsugu, who also held the nominal office for only three years. No events of much importance occurred in this interval, but an interesting description of the life of the period has been preserved in the works of Arai, the tutor and afterwards the adviser of Iyenobu. He relates among other things how he examined the Italian priest Sidotti, who came to Japan on a missionary enterprise and died in prison. With the death of the infant Iyetsugu the line of Hidetada, the second Tokugawa Shōgun, became extinct, and an heir had to be found in one of the three Tokugawa houses descended from Iyeyasu. Iyenobu, foreseeing that his own son was not likely to live long, had designated as heir Yoshimune of the house of Kii.

Yoshimune.—Yoshimune was perhaps the best of the Tokugawa Shōguns and illustrated the excellence of paternal

government when exercised by a capable and unselfish sovereign. His long rule (1716-1744) offers few exciting incidents but is a continuous record of reform and beneficial legislation, much of it obviously directed against the dangers threatening a capital and military class entirely given over to luxury. He did his best to make the court ceremonial simpler and more rational. Whereas previous Shōguns had received the Dutch envoys unseen and sitting behind a curtain, he met them face to face and conversed with them. Similarly, he made a practice of receiving ordinary Samurai in audience, if they had in any way distinguished themselves. In order to know more of the opinions and grievances of simple citizens he revived the ancient institution of a "Complaint (or suggestion) Box," which was set up outside the Supreme Court. He kept the key himself and any properly signed communication received due attention. Yoshimune spent his leisure in hunting and hawking whence, in contrast to his predecessor Tsunayoshi, he was called the Hawk Shōgun or Bird-catching Shōgun. Believing outdoor sports to be a good corrective of the luxurious life of Yedo, he encouraged the Samurai to accompany him and devised for them such strenuous forms of exercise as the unexpected swimming of a river. In 1726 he organized a great hunting expedition in which 60,000 men took part and were put through evolutions like an army in the field. There was, it appears, no code of law at this time, but Yoshimune made a beginning by himself supervising the preparation of the Hundred Articles of Kwampō, which became the basis of the criminal law. These articles were issued in 1742, but it is interesting to note that it was not thought necessary to bring them to the notice of the public, but merely to distribute copies among the judges and other officers concerned. Ōoka Tadasuke, a sort of Japanese Solomon, was city magistrate of Yedo in this period and his sagacious and often amusing decisions are among the best known stories even now.

Yoshimune was strongly in favour of primogeniture as a principle for settling disputed succession and thus avoiding the dissensions from which almost every great family suffered. Unfortunately his own family showed that the principle has disadvantages, for his eldest son Iyeshige was a debauchee and of no ability, whereas his second son seemed a most desirable successor and his advisers suggested that he might be named heir apparent. But Yoshimune was unwilling. He retired nominally in 1744, his eldest son being declared Shōgun and his grandson Iyeharu heir apparent. His intention was to supervise Iyeshige and, if he proved incorrigible, to make him retire when Iyeharu attained his majority, but he died himself before that happened. He also established his two younger sons as heads of new Tokugawa houses and later his grandson, the second son of Iyeshige, received the same honour. The three houses thus formed were those of Tayasu, Hitotsubashi and Shimizu and, in the event of direct heirs to the Shōgunate failing, had a right to the succession. Iyeshige (1744-1760) proved a deplorably bad ruler, especially after his father's death in 1751. He is not charged with specially heinous acts of tyranny but at this time the personal power of the Shōgun was so great that if he was dissolute himself he was bound to injure the whole administration. For instance, if he required money for his pleasures, the Daimyōs were informed that (contrary to the practice in Yoshimune's time) the gifts which it was the custom for them to present on ceremonial occasions ought to be of real value. Great officials imitated the Shōgun and naturally givers of presents recouped themselves at the expense of their dependents. Favouritism, extortion and corruption became rampant and risings of the peasantry occurred. The management of affairs passed into the hands of chamberlains and secretaries. Nevertheless, no great disaster occurred under Iyeshige's rule. He died in 1761 having abdicated the year before in favour of his son Iyeharu, then aged 23. Iyeharu was a youth of good parts and began his rule with some legal reforms. But though he was not a profligate like his father and inherited his grandfather's love of open air sport, he had also a dangerous love of display and magnificence and let himself be ruled by favourites, the chief of whom was Tanuma, who is said to have amassed a

colossal fortune. The dissipation and extravagance of Yedo increased and spread to the surrounding districts, for it was the custom to hire servants for the Daimyōs' mansions by the year, after which many of them returned to the country with their morals not improved. But still, contemporary testimony states that in south-western Japan and in the great fief of the Uyesugi family, whose capital was at Yonezawa, the local administration was good. A little later an interesting light is thrown on the condition of the rural districts by the career of Ninomiya (1787-1856) who founded in the Kwantō and neighbouring provinces a system of credit associations to which farmers subscribed and from which they obtained loans in case of need. The later years of Iyeharu were darkened by a series of terrible natural calamities. Earthquakes and eruptions were followed by a drought known as the famine of Temmei (the period 1781-1789), and after this came equally destructive floods. More than a million persons are said to have perished in these various disasters and the measures proposed by the Government to relieve the distress proved totally inadequate.

Iyenari.—Iyeharu died in 1786. His two sons had predeceased him and he had adopted as his heir Iyenari of the house of Hitotsubashi, according to the arrangement mentioned above. The young prince did not attain his majority until 1793, and during this period the Government was administered by Matsudaira Sadanobu, who really belonged to the Tasuya house and was a grandson of Yoshimune, although he had been adopted into the Matsudaira family. Tanuma, the late Shōgun's favourite, had to retire, his son having been assassinated two years before. According to Titsingh, the head of the Dutch factory at Deshima to whom we owe an interesting account of this period, this son was "of a truly enlightened and imposing character" and would have opened Japan to foreigners, but Japanese accounts state that the family were hated for their rapacity and corruption. The populace stoned the funeral cortège of the victim, and the assassin, though he had to commit suicide, became an object of public veneration.

Matsudaira Sadanobu's administration (1786-93) was one of the periods of reform and retrenchment which occurred periodically in the history of the Tokugawa Shōgunate. There was, indeed, something self-contradictory in the principles of that Government. Soldiers were recognized as the highest class and yet there was no place for the soldier's occupation—fighting. Japan had no dealings with foreign nations and consequently no foreign wars: even defence against foreign aggression was not a practical necessity. Internal wars between the great feudal houses were obviously harmful to the country. The result was that most Samurai, especially in Yedo, tended to drift, not towards insurrection (for the extraordinarily efficient discipline averted this danger), but towards dissipation and effeminacy. The regent set himself to correct public morals and with considerable success. The system of requiring presents was abolished; favouritism and corruption were greatly diminished and the administration of justice, which had grown very bad, became prompt and efficient. But he found the military class so hopelessly in debt that they could not pay if they lived by honest means, and therefore he had recourse to the old device of a cancellation of debts. All debts of more than six years' standing incurred by Hatamotos were nullified and more recent ones were payable at reduced interest. These ordinances were accompanied by unusually severe sumptuary legislation. The use of gold and silver for ornament was practically interdicted and there were rigorous regulations about dolls and sweetmeats. Sadanobu's reforms seem to have done real good for a time but in some other ways he was less judicious and under his rule we see faint signs of the movements which were destined to overthrow the Shōgunate and restore the authority of the emperor. Hitherto the Shōguns had been on good terms with the court of Kyōto and had kept it in obscurity while treating it with great respect. But in the interests of economy Sadanobu requested them to despatch less frequent missions to Yedo, which was taken amiss and he had a misunderstanding with the Emperor Kokaku about the imperial right to confer titles. For the moment nothing of

great importance happened, but several enthusiasts, notably Gamō, Hayashi and Takayama travelled about the country preaching the duty of paying more respect to the emperor. Takayama committed *harakiri* as a public protest against the neglect of loyalty and Hayashi was imprisoned for seeming to exalt the emperor to the prejudice of the Shōgun, but in the Meiji era he received posthumous rank as a reward for his services to the imperial house. Sadanobu retired from the regency in 1793 and the young Shōgun assumed control of the Government which he continued to exercise for 48 years, for though he abdicated in favour of his son in 1837 he continued to rule until his death in 1841. Though not devoid of talent, Iyenari cannot be ranked among the ablest men of his house, and he was somewhat under the influence of his friends and especially of his numerous se-raglio. For the first 13 years of his rule he was also strongly influenced by his father, who considered he had been slighted by Sadamaru and disliked the latter's reforms. Accordingly the old tendency to magnificence and luxury set in again. Iyenari married a daughter of Shimazu of Satsuma who had been adopted into the Konoye family, one of the branches of the Fujiwara house. He was thus brought into intimate relations with the court nobility and the great but very distant house of Kyushu, and this tended to give the Fudai—or vassals of the Tokugawa house—less power than they had previously enjoyed.

The influence of the Rōjū or council of State also declined. Iyenari paid most respectful attention to the emperor who showed his appreciation by conferring on him several titles which added nothing to his real power, but so great is the importance attached to ceremony that the Shōgunate seemed to have reached the acme of its magnificence. After the death of Iyenari's father Mizuno Tadashige became chief adviser and favourite, and when he died in 1835 he was succeeded by another Mizuno, Tadakuni, who became well known as the author of another set of sumptuary laws which were not very successful. He also seems to have been in favour of foreign intercourse.

About this time there was a famine, and popular indignation was aroused against the guilds of merchants, who were accused of buying up necessities and selling them only at outrageous prices. A serious outbreak occurred at Osaka where one Oshio designed to kill the magistrates, seize the castle and force the merchants to distribute their stores. Though the plot was betrayed and frustrated, there was serious fighting and a great part of the city was burnt. Mizuno dealt drastically with the guilds and practically suppressed them for some years, but it was found necessary to revive them and his ordinances against luxury were not more permanent. Apparently they were so worded as to bear heavily on the ordinary townsfolk, whereas earlier legislation of the same kind had chiefly affected the upper classes. Mizuno was suddenly dismissed in 1843, restored to his office next year but dismissed again and banished for good in 1845. Meanwhile, Iyenari had died in 1841 and his son Iyeyoshi, who was already titular Shōgun, had to govern without his assistance. Though Iyeyoshi was 45 years of age he had no will of his own and counted for nothing during his rule which lasted till 1853, the year of Commodore Perry's arrival.

Shinto Movement.—Under the long rule of Iyenari various movements which conspired to bring about the surprising transformation of Japan in the latter part of the 19th century began to make themselves felt. One of these was a movement in favour of pure Shinto, as distinct from Chinese Confucianism and Buddhism, the two systems most favoured by the Tokugawa régime. Yet the origin of the movement may be traced to the literary activity of Mitsukuri (1628–1700), head of the Mito branch of the Tokugawa family, who, with the help of a band of scholars composed the *Dai Nihonshi*, a general history of Japan down to 1413, which is still a standard book. The practical bearings of his studies are shown by the fact that he destroyed 1,000 Buddhist temples on his estates. In the next century followed such distinguished exponents of Shinto as Mabuchi (1697–1769), Motoori (1730–1801) and Hirata, his even more influential pupil (1778–1843). Though this movement seems to be literary and philosophic, it had a most important

political bearing. It was intensely Japanese and anti-Chinese. But in exalting everything that was purely Japanese it had to fall back on the Kojiki and Nihongi and other ancient lore which dealt with the imperial house of divine descent. Here it naturally found itself in conflict with the doctrines which were acceptable at Yedo, for all its teachings tended to glorify the emperor and

had no place for the Shōgun. A work of Hirata's which had won the admiration of the court at Kyoto was suppressed and he was banished to his native town in 1840.

Dutch Learning.—Another intellectual movement, small in numbers but of great importance, was the furtive pursuit of Dutch learning. The Japanese are the most inquisitive people in the world and the terror of European aggression did not prevent the few who had any opportunity from learning all they could about Europe, especially its science and inventions. It has been truly observed that the adventures of these pioneer students were often as interesting as the most thrilling romances published in Yedo. A physician called Sugita Fusai (c. 1780) has left an autobiography in which he describes his difficulties and troubles in learning Dutch and practical anatomy, which latter he studied on the execution ground. He wrote a book on the human body and was allowed to present a copy to the Shōgun. In this he was more fortunate than his predecessors, for a little while before, a work published by a naturalist called Gotō had been suppressed, simply because it contained the Dutch alphabet. Though the Government discouraged the study of Dutch, the Shōgun Yoshimune himself had Dutch books translated for his own benefit, and Titsingh tells us that several "persons of quality" diligently studied the language and that the Prince of Satsuma (the father-in-law of the Shōgun Iyenari) used the Roman alphabet in his letters when he wished to write secrets. When Siebold was in Japan (1823–29) his house was frequented by pupils from every part of the empire, but they got into trouble and he himself had difficulties. A little later clubs for the study of Dutch were established. There was strenuous opposition, but on the other hand medical opinion insisted on the importance of the study and made itself heard. The Government decided that only physicians might learn Dutch and a medical school was established in Osaka in 1838. The result was that everyone who wished to learn Dutch professed to be a medical student and 3,000 pupils are said to have passed through the school in 24 years. In 1795 an edict required all candidates for official posts to subscribe to the doctrines called Teishu, that is, the particular interpretation of Confucian philosophy which was taught in Government schools, though many learned men favoured other interpretations. Though these persistent efforts to suppress foreign learning and freedom of thought affected comparatively few, they contributed to the unpopularity of the Shōgunate. It had not many disinterested friends when the great upheaval came after 1854.

Intercourse with Europe and America.—Though the opening of Japan came quite suddenly and though the Shōgun's Government enforced the prohibition of intercourse with all foreigners except the Dutch with extraordinary rigour and efficiency until the last, yet naturally, from stress of weather or other causes, foreign vessels occasionally touched at Japanese ports. They were generally driven away, sometimes by gunfire even when their object was benevolent, such as the repatriation of Japanese who had strayed abroad. In 1808 when Great Britain and Holland were at war a sensation was created by the brief apparition at Nagasaki of H.M.S. "Phaëton" in pursuit of Dutch ships. The Japanese saw in this a sign of European aggression and the Dutch, wishing to preserve a monopoly of foreign trade, worked on these fears. The first attempts at establishing relations with Japan were made by the Russians in

connection with the fur trade. A Russian envoy appeared at Nagasaki in 1804, but only to receive a flat refusal. Collisions followed between Japanese and Russians in Sakhalin and the Kurile islands, but renewed Russian attempts to find some basis of amicable intercourse failed. The whaling industry began to grow at this period and ships often sent boats to the Japanese coast to obtain supplies. In 1824 the crew of an English vessel who landed in this way near Kagoshima slaughtered cattle and used other violence. This aroused strong ill-feeling and next year the Government published an expulsion decree, ordering the local authorities to drive away all foreign vessels attempting to put into port and to arrest or execute any foreigners who might land. Somewhat later the Japanese became impressed with the growing power of England in the Far East, as shown by the cession of Hongkong and the opening of various Chinese ports and Mizuno Tadakuni, who was then at the head of affairs, issued in 1843 modified instructions to local authorities saying that though foreigners were on no account to be allowed to land, yet foreign ships were not to be driven away but were allowed to receive provisions and fuel. At the same time he requested the Dutch at Deshima to supply him with models of European machines and copies of illustrated books and newspapers. Even the Dutch now began to recommend the opening up of Japan, and the king of Holland sent an envoy with a despatch advising the Shōgun to abandon the policy of isolation. The envoy was not allowed to proceed beyond Nagasaki and when a reply was at last sent in 1845 (after the fall of Mizuno) it simply stated the law of Japan as it stood, adding, "Henceforth pray cease correspondence."

Owing to the increase of whaling enterprise of trade with China, American ships were beginning to frequent the Far East but their occasional visits to Japanese ports had left a disagreeable impression, the "Morrison" having been fired on in 1837. In 1845 a resolution was introduced in Congress recommending that "commercial arrangements" should be made with Japan and for this purpose Commodore Biddle was sent with two ships next year. He stayed nine days at Uraga but his attempts to negotiate a treaty met with a flat refusal and he was roughly handled himself but, as his instructions ordered him to do nothing that could excite hostility, he accepted the apologies offered and returned to the United States.

Commodore Perry.—The Government of Washington, however, determined not to drop the matter and on July 8, 1853, Commodore Perry entered Uraga harbour with four ships and 560 men. He bore a letter from the President requesting the conclusion of a commercial treaty but abstained from any attempt to coerce or threaten. He presented his letter, distributed many presents consisting chiefly of mechanical toys and instruments, and after staying ten days sailed away to China, saying that he would return in the spring. The Japanese, who, since the days of the Mongol invasion, had not seen more than a couple of foreign ships together, were panic-stricken at the appearance of the American squadron. The emperor at Kyōto was solemnly informed of the awful event, and his majesty ordered that prayers for the destruction of the barbarians should be offered at the seven principal shrines. At first the Government of Yedo seems to have thought of resistance. The prohibition against building sea-going ships was removed and feudal chiefs were ordered to build and arm large vessels; the Dutch at Deshima were asked to furnish a man-of-war and modern military appliances and the army was prepared for action. But the conviction soon prevailed that effective resistance was impossible, and on Dec. 2 instructions were issued that if the Americans returned, they were to be given a pacific reception. Perry did return in the February of the next year (1854) with a still more formidable force of ten ships and 2,000 men and after six weeks of negotiation obtained a treaty of peace and friendship which stipulated that the ports of Shimoda in Izu and Hakodate should be opened to American ships and that Americans be allowed to frequent them within definite limits: that American consuls or agents might reside in Shimoda; that shipwrecked sailors should be relieved and that ships might obtain fuel and provisions in Japanese territory.

Perry remained in Japan till June and then went to Canton. His visit had been short and successful, but the last entry in the *Journal of Wells Williams*, his interpreter, is "Thus ends my expedition to Japan, for which praise God."

Meanwhile Japan was in a ferment. The Shōgun died in 1853 and was succeeded by two nonentities, Iyesada (1853-1858) and Iyemoshi (1858-1866). It may be mentioned that the name Tycoon commonly used by foreigners at this time is the Japanese Taikun or great prince. The title had been used in negotiations with Korea in the 16th century and was now resumed in dealing with western powers, with the object of enhancing the dignity of the Shōgun since that word means simply generalissimo. This was explained in a despatch addressed to Townsend Harris in November 1857.

The emperor was Kōmei (1847-1867) the father of Meiji, a man of more character than his immediate predecessors and of strongly conservative, that is anti-foreign, principles. From 1853 to 1860 the chief power was in the hands of Ii Naosuke, who was Tairō or First Minister, during the last two years of his life. He was a man of great intelligence and courage who, seeing that Japan had no chance of successfully withstanding foreign insistence, assumed the responsibility of signing the treaties. His policy had many prominent opponents, especially Tokugawa Nariaki of Mito, and the quarrel was complicated by this latter's desire to make his own son Shōgun. This son (who eventually became the last Shōgun under the name of Keiki or Yoshinobu, had been adopted as heir of the house of Hitotsubashi and hence was eligible for succession, but Ii successfully supported the claims of Iyemochi of the house of Kii. Ii was assassinated by Rōnin of Mito in 1860—a victim to anti-foreign sentiment and clan intrigues. However, it was not possible to refuse to other powers the concession already granted to America. Russia, Holland and England soon secured for themselves similar treaties. But these instruments were in reality mere grants of privileges and not commercial treaties such as are usual among friendly nations. America again led the way. Townsend Harris, the first consul general of the United States, arrived at Shimoda in 1856 and in the next year signed a convention which gave American citizens the rights of permanent residence at Shimoda and Hakodate and opened Nagasaki to American ships. But Harris was not satisfied with this and pressed for permission to proceed to Yedo and negotiate directly with the Shōgun. After ten months he succeeded and was received in audience. In 1859 a treaty was signed providing that the port of Yokohama should be opened from July 4, and that commerce between Japan and the United States should be freely carried on there. The Shōgun's ministers signed this document without receiving the imperial sanction and were well aware of the danger they were incurring in acting contrary to public opinion, but they were also greatly impressed by the news communicated to them by Harris, of the suppression of the Indian Mutiny, the capture of the Taku forts, the Treaty of Tientsin and the impending arrival of British and French plenipotentiaries with squadrons to enforce their demands. They therefore thought it better to sign at once a moderate treaty with America which they could offer to other powers and perhaps prevent them from asking for more. A few weeks after the signature of this treaty Lord Elgin, British commissioner to China and Japan, arrived at Shimoda, and on Aug. 20 concluded a treaty with Japan on the basis of the American treaty and in the following October Baron Gros did the same thing for the French. In Feb. 1860, the Japanese despatched their first foreign envoys to Washington. Their time of absence was strictly limited and they remained only six weeks in America. A second mission was despatched in 1862, this time to all the European courts in succession, and it returned after spending a year in making this round of visits.

The Emperor and the Shōgun.—Meanwhile the position of the Shōgun himself was becoming very difficult. Quite apart from the question of foreign intercourse, there had arisen a party whose watchword was the sanctity of the imperial house. When foreigners insisted on landing, the sentiment of the people was at first hostile. The Government of the Shōgun, having to face

the practical work of negotiation and the possibility of a bombardment, was comparatively liberal in its attitude, whereas the emperor, disturbed by no disagreeable contact with the outside world, remained severely aloof and naturally came to be regarded as the guardian of Japan's sacred soil which his servant the Shōgun could not or would not protect from barbarian invasion. The cry *Son-o jo-i*, "revere the Sovereign": "expel barbarians," which was heard everywhere, began to be interpreted as meaning revere the emperor not the Shōgun, and the incidents of the protracted crisis naturally made intelligent citizens feel the evils of a dual and not always harmonious Government. The Tokugawa statesmen did their best to bring about some form of union. A marriage was arranged between the young Shōgun and the emperor's sister and took place at Yedo in 1862. The year after, the Shōgun was summoned to Kyōto which no Shōgun had visited since 1634. He remained there three months, showing the utmost deference to the emperor and finally agreed to the issue of orders directing Daimyōs to muster troops and prepare to assist the court in the task of "sweeping out barbarians." When such a temper prevailed, it is not surprising if murderous attacks were made on foreigners. In 1862 two sentries had been killed in an attack on the British legation and an Englishman called Richardson had been cut down on the road between Yedo and Yokohama, because he got in the way of the retinue of the prince of Satsuma. The British Government demanded an indemnity and punishment of the murderers, but Prince Shimazu refused to comply and as he was the most independent of all the feudal chiefs, the Government of the Shōgun could not have compelled him to give satisfaction even had they desired it.

Bombardment of Satsuma and Chōshū.—Accordingly in Aug. 1863, Kagoshima, the capital of Satsuma, was bombarded and partially destroyed by a British fleet. In the same year the Daimyō of Chōshū, the extreme western province of the main island, whose batteries commanded the Straits of Shimonoseki, fired on Dutch, French and American vessels. As a reprisal for this an allied fleet of nine British, four Dutch and three French warships bombarded Shimonoseki in 1864 and an indemnity of \$3,000,000 was demanded. This indemnity was not completely paid until 1875, and the conduct of the Powers in using it as an instrument of diplomatic pressure and in exacting payment from the Meiji Government, which certainly was not responsible for the outrage, occasioned much rancour. As a matter of fact the Daimyō of Chōshū was in rebellion, for shortly before firing on the foreign ships, he had done the same to a vessel which was carrying a mission from the Shōgun to Kyūshū and had killed two officials. The effect produced by these bombardments was wonderful. The emperor had to withdraw his instructions for the expulsion of foreigners, for it was plain not only that foreigners were vastly superior in all mechanical arts connected with warfare, but that they were acting in combination against Japan. Henceforward the real question was not how to get rid of them but how to imitate the useful features of their civilization. This new attitude was particularly noticeable in Satsuma: the population had already shown themselves willing to use such small opportunities of foreign intercourse as they had, and the murder of Richardson and the refusal to give satisfaction had been due to their traditional arrogance and independence rather than to hatred of Europeans. They showed no resentment after the bombardment, but were eager to establish friendship with the British for whose naval efficiency they felt the greatest admiration. Much the same sentiments prevailed in Chōshū and the two clans agreed to co-operate, though subsequently their rivalry became a feature in Japanese politics. In 1865 Sir Harry Parkes arrived as British minister. His chief objects were to obtain from the emperor a ratification of the existing treaties, which had not yet been vouchsafed, to reduce the duty on imports from 15 to 5% *ad valorem*, to secure the immediate opening of Osaka and Hyōgo (Kobe) and to receive payment of the Chōshū indemnity. He was a man of somewhat peremptory methods and arranged with his colleagues to proceed with a fleet of British, Dutch and French vessels to Hyōgo, the place appointed for the negotiations. The recent memory of the bombardments of Kago-

shima and Shimonoseki and the mere idea that such proceedings might be repeated in the neighbourhood of the sacred city of Kyōto sufficed to make the court yield and the emperor gave his consent on Nov. 22, 1865, in a brief order addressed to the Shōgun directing him to make the necessary arrangements. In the next year the treaties were supplemented by a new tariff convention.

These proceedings may seem to be a victory for the Government of Yedo, but they were not, and the Shōgunate was now tottering. To begin with, the idea of abolishing the emperor was unthinkable to any Japanese. If the administration was to be simplified, it was clear to everyone that it was the Shōgun who had to go. And for practical purposes it was no doubt better that the impending work of reconstruction should be undertaken by a power which, though ancient and sacrosanct, emerged from its retirement like something new, than by a worn out feudal administration hampered by numerous quarrels with its vassals. In consenting to the treaties in 1865 the emperor was far from indicating that he yielded to the views of the Yedo Government. On the contrary he dismissed and punished the negotiators—a step without precedent and tantamount to withdrawing the administrative commission given to the Tokugawa family in the time of Iyeyasu. On this the Shōgun presented his resignation, but at the same time handed in a memorial showing that the opening of the country was inevitable. For the moment the resignation was not accepted.

Parkes showed good judgment in getting into touch with the distant but powerful clans who were about to play a great part in the making of new Japan. In 1865 he went to Shimonoseki, where the authorities expressed satisfaction with the new treaty and next year he visited Kagoshima, where Prince Shimazu entertained him with the utmost cordiality, and Shikoku. Satsuma purchased steamers and manufactured breach-loaders, and a batch of Satsuma youths were smuggled on board ship and sent for a course of instruction to England. Chōshū continued to be in rebellion and the Government of Yedo at last persuaded the unwilling emperor to begin an active campaign against it in the summer of 1866, but a few months afterwards the Shōgun died at the age of 20, leaving no issue. Hereupon the emperor ordered the suspensions of the operations against Chōshū which had not been proceeding very satisfactorily. After some months Hitotsubashi, who had been put forward as a candidate for the Shōgunate in 1858, most reluctantly consented to accept it now and took the name of Keiki. He made it a condition that the emperor should listen to his advice and that the Daimyōs should promise him their support. He was invested with his dignity at Kyōto and never visited Yedo as Shōgun, a significant sign of the change which had taken place. Part of his programme was the punishment of the rebellious Chōshū clan, but three weeks after his investiture the emperor Kōmei suddenly died of smallpox on Feb. 3, 1867, and in view of the court mourning and the accession of a new emperor the Shōgun agreed to order the disbandment of the troops on both sides.

MEIJI PERIOD

Kōmei was succeeded by his son Mutsuhito, aged 15, who under the title of Meiji (meaning Enlightened Government) became the best known name in modern Japan. The new Shōgun Keiki was a man of ability and mature intellect who had been convinced by events that it was impossible for Japan to continue in seclusion. He gave proof of his convictions by attempting to remodel the army and navy on European lines and by sending his brother to see the Paris exhibition. But there was a strong party against him in which the Daimyōs of Satsuma, Tosa and Chōshū were prominent. In Oct. 1867 Yōdō, the chief of Tosa, presented to him a memorial setting forth the difficulties of the present position and suggesting that the administration should be restored to the emperor. Keiki at once summoned a conference of heads of clans in Kyōto and informed them that he approved of the suggestion and intended to surrender his authority to the throne. The proposal was accepted without discussion, and the resignation was formally tendered and accepted. Thus ended the system

of government which had been established by Iyeyasu in 1603.

Keiki left Kyōto secretly and retired to his castle at Osaka, but the clan of Tokugawa were not so ready as their lord to give up their privileges. Their enemies also, the clans of Satsuma and Chōshū, were not satisfied and, suspecting Keiki of an intention to come back, induced the court to take measures against his followers which were, perhaps, needlessly irritating. All officials connected with the Tokugawa were deprived of the offices they held in Kyōto and the Shōgun's troops were removed from the palace gates which it was their ancient privilege to guard. Keiki could not restrain the indignation of his followers, and at last reluctantly allowed them to march against Kyōto. The attempt was a failure and they were beaten back. Keiki fled to Yedo and made unconditional submission, but in the north the struggle was not over till August 1869. The Matsudairas of Aizu resisted with especial stubbornness until their stronghold of Wakamatsu was taken and, as mentioned above in speaking of Iyeyasu's institutions, an attempt was actually made to proclaim the princely Abbot of Ueno as emperor. This prince's life is an instance of the extraordinary careers which Japanese can have. Ordained in his youth, he was head of the temples of Nikko and Ueno. At the age of 19 he was carried off to the north and proclaimed emperor. When his partisans were defeated, he was unfrocked and sent to study in Europe, where he spent seven years. On his return he commanded in Formosa, under the name of Prince Kitashirakawa, and a Shinto temple dedicated to him is one of the principal sights of the capital of that island. Yenomoto, an officer in the Shōgun's navy, who had recently returned from a stay of six years in Europe, fled with several ships to the island of Yezo (Hokkaido), which was then an almost unknown country, and established himself in Hakodate with the intention of founding an independent state. Hopeless as was their cause, he and his followers showed the greatest courage and skill and for six months kept at bay all the forces sent against them. When their fortress was at last captured their lives were spared and Yenomoto and others eventually held important posts under Meiji.

In 1868 two unfortunate attacks on European officials were made near Hyogo. But adequate reparation was offered and the Japanese officers held responsible were ordered to commit suicide in the presence of foreign witnesses. In his *Tales of Old Japan*, Lord Redesdale (Mitford) has given a most impressive account of the terrible rite of *harakiri* at which he was officially present.

In considering the extraordinary changes effected in the Meiji era, it must be remembered that only the nobles and the military class, about one-sixteenth of the population, were concerned in them. The mass of the people were amenable to discipline, but had few anti-foreign prejudices. They were, of course, alarmed when they were told that Japan was going to be overrun by barbarians and there were misunderstandings with individual foreigners. But from early times they had always been ready to assimilate when opportunity offered. In the 7th century they eagerly adopted Chinese usages: in the 16th, considering the small number of missionaries, the number of converts to Christianity was surprising. Kaempfer observed that the Japanese "have so much sense and innate curiosity that if they were not absolutely denied free and open conversation and correspondence with foreigners they would receive them with the utmost kindness and pleasure," and in the 19th century Europeans often noted the contrast between the cordial hospitality which they received from the ordinary folk and the fierce antipathy shown by officials and Samurai. But even in the upper classes it is clear that there was a strong movement of curiosity and acquisitiveness. As far back as the time of Hideyoshi there was a craze for wearing Portuguese clothes, and Iyeyasu was anxious to import such inventions as he considered useful. But his successors formed the deliberate conviction that intercourse with Catholic Europe was a national danger, and had their knowledge been wider, had they known the history of Goa and Ceylon, of Mexico and Peru, can we suppose that they would have changed their conviction? The fear that Japan might become a European dependency was by no means absurd. The closing of the country to foreigners was the work of a few individuals and so was its re-opening. But it

is clear that both in the 17th and 19th centuries what was done by the few was not disapproved by the many.

The collapse of the Yedo Government was not unnatural: it had lasted longer than the rule of the Ashikagas and Hōjōs, and in its later phases it showed the same feature of a want of really able men. The grouping of the clans about 1865 indicates that the great south-western fiefs, which had always been quasi-independent, wished to contest the supremacy of the Tokugawas. It was a chieftain of Tosa who suggested the abolition of the Shōgunate, and probably many in Satsuma desired to secure some sort of pre-eminence for their own house. Besides this, the movement in favour of Shintō had created a wide feeling that the emperor was not allowed to exercise the power which was his by right. But what is truly surprising is the manner in which not only individuals like the last Shōgun but, later on, whole classes like the Daimyō and Samurai surrendered their privileges in what they believed to be the interests of their country. Considering everything, the opposition offered to the astonishing changes which took place between 1867 and 1878 was very slight.

Another remarkable feature is that, whereas in previous critical epochs the ultimate settlement and reconstruction were the work of some man of genius such as Yoritomo, or Iyeyasu, no such figure appeared now and no individual or noble house reaped the harvest of the change. The prime movers were Samurai like Kido, Ito, Inouye, Matsukata, Okuma and Yamagata who won great distinction, but merely aspired to posts attained by any successful public man in Europe. The emperor, indeed, found himself in a new and much higher position, but obviously the change was not due to the ability or ambition of Kōmei or his young son Meiji. The latter, however, at once began to act (on the initiative of his council of course) as the sovereign of Japan in a way unknown to his predecessors. In Feb. 1868, he informed the foreign representatives that he had assumed the supreme executive authority and that his title should be substituted for that of the Shōgun in existing treaties. An imperial rescript was also published notifying his subjects that "intercourse with foreign countries shall in future be carried on in accordance with the public laws of the whole world." His Majesty also appeared out of doors, received diplomatists and summoned the nobles to the palace, where he took in their presence what was called the charter oath. Like many Far Eastern documents, this charter seems to consist of moral maxims rather than of definite legal statements, but it promises that a deliberative assembly shall be summoned, that all classes shall have a share in the government and that justice, not ancient custom shall in future be the guiding principle of the administration. As a further sign of the change which was being made the emperor and his court removed to Yedo, which henceforth bore the name of Tokyo, or the eastern capital, as distinguished from Kyōto. The abolition of the Shōgunate and the accession of Meiji are generally called by Japanese the Restoration (Isshin), the idea being that the rightful powers of the emperor were now restored to him.

The Abolition of Feudalism.—In the early days of the Restoration it had probably not been realized that the unification of the nation, which was one of the watchwords, implied the abolition of feudalism. Yet it became clear that this was necessary. As things stood every feudal chief collected and spent the revenues of his fief, and was an autocrat within his own territory. There was no homogeneous system of law operative throughout the empire. It is not easy to see how unification and uniformity could have been achieved by imperial edicts or any form of compulsion, but such was the spirit of the times that the change was made spontaneously and without any difficulty. In 1869 the chiefs of the four great western clans of Satsuma, Tosa, Chōshū and Hizen publicly surrendered their fiefs to the emperor begging him to re-organize them and bring them under the same system of law. The idea is said to have originated with Okubo Toshimichi of Satsuma and the example of the four clans was quickly imitated. In making this remarkable surrender the Daimyōs followed the advice of their leading clansmen, who doubtless thought that they might find better opportunities for a brilliant career under the new régime, but still men like the chiefs of Satsuma

and Tosa must have been inspired by a rare patriotism, for they gave up an almost regal position without any return. The emperor acknowledged the sacrifice in a laconic rescript, but it was decided to proceed with caution. The feudal chiefs were appointed as governors of the districts in which they had ruled and the Samurai retained their salaries and positions. At the same time the distinction between the court nobles and the Daimyōs or feudal chiefs, who had previously ranked below them, was abolished. But the system of local autonomy thus introduced was clearly transitional, and in 1871 a second edict was issued by which territorial nobles ceased to be governors and a system of local autonomy was abolished; taxes were to be paid into the Treasury and all officials were to be appointed by the central Government. At the same time the chiefs of Satsuma, Tosa and Chōshū accepted ministerial office in Tokyo and sent contingents of troops to form the nucleus of a national army. But the Samurai still remained a great difficulty. They were the essence of the feudal system, but now that it was abolished their existence had no meaning and their stipends practically became pensions. There were about four hundred thousand men in receipt of incomes mostly hereditary which had been granted them in consideration of their devoting themselves to military service. In 1873 a decree announced that the Government was ready to commute these pensions at the rate of six years purchase for hereditary and four years for life pensions, one half of the commutation to be in cash and one half in bonds bearing interest at the rate of 8 per cent. The Samurai were allowed to give up their swords and to engage in other occupations. Contempt for money was part of their code and they showed their loyalty to it by the fortitude and resignation with which they accepted these disadvantageous conditions. Only in Saga was there a small rebellion. At first the commutation was voluntary but further legislation followed. A conscription law made every adult male liable to military service without regard to his social standing, and in 1876 commutation was made compulsory and the wearing of two swords, the ancient badge of the warrior, was forbidden. This overtaxed the already sorely tried temper of the Samurai. It was not the financial loss which wounded them but the ruthless destruction of their old ideals and customs. Before a generation accustomed to another outlook and new occupations had time to arise, the incomes, traditions, rights and status of the gentry were all swept away: military service became a necessary part of everyone's life instead of a special career, and all this was done by a Government which when it first started could not have lasted a day without the support of the Samurai. Feelings like this played a great part in bringing about the Satsuma rebellion.

The Satsuma Rebellion.—This was the only serious reactionary movement with which the Restoration had to contend and the wonder is that there were not more. The immediate cause was a dissension in the cabinet respecting the question of declaring war on the Koreans. They had treated Japan with discourtesy and when the change of administration was notified, had sent a contemptuous reply which the Japanese Government thought it prudent to conceal for the time. In 1875 they fired on a Japanese gunboat which was surveying the coast. The gunboat replied and got very much the best of the fighting which followed. The majority of the cabinet thought that war was most undesirable at this juncture, but some members who were in favour of it resigned. The principal of these was Saigō Takamori, who retired to his native district of Satsuma. He had played a brilliant part in the Restoration and was a man of commanding character and presence; his ambitious character also doubtless influenced his conduct at this time. Satsuma was in many ways an exceptional province and the natives had a strong individuality. It had rendered little more than nominal obedience to the Shōguns: its chief had contributed more than anyone else to the establishment of the new Government by setting the example of surrendering his fief, and the people were disposed to welcome European inventions. But they remained a clan of fighting men and disliked the recent social changes. Saigō settled down in a country seething with discontent and established there schools

of arms in which young Samurai were trained in the old traditions, and also in gunnery and other branches of modern military science. He soon had an efficient and devoted army of 40,000 men and in 1877, shortly after the publication of the edicts finally abolishing the status of the Samurai, he declared war, not of course against the emperor but against his majesty's evil counsellors. The struggle lasted eight months and Saigō's defeat was apparently due to his having made the mistake of turning aside to invest the castle of Kumamoto and wasting men and time in a long siege. If he had advanced to the main island, he would certainly have found the Government unprepared to oppose him, and it is impossible to say what the issue might have been. As it was, Saigō and a band of devoted followers were all killed or committed suicide in a last battle fought outside Kagoshima. The result of this rebellion was most important, for it demonstrated to the people that the new army created by the Government was not to be despised. They had put 65,000 men into the field and had proved that military virtue was common to all Japanese and not the exclusive property of the Samurai class. It is remarkable, too, that not one of the Satsuma men in the service of the Government, military or civil, forsook it during the rebellion, not even Saigō's younger brother, who was himself a distinguished soldier. Yet Saigō did not suffer in the public esteem: he had been stripped of his honours as a rebel during his lifetime, but the court restored them posthumously in 1890, his son was made a marquis and a statue was erected in his honour at the entrance of Ueno park.

Reforms.—In the years following 1868 all manner of reforms were introduced. All the restrictions on Japanese going abroad were removed: Christianity was permitted, vaccination, posts and telegraphs, and steamships were introduced. The press became a power. The first railway (between Tokyo and Yokohama) was built with the assistance of English engineers and opened in 1872. Torture was abolished and European dress was prescribed for officials. European and American advisers were freely employed and the indiscriminate imitation of everything European was in danger of leading to vandalism and stupid blindness to the many beauties and merits of Japanese culture.

Though the general tendency was to adopt European institutions indiscriminately and too rapidly, the administration showed some circumspection in introducing parliamentary government. In the charter oath the emperor was made to say that all things must be determined by public discussion. But the first deliberative assembly was composed of nobles and Samurai only. It had no legislative powers and was dissolved after two sessions. In 1874 arrangements were made for annual meetings of provincial governors and the first was convened in Tokyo. These officials also had no legislative powers and being appointed by the cabinet could not be said to be in any way representative of the people. Their function was simply to keep the central administration informed of events and public feeling in their district. The foundations of a legislative assembly were indeed laid in the next year when a senate (Genrō-in) was appointed by imperial decree. Its duty was to discuss and revise all laws prior to their promulgation. Though this senate was abolished in 1889, yet Genrō or elder statesmen continued to play an important part in politics and were frequently consulted by the emperor. Even at the present day (1928) it is often announced that Prince Saionji, the only surviving Genrō, had been so consulted, for instance, about the formation of a new ministry.

The Government seemed disposed to let the question of representative institutions drop, but one of the leaders of the Restoration, Itagaki Taisuke, insisted on keeping it before their notice. He resigned his post in the cabinet, like Saigō, because he was in favour of war with Korea and retired to his home in Tosa, where he began a campaign in favour of representative government, and was joined by discontented Samurai and by many ambitious young men who had visited Europe or America, and found on their return that they could not obtain the posts that they desired. When the Satsuma rebellion broke out Itagaki took advantage of it to present a memorial in which he charged the administration with restraining public opinion by oppressive meth-

ods, and demanded the creation of a legislative assembly. But still the Tosa Liberals were not really demanding popular government in the European sense, and it is on record that Itagaki would have been satisfied with an assembly consisting half of officials and half of non-official Samurai. Having mastered the Satsuma rebellion, the Government felt emboldened to refuse even this, but they had a disagreeable surprise when next year, 1878, Ōkubo Toshimichi, who had been prominent as an opponent of Saigō, was assassinated by sympathisers of the latter who came not from Satsuma but from Kaga. They gave themselves up to justice and stated that one of their motives was to call attention to the Government's failure to grant representative institutions. Two months after the assassination an edict was issued ordering the establishment of elective assemblies in various prefectures and cities. A property qualification was prescribed for the electors and members. The duties of the assemblies were to levy and spend local taxes, subject to the approval of the Home Office, and they were authorized to address the central Government. On the whole they worked well, but, though they were a good school for future parliamentarians, they did not at all satisfy the ambition of Itagaki and his friends. He redoubled his agitation and was helped by the growing power of the Press. He founded the first political organization in Japan under the name of Jiyūtō or Liberal party. As its members indulged in great freedom of speech, their meetings were frequently broken up by the police, which attracted both attention and sympathy. In 1881 another political party was founded by Okuma Shigenobu who seceded from the ranks of the Administration. It was called the Shimpōto or party of progress. It might be supposed that this party would have united with the existing Liberal party, but they did not combine and indeed were rather hostile to one another. In studying recent Japanese politics, one must remember a feature which even now has hardly disappeared. A party is a body of men who follow a certain leader to whom they owe loyalty and from whom they expect reward. It is in fact the ancient clan reappearing in another sphere. The party may advocate certain principles, but its essence does not consist in any programme or platform, and identity of principles does not mean identity of party. Also the House of Peers has parties of its own which may from time to time support parties in the lower house but are not identical with them.

The Constitution.—The Administration felt the gravity of the popular demand but still would not allow itself to be hurried. An edict was issued in Oct. 1881, declaring that a National Parliament was to be established in 1890 in order that the imperial purpose of gradually creating a constitutional form of government might be accomplished. In the interval of nine years which remained, the Government made preparations for the coming change. At the Restoration in 1868, the mediaeval form of the executive had been revived, but in 1885 it was replaced by a cabinet on the European model, at the head of which was a minister-president. Itō was the first to fill the post. The senate was abolished and a privy council (Sumitsu-in) composed of persons who had won distinction in the public service was appointed.

The laws were reformed and codified. A criminal code, modelled on that of France, was brought into practice in 1882, but was subsequently modified in 1890 and 1908. Civil and commercial codes were not drawn up until 1899, and followed in the main the principles of German law. It was agreed that the future legislature should consist of two houses, peers and commons, but it was necessary to define the peers, and in 1884 an imperial rescript established five orders of nobility rendered in English as: princes, marquises, counts, viscounts and barons. In 1887 the court ceremonial and the imperial household were reorganized on the German model.

Financial questions were also taken in hand, for the national treasury was in a bad way. The Satsuma rebellion had greatly increased the already heavy liabilities of the Government and there had been a large issue of inconvertible paper currency, which had fallen 60% as compared with specie. In 1879 the Yokohama Specie bank was founded, and in 1882 the Bank of

Japan to which was reserved the privilege of issuing notes, other banks being deprived of this right which they had previously enjoyed. This issue of convertible silver notes brought paper back to par and it remained so for ten years. The railway, postal and telegraphic services were steadily extended: harbour works were constructed and the foundations of a strong mercantile marine were laid: numerous students were sent at the public expense to complete their studies in Europe or America, and the system of competitive examinations was introduced. The Government, however, did not receive in all quarters the credit which it deserved. The Opposition, while waiting for the Constitution, became more violent in its methods, not even shrinking from assassination. A class of political bullies called Sōshi came into existence who, like the ancient Rōnin, but without their romance, often terrorized the capital. The ministers had not yet assimilated European usages sufficiently to think of arguing or defending themselves in public speeches, but they gave extraordinary powers to the police. Meetings, associations and newspapers were frequently suppressed and many Sōshi were summarily banished or imprisoned. The Constitution was at last solemnly promulgated in 1889. It had been drafted by Marquis Itō who had visited Europe and America in order to study on the spot various systems of parliamentary government. According to its provisions two chambers were created, the House of Peers and the House of Representatives, with the rights of legislating, imposing taxes and petitioning the emperor. The upper house consisted of not more than 300 members, including (a) all princes and marquises, (b) one-fifth of the remaining peers, elected by themselves, (c) citizen delegates elected by the fifteen richest men of each district, (d) men of learning and ability nominated by the emperor. The House of Representatives consisted of 300 members, the electorate consisting of persons who paid at least fifteen yen in direct taxes.

His majesty opened both chambers in Nov. 1890. Prince Yamagata was induced to act as prime minister but handed over the office to Matsukata, the minister of finance, in 1891, and the career of the new parliament was at first far from peaceful. One of the great objects of Itagaki and his followers had been to abolish the clan system, but they found to their regret that it flourished under parliamentary institutions even better than before. The Sat-chō, as the two great clans were compendiously termed, managed to get the running of the whole machine into their hands, Satsuma controlled the navy, finance and industries; Chōshū the army, civil service and education. Also the cabinet's tenure of office depended solely on the emperor, and his ministers took their mandates from him and not from parliament. Hence it was impossible to turn a ministry out by a mere vote: it could be made to fall only by obstruction which rendered legislation and finance impossible and, as many of the Opposition had suffered imprisonment or fines during the recent period of agitation, the virulence of their attacks knew no bounds. Had not the House of Peers been consistent in its support of the Government the necessary routine of administration might have become difficult. But a great change occurred in the attitude of the Opposition when war with China broke out in 1894. There has never been any doubt about the patriotism of any Japanese party, and when once the interests of the country were at stake all combined to assist the administration.

Treaty Revision.—Before passing on to the wars of modern Japan, it will be well to say a few words about a question which exercised the minds of both Japanese and foreigners during many years, namely the revision of the treaties made with foreign Powers. In 1882 when the first conference met in Tokyo to consider the possibility of settling this question, the situation was as follows. Since the signature of the first treaty by Commodore Perry, a number of others had been made with foreign Powers and as they all contained a most favoured nation clause all were practically identical. The principal provisions were (a) Kanagawa and five other ports were opened to foreign trade and foreigners were allowed to reside within a radius of about 24 miles round each, called treaty limits. (b) Foreigners enjoyed extra-territoriality; that is to say, they were exempt from the jurisdiction of

Japanese law courts and were justiciable only to their own consular courts. (c) A very low rate of import duties was fixed, mostly 5% *ad valorem*. In the days of their early ignorance the Japanese found these arrangements quite convenient, for extra-territoriality saved much trouble. But when they began to go abroad they soon perceived that the situation had another aspect which was most galling to their national pride. It meant that they were not really treated as the equals of other nations and were regarded as people who could not be trusted to administer justice or impose reasonable duties, although all the Western Powers trusted one another to this extent. As hostility towards foreigners soon died out, no objection was felt to giving them freedom of residence if Japan could obtain judicial and tariff autonomy. As early as 1876 a treaty which gave the Japanese most of what they desired was concluded with the United States, but it was of little use, except as an admission of principles, for it contained a clause saying that it would come into force only when the other Powers made similar agreements. Meanwhile the laws were revised with the assistance of French and German experts. The negotiations which began in 1883 lasted no less than eleven years and the delay was not entirely due to the hesitation of foreigners. Mexico, Russia and Germany signed agreements, when suddenly Japanese opinion seemed to change. It was proposed that for a few years four foreign judges should assist the Japanese courts in trying cases in which foreigners were concerned and this was bitterly denounced as derogatory to the national dignity. The patriots of the Opposition began to talk of the danger of Japan being swamped by a foreign invasion and a bomb was thrown at Count Okuma, the minister of foreign affairs, which blew off his leg. Naturally the Japanese Government thought it well to proceed with caution and public opinion began to change again. Negotiations recommenced and a new watchword, probably inspired by the Government, "Treaty revision and equal rights" became popular. Great Britain, which had hitherto shown little disposition to make concessions, now came to the front and in 1894 consented to a new treaty which abolished extra-territoriality and gave Japan the right to fix her own import duties and a monopoly of the coasting trade. Similar treaties with other Powers were soon concluded and the emperor issued an edict declaring in unequivocal terms that it was his desire to abolish all distinctions between natives and foreigners. 1899 was the date fixed for bringing the treaties into force and it was duly observed. Complete tariff autonomy, however, was not obtained till 1911.

In the period following the institution of parliamentary government, Japan undertook two considerable wars, one with China (1894-5) and one with Russia (1904-5). She also took part in the expedition to Peking (1900) and made an alliance with Great Britain. Looking back, one can see that this military activity was well timed. During the period of metamorphosis external entanglements had been avoided: coming when it did, military and naval success consolidated the nation. The severest critics of the new régime had to admit that it had made of Japan a State which was accepted by the world as one of the Great Powers, capable of competing with the others in peace or war. As early as 1874 an incident occurred which might have led to a breach with China, if not carefully handled. A ship from the Ryū-kyū islands was wrecked on the coast of Formosa, then nominally Chinese territory, and its crew were barbarously treated by the natives. Representations at Peking had no result, so the Japanese sent a punitive expedition to the island. The Chinese Government protested, and the matter was arranged by the intervention of the British minister at Peking, Japan agreeing to withdraw her troops and China to indemnify her for the expenses of the expedition. The political status of the Ryū-kyū islands was obscure and complicated. They had a king of their own: for about two centuries they had been rather fitfully administered by the Daimyō of Satsuma, and they paid occasional tribute to both China and Japan. In 1875 Japan boldly made them into a prefecture, probably knowing that no serious trouble would occur. China protested and discussions ensued, but Japan kept the islands. The king received a pension and subsequently was made a marquis.

In dealing with the question of Sakhalin at this period the Japanese showed themselves eminently pacific. Some Japanese had settled there as early as 1620, but Russians arrived in 1847 and under the Shōgunate there were negotiations for the partition of the island, which led to no result. Apparently both parties came to the conclusion that the territory was not worth much. At one time the Russians seemed not unwilling to sell the whole, but the Japanese withdrew from the bargain and in 1875 agreed to an arrangement by which they recognized Russia's title to the whole of Sakhalin, while Russia recognized Japan's title to the Kurile islands.

The Chinese War.—At first, Japan's attitude towards Korean questions was similarly pacific. As related above, the majority of the cabinet refused to declare war in 1875, though Korea had offered provocation, and some of the ministers resigned. Japan proceeded to treat Korea in the same way as she had herself been treated by Commodore Perry. A considerable fleet was sent to demand a treaty of amity and commerce. This was signed in 1876 and three Korean ports were opened to foreign trade. When one remembers the ambitions of Hideyoshi in the 16th century and likewise the ultimate fate of Korea, it is hard not to think that Japanese statesmen were already meditating the conquest of the peninsula, but their avowed policy was perfectly pacific and reasonable. They claimed the right of trade and residence, just as western countries had claimed it in Japan, and they wished to introduce reforms, fearing that the state of Korea might become so bad that other Powers might have an excuse for intervening to restore order and for establishing themselves in a position inconveniently near to Japan. But continual difficulties were created by the Government of Peking, which adhered to the ancient doctrine of tributary states. It was the immemorial policy of China to surround herself with petty states which might act as buffers to break the shock of foreign contact: if any other Power interfered with these states she protested, but if they misbehaved themselves, she admitted no responsibility. Such a relationship had worked well in the middle ages, but it was clearly not practicable in the new era of international intercourse which had already begun. On the one hand, China seemed to recognize the independence of Korea by permitting the conclusion of treaties with Japan and subsequently with other countries: on the other, a Chinese resident, who practically directed all important affairs, was stationed at Seoul. The members of the Min family to which the queen belonged were allowed to monopolize office and misgovern the country and, whenever there was a rising, Chinese troops were despatched to suppress it. On two occasions, in 1882 and 1884, the Japanese legation was burnt in the course of outbreaks, partly, it would seem, owing to the Korean hatred of Japanese immigrants, many of whom were low-class adventurers. After the attack in 1882, Japan was allowed to have troops in Seoul for the protection of the legation, and in 1885 a convention was concluded with China by which each Power undertook not to send troops without notifying the other.

In the following years some reforms were introduced in Korea: the customs service was reorganized and foreign settlements were opened, but the Japanese continually had reason to complain that they were prevented from enjoying the commercial rights guaranteed to them by treaty and that the Chinese resident prevented them from obtaining redress. In 1894 another rising against the Korean Government broke out. The Chinese sent a force of 2,500 men to suppress it and conformably to the convention notified the Japanese, describing Korea at the same time as a tributary state. The Japanese Government replied by sending 8,000 men and stated that they would not be withdrawn "without some understanding which would guarantee the peace and good order of Korea." As the rebellion, which had been the pretext for China's intervention, had meanwhile died a natural death, the Japanese further stated that the dispatch of any more Chinese troops would be regarded as an act of hostility. In spite of this the Chinese sent by sea 1,200 troops which encountered the Japanese cruiser "Naniwa." There is some discrepancy in the accounts of what occurred, but it is generally stated that the Chinese fired first. At any rate, their ships were sunk and the

troops perished. War was declared by both nations a few days later on Aug. 1. The campaign which followed was a succession of triumphs for Japan. The Chinese entrenched themselves at Phyong-Yang (the same town which had figured in Hideyoshi's campaigns) and made leisurely preparations for defence. The Japanese took some time to arrive, but when their columns converged on Phyong-Yang they carried all the positions in a day, with great loss to the Chinese and little to themselves. On the very next day, Sept. 17, they won a brilliant naval victory at the mouth of the Yalu river. They then took Port Arthur and Talienwan with little difficulty, but had a stubborn fight with the remainder of the Chinese fleet at Wei-hai-wei. But there, also, the Chinese were obliged to surrender and the war was at an end, having lasted seven months and a half. The Chinese sent Li Hung-Chang to negotiate terms and he signed a treaty of peace with Itô, the prime minister, on April 17, 1895, at Shimonoseki. It recognized the independence of Korea and ceded to Japan Formosa and the Pescadores islands, as well as the southern part of Manchuria: China was to pay an indemnity of 200,000,000 taels and to give new facilities to foreign trade. Japan had now a disagreeable experience of European diplomacy. Russia, Germany and France presented a joint note recommending that the territory ceded on the mainland should not be occupied permanently, and it was understood that they were ready to enforce this advice by an appeal to arms if necessary. The Japanese Government grasped the position and yielded at once, but the incident long rankled in the memories of both ministers and people.

In the years between the Chinese and Russian wars there were no fewer than six ministries, but these vicissitudes were signs of the rise and fall of various cliques rather than of any serious change in policy. The two important struggles which went on all the time and continued until quite recently were, first, the contest between the oligarchs of the great clans and the more radical elements and, second, the contest between civil and military authorities for the upper hand. A significant event in parliamentary history was the foundation of the Seiyukai party by Prince Itô in 1900. It corresponded to some extent to a liberal party in Europe, but the sentiments enunciated in its original manifesto are so vague and non-committal that one might suppose all Japanese would accept them. But Prince Itô's action implied that a cabinet ought to represent a party, a principle which had not been admitted by any one of his eminence before. The position of Prince Yamagata, then prime minister, became untenable and for the fourth time Prince Itô formed a ministry, but held office for less than a year.

The Japanese emerged from the Chinese war with the island of Formosa and a free hand in Korea. They took possession of the former without much trouble, although the Chinese population rose in what was known as the Black Flag rebellion. In 1896 a Japanese administration was introduced into the island and it was duly divided into departments and prefectures. But, considering the length of time it has been in Japanese hands, the process of introducing peace and order has not been so rapid as might have been expected, for even now the unruly tribes of the north-eastern portion are imperfectly subdued and still practice head hunting.

Korea.—In Korea, too, there were many difficulties. Chinese obstruction being now removed, the Japanese tried to introduce reforms which they hoped might lead to the establishment of order and the increase of trade. Count Inouye was sent to Seoul for this purpose, but seems to have erred by excess of zeal. His successor, Gen. Miura, was even less successful and came into collision with the queen, who was a woman of most masterful character. A conspiracy was formed in which Japanese were implicated and in Oct. 1896, the palace was surprised and the queen was killed with all her suite. As the Japanese legation was accused of being privy to this conspiracy, the minister and his staff were at once recalled and put on their trial at Tokyo, but were acquitted. The results of the whole incident in Korea were disastrous. The king took refuge in the Russian legation and remained there for two years, during which time he did his best

to nullify all the reforms extorted under Japanese pressure and gave valuable concessions to the Russians, including the right to cut timber in the valley of the Yalu river. In 1898 the Germans occupied Kiao-Chiao in Shantung as an indemnity for the murder of two missionaries. Immediately afterwards Russia received from China a lease of the Liaotung peninsula, although three years before she objected to the cession of the same region to Japan, and permission to construct a branch of the Trans-Siberian railway through Manchuria from north to south. Soon after this, in 1900, came the Boxer rising and the siege of the legations at Peking. Japan acted throughout in concert with the Powers of Europe and, being the nearest country geographically, was the first to send a force to relieve not only her compatriots but the Europeans and Americans who were beleaguered in Peking and Tientsin. The conduct and results of this expedition were most gratifying to the Japanese: their troops co-operated with Europeans on an equal footing: practical comparison showed that they were inferior to none in efficiency and discipline and their behaviour was good, better in fact than the behaviour of some of the European troops. All this was eminently satisfactory to the authorities at Tokyo, but at the same time the action of Russia caused them the gravest anxiety. One result of the Boxer troubles was that Russia remained in military occupation of Manchuria and this, combined with strong pro-Russian feeling in the official circles and also among the populace of Seoul, created a position most dangerous for Japan's interests. Japan undoubtedly desired peace and while realizing that war might be inevitable did her best to avoid or postpone it. She acted in concert with Great Britain and the United States, and Russia was induced to sign a treaty pledging herself to withdraw her troops from Manchuria in three instalments.

Anglo-Japanese Treaty.—The position of Japan was further strengthened by the Anglo-Japanese Treaty (the precursor of the Anglo-Japanese alliance) which was signed on Jan. 30, 1902. It recognized "the independence of China and Korea, the special interests of Great Britain in China and of Japan both in China and in a peculiar degree, politically as well as commercially and industrially, in Korea, and the rights of both parties to take such measures as may be indispensable to safeguard those interests either against the aggressive action of any other Power or in the case of disturbances in either country." In the event of either party becoming involved in war with a third Power, the other party was to remain neutral unless "any other Power or Powers should join in hostilities against that ally, when the other high contracting party will come to its assistance and will conduct the war in common and make peace in mutual agreement with it."

The Russian War.—Russia did not withdraw her troops from Manchuria at the dates fixed, and the Japanese Government opened direct negotiations at St. Petersburg (Leningrad). They proposed that Russia and Japan should each recognize the other's status in Manchuria and Korea respectively: that both Powers should respect the territorial integrity of China and Korea and be parties to an engagement that all nations should have equal commercial and industrial opportunities in Korea and Manchuria. The negotiations lasted for five and a half months, but Russia proved unyielding and unconciliatory. The representations made in St. Petersburg were received with a silence that seemed discourteous. As the position became intolerable, the Japanese severed diplomatic relations on Feb. 6, 1904. The war which followed contained many striking incidents, especially the capture of Port Arthur and the annihilation of the Russian fleet by Admiral Tōgō. The details are given in a separate article (*see* RUSSO-JAPANESE WAR).

Brilliant as had been the victories of Japan, it was doubtful if she could continue the contest. In Russia the war had never been popular with the nation and the inglorious struggle had been most depressing. When, therefore, in June 1905 the President of the United States made an offer of mediation it was gladly accepted. The plenipotentiaries of both countries met at Portsmouth in New Hampshire, and on Aug. 29, 1905, the treaty of peace was signed. It recognized Japan's "paramount political military and economic interests" in Korea: provided for the

evacuation of Manchuria by both parties: transferred to Japan Russia's lease of the Liaotung peninsula, together with the southern section of the Manchurian railway from Port Arthur to Kwang-cheng-tse and all collateral privileges, mining or other: and ceded to Japan the southern half of Sakhalin. It was agreed that Japan should receive £4,000,000 on account of moneys spent in maintaining Russian prisoners. But, with this trifling exception, Russia refused to pay any indemnity and the Japanese plenipotentiaries did not dare to imperil the negotiations by insisting. But the Japanese public were indignant at the terms. The war had cost 170 millions sterling and 230,000 men killed or wounded, and the material gain in return for this expenditure seemed totally inadequate, however great might be the increase in prestige. Angry riots broke out at Tokyo, and the police buildings were burnt, but no better terms were obtainable. The prime minister, Prince Katsura, resigned, feeling that he could not face the diet. He made it, however, a condition that his successor, Prince Saionji, should carry through a measure which he had prepared for the nationalization of the railways of the empire and this was duly done in 1906. Katsura returned to power in 1908 and it was pretty plain that an arrangement had been made to enable him to retire until the nation's anger at not receiving an indemnity had subsided.

The Anglo-Japanese Alliance.—His services had indeed been considerable for just before the Treaty of Portsmouth was signed, he had concluded a new treaty of alliance with Great Britain. Unlike the agreement of 1902 it did not deal with the independence and integrity of Korea, but it bound the contracting parties to come to each other's assistance and conduct war in common, if "by reason of unprovoked attack or aggressive action wherever arising on the part of any other Power or Powers either party should be involved in war in defence of its territorial rights or special interests." These were defined as (a) the maintenance of peace in Eastern Asia and India, (b) the independence and integrity of China and the principle of equal opportunities for the commerce and industry of all nations there, (c) the maintenance of the territorial rights of both Powers and the defence of their special interests in Eastern Asia and India. In the same year a third treaty was signed with China confirming the transfer to Japan of Russia's rights in Manchuria. Two other agreements concluded with France and with Russia in 1907 further consolidated Japan's international position.

In view of the Treaty of Portsmouth the Powers withdrew their legations from Seoul and replaced them by consulates, and the Japanese sent Prince Itô as resident-general. A comprehensive scheme of reforms was introduced embracing law, police, education, taxation and currency. At first the Korean Government was asked to effect the necessary changes by employing Japanese advisers. But no attention was paid to the advice of these officials and a new arrangement was made in 1907 by which the resident-general practically became a governor with legislative and executive powers, including authority to appoint and remove officials and to employ Japanese in the administration. Prince Itô also found it necessary to disband the standing army, as being inefficient and a useless expense. The soldiers resisted vehemently, and many of them formed the nucleus of an insurrection which lasted two years. Though the proposed reforms seemed excellent in conception, they were perhaps enforced somewhat drastically and were most distasteful to the natives. While Prince Itô was on a visit to Harbin in 1909 he was assassinated by a young Korean, who claimed that he was avenging the wrongs of his country. Naturally the attitude of the Japanese Government became more severe: the insurrectionary movement of the disbanded soldiers was repressed with considerable loss of life, and it was shortly decided that the country must be annexed to the Japanese empire. This was done by an imperial rescript in 1910.

The Russian war had been costly but the Japanese were not afraid of spending money to secure military efficiency. Six divisions were added to the army and a new law of conscription was introduced, the general result of which was to provide within 10 years a fully trained army of 1,500,000 men and half a million recruits who could be used for reinforcement. New ships, arsenals

and dockyards were built. Of course the financial burdens of the nation increased. The national debt rose from 56 millions sterling in 1904 to 227 in 1908, and taxation became very much heavier. It is indeed surprising that there was no serious financial embarrassment, but the development of trade and industry, improved economic conditions, and the good international status of Japan combined to prevent any crisis.

Japanese Immigration into America.—Although the relations of Japan and the United States had hitherto been excellent, a question now began to arise which is still troublesome and from time to time creates difficulties. This is Japanese immigration into American territory, especially California. To a less extent the same question affects British Columbia. Experience shows that the Japanese do not settle willingly in new countries where the climate and standard of comfort are not what they are accustomed to, such as their own territories of Formosa and even Hokkaido, but that they gladly migrate, at least temporarily, to regions like the Pacific Coast of North America where the pioneer work of colonization has already been done and conditions are to their liking. In 1908 it was stated that there were more than sixty thousand Japanese in California who did not intend to become American citizens but to make money and return to their homes. They were objectionable to other classes of the population, partly on account of the difference in their customs, but chiefly because they were ready to work for longer hours and less wages than labourers of European descent. The State legislature of California made certain enactments designed to restrict the entry and residence of Japanese, and this produced intense popular indignation in Japan. In order to understand the attitude of the Japanese Government and people in this matter, which is still far from settled, it must be remembered that the recurring cause for irritation is not so much the actual inconvenience which may be occasioned by restrictive enactments, as the implication which seems to be contained in them that the Japanese are not really the equals of Europeans and Americans, but belong to an inferior race. President Roosevelt attempted to calm the anti-Japanese agitation in California without much success, but in 1911 the Japanese Government made an agreement (originally concluded with Canada, but subsequently extended to the United States) by which without surrendering any of their treaty rights they voluntarily undertook to limit the immigration of their subjects. This was known as the "Gentleman's Agreement" and though it by no means closed the question, it was admitted that the Government of Tokyo were sincere in their efforts to execute it.

It also became apparent that there was a divergence between American and Japanese views as to Manchuria, for in 1910 Mr. Knox, the Secretary of State, made an unexpected proposal that all railways in that district should be neutralized. This suggestion was not to the taste of Russia, China or Japan and fell through, but it had the result of bringing Russia and Japan together. They signed an agreement by which they pledged themselves to maintain the *status quo* in Manchuria and to abstain from any unfriendly competition in developing that region. In the same year a modification was made in the Anglo-Japanese alliance. A general treaty of arbitration between Great Britain and the United States was then under discussion, whereas the treaty with Japan, without mentioning any names, provided for the possibility that Great Britain might be her ally in the event of a war with the United States. It was now stipulated that nothing in the treaty should entail on either contracting Power the obligation to go to war with any third Power with whom a treaty of general arbitration might be in force. This new treaty was for ten years and after that period was to continue automatically unless denounced by either party.

Death of the Emperor Meiji.—In 1911, Marquis Katsura, who had been premier for nearly five years and had accomplished various financial reforms as well as the annexation of Korea, resigned and was succeeded by Prince Saionji, the leader of the Seiyukai party. Next year the Emperor Mutsuhito, better known as Meiji, died and the period called by the same name came to an end. His decease caused profound regret and was an event of

unusual importance for the nation. It cannot be said that he initiated or was responsible for the amazing changes which occurred in the Meiji era and even under his "enlightened Government" the sovereign was hidden by a veil which makes it hard to tell how great was the part which he personally played. But all accounts agree that he was a man of strong and even obstinate character and that after he attained manhood no important steps were taken without his knowledge and consent. It is known that he interfered in national crises and apparently he was never on the wrong side. During the 45 years that he was emperor he witnessed and took part in a succession of extraordinary changes such as can hardly have occurred in any other one reign in any other country of the world and, unlike most revolutionary changes, they were not to the detriment of the monarchy. Though he delegated his authority, he did not impair it and he retained until his death the veneration and devotion of his people.

He was succeeded by his son Yoshihito, born in 1879, who adopted as the title of his reign *Taishō* or Great Righteousness. Soon after his accession the Saionji cabinet fell, because the military party insisted on having two army divisions in Korea, to which the other ministers were opposed on grounds of economy. Other short and confused ministries followed.

Prince Katsura returned to political life, but found the lower house intractable. He then resigned and started in 1913 a political party called Rikken Doshikai, the Constitutional Comrades association. It attracted a large membership but unfortunately its founder died almost immediately. The Yamamoto cabinet which followed (1913) was also short lived owing to a naval scandal and the trial of high officers on the charge of having accepted bribes from a foreign company in connection with the building of a Japanese warship.

JAPAN AND THE WORLD WAR

The Siege of Tsingtao.—In April 1914 Count Okuma, who of recent years had been devoting all his energies to the foundation and development of the Waseda university in Tokyo, undertook to form a cabinet. It lasted only two years but is memorable because under this administration Japan joined the Allies in the World War and, since the Germans were in occupation of Kiao-Chiao, was called upon to take action at once. On Aug. 14, an ultimatum was sent to Berlin demanding the immediate withdrawal of German warships from Chinese and Japanese waters and the surrender of Kiao-Chiao to China before Sept. 15. As no answer was returned to this communication, Japan declared war against Germany on Aug. 23 and Tsingtao, the principal town in the German leased territory was invested. It fell on Nov. 7, and Japan assumed the administration of the territory. (For an account of the operations and capture of the city by the Anglo-Japanese forces see the article TSINGTAO, SIEGE OF.)

Admiral von Spee's ships were now seriously menacing commerce in the South Seas. Japanese squadrons were sent to the China sea and Pacific ocean and two cruisers co-operated with British vessels in patrolling the western coast of America. Towards the end of 1914, as a result of these concerted operations, von Spee's squadron was chased in the direction of Cape Horn and was ultimately sunk off the Falkland islands. The Marshall, Pelew, Caroline and Marianne islands were captured. The Japanese did not send any troops to Europe, but Admiral Saito proceeded to the Mediterranean and assumed the duty of convoying Allied vessels from port to port and protecting them against the attacks of German submarines. It is said that in all they successfully escorted 788 ships.

In 1918, Japan joined Great Britain, France and the United States in sending an expedition to Siberia and landed a considerable force at Vladivostok and in October Czechoslovak troops from the interior made their way through to the coast. An anti-Bolshevik government under Admiral Kolchak was established at Omsk and an expedition into European Russia was contemplated, but was rendered unnecessary by the Armistice of Nov. 11. Japanese troops did not advance farther inland than Chita and Irkutsk.

Okuma retired from ill-health in 1916 and Terauchi, of the party

called Seiyukai, was appointed to succeed him, although the majority in the diet belonged to the Kenseikai (Constitutionalists), a party which was an amalgamation of the Doshikai with some smaller associations and led by Kato. This appointment created considerable hostility and was considered to be due to the influence of the Genrō. The diet proved so unmanageable that Parliament was dissolved and a general election took place in 1917. It resulted in a striking victory for the Government party or Seiyukai, the Kenseikai losing heavily. This may seem a strange result considering the popular clamour which led to the election, but until quite recently the Government under whose auspices an election is held and which is in charge of the necessary police arrangements has never lost an election in Japan. In view of the war Terauchi was desirous of obtaining unanimity in foreign policy. For this purpose he created the temporary Diplomatic Investigation council, on which all political parties were represented. But in spite of its victory at the polls in 1917, his cabinet had continual trouble, complicated by rice riots and strikes, and he resigned in 1918. Hara, leader of the Seiyukai in succession to Saionji, was selected as the new premier. He was remarkable as being the first commoner to hold office and also his cabinet, as representing a party professing certain principles, approximated more nearly to European political institutions than any of its predecessors. In March 1918 the Government had been obliged by popular demand to bring forward an Electoral Reform Bill by which the property qualification for voters was reduced from a payment of ten yen in taxes to three yen. But a decided democratic movement began to show itself. This extension of the vote was not regarded as satisfactory: there was a clamour for universal suffrage and a bill providing for it was introduced by the Opposition in Feb. 1920. The Government, however, contended that as no election on the basis of the extended suffrage had yet taken place, it was premature to make a further suffrage reform without consulting the country. The diet was accordingly dissolved and at the election which took place immediately afterwards the Government party, that is the Seiyukai, as usual obtained a large majority. The position was somewhat curious for the Seiyukai, who were supposed to be the liberal party, were against universal suffrage and the Kenseikai were supporting it for political reasons, though it was distasteful to many of them.

Peace Conference.—At the Peace conference held in Paris in 1919, Japan brought forward a proposal, most dear to Japanese sentiment, that the principle of racial equality should be admitted. The Powers were invited to accord as soon as possible to all nationals of the States members of the League equal and just treatment in every respect, making no distinction either in law or in fact on account of their race or nationality. In making this proposal Count Makino explained that the clause did not demand the immediate realization of racial equality: it enunciated the principle only and left the methods of applying it in the hands of the Governments concerned. In the course of discussion the wording was somewhat modified in the hope of meeting objections, but even so the proposal obtained only 11 votes out of 17 and it was ruled that unanimity was essential. Japan accepted the decision, reserving the right to raise the question again at an opportune moment, but no doubt this refusal to recognize racial equality created a very unfortunate feeling. In other respects the main results of the peace for Japan were two in number. First, the former German islands in the Pacific lying north of the Equator which had been under Japanese occupation since 1914 were now allocated to Japanese administration under mandate. Secondly, in spite of the objections of China, it was finally decided to give Kiao-Chiao to Japan, but on the understanding that she would not retain it but would restore it to China as a mark of goodwill and friendship. Both these transfers of territory created a good deal of discussion, which was continued at the Washington Conference summoned at the end of 1921. One of the islands transferred under mandate was Yap in the Caroline group, which had a special importance as being a centre of the cable system in the Pacific. The United States took exception to Yap becoming an integral part of Japanese territory on the ground that it vitally affected the world's communications. The question was eventually

settled: an agreement was signed in which the United States admitted the authority of Japan as the mandatory power in Yap, while Japan accorded to the United States full rights and facilities in respect of cables.

The question of the rendition of Kiao-Chiao was complicated by the relations which had arisen between China and Japan during the war. In 1915 the Powers of Europe were engaged in a conflict the issue of which was by no means certain; should Germany prove victorious Japan's prospects in China were not at all favourable. The internal condition of China was equally uncertain and no one could say what form of government might eventually be established there. Japanese troops were in occupation of Tsingtao and a portion of Shantung. In these circumstances the statesmen of Tokyo thought it wise to make use of the opportunity and strengthen the position of their country.

The Twenty-one Demands.—Baron Kato, the minister of foreign affairs, presented to the Government of Peking what became known as "the Twenty-one Demands," ranged in five groups dealing with (a) Shantung, (b) Manchuria, and Eastern Mongolia, (c) the Hanyehping Company, (d) an engagement that China would not cede any harbour to a third Power. The fifth group was not at first made public but was presented confidentially as "wishes." It included the appointment of Japanese as advisers in political, financial and military matters: the priority of Japanese capital in railways, harbours and mines in the province of Fukien opposite to the Japanese island of Formosa: and other important points. The demands were presented in January and for some time no reply was received, but in May the Japanese Government pressed for a definite answer within a time limit and China accepted within the month. Two treaties were concluded, one dealing with Shantung and the other with Mongolia and Manchuria.

The Washington Conference.—By the latter the leases of Port Arthur and Dairen as well as of the South Manchurian railway and the Antung-Mukden railway were extended to 99 years and Japanese were accorded various privileges, residential, commercial, agricultural and industrial. The question of these treaties did not come up at the Washington Conference officially but, since it stood in the way of a good understanding, informal discussion between the Chinese and Japanese delegates was arranged. The restoration of the former German leased territory to China was agreed upon. The Japanese delegates also stated that in view of the changes which had taken place since 1915 they were ready to withdraw many of the demands then made and granted; e.g., the preferential rights regarding Japanese advisers. The most important part of the treaty of 1915 still remaining in force is the agreement respecting the Kwangtung peninsula (another name for the Dairen territory), South Manchuria and Eastern Mongolia. In virtue of it the leases of that peninsula, of the South Manchurian railway and the Antung-Mukden railway remain extended for 99 years, that is till 1977, 2002 and 2007 respectively. The administration of the former German leased territory in Shantung was actually transferred to China in Dec. 1922.

The Japanese troops remained in Siberia longer than those of other Powers, but a promise was made at the Washington Conference to withdraw them as soon as the situation permitted. Japan, as a near neighbour, was affected by the fact that Siberia, since the death of Kolchak, was in Bolshevik hands and a most unfortunate incident had occurred in March 1920 when 700 Japanese were massacred at Nikolaievsk by a Bolshevik guerrilla gang. On this the Japanese occupied northern Sakhalin. The troops on the mainland were withdrawn in 1923 and in the same year negotiations were started for the recognition of the Soviet Government. These negotiations were at first informal but were subsequently conducted by the Japanese and Soviet representatives at Peking and resulted in a convention signed in Jan. 1925. By its terms Japan recognized the Soviet Government which tendered "an expression of sincere regret" for the massacre of Nikolaievsk. Japan undertook to withdraw her troops from northern Sakhalin immediately, special arrangements being made for the working of oilfields in this region by Japanese firms. There were further stipulations as to granting other concessions and fishing rights. It is significant that whereas in 1915 the Japanese

Government seemed inclined to adopt a forward policy on the mainland, their subsequent attitude became most unassuming. They withdrew from Shantung and Siberia and did not even attempt to retain the northern portion of Sakhalin.

For the various agreements respecting the limitation of naval armaments and other matters at the Washington Conference, *see* that article. Of special importance was the agreement by which the Anglo-Japanese alliance was brought to an end and replaced by a Four-Power Treaty between France, Great Britain, Japan and the United States.

In 1921 the Crown Prince Hirohito made a tour in Europe and was received in Great Britain with the greatest cordiality by both the court and the public. This was the first time that a prince in the direct line of succession had left the sacred soil of Japan. In 1922 the Prince of Wales returned the visit and was received with equal cordiality.

The health of the emperor had never been robust. From the beginning of 1920 he ceased to appear in public and on Nov. 25, 1922, the Crown Prince was appointed regent. In 1924, H.I.H. married the daughter of Prince Kuni, head of one of the collateral princely houses.

THE GREAT EARTHQUAKE

The Hara cabinet continued in power until Nov. 1921. From a Japanese point of view, it was only moderately successful in foreign politics and many accusations of corruption in domestic matters were brought against it. Nevertheless the sudden assassination of Mr. Hara on Nov. 4 appeared to be the act of a crazy youth rather than a sign of popular resentment. Takahashi, minister of finance, succeeded Hara both as prime minister and head of the Seiyukai party but, finding the cabinet not amenable to his leadership, resigned after six months and Admiral Tomosaburo Kato, minister of marine and chief delegate to the Washington Conference, became prime minister in June 1922. Though he had no party affiliations he was promised the unconditional support of the Seiyukai. His first act was to abolish the temporary Diplomatic Investigation Council established in 1917. He endeavoured to cope with the growing social unrest and with the very serious commercial depression which was beginning to set in as a reaction after the abnormally favourable conditions which had prevailed at the end of the war. Unfortunately his health was bad and he died after little more than a year of office. Count Yamamoto, who had lived in retirement since the collapse of his cabinet in 1914, was commanded by the throne to form a ministry and while he was engaged on the task there occurred the terrible earthquake of Sept. 1, 1923 (*see* EARTHQUAKE). This stupendous disaster relegated ordinary political affairs to a secondary place for some time.

The Government took prompt action for the relief of the afflicted population, but the question of reconstruction created great divergences of opinion and the projects of Viscount Goto, minister of the interior, and the officials principally concerned created much discussion. On Dec. 27 another crazy youth made an attempt on the Prince Regent's life and the cabinet, regarding it as a disgrace to their administration, resigned. This action was entirely in accordance with Japanese political etiquette, but it was probably also a not unwelcome escape from a difficult position. Viscount Kiyoura was summoned to form a ministry. His cabinet was non-party and consisted almost entirely of bureaucrats and, as it showed no marked ability in dealing with the pressing problems created by the earthquake, discontent became general. The Seiyukai split into two sections, the seceding party being called the Seiyuhontō. A general election was held in May, 1924, at which the Kenseikai party obtained 162 seats, the Seiyukai 137, and the Seiyuhontō 94. Viscount Kato Takaaki, former minister of foreign affairs and ambassador at London, formed a coalition cabinet and in March, 1925, carried through the Universal Suffrage Bill, by which all males above 25 received the vote. But divisions began to appear in the coalition cabinet and some important members resigned. Gen. Giichi Tanaka became head of the Seiyukai and there was much talk of this party reuniting with the Seiyuhontō. In July the cabinet could not agree

upon a scheme proposed for the reduction of taxation and Kato resigned. He was ordered, however, to continue as prime minister and accordingly formed a new and homogeneous cabinet, consisting entirely of Kenseikai members but, unfortunately, he died suddenly in the following January. The minister of home affairs, Wakatsuki, succeeded him. Difficulties connected with immigration into America increased. In 1921 California and the other Western States made it illegal for a Japanese to own or lease land or even act as guardian for his own children born in America (who are by law American citizens) if they held land. On May 15, 1924, Congress passed an immigration law excluding Asiatics, which was regarded as equivalent to a declaration that Japanese, whatever their individual merits might be, were inadmissible as immigrants. This discrimination aroused profound resentment in Japan and the Government protested.

The Emperor Taisho died on Christmas Day 1926 and was succeeded by his son the prince regent, who adopted Showa as the title of his reign.

In November and December 1928 the new Emperor performed all the ceremonies prescribed by tradition in connection with his enthronement, and made several pronouncements declaring the policy of the Showa era. A new ministry was formed by Yuko Hamaguchi, July 2, 1929.

BIBLIOGRAPHY.—Wenckstern's *Bibliography of the Japanese Empire* contains the names of all important books about Japan, both ancient and modern. Vol. ii., published in 1907, deals with literature which appeared from 1894-1906. The most important recent work on Japanese history is Murdoch, *A History of Japan*, 3 vols. Other recent works are Sir E. Satow, *A Diplomat in Japan* (1922); J. H. Gubbins, *The Making of New Japan*; J. L. Longford, "Japan" in the series, *Nations of To-day* (1923). (C. EL.)

JAPAN, BANK OF: see NIPPON GINKO.

JAPANESE ARCHITECTURE. The physical features of the country and the national characteristics of cleanliness and simplicity have determined and guided the general trend of Japanese architecture; wood is the principal building material, for Japan is abundantly supplied with such splendid timber as *hinoki* (*Chamaecyparis obtusa*), which is still in excellent condition in buildings 12 or 13 centuries old. A commission was created in 1897 for the preservation and care of such buildings, as well as sculpture and other works of art, and up to the beginning of 1928 more than 1,100 buildings, in spite of the recurrent conflagrations, had been placed under "special State protection."

Pre-Buddhistic Period.—The primitive form of Japanese architecture is known as "primaeval palace construction." It consists in two posts set in the ground and supporting a ridge-pole, to each end of which are lashed slantwise two rafters reaching to the ground. To these rafters are tied horizontal beams to support a thatch which serves both as walls and roof; later a wooden floor was introduced, the whole structure raised, and the original shape of the roof retained while vertical walls were added. This simple form of architecture has been adhered to in some shrines sacred to Shintō. The oldest style is *Ō-yashiro*, the prototype of which is the shrine at Izumo; it developed into such forms as *Ō-tori* and *Sumiyoshi*, in none of which is there any evidence of the curves of a later date. These forms soon underwent slight variation, forming the style known as *Shinmei*, a perfect example of which is the Imperial Ise Shrine, which is rebuilt every 20 years, exactly the same to the minutest detail, with plain white wood and a thatch of *chamaecyparis* bark. It is recorded that the emperor Nintoku (A.D. 313-399) did away with palace decorations for the sake of economy, and "lofty architecture" is spoken of in connection with his reign as well as with those of two succeeding emperors, thus showing that the palaces at that time were no longer built in the simplest form. Their architectural development, however, was retarded, owing to the custom of changing the seat of the imperial court at the death of each emperor, and real growth, therefore, only came with the establishment of the court, first at Nara (708) and later at Kyoto, where it remained nearly 11 centuries before it was finally removed to Tokyo in 1868.

Early Chinese Influence.—The official introduction of Buddhism to Japan from Korea in A.D. 552 completely changed the architecture as well as other branches of Japanese art. Temples

on a grand scale with elaborate detail were built. Some of the buildings of the Hōryūji monastery date from the beginning of the 7th century, and are considered to be the oldest wooden buildings in the world. With Buddhism, the influence of the six dynasties of China became evident, though those who built the Japanese temples were Koreans introduced at the same time. Soon afterwards, however, T'ang influence became irresistible, and monasteries assumed a still greater grandeur in scale, as may be seen from what remains of Tōdaiji at Nara (completed about 750), a representative work of the Tempyo period (708-781). The exterior of the temple was coated with red oxide of lead and the interior painted in vivid colours, especially in the shade known as *ungen*; the palace at that time was also probably gorgeous with red pillars and green tiles. With the rise of two powerful sects of esoteric Buddhism (Shingon and Tendai) in the early Heian period (782-888) temple architecture again underwent a change, as the tenets of those sects required the monasteries to be built on mountain tops; Shintō architecture changed also and a curve was given to gable and roof, such forms being evolved as *Kasuga*, *Nagare* and *Hiye*.

First Nationalist Movement.—In the second half of the 9th century intercourse between Japan and China was interrupted. Left alone, Japan enjoyed a period of self-realization which gave the native taste a chance to discriminate and reassert itself in architecture, as well as in other branches of art. Grace and finish were imparted to architectural detail without sacrificing the strength and harmony of the whole. To the roof was given a gentle sweep of exquisite grace; to the interior a richer, but more subdued tone. However, the later Fujiwara period (1069-1185) revealed signs of weakness and a tendency to over-refinement and delicacy, and a philosophical endeavour to amalgamate Shintoism and Buddhism resulted in the modification of Shintō architecture. Aristocrats began building their mansions much after the fashion of the imperial residences; a style of architecture—*Shinden-zukuri*—consisting of a series of oblong houses systematically arranged and joined by corridors, with a garden laid out on the southern side in which was a big pond, became the fashion.

Second Chinese Influence.—Another great wave of Chinese influence began to be felt in the Kamakura period (1186-1335), when the Zen sect of Buddhists, which was destined to grip the mind of the people and to influence the art of the country fundamentally, was introduced from China. At the same time a peculiarity of the Sung dynasty under the name of "Tenjiku," or Indian, was introduced. Side by side with these imported styles the native architecture continued, and only later was influenced by the Zen principles; the "Tenjiku" style, apparently not congenial to native taste, was allowed to die out. In the Zen style the interiors were either plain, or coloured with utmost simplicity, a low relief generally constituting the only form of decoration. The period being strongly militaristic it was but natural that a style should arise, known as *Buke-zukuri*, for military aristocrats. It was a natural native growth, but its fuller development was seen in the Nanbokuchō (1336-93) and the Ashikaga (1394-1573) periods. Generally speaking, the Ashikaga period emphasized detail, ignoring structural significance, and revealing weakness in place of refinement, though it produced some great works with far-reaching consequences.

Based upon the *Shinden* style of Fujiwara and the *Buke* style of Kamakura, already mentioned, and under the influence of Zen, there arose a form known as *Shoin-zukuri* (a study style) in connection with domestic and palace architecture. It admitted more light into the house and provided the room with *tokonoma* (a recess for paintings and flowers to serve as decoration) and shelves for ornaments, etc.—two characteristic and pleasing features in the Japanese house. However, a greater triumph of native architecture was the creation of the *Chaseki*, a place for *cha-no-yu*, commonly known as the tea ceremonies, which, with Zen at its foundation, has most vitally influenced all branches of Japanese art, especially painting, architecture and garden designing. In the *chaseki* variation was insisted on lest monotony should weary the mind, and harmony and balance lest freedom of soul should be disturbed. While *cha-no-yu* was in vogue—in the latter part of

6. Shinto shrine at Nachi
7. Hōwōdō of Uji, built in the 11th century
8. Kondo of the Horyuji Monastery, built at the beginning of the 7th century; said to be the oldest wooden building in the world

the Ashikaga period culminating in the Momoyama period (1574-1602)—there developed the art of building fortified castles, strong and massive, and resistant to earthquakes. In the Momoyama period, though the forms were too well established to suffer any material change, architecture sustained a great innovation. For the first time in its long history, there were built lay buildings which far surpassed the temples in splendour; among noteworthy examples now remaining may be mentioned the Hiunkaku and the Stork chamber, both in Nishi Hongwanji, Kyoto, but originally at Momoyama, and the sanctuary of Ninnaji at Omuro which was part of an imperial palace.

Second Japanese Nationalist Movement.—Another nationalist period began with the Tokugawa régime (1603-1867), a period of peace and wealth. Many new buildings were erected and ruined temples restored; but it was in the construction of mausoleums and great edifices built over the bones of Tokugawa Shoguns that the spirit of the age found its fullest expression. The best examples may be seen at Nikko. They are in a style known as *Gongen* or *Yatsumune*, suggesting a complicated system of roofs; the buildings were lacquered within and without, and profusely decorated with carvings. Many feudal lords of the period, following the example of the Shogun, erected such extravagant buildings that it became necessary to impose restrictions. The magnitude of the scale on which the Shogun kept his court may be conceived from the Nijō palace in Kyoto, still well preserved.

Dwelling-houses.—The evolution of the common dwelling-houses of to-day was completed in the Tokugawa period. It was based on the *Chaseki* and *Shoin* styles, which were adopted by the people in general, and it brought with it a great development in landscape gardens which became indispensable as an integral part of the dwelling. The ordinary dwelling-house is one or two storied, roofed either with grey tiles, or in the country, with thatch. The floor is covered with closely-fitted mats 2 inches thick, measuring 3 × 6 ft., the size of rooms being computed by the number of mats in them. The house is divided into rooms by sliding screens; light is admitted by a paper-covered lattice mounted as a sliding window, these screens are removable so as to throw the series of rooms into one. At night the house is closely shuttered by wooden panels running in grooves on the outside. It is now usual to have one reception room furnished in Western style. The kitchen, long neglected, has been much improved by the introduction of Western conveniences and labour-saving devices. The whole interior, however, remains essentially simple and refined.

Post-Restoration.—With the restoration of power to the imperial throne in 1868, which was followed by the suppression of the feudal system, an attempt was made "to abolish every institution in Japan which had no counterpart in the civilized west." Naturally, the Western style of architecture was welcomed with a zeal that led to the invitation of European and American architects to the country to demonstrate the art of building with bricks, stone, iron and concrete. Some attempts were made to harmonize the Western and native styles of architecture, but with little success. A certain reaction set in just before the great earthquake and fire of 1923 destroyed much of Tokyo and its vicinity, exposing the weaknesses of both styles. A tendency, however, is to be noted towards the adoption, on one hand, of Western architecture for public buildings, and on the other towards maintenance of the pure native style for private dwelling-houses, since the old customs are still kept up in private life and the taste for simplicity remains essentially unchanged. JAPANESE BEETLE, a cetoniid beetle (*Popillia japonica*) which was accidentally introduced into the United States in the

larval form in earth around the roots of some plant imported from Japan. It was first discovered in the United States in 1916 near Riverton, N.J. At the end of 1923 it had infested an area of about 2,500 sq.m. in New Jersey and Pennsylvania. Since that time it has entered adjoining States. The adult beetle feeds upon about 200 species of plants, including practically all the economic crops, seeming to prefer, however, apple, quince, peach, sweet cherry, plum, grape, blackberry, clover and corn. It also attacks the foliage of many shade trees and ornamental shrubs; also many weeds, especially smartweed (*Polygonum sp.*). In many cases it completely defoliates trees and feeds upon the earlier-ripening varieties of fruits. The larva, living below the surface of the ground and feeding upon the roots of plants, damages lawns, pastures and golf courses, and also the roots of strawberries, cabbage and other plants that have been set in heavily infested fields. The eggs are deposited in the soil, and hatch in about 14 days. The larva is one of the so-called white grubs, and passes its entire existence underground. The winter is passed in this stage, and during May it transforms to prepupa, and then to pupa, the adult beetle emerging about the middle of June.

The adult beetle is about $\frac{3}{8}$ in. in length, and about the same in width. It is bright metallic-green in colour, with coppery-brown wing covers. The beetles fly readily, feed avidly and lay eggs in late summer. There is only one generation each year, five-sixths of the time being spent in the soil as egg, larva or pupa.

The insect has spread from the original centre of infection at the rate of from 10 to 15 m. per year, practically entirely by the flight of the adults, which may occasionally be carried by storms to very considerable distances. The movement of infested farm products and of soil in which the larvae occur is another method of distribution. During 1923 more than 32,000 beetles were removed from sweet corn consigned to New York from one New Jersey district. Vigorous attempts have been made by the States concerned and by the Federal Government, by quarantine and inspection, to prevent the rapid spread of the insect. Intensive investigations for direct remedies have been carried on for a number of years. Methods of treating the soil on lawns and golf courses have been developed; and effective sprays have been found. The beetles seem to avoid trees sprayed with arsenical compounds, but it has been found that a substance known as geraniol attracts them to unsprayed trees, and when they have concentrated upon such trees are killed by a contact insecticide.

Under the auspices of the U.S. Government, intensive studies of the Japanese beetle have been made in its original home. Several species of parasitic wasps and flies have been found to destroy it there, and these have been imported into the United States, where several of them have become established. (L. O. H.)

JAPANESE GARDENS. The art of garden-making was probably imported into Japan from China or Korea. Records show that the imperial palaces had gardens by the 5th century, their chief characteristic being a pond with an islet connected to the shore by bridges—as is shown later by mentions of the emperor Shōmu's (724-748) three gardens in Nara. During the Heian period (782-1185), when the symmetrical *shinden* style of architecture prevailed, the main garden (as often, even to-day) was laid out on the southern side of the house, always with hills and a pond with an island. However, with the change in domestic architecture of the Kamakura period (1186-1335), came modifications of the garden. Learned Zen priests, who assiduously studied the art of garden-making, gave Buddhist names to different rocks in the design, and linked religio-philosophic principles with the rules governing it. Other cults and superstitions crept in also, further complicating the design.

With the supremacy of the Ashikaga dynasty (1394-1573) came popularization of gardens, which were designed to be enjoyed from within as from without, opening a new era in the development of garden-making. The subjective mood became dominant, and the gardens reflected individuality. People demanded *shibumi* in their gardens—an unassuming quality in which refinement underlies a commonplace appearance, appreciable only by a cultivated taste. Aesthetic priests, "tea-men," and connoisseurs devised new forms of gardens for *cha-seki*, the little pa-

BY COURTESY OF JIRO HARADA

GENERAL KEY TO GARDEN DESIGN OF LANDSCAPE TYPE

vilions or rooms built for *cha-no-yu* (tea-ceremonies), and a special style developed which revolutionized Japanese garden art.

Styles in Gardens.—The vogue of designing in the three degrees of elaboration—*shin*, *gyo* and *so* (elaborate, intermediate and abbreviated)—was adopted also for gardens. Many splendid gardens were produced in the Momoyama (1574–1602) and Edo (1603–1868) periods. However, the centre of garden activity gradually shifted from Kyoto to Edo, the seat of the Tokugawa Shōgun. One development was a utilitarian phase; e.g., the duck pond in the Hama detached palace in Tokyo, and the cultivation in the Kairaku-yen at Mito of reeds for arrow-shafts, and plums for military supplies. Feudal lords generally had fine gardens in their provincial homes as well. Quite a number of gardens have survived the abolition of the feudal system after the Restoration of 1868, when so many celebrated gardens perished through neglect or were sacrificed. The establishment of public parks, which were not unknown even in feudal times, has been specially encouraged throughout the country since 1873. Gardens of Western style came with other Western modes but made little headway. The great earthquake and fire of 1923 demonstrated the utilitarian value of the Tokyo gardens. Tens of thousands found safety in the parks and in the large private gardens scattered throughout the city.

Classes of Gardens.—Japanese gardens are generally classified, according to the nature of the ground, under two heads: *tsuki-yama* (artificial-hills) and *hira-niwa* (level-gardens), each having special features. *Tsuki-yama* consists of hills and ponds, and *hira-niwa* of a flat piece of ground so designed as to represent a valley, a moor, and so on, and *tsuki-yama* may embrace a portion laid out as *hira-niwa*, both types being treated in the three degrees of elaborations already mentioned. Hill-gardens as a rule include a stream and pond of real water, but in the *kare-sansui* (dried-up landscape) style, while rocks are composed into the form of a waterfall and its basin, and of a winding stream and pond, gravel or sand is used to symbolize water, or to suggest the temporary phase of a naturally dried-up landscape. In extreme examples, where prime importance is given to rocks, and trees are absent, a real “rock garden” may be said to result. There are also styles known as *sen-tei* (water-garden) or *rin-sen* (forest-water), and, in level gardens, *bunjin-zukuri* (literary men’s style), a very simple and small type, originated by dilettanti in Chinese literature. The tea-garden or *roji* (dew-ground or passage) as it is called, is another distinct style evolved to meet the requirements of the tea ceremonies, as already mentioned. *Genkwan-saki* (front of entrance) or house-approaches have always claimed special treatment—a simple curve, wherever possible, partially to conceal the entrance to the house and give character to its front view.

Characteristic Features.—The characteristic features of a Japanese garden are the waterfall, of which there are ten or more different modes of arrangement, the spring and the stream to which it gives rise, the lake, the hills built up from the earth excavated when its basin is dug, the islands with many varieties of bridges, and the natural stones which constitute the skeleton of the garden. The selection and effective distribution of these stones are the prime consideration and have been endlessly experimented with and deeply pondered, the cream of such experiments in composition being handed down by means of drawings. The studied irregularity of the arrangement of the stepping-stones in the *cha-no-yu* garden, wherein beauty and use are combined, is a noteworthy element of garden-design. In modern Japanese gardens flowers are few and evergreens popular. The significance here is that simplicity, restraint and consistency are sought rather than gaiety, showiness or the obvious variations of the seasons, and subtle gradation in the tones of the foliage is preferred to the changing aspect of deciduous trees, though with some exceptions such as maple trees. As in the case of stones, trees must be distributed in the garden in harmony with their natural origin and habit of growth. Of garden furniture and accessories, the well, decorative and useful alike, the stone water-basin, endless in variety, stone lanterns, figures and pagodas, arbours and summer-houses, are the most characteristic, together with gateways and fences, particularly the widely varying *sode-gaki* (sleeve-fence) attached to the side of the house to screen certain portions, and used to blend harmoniously the natural beauty of the garden with the human art displayed in the architectural features of the house.

Ideals and Aims in Garden Design.—The ideals of garden-designing have often been modified during its long history, being influenced by the prevailing thought of each period. At one time eminent Zen priests designed gardens in accordance with the principles which lay at the base of their philosophical teaching; at another, painters became deeply interested and designed gardens as though they were painting landscapes on silk. In the course of history the objective standpoint in garden-making gave place to a subjective impulse. Various philosophic principles and religious doctrines were embodied in the making of gardens, not so much to interpret those particular principles and doctrines as to explain the aesthetics of garden design, and more particularly of the distribution of natural rocks, by illustrations drawn from familiar philosophic principles. Long after such principles have ceased to sway the mind of the people, the terminology survived, preserving a repertory of symbols. The laws of direction, of harmony, of the five elements, the principles of cause and effect, of the active and passive, of light and shadow, or of the nine spirits of the Buddhist pantheon, as well as superstitions of all sorts, still continue to

6. Imperial Garden at Shinjuku, Tokyo

influence to some extent the general design of gardens.

The aim is to bring man closer to Nature, and all manner of means have been resorted to in the effort to realize it. Some of the master-designers reproduced in miniature famous scenes of China and Japan. They planned the garden and planted trees to give the illusion of a view extending over and beyond its own immediate confines, but at the same time they so designed it as to be a secluded and sylvan retreat from the world, great ingenuity being displayed in both directions. In some instances, with only a few stones in a narrow strip of ground, a great expanse of landscape has been included as a background. In another instance, Rikyu, in his garden at Sakai, obstructed the open view of the sea in such a way that only when the guest stooped at the stone water basin to wash his hands and rinse his mouth preparatory to entering the *cha-seki*, did he catch an unexpected glimpse through the trees of the shimmering sea, thus being suddenly made to realize the relation of the dipperful of water lifted from the basin to the vast expanse of sea, and of himself to the universe. The Japanese have tried to emphasize in their gardens the charm of restraint, and of beauty so concealed that it may be discovered individually, thus providing that thrill of joy to the soul which comes from doing a good deed in stealth. Thus, at least in its ideals, the Japanese garden, which has always been part and parcel of the home, by no means stops at merely creating and arranging beautiful spots, but aims at being natural that it may satisfy the human craving for nature, and, by supplying peace and repose, may be a retreat in which man's spirit can wander and find spiritual recreation and sustenance. JAPANESE INDUSTRIAL BANK, THE. This bank, the *Nippon Kogyo Ginko*, was established by the Japanese Government in 1902 as a joint stock company with an authorized capital of 50,000,000 yen fully paid up.

The business of the Industrial Bank is (1) to make loans on pledges of national and local bonds and Companies' debentures and shares; (2) to subscribe for or take up national and local bonds and companies' debentures; (3) to receive deposits of money and accept articles of value for custody; (4) to engage in trust business for mortgage debentures; (5) to discount bills; (6) to promote bills of exchange; (7) to make loans on security of foundations created as prescribed by law; (8) to make loans on mortgage of ships or ships under construction, such loans to be redeemable by annual instalments within a period not exceeding 15 years (or less as fixed); (9) to make loans on security of ship-building materials or equipments; (10) to subscribe for or take up shares which have been approved by the competent Minister of State; (11) to subscribe for national or local bonds and companies' debentures, or to act as agent for receiving these instalments payable by general subscribers; (12) to make call-loans or loans for a fixed term on security of sites and buildings belonging to factories or of residential land buildings lying in localities where the City Organization Law is in force, and (13) to purchase national or local bonds or companies' debentures and shares or gold and silver bullion with available money which the bank may employ for the purpose.

(S. YA.)

JAPANESE LANGUAGE. Japanese is an agglutinative language. Its origin is still a matter of conjecture. Korea was probably the first foreign country with which Japan had relations; but whether and to what extent she borrowed from its language is uncertain, and it is not till she came into contact with China that we are on sure ground. From that country she borrowed the ideographs now in general use, attempting at the same time to follow the Chinese pronunciation of the period. In the process of time, however, the true Chinese sounds and their Japanese imitations drifted so far apart that save in a comparatively few instances they are to-day quite different. Originally introduced into Japan at the end of the 3rd century A.D., the ideographs were then pronounced according to what is called the *Gō-on* (*Wu* sound); but in the 7th and 9th centuries this was superseded by the *Kan-on*

(*Han* sound), which is that now in general use. The following are examples:—

Gō-on. <i>Nin.</i> <i>Mon.</i>	Kan-on. <i>Jin.</i> <i>Bun.</i>	Japanese equivalent. <i>Hito.</i> <i>Fumi.</i>	Meaning. <i>Person.</i> <i>Letter.</i>
--------------------------------------	---------------------------------------	--	--

The ideographs run into many thousands; but the number which the ordinary educated Japanese is able to read and write correctly probably does not exceed seven or eight thousand. When first introduced they were used for phonetic purposes as well as for their regular one; but, as they proved too cumbersome for the former, two syllabaries, called respectively the *Katakana* and the *Hiragana*, were eventually derived from them and are in use to-day. Each contains 50 characters; but the *Hiragana*, which is used in writing, has many variants. The movement to dispense with ideographs entirely and to substitute for them Roman letters (*Romaji*) has not so far achieved much success. The original native vocabulary was very limited; but the introduction of the ideographs and Chinese literature and philosophy enriched it materially, and since the invasion of Western ideas and scientific terms expansion has been most marked. Chinese ideographs being singularly well fitted to express these ideas and terms, it is by combinations of them in groups of two or more that the modern Japanese vocabulary has been built up. Very many of these words have found their way into the ordinary spoken language; but the process of colloquialization is not complete and perhaps never will be. Many words, too, have been adopted from European languages, some before the Meiji restoration, most since. Examples are *būdoro* (vitrio), glass; *kasūtera* (castilla), sponge cake; *kōhī* (kof-fī), coffee; *bōto*, boat; *naifu*, knife; etc. The most generous borrowings have been from English, and it is no unusual thing to see in a newspaper an expression printed in Chinese ideographs with the English equivalent in *kana* at the side. There are two distinct languages in Japanese, the colloquial and the written; but the newspaper and the complicated needs of modern life are gradually breaking down the barriers between them.

Grammar.—With regard to pronunciation it may be said in general terms that both vowels and consonants are softer than in most European languages, the vowel sounds resembling the Italian. The long vowels are pronounced approximately as follows:—

ā,	as	a	in father.
ē,	"	e	in grey.
ī,	"	ii	in siege.
ō,	"	o	in cone.
ū,	"	oo	in brood.

There is hardly any tonic accent in pronouncing words. The older Japanese grammarians recognized only three parts of speech, the substantive, the predicative, and the postposition (*teniwoha*); European categories are not particularly suitable. The following are some salient points of Japanese grammar and syntax expressed in the broadest and most general terms. There is no article, and the noun, which is indeclinable, has neither number nor gender. It is in fact a "universal" and not a "particular." Gender is expressed by the use of the prefixes *o* (male) and *me* (female), modified occasionally for purposes of euphony, or by the words *otoko*, *osu* (male) and *onna*, *mesu* (female); e.g., "a boy," *otoko no ko*; "a girl," *onna no ko*. Abstract nouns are generally expressed by Sino-Japanese words or by the combination of an adjective or a verb with the word *koto* (thing). Inanimate objects are rarely personified, and compound nouns are common. Case is shown by the postpositions *ga* or *wa* (nom.), *no* (poss.), and *wo* (acc.). *Wa* emphasises the word it follows. Adjectives have three endings—in *i* (attributive or predicative), in *o*, and in *ku* (adverbial). There are no inflections to indicate degrees of comparison; but so-called secondary inflections, produced by combinations of the verb *aru* (is) with the adverbial form of the adjective, exist to indicate tense and mood. The personal pronoun is avoided whenever possible and person shown by the context. The stock form of "I" is *watakushi*, of "you" *anata* or *kimi* (polite) and *omae* (depreciatory). There is no relative pronoun, its place being taken by a verb used adjectivally; e.g. "the dog which barks," *hoeru inu* (barks dog). Verbs may be conveniently divided into two conjugations (Lange; Chamberlain

gives three). In those of the first conjugation the stem ends in *e* or *i* and remains unchanged, in those of the second it ends in *i* but changes in conjugation. There are a few auxiliary and irregular verbs and many compound. There is also a desiderative form ending in *-tai*, really an adjective and subject to inflection. The passive voice is rarely used in Japanese, and there is no special conjugation for it. But passive and potential forms are derived by adding *rareru* to the stem of verbs of the first conjugation, and *reru* to that of verbs of the second. Similarly, causative verbs are formed by adding *saseru* and *seru* to the stem respectively. In all three the vowel *a* is also added to the stem in the case of verbs of the second conjugation.

There are two series of numerals, one Japanese, the other derived from Chinese. They are as follows:—

Japanese	Chinese	English
hitotsu	ichi	one.
fütatsu	ni	two.
mitsu	san	three.
yotsu	shi	four.
itsutsu	go	five.
mutsu	roku	six.
nanatsu	shichi	seven.
yatsu	hachi	eight.
kokonotsu	ku	nine.
tō	jū	ten.

100 is *hyaku*, 1,000 is *sen*, and 1,000,000 is *hyaku man*. There are also a number of auxiliary or classifying numerals. For instance, "two books" is *hon ni satsu* (books two volumes), and "two horses," *uma ni tō* (horses two heads), *satsu* and *tō* being respectively the classifying numerals of the objects specified. Ordinals are formed by prefixing *dai* (order) to the Chinese cardinal number, by adding *me* or *bamme* to it, or by using *dai* and *me* or *bamme* together; as, "the second," *dai ni, ni bamme*, or *dai ni bamme*. The place of the preposition in English is taken by the postposition. There are two kinds; postpositions proper and quasi-postpositions, the latter really substantives to which the postposition *no* is prefixed; e.g., "outside," *no soto* (exterior of). Adverbs proper and conjunctions scarcely exist. Honorifics, whether in the shape of special prefixes, nouns, or verbs play a very important part in the language, and particular care must be exercised in their use.

The fundamental rules of syntax are briefly: (a) qualifying words precede the word qualified, (b) the object precedes the verb, (c) the verb is at the end of the sentence. There are no expressions in Japanese corresponding exactly to "Yes" or "No," and in replying, for instance, in the affirmative to questions such as "Is that so?", "Did you go?", etc., a Japanese would say "It is so" or "I went." Similarly, if the answer were in the negative he would say "It is not so," or "I did not go." The following points deserve the attention of the student: (1) long and short vowels should not be confounded, (2) the use of personal pronouns should be avoided, (3) honorifics should not be applied to himself by the person speaking, but care should be taken to apply them to superiors.

JAPANESE LITERATURE. From the neighbouring continent the Japanese derived the art of writing, probably about the middle of the 3rd century, but the earliest book now extant dates from 712. This is the *Kojiki* (Record of Ancient Matters), translated into English by Chamberlain, as vol. x. of the *Transactions of the Asiatic Society of Japan*. The *Kojiki* is written in the archaic form; that is to say, the language is that of old Japan, the script, although ideographic, being used phonetically only. It is a species of saga, setting forth not only the heavenly beginnings of the Japanese race but also the story of creation, the succession of the various sovereigns and the salient events of their reigns, the whole interspersed with songs, most of which may be attributed to the 6th century. The next authentic work, *Nihongi*

(Chronicles of Japan), composed only eight years later, was completely Chinese in style and embodied Chinese traditions and Chinese philosophical doctrines. The poetry of Japan is distinctive. Its form has remained unchanged till modern times. The *tanka* is a five line verse of 5, 7, 5, 7, 7 syllables, and the *hokku* of three lines (5, 7, 5). The *content* of Japanese poetry began to change with the importation of Chinese metaphors and actual Chinese words. The two masters of pure Japanese verse were Hitomaro and Akahito (8th century), followed by Tsurayuki (early 10th century). In 756 was published the *Manyōshū* (Collection of a Myriad Leaves), a work containing the best verses of Hitomaro, Akahito and a host of minor poets. In 905 Tsurayuki and three other poets compiled the *Kokinshū* (collection of Odes, Ancient and Modern), and this was the first of the *Ni-jū-Ichi Dai Shū* (Anthologies of the Twenty-One Reigns), a series finally completed in the 15th century. With the mention of the *Hyaku-Nin-Isshū* (Hundred Verses by a Hundred Poets), assembled by Teika Kyō in the 13th century, the tale of Japanese poetry is told. From the end of the 9th century the making of poetry declined and although, in their passion for everything Chinese, the leaders of the literary world imitated the Chinese style of verse, none of their efforts ever attracted the attention of Chinese poets. Since Chinese poetry, like that of the West, has rhymes and a great variety of metres, as well as a complicated system of "parallelism" between the characters of the different lines, and the Japanese disregarded all these points, their non-success is not surprising.

THE DARK AGE

The so-called dark age of Japanese literature (c. A.D. 1425-1625) was not entirely unproductive; besides the *Tsurezure gusa* (Idle Thoughts), by Kenkō-bōshi, it gave the drama (*Nō*) to Japan. Tradition ascribes the origin of the drama to a religious dance of a pantomimic character, called *Kagura* and associated with Shintō ceremonials. The *Nō*, however, owed its development mainly to Buddhist influence. Very soon the *Nō* came to occupy in the estimation of the military class a position similar to that held by the *tanka* as a literary pursuit, and the *gagaku* as a musical, in the imperial court. For a moment, when the tide of Western civilization swept over Japan, the *Nō* seemed likely to be permanently submerged. But, in recent years, the popular mind has definitely been drawn from its favourite, rather coarse, variety stage to an appreciation of the classical drama. There are five schools of *Nō* presentation and a healthy competition stimulates public interest.

There was an attempt, in the period immediately following the dark age, to popularize the purely Japanese art of versification and the Tokugawa era (1603-1867) opened even more splendidly than it closed. Bashō and a collection of his "disciples" made the earlier years of this period lustrous with the myriad *hokku* or *haikai* (verses of three lines, 5, 7 and 5 syllables), produced on all subjects from the minutest natural object to personal reproaches, and thumb-nail sketches of new ideas, as when "the writing of Dutchmen" was said to "straggle like geese across the sky!"

Soon after the end of the Tokugawa period some imaginative Japanese saw an opportunity to pull their ancient poetry out of its rut. Foreign models of odes, sonnets, ballads, quatrains and long poems were slavishly copied; even *vers libre* was forced into a Japanese dress. The genius of the language, however, was all against such an innovation and the party led by Prof. Tozama watched its efforts fade into nothingness without even stirring the surface calm of the national taste.

Influence of Women.—A close view of the history of Japan will demonstrate the tremendous activity of men in the numerous battles and feudal squabbles which began soon after A.D. 1000. In these circumstances it is far from surprising that women dominate the literary history of Japan. Not only did women begin it (the empress Gemmyō ordered the transcription of the *Kojiki*, and again to an empress we owe the *Nihongi*), but they perpetuated it, and there are few, if any, works of outstanding merit in the pure Japanese tongue written by men. The latter, for the most

part, slavishly copied the Chinese style until it became recognized as the one vehicle for men, and women were left to guard the pure tongue. This distinction still prevails not only in writing but in speech, so that a Japanese woman's conversation is not only softer but more diffuse (Japanese being an inexact language), while the men interlard their speech with the direct, vigorous Chinese vocables. Early in the 11th century two notable works appeared from the pens (or rather, brushes), of two court ladies. The *Genji Monogatari* (Story of Genji) by Murasaki no Shikibu is a lengthy novel, tedious in itself, but valuable as a mirror of the real life of that time. The *Makura no Sōshi* (Pillow-sketches) by Sei Shōnagon is an amazingly unaffected record of the writer's impressions of life and its problems in daily practice ("Things I dislike heartily," "Things I am fond of" are two perfectly delightful sections of these fugitive papers). Through the naïveté of the writer's confessions appears a marvellously clear picture of life in aristocratic and Court circles in the 11th century.

THE TOKUGAWA PERIOD

The Tokugawa era (1603-1867), which popularized the drama, had memorable effects upon Japanese literature. Yedo, the shōgun's capital, displaced Kioto as the centre of literary activity. An unparalleled development of mental activity necessitated wholesale drafts upon the Chinese vocabulary. To this may be attributed the appearance of a group of men known as *kangakusha* (Chinese scholars). The most celebrated among them were: Fujiwara Seikwa (1560-1619), who introduced his countrymen to the philosophy of Chu-Hi; Hayashi Rasan (1583-1657), who wrote 170 treatises on scholastic and moral subjects; Kaibara Ekken (1630-1714), teacher of a fine system of ethics; Arai Hakuseki (1657-1725), historian, philosopher, statesman and financier; and Muro Kiusō, the second great exponent of Chu-Hi's philosophy. Iyeyasu's grandson, the feudal chief of Mito (1662-1700), organized the compilation of *Dai-Nihon-Shi*, in 240 volumes. This became now the standard historical work and was followed by the imperially named *Reigi Ruiken* (Rules of Ceremonial), in more than 500 volumes. In the year 1827 was published the *Nihon Gwaishū* (General History of Japan), by Rai Sanyo. These works are, for the most part, mere dull recitals of plain fact with no style or alleviation of any kind. At a later period popular ballads, dramatically detailing the struggles of great rival clans, replaced these histories in the popular fancy. In the last years of the 19th century the Japanese recognized this sad defect and instituted a section for historiographers in the Imperial university of Tokyo.

Although the incursions made into Chinese philosophy and the revival of Japanese traditions during the Tokugawa epoch contributed materially to the overthrow of feudalism and the restoration of the Throne's administrative power, the immediate tendency of the last two events was to divert the nation's attention wholly from the study of either Confucianism or the *Record of Ancient Matters*. A universal thirst set in for Occidental science and literature, so that students occupied themselves everywhere with readers and grammars modelled on European lines rather than with the *Analects* or the *Kojiki*. English at once became the language of learning. Thus the three colleges which formed the nucleus of the Imperial university of Tokyo were presided over by a graduate of Michigan college (Prof. Toyama), a member of the English bar (Prof. Hōzumi) and a graduate of Cambridge (Baron Kikuchi). If Japan was eminently fortunate in the men who directed her political career at that time, she was equally favoured in those who presided over her literary culture. Fukuzawa Yukichi, founder of the Keiō Gijuku, now one of Japan's four universities, did more than any of his contemporaries, by writing and speaking, to spread a knowledge of the West, its ways and its thoughts; and Nakamura Keiu laboured in the same cause by translating Smiles's *Self-help* and Mill's *Representative Government*. A universal geography (by Uchida Masao); a history of nations (by Mitsukuri Rinshō); a translation of *Chambers's Encyclopaedia* by the department of education; Japanese renderings of Herbert Spencer and of Guizot and Buckle—all these made their appearance during the first 14 years of the Meiji

era. The business of translating went on apace. Great numbers of European and American authors were rendered into Japanese—Calderon, Lytton, Disraeli, Byron, Shakespeare, Milton, Turgenev, Carlyle, Daudet, Emerson, Hugo, Heine, De Quincey, Dickens, Körner, Goethe—their name is legion and their influence upon Japanese literature is conspicuous. This energetic pursuit of another alien literature had its inevitable reaction in a further nationalist movement. When English was made a compulsory subject in all Japanese schools this movement was made even stronger as a direct result of the schoolboys' revolt against forced tuition in a difficult study. The full effects of this, however, were not to be felt until the dawn of the next era (Taishō).

The glory of Meiji was, alas, not to be sustained. Whether the mistake lay with the old giants of the Meiji era or in the insufficiency of their sons it is impossible at this close range to decide. In the later years of the Meiji period it became obvious that the spirit animating the intellectual and literary leaders was dying; some of the old magic still clung to the name of the dynasty, but nothing more. The new writers lacked the capability for sustained effort, their works were spasmodically produced, and were often completely without style. There was an unrestrained crudeness about the new literature which horrified those who still remembered the early Meiji period.

The change was almost complete when the young men began banding themselves together into various associations, such as the "New Romanization Society" (Shin Romaji Kai), the "Foreign Language Research Society" (Gaikokugo Kenkyū Kai), the "Japanese Script Society" (Nipponji Kai), etc. These unofficial organizations achieved very little, except of positive harm. Americanisms, cant and slang terms, undistinguished from "standard English," were imported freely and incorporated into novels, belles-lettres and even scientific treatises. The free-verse writers of England and America must be held responsible for a peculiarly displeasing form of composition which, while entirely foreign to the genius of the Japanese language, was adopted by the writers of this period in place of the *tanka* and *hokku* as the only possible style of poetic composition. The actual result of these liberal importations from foreign fields was the flood of ineffective and often vulgar books offered to foreign students as Japanese contemporary literature. While book-production was never so ample, it was never so uniformly devoid of merit.

The Meiji era translations of European classics and contemporary works, though marred by many faults of inexperience, are still to be preferred to later versions. Bacon, Shakespeare, Macaulay, Milton, Byron, Shelley, Keats, Victor Hugo, de Maupassant, Dante, Heine were all retranslated under this dynasty. The new translations are, however, far from being reliable. In many cases whole sections of the original are left untranslated, at the whim of the editor. Despite this, the character "zen" (complete) is found on the back of the book and on the title-page. In other cases, scenes which are purely national in the original work are recast, details being altered to suit Japanese surroundings. Thomas Hardy's novels suffer particularly in this unnatural transmutation: in one or two popular translations now in vogue Hardy becomes merely a mediocre Bakin leading some dull puppets over dreary Japanese marshes.

THE MODERN MOVEMENT

The outstanding literary feature of the Taishō era is the inundation of Japan by Russian works. Tolstoi ceased to be fashionable; Andreyev, Balmont, Sologub, Pushkin, Zinaida Hippis, Lermontov, Gogol, Tchekhov and Turgenev held the imagination of youthful Japan during these years. Although no further impulse was needed, it was supplied by the signing of the Russo-Japanese Treaty early in 1925, when numerous societies for the encouragement of research into Russian literary and philosophic fields sprang into existence. Russian plays were hastily and imperfectly translated into Japanese (*The Cherry Orchard* was a noteworthy exception), and produced by Japanese actors at the Little theatre in Tsukiji, Tokyo. Gogol, in his more dreary moods, was freely translated into novels of social life, and the sentimentality so characteristic of the true Japanese novelist becomes tintured

with a despair imported from the Siberian steppes. Arishima Takeo, an idol of the young reader in modern Japan, demonstrated this phase not only in his novels but in his life and death.

The Occidental treatment of women engaged the attention of writers of all classes, and political writers condemned the drastic changes proposed by the novelists. Foremost, perhaps, not only of modern woman-novelists but of all since the days of Murasaki no Shikibu, is Mrs. Yayoi Nogami, wife of Nogami Toyochiro, the greatest living Japanese authority on the classical drama (Nō), and translator of Bernard Shaw. A later novel of hers, *Kaishin Maru* (The Seagod Ship), is justly esteemed above all contemporary works.

No account of modern Japanese literature would be complete without reference to certain writers who, in spite of their lack of real merit, have captured and held the popular imagination. Natsume Sōseki is chiefly remembered for his *Wagahai wa Neko de Aru* (I am a Cat) and *Botchan* (The Boy). He died before the full force of change induced by indiscriminate importation had been felt, and his work was modelled rather on the later Meiji style. "The Two Kikuchi," as they were familiarly called (Kikuchi Kan and Kikuchi Yuhō), devoted themselves to the writing of novels in which women's problems are discussed and advanced views of social life are set forth. Kume Masao, Satomi Ton and Akutagawa Ryunosuke also, in some measure, gratified the current passion for original styles and exotic scenes. Kurata Hyakuzo is regarded as the leading spirit of modern Japanese drama; one of his plays, *The Priest and his Disciples*, has been translated into English and published with the original text by Glenn Shaw (Tokyo, 1923). The sex-novel of Europe has its imitations in works by Tanizaki Junichirō and Morita Sōhei. Tanizaki writes very colloquially on the subject of hysterical women, psychoanalytic studies in the West providing him with unlimited material. Morita Sōhei was once considered a very brilliant writer, his *Baien* (Sooty Smoke) being an exceptional success. He afterwards turned his attention to translations of Ibsen's plays.

Matsuura Hajime is the only literary man of this period to remain true to the best traditions of his country's literary history. Unaffected by the many new movements for the development of art, letters and the drama, he is the foremost poet and essayist of modern Japan. In 1925 he resigned his professorship at the Imperial university in Tokyo, "as a protest against the insincerity and shallowness of modern academicians, artists and writers, who would profane the shrine of pure art by setting up base images of foreign clay." In his *Bungaku no Byakkō* (The Pure White Light of Literature) Matsuura displays a sensitiveness and purity of ideal which had been lost to Japan since the close of the Nara period.

The constitutional ban on revolutionary and socialist doctrines resulted in the issue of a complete Marxian library and a series of handbooks purporting to be short cuts to Bolshevism. The Showa period, which began in December 1926, has so far not made any original literary gesture and there is no sign of a return to the early simplicity of literary models.

(A. N. J. W.)

JAPANESE MUSIC. The traditional origin of Japanese music is generally traced back to Izanagi and Izanami, the creator and creatress of the country in Japanese mythology, whom the 8th century *Kojiki* records as having sung together in chorus. Dancing is likewise linked with the performance of the celestial deities before the cave of the Sun Goddess, when songs were sung and Amano Kanatomi-no-mikoto played on a harp formed of 6 stretched bows. Historically, too, vocal music came first and when instruments were introduced, they were generally the accompaniments of the dance as well as song. When foreign musical instruments were imported their influence was felt in Japanese vocal music, but ethnical characteristics have helped to develop it in the direction of *uta-mono* (singing) and *katari-mono* (recitative) so that at the present time there is the *gagaku* (classical court music) with a history of more than 10 centuries behind it, the

naga-uta (long songs), with a tradition several centuries old, and the music for the popular *samisen* (three-stringed guitar) going back some 300 years, all developing side by side with the lately-imported European music.

Primitive Period.—The musical history of Japan may be divided into 4 periods: The first is the primitive period ending with the death of the emperor Inkyō (412-453) when native music existed in which the stress was laid on the beauty of the human voice, though later more value was attached to its literary contents. This consisted of *rōyēi* (chanting poems), *kume-uta* (songs of war), *imayō* (the singing of genre sonnets), and such instrumental music as *kagura* (sacred dance), *saibara* and *uta-gaki* in which men and women joined in the revels on the outskirts of their villages. Records speak of the emperor Inkyō playing on a *wagon* (Japanese native *koto*) and the empress dancing at the imperial banquet given in 419 on the completion of their new palace building. Hand-drums and pipes made of bamboo appear to have been in existence at that time.

Period of Foreign Music (453-1186).—The second period is marked by the importation of foreign music, beginning with 453 and lasting about 700 years. Its main events may be summarized as follows, each numeral covering about a century: (1) The king of Shiragi (in Korea) sent 80 musicians to attend the funeral of the emperor Inkyō in 453, thus marking the first importation of foreign music into Japan, although the custom of using music at the funeral ceremonies of important persons was already in existence locally, while in 554 a number of musicians were sent from Shiragi to the court of the emperor Suiko. (2) The king of Kudara (in Korea) in the middle of the 7th century dispatched a number of musicians to remain at the Japanese court, some of them being replaced later by a new batch; about the same time music came also from Koma (in Korea). At this time *kure-gaku* (*gagaku*) was also introduced which played an important part in Buddhist ceremonial, and some of the masks worn in connection with this music are still preserved in the Horyūji monastery. (3) Indian, as well as Chinese, music had already found its way to Japan through Korea. But the influence of T'ang music, coming direct from China, became irresistible and played an important part in the grand inauguration ceremony of the Great Buddha of Todaiji, Nara, in 752. (Some of the masks and dresses used on that occasion are still preserved in the imperial treasure-house, Shōsō-in.) The music of European Turkey and of Arabia also found its way to Japan before the establishment in 702 of the imperial bureau for music (*Uta-ryo*) which consisted of more than 500 singers, musicians, etc. (4) The *biwa* and the *koto* (the Chinese *kin*) were brought in from China. (In the Shōsō-in collection dating from the 8th century there are examples of *wagon*, Chinese *kin*, 5-stringed *biwa*, 4-stringed *genkan*, *shō* and *wu*, a kind of mouth-organ with long pipes of slender bamboo, harps and flutes.) There was a revival of T'ang and Korean music and this foreign music so dominated the Uta-ryo, that O-uta-dokoro was created for the development of native music to be used on certain ceremonial occasions. (5) The contact between and harmonization of foreign and native music gave rise to new instruments such as the *hichiriki* pipe. (6) There was a further development of *gagaku* for the court use. (7) There came into existence *shirabyōshi* (white measure-markers) whose semi-poetical chants were accompanied by drum and fife. It was during this time that a separation of popular from the aristocratic music took place.

Period of National Music (1186-1896).—The third period covers about 700 years, beginning with the reign of the emperor Gotoba (1186), and is characterized by the birth of genuine national music. The principal features of the period, each covering about a century, are: (1) the vogue of *hei-gaku*, the recital to *biwa* accompaniment of epics of the Taira clan, and of *yei-nen* (life-lengthening dance) by the monks; (2) the rise of *Den-gaku* (originally an agricultural mime) which found favour with the military class; (3) the rise of *Saru-gaku* (monkey mime) patronized by the court; (4) a new movement was in evidence in native music and there appeared the signs of the birth of popular or people's music; (5) a real popular music was born with the appearance in the Hoei era (1704-11) of the *samisen* (3-stringed

JAPANESE PAINTING AND PRINTS

BY COURTESY OF (1) THE MUSEUM OF FINE ARTS, BOSTON, (2) THE METROPOLITAN MUSEUM OF ART, NEW YORK

KORIN AND KOYETSU SCREENS

Korin and Koyetsu were two of the most famous painters of Japan and the two screens shown herewith represent their styles. The top screen, with its almost incandescent coloration of the jagged rocks around which raging waves lash, shows the strength and verve of Korin's art; while the lower screen, in its grasp of the colour and mood of autumn, gives an idea of Koyetsu's understanding of nature. Another piece by Korin is shown in "Screens," Plate II

banjo), being a Japanese modification of 2-stringed lute with snake skin brought from Luchu; (6) the *samisen* music of the common people made great stride and alongside it *uta-mono* (songs) and *katari-mono*, such as the tragic recitation of the *yoruri* also flourished; (7) there was a commingling of various kinds of music in the closing century of this period.

Period of European Music (1896—).—The fourth period begins with the end of the China-Japan war in 1896, and is characterized by the importation and spread of European music in Japan. It was in 1896 that Western gramophones found their way to Japan. Such a welcome did the Japanese give to them that ten years later a gramophone company sent their agents there and had a good deal of Japanese music recorded. European music gained great favour in Japan, especially with the young people, and it so dominated the Tokyo Academy of Music, the highest institution of its kind in Japan, that in 1911 a special commission was set up in the academy with the purpose of preserving the traditional music of Japan. Naturally pianos and Western violins have entered much into Japanese homes. But the *koto*, *samisen* and *shakuhachi* (bamboo pipe) are still retained, and the tragic recitative of the *yoruri* or *gidayu*, with or without the accompaniment of puppet or other plays, together with other forms of recitative such as the popular *naniwa-bushi*—epic of 47 Ronins, etc.—and the remnant of the minstrelsy of the *biwa-hōshi*, and such native styles of singing as *naga-uta*, *uta-zawa*, and *ko-uta*, still hold their own in varying degrees.

It has often been observed that the Japanese have not made such progress in music as in other branches of art and this has been put down in part to Japanese religious teaching which has caused the people to regard all expressions of emotion as vulgar. (J. HAR.)

JAPANESE PAINTING AND PRINTS. Although Japanese painting originated in China, it is a mistake to suppose that in art the Japanese have been merely imitative. It was inevitable that the great empire of the continent, with its ancient civilization, should be to Japan even more than Italy and Greece have been to Western Europe. But in their art there is always a difference; and in certain schools and periods the Japanese genius has triumphantly asserted its special gifts and qualities.

General Characteristics.—Japanese painting ignores the cast shadows of nature. It attempts no sculptural effects. It insists very little on the relief of objects portrayed, and prefers the suggestion of modelling to its actual representation. It employs an empirical system of perspective. It does not aim at the complete representation of a scene, but, selecting the significant elements, uses blank space as a factor in the design. Though the Japanese artists study nature with ardent attention, their aim is to train the memory so that when what they wish to paint is completely visualized they shall be able to record the mental image with the utmost vividness and truth. They concentrate on life, movement, character, but always with an eye to decorative effect. Their technique follows that of the Chinese. The medium is Chinese ink, a substance yielding tones that range from deepest lustrous black to silvery grey and water-colours, to which rice-paste or diluted fish-glue is sometimes added according to the pigment used. Paintings are either in ink alone, or light-coloured or full-coloured. The material is silk or absorbent paper. Anything like the elaborate confection of a European oil-painting is therefore unknown. The expressive strokes of the brush are valued as a direct communication of personality, like the handwriting which, also employing the brush, not a pen, is an invaluable training for the painter.

Fresco-painting was practised in early times, but never to the same extent as in China. Pictures are usually in the form of *kakemono*, hanging-paintings, or *makimono*, horizontal-scrolls, which are sometimes of immense length. But some of the finest Japanese paintings are in the form of screens, usually six-fold; these, if in colours, are generally on a gold or silver ground. There are also paintings on sliding-panels, and framed pictures. The *kakemono*, mounted on fine brocade, are kept rolled up, and when shown, are hung in a sort of alcove called the *tokonoma*, reserved for this purpose.

The motives of Japanese painting are often similar to those of

Chinese art; but except in periods when Chinese influence was paramount, the life of action becomes a far more prominent and fruitful theme. The Japanese, being essentially martial, while the Chinese are pacific, found congenial matter in the painting of heroic episodes of the civil wars which raged so long in mediaeval times. Where the Chinese tradition was followed, the Japanese painters tended to use a smaller scale. The national instinct for

AN ACTOR PRINT BY TOYOKUNI, ONE OF THE THREE MASTER ARTISTS OF THE LAST DECADE OF THE 18TH CENTURY

neatness, for fastidious and cleanly order, is reflected in their art. The high spirit that goes with a martial temper, and a frank gaiety, are also distinctive qualities that find expression in art. Perhaps the chief bane of Japanese painters has been an extreme dexterity, tending to sacrifice inner significance to clever manipulation of the brush. Nevertheless it must be emphasized that the Japanese have for centuries shown an instinctive taste that amounts to genius; and perhaps in no country has fine taste been so widely diffused. The colour-prints of the 18th century were produced by men of the artisan class solely for a public of the same class. Despised by connoisseurs in their own country because of this association, they were appreciated as miracles of refinement and exquisite design by Europeans familiar with the art of the whole world. China has nothing comparable to show of the kind. Nor, so far as we know, have the Chinese ever produced anything like the superb array of screen-paintings by great masters which are among the greatest glories of Japanese painting. If in general Japanese art is less profound than Chinese art, yet among the early religious paintings are some sublime masterpieces. In the portrayal of swift and vehement action Japanese draughtsmen of mediaeval times are unsurpassed. In the art of the later periods there is a world of humorous vivacity and observation. Japanese painting represents a continuous tradition of 1200 years, perpetually renewing itself and alive to-day. But the fact that nearly all its great masterpieces have remained in Japan has prevented the real range of its achievement from being appreciated by the world at large.

History: Early Buddhist Art.—In the 6th century A.D. Buddhism, in its triumphal progress from India, overflowed, by way of Korea, into Japan. Such rudimentary efforts at mural painting as had existed before hardly need a mention; the real tradition of Japanese painting starts from the introduction of Buddhism. Of its earliest phase the one existing relic is the so-called Tamamushi Shrine, a portable wooden shrine painted with Buddhist figures and legendary scenes in an oil medium and in Chinese Buddhist style. The earliest independent painting is somewhat later in date. It is a portrait of the Crown Prince Shōtoku with his two sons. Shōtoku was a great and enlightened prince, who as regent under the empress Suiko (reigned 593–628) was the chief influence in the propagation of Buddhism and in the fostering of the arts. In this painting, now thought to have been made after Shōtoku's death, and in the few other works surviving from the 7th and early 8th century, such as the "Beauties under the Trees," a screen-painting, and the exquisite "Kichijōten" in Yakushiji temple, the style of the earlier T'ang period in China is very closely followed. The same full and rounded type of face, the same fashions in coiffure and dress, the same suavity of demeanour, are found in some fragments of Chinese secular painting discovered by Sir Aurel Stein at Turfan (Turkistan) in a tomb of the early 8th century. The grandest works of this time, however, are the frescoes in the Hōryūji temple at Nara: they are no doubt closely modelled on T'ang wall-paintings. Tradition ascribes both these and the portrait of Shōtoku to Korean artists. In 756 the consort of the Emperor Shōmu dedicated the belongings of her dead husband to Buddha. These have been preserved to this day in the Shōsōin at Nara, and bring vividly before us the outward signs of the Chinese civilization of the period, as reflected in the Japanese court. To what extent these objects of noble design and exquisite workmanship were Japanese productions, it is difficult to say. But it is certain that the Japanese adopted the arts and graces, the costume and ceremony, the literary and aesthetic pastimes, of Chinese life in no spirit of barbarian mimicry, but with a responsive appreciation. Fine taste and a sensitive docility are qualities in which the Japanese have been surpassed by no other race.

In 794 the capital was moved from Nara to Kyōto, then called Heian; and from this date to 1100 extends the Heian period, the later part of it being often called the Fujiwara period from the ascendancy of the great clan of Fujiwara. We now begin to find recorded the names of individual artists. Among these is the priest and saint, Kōbō, who visited China in 804–806; a few pictures by him still survive, which show that he could compete with Chinese masters on equal terms. The greatest name of the 9th century is that of Kanaoka, who painted secular scenes, animals, birds and flowers, as well as Buddhist subjects. Tradition places him among the greatest of Japanese painters, but no work of his brush now remains. Some splendid pictures have borne his name for centuries, but are now judged to be of considerably later date. We may presume, however, that with Kanaoka Japanese art began to assume a character of its own. From the end of the 9th century to the 14th intercourse with China was almost suspended; and, shut up within herself, Japan sought to assimilate all the marvellous inheritance she had received from the continent, and at the same time to develop her art according to her own genius. Kanaoka founded the Kose School, Kose being his family name. Other schools which arose were the Takuma and the Kasuga schools, and later the Tosa School, all of them belonging to the Yamato or national tradition. The pictures that have survived of this early period are all of Buddhist inspiration; and though we know from records that the artists by no means confined themselves to religious themes, probably their grandest work was in the Buddhist style. Eshin Sōzu (d. 1017) ranks as the greatest of the religious painters of Japan. He is especially associated with beatific visions of Amida Buddha—rising in glory behind the mountains, or descending to welcome the blessed soul to Paradise—though some of the works attributed to him by tradition have been taken from him by modern criticism. During the Fujiwara period the painting of screens, panels and fans was fashionable; even more popular, towards the end of it, were the picture-rolls,

often illustrating diaries or stories and combined with manuscript.

The Yamato or National Style.—A definitely Japanese style had now been created. Nothing that we know of in Chinese art prepares us for the amazing rolls of Toba Sōjō (1053–1140). The priest Kakujō, who became an archbishop, is known in art by this ecclesiastical title. He painted a grand Death of Buddha, but is best known for the witty and animated drawings in which he satirized personages of the day, including the clergy, under the guise of frogs, monkeys, etc. Whether in drawing animals or human figures, his brush tingles with life. Nothing could stale the freshness of these masterly sketches.

The art of caricature is known in Japan after him as Toba-ye; but later artists, while imitating him in a fondness for animal travesties, exaggerate his methods to satiety. Nevertheless, this strain of buoyant fun, which is found thus early, is a notable characteristic of Japanese art. Contrasted with Toba Sōjō is Takayoshi, whose work reflects the life of the Court at the close of the Fujiwara days, its refined voluptuousness, its exquisite leisure, its devoted cult of beauty. It was Takayoshi who made the first illustrations to the Genji Monogatari, the marvellous novel written by the Lady Murasaki at the beginning of the 11th century. Here we find at its most splendid and original the fully-formed style of the Tosa school in which the Yamato tradition was to persist so vigorously. All that is truly Japanese, and least Chinese,

"THE STORY OF KASANE," AN ACTOR PRINT BY TOYOKUNI'S EMINENT PUPIL, KUNIYOSHI

in later painting derives from elements here established. It is an art of frank and audacious convention, quite unlike any other art in the world. The conception of life as a continual ceremony is reflected in the formality of the design, in which the play of curving forms against straight line and angle is enriched by the contrast of low-toned but glowing colour. It is an art of interiors chiefly; the profuse beauties of nature are symbolized by tree or flower detached in delicate isolation. There is no hint of Chinese impressionism; cloud and mist intervene in the design as solid bands of gold. About the middle of the 12th century the long

1. The broken shoe-string, by Suzuki Harunobu (1718-70), the first painter to employ full colours in wood block printing
2. Two youths and a girl playing a flute, by Torii Kiyonaga (1752-1815)
3. Beauty in the mirror, by Kitagawa Utamaro (1753-1806) one of Japan's greatest masters of figure design
4. Theatre manager reading an announcement, by Toshiusai Sharaku

rivalry of the great clans of Taira and Minamoto came to a head, and Japan was given up to civil war.

Kamakura Period.—In the end the Minamoto triumphed, and Yoritomo took to himself the title of Shōgun. He established his capital at Kamakura, after which the ensuing period is named. The portrait of Yoritomo here reproduced (Plate II.) is an ancient copy of a picture preserved at Kyōto and ascribed to a contemporary painter, Takanobu. We observe the emphatic angles and straight lines on which the design is built; a certain squareness, contrasting with the grandly flowing curves of Chinese painting. Kamakura painting is indeed the most truly national phase of Japanese art, the art of a martial and heroic people. The swift and summary power of stroke, the animated intensity of delineation, which Toba Sōjō had shown so signally, were now applied to scenes of action and war. Mitsunaga, Nobuzane and Keion are the supreme masters of a vigorous school. "Keion," now thought to be a legendary name, is the traditional author of three picture-rolls of scenes from the civil war, one of which is in the Boston museum. For dramatic design, energy of movement, vehemence of action, the draughtsmanship here shown is not surpassed in the world's art. A detail from the Boston Roll is reproduced (Plate IV., fig. 1).

Mitsunaga is no less a master of expressive gesture and nervous line. Nobuzane is famed for a series of portraits of poets, but his masterpiece is the incomparable portrait of Kōbō Daishi as a child kneeling upon the lotus, an exquisite work. Takakane, Yoshimitsu, and Korehisa in the 14th century rival the preceding masters in splendour of colour and energy of line. This was a truly national school, and it is unfortunate that its masterpieces are so little known, and that the glories of this school can only be fully appreciated in Japan itself. (Many scenes from these rolls have been reproduced in colour in *The Kokka* magazine.) Besides the interiors with their scenes of court life and amorous intrigue, in which no one rivalled Takayoshi, and the battle-scenes, a favourite theme was the life of this or that saint; and here we find episodes and incidents taken from the ordinary life of the people, depicted with an intimacy of truth, a humour and pathos, which are emphasized by the contrast of the formal conventions of the background. Paintings of horse-taming and of demons on a journey are also famous. The school, usually styled the Tosa school, began to show signs of enfeeblement in time; and though Mitsunobu and Yukihide did admirable work in the 15th century, a strong reaction from China was already inaugurating a new era in art.

Ashikaga Period. The Chinese Renaissance.—During the 15th century a complete change was to come over the spirit of Japanese painting. During the civil wars of the Kamakura epoch the doctrines of the Zen sect of Buddhism had taken a deep hold of the samurai, or lesser nobility, as well as of the monks. Zen despised ceremony, the worship of images, dogmas; it relied on wordless communication, on contemplation of the absolute in oneself. Zen had been the dominant inspiration of the art of the latter part of the Sung period in China; and it was to the painting of Southern Sung that the Japanese now turned, and took for the supreme exemplars of this new movement or revival the great landscape masters Hsia Kuei and Ma Yüan and a master of the ink-sketch, Mu Ch'ī. The Ashikaga line of Shōguns established their power in 1335 and were to remain in power till 1573. They removed from Kamakura, and Kyōto once again became the capital. During the early part of the period there was renewed intercourse with China; yet the contemporary art of the Ming period had little or no influence at this time in Japan. On the other hand, the ink-paintings inspired by Zen doctrine during the Sung era were eagerly collected. Zen had no longer any power or following in China; it was therefore Japan's opportunity, and in this phase of Chinese painting Japanese collections are particularly rich.

This revival had already a few precursors in the 14th century, notably Chō Densu, known also as Minchō (1351-1427), famous as a painter of Arhats or Buddhist Apostles and one of the greatest religious painters of Japan. And before the 15th century was over the talent of the rising generation was drawn more and more to the Chinese style. From the long rolls depicting in rich colour

heroic stories, or ceremonious scenes of court life, or saintly legends, men turned to the swift ink-sketch, charged with concentrated energy—a spray of blossom, a bird poised on a reed, a glimpse of mountains among the mists, a sage absorbed in thought; the theme, whatever it was, being not so much the thing represented as what it evoked in the spectator's mind: fact transmuted to symbol and idea. To find the spiritual reality in oneself was

"WOMEN AND CHILDREN." A 17TH CENTURY WOODCUT BY MORONOBU

A translation of the script is: "In choosing a wife (or husband), first, she must be beautiful; then love, and then sympathy comes. And finally there must be conjugal affinity (determined by the signs of the zodiac at birth); if not, the children will be frail, and suffering from poverty will come. Everything will be unsuccessful, causing continual quarrels between husband and wife. Remember these words well."

the Zen aim; and, an impulse from a vernal wood, embodied by the painter's brush in a hinted scene, could be of more potency than all the teaching of the sages. Soga Shūbun, a Chinese artist who settled in Japan, was a pioneer of the revival; he founded a line of painters, among whom his son Soga Jasoku is the most famous. Other pioneers were Josetsu; Bunsei, an artist till recently confused with Josetsu; and Shūbun the Priest (to be distinguished from Soga Shūbun). These were followed by Oguri Sōtan; Nōami and his son and grandson, Gei-ami and Sōami; Keishoki, and other masters. All of these belong to what became known as the Chinese School.

A yet greater artist, Sesshū (1420-1506), formed a more personal style and founded the school known by his name. He visited China, but found no peer among the Chinese. The force and intensity of his conceptions are matched by the vehemence of his brush strokes. In Japanese esteem Sesshū probably ranks as the greatest painter of Japan. His follower Sesson at times rose almost to Sesshū's height. A third school was originated by Kanō Masanobu, the first of the long line of Kanō artists, which has lasted into our own day. Though the art of this whole movement can never mean so much to Western minds as it means to Japanese, because of its subjective character, and though its achievements cannot be regarded as equalling those of the Chinese masters it adored, still the revival was of inestimable value to an art which was becoming impoverished through isolation, by re-unit-

ing it to the main stream of Asiatic culture. It is permeated by ideas, and its art breathes a lofty atmosphere. The Kanō tradition would not have become so powerful had it not been for the genius of Motonobu, son of Masanobu, who is one of the greatest masters of Japanese painting (1476-1559). In his work the Kanō manner assumes the well-marked character which it was to preserve so long. The painters of the Ashikaga revival painted almost exclusively Chinese subjects; but Motonobu painted also scenes from Japanese legend, the special province of the Tosa school. The Kanō masters dominated painting for some generations. Motonobu's grandson, Yeitoku (1543-1590), gave a new character to the Kanō style. The last Ashikaga Shōgun was deposed in 1573.

Toyotomi Period 1573-1602.—There was a revulsion in taste from the reticent severity of Ashikaga towards material splendour. Hideyoshi, the low-born conqueror of Korea, and his nobles, built huge castles, sumptuously decorated. Yeitoku and his pupils painted gorgeous screens to meet their demands. Among the screen-paintings of this period are some of the finest creations of Japanese art. They combine energy and breadth with monumental design, and often with splendid colour. The lines have the imaginative feeling which expresses high artistic sensitiveness and finely developed taste. In its next phase the Kanō school returned or tried to return to the simpler taste of Ashikaga times. The civil wars ended at last with the establishment of the Tokugawa dynasty of Shōguns, and Japan, settled in peace, again shut herself up from the world.

Tokugawa Period.—Tanyū (1602-1674), a painter of extraordinary brilliance and power of brush was the model which the Kanō school was to follow thereafter. Ink-painting, usually with light tints added, was the favourite medium; but the Zen inspiration which had given aroma and significance to the slight paintings of the Ashikaga masters had lost its fervour, and virtuosity could not take its place.

The Tosa school still maintained itself; but by now both traditions of painting, the Chinese and the native or Yamato style, far removed from each other as they were, were living on their past and repeating a consecrated formula. The time was ripe for new movements.

Kōyetsu (b. 1558) was not only a distinguished painter and an incomparable calligrapher but also designed in wood, metal, lacquer and brought about a revival of the arts of wood-cutting and printing. Somewhat like William Morris, he presided over a village in which his craftsmen pursued their various crafts under his direction. The screen in the Metropolitan Museum, New York, reproduced (Plate I.), used to be considered the work of Kōyetsu; but, as is often the case with screen-paintings, the actual authorship is problematic. Kōyetsu sometimes collaborated with his friend and follower Sōtatsu, the one supplying the calligraphy, the other the painting. They formed a style which is the most intimately Japanese of all the schools. Yeitoku had already created in his screen-painting a style of 'mural' art which, while taking over some of the Tosa conventions and its traditions of colour, drew from Chinese example a synthetic power, an emotional concentration, and a massive grandeur such as none of the old Tosa artists either aimed at or achieved. Kōyetsu and Sōtatsu, who founded their art on Tosa principles, completed this fusion of styles and refined on it with the sensitive delicacy of Japanese genius. Starting from an abstract design consisting of related or opposed forms, masses, tones, they fit or melt into the design whatever they choose of natural form and colour. Kōrin (1661-1716) carried the style to yet further audacities. He uses a freedom and extravagance which in Europe only caricaturists have ventured on to express a superbly decorative idea. The Wave Screen at Boston (Plate I.) is even more an imaginative conception than a glorious decoration. Kōrin's masterpieces were in lacquer as well as painting. His brother Kenzan was a fine painter, but even more distinguished as a potter. The style was to be revived later by the exquisite but rather cold Hōitsu (1761-1828).

Ukiyo-ye.—Another school which arose in the early 17th century was Ukiyo-ye, the painting of the transient world of daily life. The old Tosa rolls had often portrayed the doings of ordinary folk, but only as accessories to an episode in saintly or heroic

lives. Certain Kanō painters, chiefly Sanraku, ventured at times on the kind of subject which we call *genre*, though without avowing their authorship of such pictures. Iwasa Matabei (1578-1650) was the first to make this kind of picture his main concern and to take pride in it. His authentic works, one of which is reproduced (Plate VI., fig. 1), are extremely rare; but paintings by his followers are numerous. Although the Chinese in far-off T'ang times had made masterpieces in this kind, especially of the occupations of women, this was a genuinely Japanese movement and fertile in results. Later in the century Moronobu, an admirable painter, exploited the woodcut as an inexpensive means for mirroring the contemporary life of the people; and the woodcut, first hand-coloured then colour-printed, became the medium of a truly popular art which yet was of singular refinement. It is by the colour-prints that Ukiyo-ye, and indeed Japanese pictorial art as a whole, is best known in the West (they are separately treated below). But all the masters of the colour-print were also painters, and a few of the best Ukiyo-ye painters, like Chōshun, designed no prints. The chief masters of this school, Okumura Masanobu, Harunobu, Kiyonaga, Utamaro and others in the 18th century, Hokusai and Hiroshige in the 19th, are notable artists who have received fuller appreciation in the West than in their own country, where they have not the prestige of the classic schools. Ukiyo-ye was almost exclusively the art of the populace of Yedo. Meanwhile in Kyōto, during the 18th century, other movements were stirring.

In 1731 a Chinese painter Shen Nan-pin came to Nagasaki and stayed two years. He was greatly admired and imitated. A school often known as the Neo-Chinese school, since it was different in its aims and inspiration from the Chinese revival of the 15th century, took for models the decorative, coloured style of later Ming or the light, freely-handled landscapes in ink of the Bun-jin-gwa or Literary Man's Painting. Bunchōrikio, Taigado, Buson, Kwazan and others worked with distinction in these Chinese styles. A pupil of Buson's, Goshun, broke away to some extent from this school, craving for a stronger element of the naturalism which was in the atmosphere of the time. Of this naturalism Okyo (1733-95) was the protagonist. Gifted with extraordinary preciseness of vision and wielder of an unerring brush, Okyo studied more directly from nature than any Japanese before him, though he never deserted the main conventions of his country's art. His conceptions are sometimes grandiose but never impassioned. His impeccable, fastidious art is rather cold. Ganku (1745-1834), who is sometimes reckoned as the founder of a separate school, expresses a more impulsive temperament. He is famous for his tigers.

The naturalistic movement which Okyo did most to influence is embodied in the Kyōto painters known as the Shijō school, with whose style that of the followers of Bunchō and the neo-Chinese movement tended, during the 19th century, to coalesce. Mori Sosen (1747-1821), an exquisite painter of monkeys, deer and other animals, which he studied in their native forests, is the most eminent of these masters of a graceful naturalism. Contemporary with Okyo, Soga Shōhaku harked back to the great times of Ashikaga, and tried in his ink-pictures of Chinese sages to recover, with some measure of success, the fire and inspiration of the 15th century. Jakuchū was another contemporary artist who pursued an independent line; he recalls the rich colouring of Ming pictures in his gorgeous paintings of cocks and hens and fishes. The Kanō school still produced its academic repetitions of old themes; but its best pupils tended to break away, like the brilliant Itchō (1652-1725) who painted Ukiyo-ye subjects. In the early 19th century there was a revival of the Tosa style by two gifted painters, Totsugen and Tameyasu. Formed in the Kanō school, Yōsai (1787-1878) made a style of his own; he is famous for his pictures of heroic subjects. Contemporary with him were Zeshin, the distinguished lacquer-designer and painter, and Kyōsai, a various and vigorous master.

Meiji Period.—From the 17th century onwards European influence begins intermittently to be felt. Yamada Emosaku in that century learned oil-painting from the Dutch. In the 18th century Shiba Kōkan painted in European style; and European perspective is attempted in many Ukiyo-ye prints. During the first

years of the Meiji period (1868-1911) when Western ideas were being eagerly adopted, the European or Dutch style of painting was more cultivated than any other. An English artist, Charles Wirgman, who came to Japan in 1857, had a number of pupils, of whom the best was Takahashi Yuichi. In 1876 the Government invited an Italian artist, A. Fontanesi, to teach painting; he was very successful for a short time. In 1878 E. F. Fenollosa, an

American critic, became professor of philosophy in Tokyo. He was the first to open the eyes of the West to the beauty and importance of the older art of Japan and China; but he also had great influence in Japan. He persuaded the Government to forbid the temples to sell works of art, and to schedule as national treasures all the most precious objects. His enthusiasm for the old traditions reacted on Japanese artists. The School of Fine Art set up with Italian professors had been a failure. A new school was established in 1887, and among the teachers were Kawabata Gyokusho, Hashimoto Gahō and Kanō Hōgai, all eminent painters in traditional styles, though not quite unaffected by Europe. In 1898 a secession from this school, under Okakura Kakuzō, founded the Nihon Bijutsu-in for the teaching of national styles of painting. To this movement belong Yokoyama Taikwan and Shimomura Kwanzan, distinguished living artists. Takeuchi Seiho and Kawai Gyokudō are among the most eminent artists of to-day who maintain the Asiatic traditions of art. Many gifted painters practise oil-painting and follow Western methods; but though the adoption of so much of Western civilization must inevitably modify the mental outlook, it does not seem likely that Japan's ancient inheritance in art will ever be wholly superseded. (A full account of contemporary painting is given in Elisséev's *Peinture Contemporaine au Japon*.)

ENGRAVING

Copper-engraving and etching, learned from the Dutch, were practised by some Japanese in the 18th and 19th centuries, but the medium did not prove congenial. The woodcut is the national mode of engraving and has been carried to a pitch of marvellous perfection. The art of the woodcut was introduced into Japan from China in the wake of Buddhism. It was used for the printing both of texts and pictures. Actually the earliest surviving specimens of printed texts in the world are Japanese, and are in the form of Buddhist charms enclosed in miniature wood pagodas distributed among the temples in the 8th century A.D. For a long period the woodcut was confined to the reproduction of popular images of piety, similar to the Chinese prints discovered at Tun-huang by Sir Aurel Stein. Some remarkable woodcuts were made in 1414 to illustrate a block-printed history of the Yūdzu Nembutsu but there was no real development of the art till the 17th century. In 1608 an illustrated edition of the Ise Monogatari appeared with woodcuts attributed by some critics to Kōyetsu.

Other illustrated editions of classic stories followed. But it was Hishikawa Moronobu (1618-1694) who transformed the art and made possible all the brilliant work of the Ukiyo-ye designers of the 18th century. A desire for the pleasures of art had sprung up among the lower classes, now that they at last enjoyed the peace of a settled Government. Paintings were too expensive. Moronobu saw the enormous possibilities of the woodcut, and adapting his style to the limitations and possibilities of the medium, devoted himself to supplying the need of the people. He designed chiefly for books, with or without text. A comparison of his early work (c. 1660) with his later books shows the immense stride forward that the engravers made under the stimulus of Moronobu's genius. There was soon a demand for colour. Moronobu and his pupils produced broad-sheets as well as books, and these were often coloured by hand, *tan* or red-lead being the dominant colour; hence the name *tan-ye* for these prints.

The theatre was a passion of the Yedo populace; and an actor Torii Kiyomoto, who designed posters for the Osaka theatre, came to Yedo in 1687 and, though his own work has not survived, he founded a famous dynasty of artists. His son Kiyonobu was the first to design portraits of actors, which were to remain one of the staple themes of the print-designers. Kiyonobu's son, Kiyomasu, rivalled his father. Competing in popularity with the portraits of actors were the portraits of fashionable beauties, especially courtesans. The Kwaigetsudō group of artists during the early years of the 18th century produced some stately prints of women. But in this field Okumura Masanobu was much more inventive and fertile; he designed idyllic groups and enlarged the whole range of the woodcut, while the Torii masters kept almost entirely to the stage. Kiyonobu died in 1729, but prints signed with his name continued to be published till the mid-century. This second Kiyonobu has not yet been identified with certainty.

In 1740 or 1741 was published the first two-colour print. The colours chosen were *beni* or rose-red, and green. Colour-printing had been practised for at least a century before this in China; but the Yedo printers seem to have learned the art afresh. (In a work called *Jinkō-ki*, 1627, one of the woodcuts is printed in colours. "Block-Printing and Book Illustration in Japan," by L. Norton Brown, p. 29.) The cherry-wood used was cut on the plank with a knife, as in Europe till the days of Bewick. A separate block was cut for each colour; so for a two-colour print there would be three printings. An accurate register was secured by the simple means of a guide-mark in the form of a right-angle at the lower right corner of the key-block and a straight line parallel to the lower edge at the left corner. There was no press. Colour-printing soon ousted the hand-coloured print in popularity, though the latter was still practised for some years. The two-colour or *beni* print continued till 1764, and a marvellous range of colour-design was accomplished within this narrow compass. In 1764 the first polychrome prints were made by Harunobu, who till his death in 1770 was to reign undisputed over Ukiyo-ye. Everyone imitated his style. He created the fashion for a smaller sheet, with smaller figures of exquisite grace. He was an enchanting colourist. His chosen subjects were youthful idylls, and he avoided the stage. Harunobu's closest follower was Koryūsai who after his death developed a more personal style, specially excelling in the *hashira-ye* or pillar-print. Shunshō revived the prestige of the theatrical print, neglected by Harunobu, and produced a long series of extremely fine designs before his death in 1792. But from about 1780 to 1790 Ukiyo-ye was again dominated by a single master, Kiyonaga (1752-1815) in whose designs the almost infantine grace of Harunobu's types was supplanted by tall and stately figures, and his interiors were exchanged for out-door scenes. Kiyonaga designed some masterpieces, especially in the form of diptychs and triptychs, and was closely imitated by a whole generation; there is an unrivalled poise and dignity in his groups, and his drawing is masterly; but he had little invention in figure-composition and is apt to be monotonous. Utamaro (1754-1806) is the greatest master of figure-design in the whole school. Among his earlier works are picture-books of insects and shells, exquisite in quality; but his absorbing theme is woman. In the last few years of his life there is a falling-off, but it was a

time of rapid decline in the general taste. In the discovery of beautiful relations between figures, and in a sort of intensity of design, Utamaro is incomparable.

During the 1790's Yeishi and Toyokuni competed with Utamaro for popular favour. Sharaku published in 1794-95 a series of actor-prints surpassing in power all his predecessors in this line, and now immensely sought-after. Artists admired them, but the public disliked their pungency. After Utamaro's death in 1806, the decline became a downfall. The school was regenerated by Hokusai (1760-1849), who found a new inspiration in landscape. His Thirty-Six Views of Fuji and other sets (c. 1820-1830) contain some of the finest landscape designs ever made. A little later Hiroshige (1797-1858) in countless sets of prints depicted every aspect of his own country in every weather, with extraordinary intimacy and freshness. Meanwhile Kuniyoshi and Kuniyada were the outstanding masters of figure-design. After Hiroshige's death aniline dyes were introduced. The school which had mirrored the popular life of Yedo for two centuries now virtually came to an end. During Meiji period (1868-1911) there was a revival, but the art had lost its character. From the days of Moronobu the artists had designed for the woodcut; now, the woodcut was merely the reproduction of a painting. The use of cheap pigments sadly affected the quality of these clever prints. Yoshitoshi, Toshikata and Gekko were perhaps the best of the designers in this period.

All the artists of the colour-print designed illustrations for books, the number of which is almost incredible. Many, however, of the book-illustrations were the work of artists who designed neither single-sheets nor colour-prints, and some of these artists did not belong to the Ukiyo-ye school at all. O-oka Shunboku (1688-1768) was an Osaka artist, who published a number of picture-books; one of these, a copy of a Chinese work of 1702, was printed in colours in 1746. An older contemporary of his, Tachibana Morikuni, was a notable book-illustrator, also at Osaka. Sukenobu was extremely popular as a designer of picture-books of women and children, and strongly influenced some of the earlier Ukiyo-ye artists. Tsukioka Tange made drawings for many of the *meisho* or guide-books. Some of these artists devoted much of their work to reproducing classic pictures or furnishing decorative designs for artisans. The first colour-printed book was produced at Osaka by Sukenobu in 1745. In Yedo, Harunobu produced some beautiful picture-books. Among others too numerous to mention, Shunshō and Shigemasa's *Beauties of the Green Houses* ranks as one of the finest colour-printed books, with Utamaro's *Insect Book* in quite a different style. Hokusai's *Hundred Views of Fuji* and *Mangwa* are famous books in black and white or with a faint tint only. Among more modern works Yōsai's *Zenken Kojitsu* and Bairai's books of birds deserve mention.

A new style of colour-printing began in 1889 when the *Kokka* began to reproduce old paintings. For the woodcuts printed in this magazine and in the sumptuous publications of the Shimbi Shoin body-colours are used, and sometimes as many as 100 blocks. Not as faithful as photographic reproductions, these prints have an extraordinary beauty of texture and in their way are unrivalled. See JAPAN: *Moral Characteristics*; CHINA: *Aesthetic Development*; ART: *Far Eastern Methods*; SCREENS OF CHINA AND JAPAN; CHINESE PAINTING.

JAPANESE SCULPTURE. It is surprising that so many pieces of sculpture should still be preserved in Japan when we know that they have been housed in wooden buildings which have been reduced to ashes again and again by recurrent conflagrations. Such preservation has been mainly due to the important part sculpture has always played in religion, and in later times to the

reverent attitude towards those works of art tolerated by the "tea men" when the *cha-no-yu* (commonly known as the tea ceremonies) came into the life of the people in the 15th century. A commission was created in 1897 for the systematic preservation and care of works of art, and up to the beginning of 1928 no fewer than 1,800 pieces of sculpture, together with about an equal number of objects of aesthetic and historical value, have been scheduled as "national treasures" in addition to the 1,100 old buildings which likewise have been placed under "special State protection."

Few examples in stone remain of the sculpture of the pre-Buddhist period. The stone warriors discovered in the province of Higo date from the second decade of the 6th century A.D. and are rude in workmanship. There survive, however, from this early period a large number of *haniwa*, or baked clay figures of men, women, animals and birds, which decorated the burial mounds of illustrious personages. The expression of peace and amiability on the faces of all these human figures is noteworthy.

Historic Period.—The real history of Japanese sculpture may be said to date from the official introduction of Buddhism from Korea in A.D. 552. Fortunately, there are preserved to this day a comparatively large number of Buddhist images of that time. Most of them are of impassive character, reminiscent of the North Wei dynasty, and showing in bronze and wood the technique of stone. Naturally, there are some that are of Korean type, as Japanese of Korean descent were among the noted sculptors of that time. Among the relics of this period mention may be made of many bronze figures in the Imperial Household collection, including a Kwannon (Avalôkitêsvara) bearing the date 591, and the famous group of 48 figures. Among others, there is a gilded bronze Sakyamuni, dated 623, with two attendants, in the Kondō of Hōryūji, where the group was originally placed by the sculptor Tori, who modelled them. A standing image of Kwannon, of a Korean type, also belongs to the Hōryūji monastery, and in the Dream hall there is another wooden image of Kwannon attributed to Shōtoku Taishi; there is also in the nunnery of Chūgūji, close by, a seated image of Nyo-i-rin Kwannon, and a similar figure is in the temple of Kōryūji at Uzumasa. The peculiarly Japanese grace softening the stiff uncouth style of the last two pieces is remarkable.

A noticeable development occurred in the sculpture of the Hakuho period (645-707), when magnificent figures in bronze were cast, as may be seen from the Yakushi (Bhāishajyaguru) trinity in Yakushiji of Yamato, all measuring about 10 ft. in height, and with Aryan rather than Chinese features. A masterful achievement in refined workmanship may be seen in the bronze Amitābha trinity, which belonged to Tachibana Fujin.

Tempyō (708-781) was a great period of sculpture when thousands of Buddhist images were created in clay, wood, dry lacquer and bronze. The gigantic seated Buddha of Tōdaiji, measuring some 53 ft. in height, was cast at that time, though the head had to be recast twice after being destroyed by fire. The four Deva-kings in the Kaidan-in of the Tōdaiji monastery and the Twelve Generals in Shinyakushiji are excellent examples of the period in clay. Miroku Bosatsu (Māitrēya) of Hōryūji, and the Eight Genii and the Ten Great Disciples of Buddha in Kofukuji, are among the works in dry lacquer, a technique peculiar to this and the next period. Power and strength may be said to characterize the sculpture of this age, with a tendency to combine realistic with idealistic elements.

The new sects of esoteric Buddhism, Tendai and Shingon, infused a new life into sculpture in the early Heian period (782-888), many learned priests and talented sculptors devoting themselves to the production of deities in wood so faithful to the originals in the *sutras* that they long served as models for forms. Many of the masterpieces of this period are preserved in the temple of Tōji and Jingoji in Kyoto, as well as in Muroo-dera in Yamato. The best of them are executed in bold and deep-cut lines and are characterized by great dignity. The exquisite statue of the 11-faced Kwannon in the Hokkeji nunnery, commonly attributed to the Tempyō, may also be included among the works of this period.

BY COURTESY OF JIRO HARADA

BUDDHISTIC IMAGES IN CLAY, WOOD AND DRY-LACQUER

1. A Bodhisattva, clay figure; Tempyo period (708-781). Kept in the five-storied pagoda of the Horyuji
2. Kwannon (Avalokitesvara) wood sculpture; Asuka period (552-644); belonging to the Horyuji

3. Amida Buddha, wood sculpture, gilded; 11th century, in the Howodo, Uji
4. One of the Ten Great Disciples of Buddha, dry-lacquer; Tempyo period; belonging to the Kofukufuji, Nara
5. A Bodhisattva, wood sculpture; Asuka period; belonging to the Horinji

The Fujiwara Periods (889–1183).—At the beginning of the early Fujiwara period (889–1068) sculptors simply followed in the footsteps of their predecessors, until the appearance of the great master, Jōchō. With the assistance of his pupils, Jōchō completed a wooden image of Dainichi (Mahavairocana) 32 ft. high for Hōshōji, and hundreds of smaller statues. As in architecture, the nationalist spirit was at work in sculpture, modifying the original type of Buddha. The face became fuller, with narrow benevolent eyes, the lines of the robes took an eloquent flow, the whole figure was realistically represented in beautiful proportions, and the colouring was in accordance with a refined taste, all tending to nobility and dignity. Among the best examples of works of the period now remaining are: the Amitābha of Hōkaiji in Yamashiro, the 9 statues of Amitābha of Joruriji and the Amitābha trinity of Sarzen-in both in Kyoto and the Amitābha in Hōwōdō at Uji.

In the later Fujiwara period (1069–1183) a tendency became apparent in the direction of excessive detail, elegance and over-emphasis, and by the end of the Fujiwara period the work had become weak and effeminate. In the products of masters only were vigour and life maintained. The use of cut-gold for decoration (leaf-gold cut into strips and applied to form patterns, etc.) which began to be an important factor in early Fujiwara, became profuse towards the close of late Fujiwara.

From Kamakura to Momoyama (1186–1602).—The over-refinement and effeminate delicacy of feeling developed by the end of the preceding era was succeeded in the Kamakura period (1186–1335) by something bold and strong, the romantic giving place to the dramatic. Naturalistic representations were introduced, such as the insertion of rock crystals for the eyes and the use of strong colours and cut-gold for the decoration of robes, etc. There were two elements to be noted: a new school with Sung elements, and the tenacious Fujiwara school of Kyoto which was not eclipsed till the period that came after Kamakura. There was a style in which the figures were of short stature and impressive force, and another in which they were represented in long, flowing robes that partly overhung the pedestal; both these styles reveal the influence of Sung and Yuan. Though wood was the most common material, the masters worked in bronze as well. A great masterpiece is the big bronze Buddha at Kamakura, seated in perfect serenity, with eyes whose gaze penetrates into the very soul of each worshipper standing before him. Two master sculptors, Kaikei and Unkei, made themselves famous, not only during this period, but throughout the history of Japanese sculpture. Their joint work may be seen in two Deva-kings guarding the great south gateway of Tōdaiji.

In the Nambokuchō (1336–93) and Ashikaga (1394–1573) periods the art of sculpture stagnated, though some dignified portraits in wood were produced. Representation reached the extreme of elaboration, and the statues of deities became more human in character. The Kwannon in the Tokyo Imperial Household museum, minutely decorated all over with coloured lacquer and cut-gold, with rock crystals inlaid for the eyes and lips, may be considered one of the best examples of the period. It is to be noted that many sculptors of the time turned their attention to carving masks used in the *Nō* drama, which flourished among the feudal lords.

The aversion from monks shown by Oda Nobunaga and Toyotomi Hideyoshi resulted in the destruction of many temples, and in the Momoyama period (1574–1602) circumstances were not at all conducive to the development of Buddhist sculpture. The great castles and palaces, however, were profusely decorated externally and internally.

Modern and Recent Sculpture.—During the peaceful Tokugawa régime (1603–1867) the talent of sculptors was mainly turned to the production of articles of luxury for the people. *Nō* masks required a high degree of skill, and a great demand was created for smaller carvings in wood and ivory, such as *netsuke*, or the ornamental piece fastened to the end of the cord attached to the tobacco pouch or the *inro* (small medicine cases hung from the sash). With the restoration of the temples, many images were carved, but these were merely reproductions of

the old works of art. Work characteristic of the period is to be found, however, in the carvings adorning temple buildings and shrines. Some localities, such as Kyoto and Nara, produced peculiarly characteristic wooden dolls.

With the restoration of power to the imperial throne in 1868, which was followed by the abolition of the feudal system, a change came over Japanese sculpture. The introduction into Japan of Western clay-modelling, first taught at the Tokyo School of Arts, gave a great impetus to the development of sculpture in Japan. Not only has the new technique found a large number of followers, but the traditional wood-carving has received a great stimulus which has led to improvement. The traditional school, however, still continues to work mainly in wood, while the exponents of foreign ideals choose bronze, marble and clay, as well as wood. In spite of the aggression of the younger school, the older school courageously struggles to hold its own and to preserve that which is characteristically Japanese. (See CHINESE SCULPTURE; IVORY CARVING, JAPANESE; WOOD CARVING, FAR EASTERN; MASKS; JAPANESE ARCHITECTURE.) (J. HAR.)

JAPANNING. The art of coating surfaces of metal, wood, etc., with a variety of varnishes, which are dried and hardened on in stoves or hot chambers. These drying processes constitute the main distinguishing features of the art. The trade owes its name to the fact that it is an imitation of the famous lacquering of Japan. Japanning is done in transparent varnishes, in black and in body colours; but black japan is the most characteristic and common style of work. The varnish for black japan consists essentially of pure natural asphaltum with a proportion of gum animé dissolved in linseed oil and thinned with turpentine. In thin layers such a japan has a rich dark brown colour; it only shows a brilliant black in thicker coatings. For fine work, which has to be smoothed and polished, several coats of black are applied in succession, each being separately dried in the stove at a heat which may rise to about 300° F. Body colours consist of a basis of transparent varnish mixed with the special mineral paints of the desired colours or with bronze powders. The transparent varnish used by japanners is a copal varnish which contains less drying oil and more turpentine than is contained in ordinary painters' oil varnish. Japanning produces a brilliant polished surface which is much more durable and less easily affected by heat, moisture or other influences than any ordinary painted and varnished work. It may be regarded as a process intermediate between ordinary painting and vitreous enamelling.

Japans may be applied by either the brushing, spraying or dipping process, and are extensively used in the finishing of the chassis and mud-guards of motor-cars, ordinary ironmongery goods and domestic iron-work, deed boxes, clock dials and papier-mâché articles. The process is also applied to blocks of slate for making imitations of black marble for chimney pieces, and in a modified form is employed for preparing enamelled, japan or patent leather.

JAPHETH was, according to the tradition of the "Priestly" stratum of the Old Testament, the third "son" of Noah; but the older tradition of Gen. ix. 20–27 represents him as the second son. The oracle of blessing, Gen. ix. 27 ("God enlarge Japheth, and let him dwell in the tents of Shem, and let Canaan be his servant") displays hostility against Canaan, and looks favourably upon Japheth, but is not easy to interpret clearly. "Dwell in the tents of" is usually understood to mean "have friendly intercourse with." Bertholet considers the passage late, and suggests that it may have been introduced to express the friendly feeling of the Jews for their Hellenic conquerors, because the table of nations in Gen. x. represents Japheth as the ancestor of the northern peoples, including those of Asia Minor, and the Mediterranean Sea, as well as Armenia. Others understand the phrase to mean "forcibly dispossess," on which basis Wellhausen found a reference to the Phoenicians or Philistines. Ed. Meyer thinks of the northern peoples, including the Philistines, who descended upon Syria in the 12th century. He connects the name with the Greek Titan Iapetos. Gunkel suggests, with some hesitation, the Hittites. See the *Cambridge Ancient History*, vol. i. pp. 184 sqq. (W. L. W.)

JAPONICA, PIRUS: see QUINCE.

JAQUES-DALCROZE, EMILE (1865–), Swiss composer and teacher of musical eurhythmics (*q.v.*) was born at Vienna July 6, 1865, of French-Swiss parents. He went to Geneva in 1875 where he attended the college and the university, and followed the courses at the Conservatoire. He then studied (1887) at the Conservatoires of Vienna and Paris and completed his musical education under Délibes. In 1886 he accepted the post of *chef d'orchestre* at Algiers. Returning to Vienna he studied composition under R. Fuchs and A. Bruckner. After the death of Hugo de Senger, he directed the sol-fa and harmony courses at the Conservatoire of Geneva (1891). His numerous works include many charming songs, including *Chansons populaires*, *Chansons du coeur qui vole*, *Chansons de route*, etc. These are written in the simple form of the folk song and have obtained great popularity, not only in Switzerland, but in other countries. His other musical compositions are very numerous, and include three string quartets, two violin concertos and several orchestral suites; also symphonies and choral works on a large scale, such as *La Veillée* (1893) and *Le Festival Vaudois* (1903). Among his other descriptive compositions may be mentioned: *Le violon maudit* (1893), *Janie* (1893), *Sancho Panza* (1897), *Le poème alpestre* (1896), *Le bonhomme jadis* (1905), *Les jumeaux de Bergamo* (1908), *Echo et Narcisse* (1912), *La fête de Juin* (1914), *Les premiers souvenirs* (1918), *La fête de la jeunesse* (1923). His great work, however, has lain in the development of the eurhythmic instinct, particularly in children, and since 1915 he has been the director at Geneva of the *Institut Jaques-Dalcroze*, which he originally founded at Hellerau in Bavaria. His method consists of a development of the instinct for rhythm in close conjunction with the sense of hearing and the instinct for tone, and is based on defined relations between bodily movements and the movements of sound. Special schools based on the Dalcroze method have been founded in London, Paris and elsewhere. The system may be studied in the following works by E. Jaques-Dalcroze: *Rhythmic Movements* (1920); *Rhythm, Music and Education* (1921); and *The Eurhythmics of Jaques-Dalcroze*, by various authors (1912).

JARARACA (*Lachesis jararaca*), a poisonous crotaline snake of tropical South America, related to the bushmaster (*q.v.*). (See SNAKE.)

JARGOON or **JARGON** (occasionally in old writings *jargounce* and *jacounce*), a name applied by modern mineralogists to those zircons which are fine enough to be cut as gem-stones, but are not of the red colour which characterizes the hyacinth (*q.v.*). The name is related to Arab *zargun* (zircon). Some of the finest jargoons are green, others brown and yellow, whilst some are colourless. The colourless jargoon may be obtained by heating certain coloured stones. (See ZIRCON.)

JARİR IBN 'ATĪYYA UL-KHATFI (d. 728), Arabian poet, was a member of the tribe Kulaib, a part of the Tamim, and lived in Irak. He succeeded in winning the favour of Hajjāj, the governor of Irak. (See CALIPHATE.) He became widely known by his feud with Farazdaq and Akhtal, and later went to Damascus. He was the only poet received by the pious Omar II.

His verse, which, like that of his contemporaries, is largely satire and eulogy, was published in 2 vols. (Cairo, 1896).

JARKENT, a town of Asiatic Russia in the Kazakstan A.S.S.R. in 44° 12' N. and 79° 57' E. on a tributary of the Ili river. It is on a caravan route from Kulja in East Turkistan, and manufactures *makhorka* tobacco and beer. Pop. (1926) 10,956.

JARNAC, a town of western France in the department of Charente, on the right bank of the river Charente, and on the railway 23 m. W. of Angoulême, between that city and Cognac. Pop. (1926) 3,566. The church contains an interesting ogival crypt. Brandy, wine and wine-casks are made in the town. Jarnac was in 1569 the scene of a battle in which the Catholics defeated the Protestants.

JARNACH, PHILIP (1892–), French composer, was born at Noisy of Spanish parents on July 26, 1892. From 1907 he studied in Paris under Risler for piano and Lavignac for harmony. In 1914 he went to Switzerland and from 1918–21 was professor of counterpoint and composition at Zurich conserva-

toire. He continued his own studies there under Busoni, whose opera *Dr. Faust* he completed after the composer's death. Jarnach's Paris period embraces his work up to op. 9. With op. 10, a string quartet performed at the Donaueschingen festival in 1921, his mature work begins. His string quartet op. 16 was also played at Donaueschingen and at the Salzburg festival in 1924.

JÄRNEFELT, EDVARD ARMAS (1869–), Finnish composer and conductor, was born at Viborg on Aug. 18, 1869. He studied in Helsingfors and afterwards in Berlin and Paris. From 1898 to 1903 he conducted concerts at Viborg. In 1904 he went to Helsingfors as conductor of opera and from 1906 to 1907 was director of the musical institute in that city. Since 1907 he has lived in Stockholm, where he is Hofkapellmeister. Järnefelt is probably the best known of Finnish composers after Sibelius. His *Präludium* and his songs have appealed to a wide public. His works include *Korsholm*, symphonic poem (1894); *Heimatklang*, symphonic fantasy (1895); *Serenade*; *Präludium* to drama *The Promised Land*; songs for chorus and orchestra; male choruses, songs, and piano pieces.

JARO, a municipality (with administration centre and 29 barrios or districts), of the province of Iloilo, island of Panay, Philippine Islands, on the Jaro river, 2 m. N.W. of Iloilo, the provincial capital, with which it is connected by railway. Pop. (1918) 24,572. It lies on a plain, in the midst of a rich agricultural region, has many fine residences and a cathedral, and is an important market. In 1918, it had 15 manufacturing establishments with output valued at 150,000 pesos; 3 sugar mills with output valued at 205,300 pesos; and 724 household industry establishments with output valued at 204,800 pesos. Of the 18 schools, only seven were public. The language spoken is a dialect of Bisayan.

JAROSITE, a mineral species consisting of hydrous potassium and aluminium sulphate, and often occurring as incrustations of minute indistinct crystals with a yellowish-brown colour and brilliant lustre. The best specimens, consisting of crystalline crusts on limonite, are from the Jaroso ravine in the Sierra Almagrera, province of Almeria, Spain, from which locality the mineral receives its name. It appears to be a common product of decomposition of sulphides in mineral veins, and one variety, from Nevada and New Mexico, plumbojarosite, contains lead.

JARRAH WOOD, the product of a large tree (*Eucalyptus marginata*) found in south-western Australia, where it is said to cover an area of 14,000 sq. m. The trees grow straight in the stem to a great size, and yield squared timber up to 40 ft. length and 24 in. diameter. The wood is hard, heavy and close-grained, with a mahogany-red colour, and sometimes sufficient "figure" to render it suitable for cabinet-makers' use. The timber possesses several useful characteristics; and great expectations were at first formed as to its value for shipbuilding and general constructive purposes; these expectations have not, however, been realized. Its greatest merit for marine purposes is due to the fact that it resists, better than any other timber, the attacks of the *Teredo navalis* and other marine borers, and on land it is equally exempt, in tropical countries, from the ravages of white ants. When felled with the sap at its lowest point and well seasoned, the wood stands exposure to the air, earth or sea remarkably well, on which account it is in request for railway sleepers, telegraph poles and piles in the British colonies and India. The wood, however, frequently shows longitudinal blisters, or lacunae, filled with resin, such as may be observed in spruce fir timber; and it is deficient in fibre, breaking with a short fracture under comparatively moderate pressure.

JARROW, port, municipal borough, Jarrow parliamentary division, Durham, England, on the right bank of the Tyne, 6½ m. below Newcastle, and on the L.N.E. railway. Pop. (1921) 35,576. The parish church of St. Paul was founded in 685, and retains portions of pre-Norman work and good Decorated and Perpendicular details. Close by are the scattered ruins of the monastery begun by Biscop in 681, and consecrated by Ceolfrid in 685. Within the walls of this monastery the Venerable Bede spent his life. The town is wholly industrial, devoted to ship-building, chemical works, paper mills and the neighbouring collieries. It owes its development very largely to Sir Charles Mark Palmer.

Jarrow Slake, a river bay, 1 m. long by $\frac{1}{2}$ m. broad, contains the Tyne docks of the L.N.E. railway company. A great quantity of coal is shipped. Jarrow was incorporated in 1875.

JARRY, NICOLAS, one of the best known 17th century French calligraphers. He was born at Paris about 1620, and was officially employed by Louis XIV. His most famous work is the *Guirlande de Julie* (1641). He died some time before 1674.

JASHAR, BOOK OF, a Hebrew composition mentioned as though well known in Josh. x. 13 and 2 Sam. i. 18. From these two passages it seems to have been a book of songs relating to important events, but no early collection of the kind is now extant, nor is anything known of it. Various speculations have been put forward as to the name: (1) that it means the book of the upright, i.e. Israel or distinguished Israelites, the root being the same as in Jeshurun; (2) that Jashar is a transposition of *shîr* (song); (3) that it should be pointed Yashir (sing), and was so called after its first word. None of these is very convincing, though support may be found for them all in the versions. The Septuagint favours (1) by its rendering ἐπὶ βιβλίῳ τοῦ εὐθούς in Samuel (it omits the words in Joshua); the Vulgate has *in libro iustorum* in both places; the Syriac in Samuel has *Ashîr*, which suggests a Hebrew reading *ha-shîr* (the song), and in Joshua it translates "book of praises." The Targum on both passages has "book of the law," an explanation which is followed by the chief Jewish commentators, making the incidents the fulfilment of passages in the Pentateuch. Since it contained the lament of David (2 Sam. i. 18) it cannot have been completed till after his time. If Wellhausen's restoration of 1 Kings viii. 12 be accepted (from Septuagint, 1 Kings viii. 53, ἐν βιβλίῳ τῆς ψόδης) where the reference is to the building of the Temple, the book must have been growing in the time of Solomon.

In later times when it became customary to compose midrashic works under well-known names, a book of Jashar naturally made its appearance. This has nothing to do with the older book.

(L. E. B.)

JASHPUR, a feudatory state of India in the Central Provinces, having been transferred from Bengal in 1905. The country is divided almost equally into high and low lands. The Uparghat plateau on the east rises 2,200 ft. above sea level, and the highest hill in these uplands is Ranijula (3,527 ft.). The only river of importance is the Ib, the sands from which from time immemorial have been washed for gold. The high Khuria plateau is much resorted to by graziers from Mirzapur, in the United Provinces. The area of the State is 1,963 sq.m., and the population 154,156, mainly aboriginal; no fewer than 34,000 are Christians, due to mass conversions of the Oraons between 1901 and 1911. Jashpur iron, which is smelted by the Kols, is highly prized. Sal forests abound, and elephants, bison and much other big game are to be found. Jungle products include, besides timber, lac, silk cocoons and beeswax, which are exported.

JASMIN, JACQUES (1798-1864), Provençal poet, was born at Agen, his family name being Boé. In 1825 he published his first volume of *Papillotos* ("Curl Papers"), containing poems in French, and in the familiar Agen *patois*—the popular speech of the working classes. Jasmin was the most famous forerunner in Provençal literature (*q.v.*) of Mistral and the *Félibrige*. His poetic gift, and his flexible voice and action, fitted him admirably for this double rôle of troubadour and jongleur. In 1835 he recited his "Blind Girl of Castel-Cuillé" at Bordeaux, in 1836 at Toulouse; and he met with an enthusiastic reception in both those important cities. Most of his public recitations were given for benevolent purposes, the proceeds being contributed by him to the restoration of the church of Vergt and other good works. Four successive volumes of *Papillotos* were published during his lifetime, mostly pictures of humble life—in many cases real episodes—carefully elaborated by the poet. In 1852 Jasmin's works were crowned by the Académie Française, and a pension was awarded him. His title of "Maître-ès-Jeux" is a distinction only conferred by the academy of Toulouse on illustrious writers. Pius IX. sent him the insignia of a knight of St. Gregory the Great, and he was made chevalier of the Legion of Honour. He spent the latter years of his life on a small estate which he had

bought near Agen and named "Papillotos," and which he describes in *Ma Bigno* ("My Vine"). He died on Oct. 4, 1864.

See P. Mariéton, *Jacques Jasmin* (1898).

JASMINE or JESSAMINE, botanically *Jasminum*, a genus of shrubs or climbers of the family Oleaceae, and comprising about 100 species, of which 40 or more occur in the gardens of Great Britain and North America. The plants of the genus are mostly natives of the warmer regions of the Old World; there is one South American species. The leaves are pinnate or ternate, or sometimes apparently simple, consisting of one leaflet.

The common white jasmine, *Jasminum officinale*, one of the best known and most highly esteemed of hardy cultivated ligneous climbers, is a native of northern India and Persia. In the centre and south of Europe it is thoroughly acclimatized. Although it grows to the height of 12 and sometimes 20 ft., its stem is feeble and requires support. The fragrant white flowers bloom from June to October.

The zambak or Arabian jasmine, *J. Sambac*, is an evergreen white-flowered climber, 6 ft. high. The Spanish, or Catalanian jasmine, *J. grandiflorum*, a native of the north-west Himalaya, and cultivated both in the old and new world, is very like *J. officinale*, but differs in the size of the leaflets; the branches are shorter and stouter, and the flowers very much larger, and reddish underneath. By grafting it on two-year-old plants of *J. officinale*, an erect bush about 3 ft. high is obtained, requiring no supports.

The aroma is extracted by the process known as *enfleurage*, i.e., absorption by a fatty body, such as purified lard or olive oil. Square glass trays framed with wood about 3 in. deep are spread over with grease about half an inch thick, in which ridges are made to facilitate absorption, and sprinkled with freshly gathered flowers, which are renewed every morning during the whole time the plant remains in blossom. Three pounds of fresh flowers will perfume 1 lb. of grease—this is exhausted by maceration in 1 pt. of rectified spirit to form the extract.

The distinguishing characters of *J. odoratissimum*, a native of the Canary Islands and Madeira, consist principally in the alternate, ternate and pinnate leaves, the 3-flowered terminal peduncles and the 5-cleft yellow corolla with obtuse segments. The flowers

FLOWERING BRANCH OF JASMINE

have the advantage of retaining when dry their natural perfume, which is suggestive of a mixture of jasmine, jonquil and orange-blossom. In China *J. paniculatum* is cultivated as an erect shrub, known as *sieu-hing-hwa*; it is valued for its flowers, which are used with those of *J. Sambac*, in the proportion of 10 lb. of the former to 30 lb. of the latter, for scenting tea—40 lb. of the mixture being required for 100 lb. of tea. *J. angustifolium* is a beautiful evergreen climber 10 to 12 ft. high, found in the Coromandel forests, and introduced into cultivation.

Other hardy species commonly cultivated in gardens are the low or Italian yellow-flowered jasmine, *J. humile*, an East Indian species introduced and now found wild in the south of Europe, an erect shrub 3 or 4 ft. high, with angular branches, alternate and mostly ternate leaves, blossoming from June to Sept.; the common yellow jasmine, *J. fruticans*, a native of southern Europe and the Mediterranean region, a hardy evergreen shrub, 10 to 12 ft. high, with weak, slender stems requiring support, and bearing yellow, odourless flowers from spring to autumn; and *J. nudiflorum* (China), which bears its bright yellow flowers in winter or early spring before the leaves appear.

JASON, in Greek legend, son of Aeson, king of Iolcus in Thessaly. After his return from Colchis (*see ARGONAUTS*), he lived at Corinth with his wife Medea (*q.v.*) for many years. At last he put away Medea in order to marry Glaucus (or Creusa), daughter of the Corinthian king, Creon. To avenge herself,

Medea presented the new bride with a robe and head-dress, by whose magic properties the wearer was burnt to death, and slew her children by Jason with her own hand. His death was said to have been due to suicide through grief, caused by Medea's vengeance (Diod. Sic. iv. 55); or he was crushed by the fall of the poop of the ship "Argo," under which he had laid himself down to sleep (Eurip., *Med.* 1386).

See articles by C. Seeliger in Roscher's *Lexikon der Mythologie* and by F. Durrbach in Daremberg and Saglio's *Dictionnaire des antiquités*; H. D. Müller, *Mythologie der griechischen Stämme* ii. 328 (1861), who explains the name Jason as "wanderer"; W. Mannhardt, *Mythologische Forschungen* pp. 75, 130 (1884); O. Crusius, *Beiträge zur griechischen Mythologie und Religionsgeschichte* (Leipzig, 1886).

JASON OF CYRENE, a Hellenistic Jew, who lived about 100 B.C. and wrote a history of the times of the Maccabees down to the victory over Nicanor (175-161 B.C.). This work is said to have been in five books and formed the basis of the present 2 Macc. (see ch. ii. 19-32).

JASPAR, HENRI (1870-), Belgian statesman, was born at Schaerbeek, Brussels, on July 28, 1870. He is a member of the Catholic party. While minister of economic affairs in Nov. 1918, he organized the reconstruction of Belgian industries; becoming deputy for Liège in 1919. In 1920, having been appointed minister of the interior and afterwards minister for foreign affairs, he endeavoured, during the Inter-Allied Conference in which he took part, to strengthen the entente between England, France and Belgium, and to secure reparations and security for his own country. In 1922 he negotiated a pact of security and guarantee with England; this, however, owing to the defeat of the French Government, failed to come into operation. Belgium's entry into the League of Nations was due to the efforts of Jaspas, as also was her representation on the Permanent Court of International Justice at The Hague. In July 1921 he concluded an economic agreement between Belgium and Luxembourg and other commercial treaties. He took part in the Dawes Plan negotiations in 1924, but resigned as minister for foreign affairs on March 11, on the rejection by the Chamber of the Franco-Belgian Convention. In May 1926 he took office as prime minister and minister of the interior in a ministry of "national unity." He at once initiated measures to secure economy in the public administration. He had to face a serious financial crisis and a threatened "flight from the franc." There was some difficulty in reconciling the dissident elements in this cabinet, which was eventually reconstituted on Nov. 29, 1927, without the participation of Vandervelde (the outstanding figure in the original cabinet) and his Socialist followers. (See BELGIUM.)

JASPER, an impure variety of quartz. It is compact, and being very hard it takes a fine polish. It occurs in many colours—dark green, brown, yellow and sometimes blue or black. Occasionally it is found banded with many different coloured stripes. Unlike chalcedony, it is opaque, and does not possess a splintery fracture. The term jasper is now restricted to opaque stones, but the ancient jaspis or *λάσπις* was at least partially translucent, and probably included some chalcedony and chrysoprase. Many medicinal values were attributed by the ancients to this stone, and even in 1609 it was still believed that a jasper hung about the neck strengthened the stomach.

Egyptian jasper is brown, occurring as nodules of an agate-like formation in the Libyan desert and the Nile valley. Red jasper is found at Hessen, Löhlbach and Dakota. In riband jasper the colours are arranged in bands, as in the well known Siberian stones, in which there is a definite alternation of red and green stripes. Agate jasper is intermediate between true jasper and chalcedony. An artificially coloured jasper is extensively produced in imitation of lapis lazuli.

See C. W. King, *Precious Stones, Gems and Precious Metals* (1865); M. Bauer, *Precious Stones* (trans. L. J. Spencer, 1904); A. Eppler, *Die Schmuck und Edelsteine* (Stuttgart, 1912). (W. A. W.)

JASSY (Rum. Iași), the capital of the department of Jassy, Rumania; situated on the left bank of the river Bahlui, an affluent of the Jijia, about 10 m. W. of the Pruth. Pop. (1928) 185,000 including a great number of Jews. Jassy communicates by rail with Galatz, Kishinev and Czernowitz. The surrounding country

is one of uplands and woods, among which rise the monasteries of Cetatuia, Frumoasa, and Galata with its mineral springs, the water-cure establishment of Rapide and the great seminary of Socola. Jassy is the seat of the metropolitan of Moldavia and Suceava, and of a Roman Catholic archbishop. The two oldest churches date from the reign of Stephen the Great (1458-1504); perhaps the finest, however, are the 17th century metropolitan, St. Spiridion and Trei Erarchi, the last a curious example of Byzantine art, erected in 1640 by Vasile Lupu (The Wolf), and adorned with countless gilded carvings on its outer walls and twin towers. The St. Spiridion Foundation (due to the liberality of Prince Gregory Ghika in 1727 and available for the sick of all countries and creeds) maintains hospitals and churches in several towns of Moldavia, besides the baths at Slanic in Walachia. There are six hospitals, the chief Rumanian university, a military academy and schools of art, music and commerce; three museums, a fine hall and a theatre; the state library, where the chief records of Rumanian history are preserved; an appeal court, a chamber of commerce and several banks. The city is the headquarters of the IV. Army Corps. It has an active trade in petroleum, salt, metals, timber, cereals, fruit, wine, spirits, preserved meat, textiles, clothing, leather, cardboard and cigarette paper, and a considerable industry. Jassy is mentioned as early as the 14th century, and probably derives its name from the Cuman "Jazyges" or bowmen. It was often visited by the Moldavian court. In 1565, Prince Alexander Lapusneanu moved the capital of Moldavia from Suceava to Jassy. It was already famous as a centre of culture. Between 1561 and 1563 an excellent school and a Lutheran church were founded by the Greek adventurer, Jacob Basilicus (see RUMANIA: History). In 1643 the first printed book published in Moldavia was issued from a press established by Vasile Lupu. He also founded a school, the first in which the mother-tongue took the place of Greek. Jassy was burned by the Tatars in 1513, by the Turks in 1538 and by the Russians in 1686. By the Peace of Jassy the second Russo-Turkish War was brought to a close in 1792. A Greek insurrection under Ypsilanti in 1821 led to the storming of the city by the Turks in 1822. In 1844 there was a severe conflagration. In 1861 the government of Rumania was removed to Bucharest; but during the World War was again temporarily transferred to Jassy.

JASTROW, MORRIS (1861-1921), American orientalist, was born in Warsaw, Poland, on Aug. 13, 1861, but at five was taken to Philadelphia, where his father, a rabbi, had been called. He was educated at the University of Pennsylvania and at French and German universities. In 1885 he returned to Pennsylvania as instructor, but soon became professor of Semitic languages and literature and also librarian. He died on June 22, 1921, at Jenkintown, Pa. His early work dealt with archaeological and historical subjects, including *Aspects of Religious Belief and Practice in Babylonia and Assyria* (1911); and *The Civilization of Babylonia and Assyria* (1915). The World War caused him to apply his knowledge of the Orient to contemporary problems as in *Zionism and the Future of Palestine* (1919), and *The Eastern Question and its Solution* (1920).

See J. A. Montgomery, "Morris Jastrow, Jr.," in *The Amer. Jour. of Semitic Lang. and Lit.* (vol. xxxviii., Oct. 1921), and the memorial reprint from the *Jour. of the Amer. Oriental Soc.* (vol. xli., pt. 5, 1921), which contains several estimates and a bibliography.

JĀT, the largest cultivating caste in north-west India, numbering 7,374,817 in 1921, and especially strong in the Punjab, and adjacent districts of the United Provinces, etc. The origin of the name (also Jalt), is unknown. In the Baloch country its equivalent is Jagdal. The early Mohammedans wrote of the Jāts country as lying between Kirmān and Mansūra. Then they are associated with the Meds of Sind, where they appear in force. Both Timūr and Babur speak of them as unruly tribes who hampered their invasion. The Rājput traditions recognize them as one of the 36 royal races. Speculation has identified in them the Getae of Herodotus, a thesis almost plausible in comparison with those which assign to them Scythian or Indo-Scythian origin. Of Indo-Aryan type the Jāts form a great congeries of tribes which have a persistent tradition that they came from Garh Gajni, possibly

Ghazni, but more probably some place on the Indus. The Jāts, moreover, are all but unanimous on two points, one, that they are fairly recent settlers in their present seats, the other that they were once Rājput̃s who by adopting widow re-marriage, or ploughing, lost status. Only three clans are supposed to have been Jāts *ab initio*. Several data point to the south-east Punjab near Delhi as their homeland and not far from it in Bhartpur and Dholpur were founded the only Hindu Jāt States historically known. They sprang up when the Moghul empire decayed. The later Jāt States in the Punjab were of Sikh origin.

In the south-east Punjab and east of the Jumna the Jāts are mainly Hindus; in the south-west Muslim; in the central Punjab, Sikhs. But the fertile belts are seldom Jāt or even Hindu. They are held by Mohammedan Rājput̃ tribes intermingled with Jāts converted to Islam as if the earlier Muslim inroads had driven the Hindu tribes into the dry uplands or the infertile country bordering on Rājputāna. Intensely democratic by instinct the Jāts have yet evolved hypergamy among themselves. Thus some families will not practise widow re-marriage. But this does not restore them to Rājput̃ status. It makes them refuse brides to less punctilious clans and reduce the number of girl babies. Under the Sikh monarchies democracy was modified, but the Jāt was never very submissive to his chiefs or to Brahmans. He has remained essentially the yeoman peasant, industrious, reticent, a little dour, but an excellent soldier, sedate and resolute. He is a good wrestler and horseman.

JĀTAKA, the technical name, in Buddhist literature, for a story of one or other of the previous births of the Buddha. The word is also used for the name of a collection of 547 of such stories included in the Buddhist Pāli canon. The form of most of these tales is a very common Indian one known as *ākhyāna*. It may be a beast fable, a story of common life, or a folk tale told in prose, with the climax or essential part of the dialogue in verse. It is this verse or verses which, as being the utterance of the Bodhisatta or future Buddha, constitutes the canonical portion of the Jātaka. The Jātaka itself (the story of the past) is always preceded by a story of the present, an incident in the life of the historical Buddha, which is the occasion for his telling the story of the past, and followed by the identification, in which the chief characters are declared to be previous births of persons who appear in the story of the present. There is also a verbal commentary explaining the archaic language of the verses.

A few of the tales are almost identical with some of the beast fables of Aesop, and a larger number with the tales of the *Panchatantra*. It is especially among these where evidence of adaptation from non-Buddhist sources appears, the Bodhisatta in some of them being merely a spectator, but necessarily introduced in order to turn the story into a jātaka. The last ten are long romances, and the last of all, the *Vessantara-jātaka*, is a favourite subject of dramatic representation in Burma. The ethical teaching is mostly that of the virtues of secular life, and moral retribution is emphasized by the doctrines of Karma and re-birth (see KARMA).

The introduction to the Jātaka-book (*Nidāna-kathā*), which was compiled in Ceylon, but mainly from Indian sources, contains a biography of the Buddha from the period when he first determined to attain Buddhahood down to the beginning of his preaching. There is no evidence for the view formerly held that it was this introduction which reached Persia and formed the direct source of the story of Barlaam and Joasaph. The Buddhist features in this story more probably came from a Sanskrit source, and recent discoveries show that they passed through a Manichaean channel (see BARLAAM AND JOSAPHAT).

Jātaka is mentioned in the canon as being one of the nine divisions of the word of the Buddha, but this is no evidence for the age of the Jātaka-book. The prose of this is a re-translation into Pāli from the Singhalese, probably in the fifth century A.D. A few of the tales, with the same verses but with very archaic prose, are found in the Vinaya, and these appear to be survivals of jātakas as they existed before their translation into Singhalese. The earliest evidence for a collection of such tales is in the carvings illustrating a number of jātakas on the stupa of Bharhut,

which are assigned to the third or second century B.C., but additions to the collection probably went on much later. The Pāli canon also contains the *Cariyā-piṭaka*, a collection of 36 jātakas told shortly and baldly in verse.

There is no such great collection of jātakas in Sanskrit works, but many of the Pāli jātakas as well as others are found in the *Mahāvastu* and in Tibetan and Chinese translations from Sanskrit. The *Jātakamālā* is a collection of 34 jātakas in Sanskrit verse by Āryaśūra, a writer of the fourth century A.D. The Avadānas are a similar type of tale, and many of them actually are jātakas (see AVADĀNA).

JATH, native state of India (Bijapur agency), in the Deccan division of Bombay. The small state of Daphlapur was added to Jath on the death of its last ruler in 1917. Area, 981 sq.m. Pop. (1921) 82,654. Tribute £756. Agriculture and cattle-breeding are carried on; there are no important manufactures. The chief, whose title is *deshmukh*, is a Mahratta of the Daphle family. The town of JATH is 92 m. S.E. of Satara. Pop. (1921) 5,193.

JATIVA (formerly written XATIVA) or **SAN FELIPE DE JATIVA**, a town of eastern Spain, in the province of Valencia, on the right bank of the river Albaida, a tributary of the Júcar, and at the junction of the Valencia-Murcia and Valencia-Albacete railways. Pop. (1920), 14,148. Játiva was the Roman Saetabis. afterwards Valeria Augusta, of Carthaginian or Iberian origin. Pliny (23-79) and Martial (c. 40-102) mention the excellence of its linen cloth. Under the Visigoths (c. 483-711) it became an episcopal see; but early in the 8th century it was captured by the Moors, under whom it attained great prosperity, and received its present name. It was reconquered by James I. of Aragon (1213-76). During the 15th and 16th centuries, Játiva was the home of many members of the house of Borgia or Borja, who migrated hither from Borja in Saragossa. Játiva is built on the margin of a fertile plain, and on the southern slopes of the Monte Bernisa, a hill with two peaks, each surmounted by a castle.

JAUCOURT, ARNAIL FRANÇOIS, MARQUIS DE (1757-1852), French politician, was born on Nov. 14, 1757 at Tournon (Seine-et-Marne). He adopted revolutionary ideas and became colonel of his regiment (Condé's). In the Assembly, in which he represented Seine-et-Marne, his views were too moderate for his colleagues and he resigned in 1792 and was arrested on suspicion of being a reactionary. Mme de Staël procured his release just before the September massacres. He accompanied Talleyrand to England, returning after the execution of Louis XVI. Under the consulate he was for some time president of the tribunate. In 1803 he entered the senate, and in 1804 was attached to the household of Joseph Bonaparte. His imperialist views cooled, and at the Restoration he became minister of state and a peer of France. At the second Restoration he was for a brief period minister of marine. He devoted himself to the Protestant interest in France. A member of the upper house throughout the reign of Louis Philippe, he was driven into private life by the establishment of the Second Republic, but lived to rally to the government of Louis Napoleon, dying in Paris on Feb. 5, 1852.

JAUER, a town in the Prussian province of Silesia, 13 m. south of Liegnitz, on the Wüthende Neisse. Pop. (1925) 12,158. The town was first mentioned in 1242, and was formerly the capital of a principality embracing about 1,200 square miles. From 1392 to 1741 it belonged to the kings of Bohemia, being taken from Maria Theresa by Frederick the Great. Jauer was formerly the prosperous seat of the Silesian linen trade, but three burnings in the Thirty Years' War permanently injured it. St. Martin's church dates from 1267-90, and the Evangelical church from 1655. Jauer manufactures leather, carpets, cigars, carriages and agricultural machinery.

JAUHARI (ABU NASR ISMAIL IBN HAMMAD UL-JAUHARI) (d. 1002 or 1010), Arabian lexicographer, was born at Farab on the borders of Turkistan. He studied in Farab and Bagdad, and settled first in Damghan, then at Nishapur, where he died. His great work is the *Kitāb us-Ṣaḥāḥ fil-Lughā*, an Arabic dictionary, in which the words are arranged alphabetically according to the last letter of the root. He only partially finished the last recension, but the work was completed by his pupil, Abū Ishāq Ibrāhīm ibn Ṣāliḥ ul-Warrāq.

Of the edition begun by E. Scheidius with a Latin translation, one part only appeared at Harderwijk (1776). The whole has been published at Tebriz (1854) and at Cairo (1865), and many abridgments and Persian translations have appeared; cf. C. Brockelmann, *Geschichte der arabischen Literatur* (Weimar, 1898), i.

JAUNDICE or **ICTERUS**, a term in medicine applied to a yellow coloration of the skin and other parts of the body, often associated with some derangement affecting the liver. This yellow colour is due to the presence in the blood of bile or some of its constituents. Jaundice, however, must be regarded as a symptom of some morbid condition previously existing and not as a disease *per se*.

Cases with jaundice may be divided into two groups:—

1. **Obstructive Jaundice.**—Any obstruction of the passage of bile from the liver into the intestinal canal is sooner or later followed by the appearance of jaundice, which in such circumstances is due to absorption of bile into the blood. The obstruction is due to one of the following causes: (1) Obstruction by foreign bodies within the bile duct, e.g., gallstones or parasites; (2) inflammation of the duodenum or the lining membrane of the duct; (3) stricture or obliteration of the duct; (4) a tumour growing from the duct; (5) pressure on the duct from without, from the liver or other organ, or tumours arising from them. Obstructions from these causes may be partial or complete, and the degree of jaundice will vary accordingly, but it is to be noted that extensive organic disease of the liver may exist without the evidence of obstructive jaundice. By a blood test and the van der Bergh reaction, obstructive jaundice may be distinguished from all other varieties.

The effect upon the liver of impediments to the outflow of bile is an increase in its size, the whole biliary passages and the liver cells being distended with retained bile. The bile thus retained is absorbed into the system, and shows itself by the yellow staining seen to a greater or less extent in all the tissues and many of the fluids of the body. The kidneys, in such circumstances, excrete a portion of the retained bile in the urine.

The symptoms accompanying obstructive jaundice necessarily vary according to the nature of the exciting cause. The first sign of jaundice itself is a yellow coloration of the white of the eye, which is speedily followed by a similar colour on the skin over the body generally. It may be also well seen in the roof of the mouth, but in the lips and gums is not observed till the blood is first pressed from them. The tint varies in depth and in complete obstruction of long duration may be olive-green or dark brown.

The urine exhibits colour changes even before they can be detected on the skin or elsewhere. It is always dark brown like porter, but after standing in the air it becomes greenish. It contains both bile pigments and bile acids. The former are detected by the play of colours yielded on the addition of fuming nitric acid, the latter by the purple colour, produced by placing a piece of lump sugar in the urine tested, and adding thereto a few drops of strong sulphuric acid.

The contents of the bowels, owing to lack of bile, are clay-coloured or white, contain undigested fats, and have an extremely offensive odour. Constitutional symptoms are always present. The patient becomes languid, drowsy and irritable, and has generally a slow pulse. Yellow vision appears to be present in some very rare cases. When not dependent upon serious organic disease, jaundice from obstruction may exist many years, as in those instances where the walls of the bile ducts are thickened from chronic catarrh, but are only partially occluded. In the common cases of acute catarrhal jaundice recovery usually takes place in two or three weeks.

The treatment of this form of jaundice is that of the underlying

cause. With its removal the jaundice will disappear, but diaphoretics and diuretics to promote the action of the skin and kidneys are useful. In the more chronic forms the waters of Carlsbad have a high repute.

2. **Haemolytic Jaundice.**—This is a symptom in certain diseases, e.g., yellow fever, acute yellow atrophy, malaria, some forms of spirochaetosis, pyaemia, certain poisons, such as phosphorus, toluylenediamin and snake venom. Jaundice of this kind is relatively slight, compared with that of the obstructive variety. The grave constitutional symptoms often present must be ascribed to the disease with which the jaundice is associated.

Under this group there are the jaundice of new-born infants, which varies enormously in severity; the cases in which a slight form of jaundice obtains in several members of the same family, without other symptoms, and which may persist for years; and lastly perhaps, the group of cases with hypertrophic cirrhosis. (See also ALIMENTARY SYSTEM, DISEASES OF.)

JAUNPUR, a city and district of British India, in the Benares division of the United Provinces. The city is on the left bank of the river Gumti, 34 m. N.W. from Benares by rail. Pop. (1921), 32,569. Jaunpur is an ancient city, the former capital of a Mohammedan kingdom which once extended from Budaun and Etawah to Behar. It abounds in splendid architectural monuments, most of which belong to the period when the rulers of Jaunpur were independent of Delhi. The fort of Feroze Shah is in great part completely ruined, but there remain a fine gateway of the 16th century, a mosque dating from 1376, and the *hamams* or baths of Ibrahim Shah. Among other buildings may be mentioned the Atala Musjid (1408) and the ruined Jinjiri Musjid, mosques built by Ibrahim, the first of which has a great cloistered court and a magnificent façade; the Dariba mosque constructed by two of Ibrahim's governors; the Lal Darwaza erected by the queen of Mahmud; the Jamma Musjid (1438–1478) or great mosque of Husain, with court and cloisters, standing on a raised terrace, and in part restored in modern times; and finally the splendid bridge over the Gumti, erected by Munim Khan, Mogul governor in 1569–1573. The city has now lost its importance, the only industries surviving being the manufacture of perfumes and papier-mâché articles.

The DISTRICT OF JAUNPUR has an area of 1,550 sq.m. It forms part of the wide Gangetic plain, and its surface is accordingly composed of a thick alluvial deposit. The whole country is closely tilled, and is divided into two unequal parts by the sinuous channel of the Gumti, a tributary of the Ganges, which flows past the city of Jaunpur. The Gumti is liable to sudden inundations during the rainy season, owing to the high banks it has piled up at its entrance into the Ganges, which act as dams to prevent the prompt outflow of its flooded waters. The greatest recorded flood took place in Sept. 1871, when 4,000 houses in the city were swept away, besides 9,000 more in villages along its banks. Pop. (1921), 1,155,105. Sugar-refining is the principal industry.

In prehistoric times Jaunpur seems to have formed a portion of the Ajudhya principality, and when it first makes an appearance in authentic history it was subject to the rulers of Benares. With the rest of their dominions it fell under the yoke of the Mohammedan invaders in 1194. In 1388 Mālik Sarwar Khwāja was sent by Mohammed Tughlak to govern the eastern province. He fixed his residence at Jaunpur, made himself independent of the Delhi court, and assumed the title of Sultan-us-Shark, or "eastern emperor." For nearly a century the Sharki dynasty ruled at Jaunpur, and proved formidable rivals to the sovereigns of Delhi, until in 1478 Bahlol Lodi recovered his imperial sway. In 1775 the district became British by the Treaty of Lucknow.

JÁUREGUI, JUAN DE (1583-1641), Spanish poet, whose *Rimas* (1618), a collection of graceful lyrics, is preceded by a controversial preface which attracted much attention on account of its outspoken declaration against *culteranismo*. His poem *Orfeo* (1624), however, is visibly influenced by Góngora, while a translation of the *Pharsalia* (begun before 1614 but not published until 1684) reveals Jáuregui as a complete convert to the new school.

JAURÉGUIBERRY, JEAN BERNARD (1815-1887), French admiral, was born at Bayonne on Aug. 26, 1815. He entered the navy in 1831, served in Crimea and in China, was governor of Senegal, and was promoted to rear-admiral in 1869. He was the most distinguished of the many naval officers who did good service in the military operations in the Franco-German War of 1870-71. In 1875 he was a member of the council of admiralty: and in February 1879 he became minister of the navy in the Waddington cabinet, and on May 27 following was elected a senator for life. He was again minister of the navy in the Freycinet cabinet in 1880. Jauréguiberry died in Paris on Oct. 21, 1887.

JAURÈS, AUGUSTE MARIE JOSEPH JEAN (1859-1914), French socialist leader, was born at Castres (Tarn) on Sept. 3, 1859. His ancestors on his father's side included two admirals, of whom one was ambassador to Spain and to Russia, and Minister of Marine. Jaurès was educated at the collège of Castres, at the Collège Sainte Barbe, the Lycée Louis le Grand and the École Normale Supérieure in Paris. His career at the normal school was the most brilliant possible, and his fellow students, among them being Henri Bergson, predicted for him a great political future.

After having passed the "concours d'agrégation" Jaurès was elected, in 1881, master of philosophy at the Lycée d'Albi. In 1883 he became lecturer in the university of Toulouse. But he had already set his mind upon a parliamentary career, although his mother did her best to dissuade him. At the legislative elections of Oct. 4, 1885, he was elected deputy for Tarn. He was 26 years old. During the first two years of his term, he took little part in debates. His poetic and burning eloquence embarrassed parliamentarians accustomed to the so-called "britannique" eloquence of Clemenceau, Waldeck-Rousseau, Ribot, Pelletan, Freycinet and others. His maiden speech was delivered Oct. 21, 1886, on a question relating to primary education. On every question with which he dealt in the Chamber, he adopted a courageous attitude which showed him incapable of sacrificing his principles to parliamentary compromise or to motives of self-interest. Without allying himself to any party, he devoted himself passionately to the public good and to the general welfare; but at the close of the session the meagre results of his efforts discouraged him so much that he decided to abandon politics, and asked to be reinstated in his post of professor at the University of Toulouse. Persuaded by his friends, however, he stood for Castres, and failed. In November Jaurès resumed the professor's chair. His lectures were now thronged with students, workmen, middle class folk, other professors, men of science, men of learning. During this period he wrote his theses for the doctorate. His French thesis was entitled *De la réalité du monde sensible*. In his Latin thesis he traced the origins of German socialism *De primis socialismi germanici lineamentis apud Lutherum, Kant, Fichte et Hegel*.

In the articles which he wrote at this time for the local organ *La Dépêche* his ideas on politics and economics were seen to turn more and more towards Socialism, to which, at the close of 1890, he at last publicly announced his adhesion. After the strike at Carmaux, in the course of which he defended the claims of the miners, Jaurès was elected deputy, in 1893, at a local election, and his term of office was renewed at the general elections of 1894. Defeated again in 1898, he was re-elected in 1902; and his electorate remained faithful to him from that time on. In the Chamber he took a large part in the debates on the Panama and Boulanger crises, in discussions of agrarian and colonial questions, on fiscal policy and protectionist measures, on syndicalism and the separation of Church and State, on military laws and electoral reform. In the Dreyfus affair his energetic intervention captured

the Socialist party, which hesitated at first to take part in a conflict which seemed not to concern the proletariat. His campaign in favour of Dreyfus, a "living witness to military lies, to political cowardice, to the crimes of authority" did not cease until Dreyfus was definitely rehabilitated.

Led by the logical development of his metaphysical and religious ideas to social conceptions which obliged him to accept the Socialist teaching, Jaurès adhered closely to the rapidly growing Socialist party. The socialism of Jaurès differed essentially from the Marxian doctrine. "Our socialism," wrote Jaurès, "is French in origin, French in inspiration, and French in character." His ultimate aim was harmony founded on justice. Social harmony implies the disappearance of an injustice which provokes conflicts, hatreds and their horrible consequences, an injustice originating in capitalist ownership. Jaurès was a socialist because "the domination of one class is an outrage against humanity." Into this doctrine he breathed his own glowing and generous ideas and, at the same time, drew from it the strength with which he animated it. "No serious social programme can be realised without a definite social doctrine," he wrote, and for him the whole socialist ideal must inspire organic reformatory action and thus establish a socialism, democratic, republican and lay. Jaurès strove to bring about unification of the various socialist groups. At the Congress of 1901, a section of groups rallied to him under the name of the *parti socialiste français*, while the others formed the *parti socialiste de France*. After the Amsterdam Congress in 1905, the two groups coalesced and Jaurès became, in fact, their moral and intellectual chief. Thereafter his political activity was bound up with that of the unified Socialist party, whose parliamentary activity he directed with great skill. He drafted most of the resolutions at Socialist congresses and defended them in an admirably conciliatory spirit.

His philosophy of history, unlike that of Marx, did not hold that the development of society is explained by historical materialism; he postulated for it an intelligent directing force and an ideal wisdom. To uphold his convictions, Jaurès, after the Amsterdam Congress in 1905, struggled alone against the entire International for a share of power and for the preservation of the democratic-socialist bloc. He violently attacked and denounced as impotent the German Social Democracy which dominated the Congress and was supported by the old French Socialist organisations. On April 17, 1904, Jean Jaurès, with Aristide Briand, founded *l'Humanité*, which has become the daily organ of the Socialist party. His daily leading article in it was written for the most part from his seat in the Chamber.

Jaurès early foresaw that the unstable equilibrium of the Triple Alliance and the Triple Entente was bound to end in a catastrophe, and he wished to avert it by the simultaneous international action of the proletariat. A passionate lover of France, he sought to spare his country the horrors of devastation by war. While he maintained that a democracy should not have an aggressive policy, he did not deny the duty of every nation to defend itself. To prevent misunderstanding between socialism and patriotism he wrote: "A nation which could not count, in days of crisis or when its life is in danger, upon the national devotion of the working class, would be a wretched thing indeed." He supported the policy of arbitration and all measures to secure international peace, but at the same time, in the name of the workers of France, he insisted "that the nation organise all its military forces, irrespective of class or caste, for the sole purpose of national defence." Against Germany, militarist and absolutist, stood France, a nation in arms, practising "a policy of supreme national defence which would lead not only to peace but to the assurance of peace." Jaurès expounded and developed his ideas on the organisation of "a nation in arms" in his great book, *L'Armée nouvelle*.

The policy of world-wide solidarity which Jaurès proclaimed was of no avail against the blind forces which precipitated the War, but Jaurès continued to strive for peace. On July 28, 1914, before the outbreak of war, he, and some of his most eminent Socialist colleagues, went to Brussels to confer, in the name of the French Socialist party, with representatives of international labour on the best means of averting the threat of war, which he

still thought could be avoided. But he was none the less full of anguish over the fate of France, compelled to defend herself against aggression. On this particular subject, he certainly felt no hesitation, for he had always been animated by the purest patriotism.

Il y a un groupement historique qui s'appelle la France, qui a été constitué par des siècles de souffrances communes, d'espérances communes; les lentes formations monarchiques en ont peu à peu juxtaposé et soudé les morceaux, et les ardentes épreuves de la Révolution l'ont fondu en un seul métal. C'est la patrie française . . . Oui, il y a des luttes, des antagonismes profonds de classe. Mais quels que soient ces luttes politiques, ces divisions économiques, ces antagonismes sociaux, ils ne peuvent pas porter atteinte à l'idée même de la patrie. . . . Si notre patrie est menacée . . . nous serions des premiers à la frontière pour défendre la France dont le sang coule dans nos veines, et dont le fier génie est ce qu'il y a de meilleur en nous.

These noble words leave no doubt as to the attitude which Jaurès would have taken, or of the rôle which he would have played in the "holy war for our beloved France if ever she were attacked." But on the very eve of mobilisation, in Paris, on July 31, 1914, at 9.40, Jaurès succumbed to the bullets of an assassin—a wretched half-wit, impelled to this stupid crime by the calumnies of the adversaries of the great tribune. His obsequies were celebrated on Aug. 4 in the midst of an immense popular gathering, and his body was interred at Albi. In 1925 his mortal remains were brought back to Paris, and, borne on the shoulders of his faithful miners of Carmaux, deposited in the Panthéon. (E. H.E.)

JAVA, fourth in area but most important of the islands of the Malay Archipelago which constitute the Dutch West Indies, belonging to the Netherlands, is separated from Sumatra on the west by the Sunda strait, 14-50 m. wide, and from Bali on the east, by Bali strait, 1½ m. wide in the north. It is 622 m. long and 121 m. wide in greatest dimensions, and its area without the island of Madura (q.v.) is 48,504 sq.m. Its population (1926) was 36,403,833, including that of Madura (1,743,818 in 1920), two and a half times that of the remaining islands, which have more than thirteen times the area of Java. It lies between 5° 52' and 8° 47' S. and 105° 12' and 114° 35' E.

Mountains.—A longitudinal mountain chain from west to east is flanked by lowlands which are more continuous on the north. In the east the portion west of Pasuruan (with volcanic highlands and peaks up to 10,968 ft.) is wider, while a peninsula (with the volcanic Tengger, Iyang and Ijen highlands and peaks up to 12,049 ft.) tapers out eastwards. In the southeast Balambangan

serious eruptions are few and the black volcanic soil is very fertile; 13 of the 125 volcanic centres are active and Gedeh and Papan-dayan have caused damage within the last 200 years. The Bromo (7,800 ft.), always steaming, rises from a huge crater bed of sand, and the Ijen plateau, one of the largest of extinct craters, covers 53,000 acres. Papandayan is capped by sulphur deposits, and the volcanic centres show solfatara (steam jets), boiling wells and mud cauldrons, with the ground coloured bright red, yellow and green, and, in some places, poisonous gases may be seen arising.

Rivers.—Most rivers in Java run northwards, down the longer slope, but a few go to the south coast and the Solo and the Brantas in east Java are turned east by northern mountain ranges; they are the longest of the rivers, the Solo being 310 m. long and navigable up to Surakarta. The Brantas is navigable up to Kediri. The southern streams are rapid and rough. In the west the Tarum and Manuk are navigable for some distance. All are used for irrigation.

Plains.—In the east the northern Japara plain is formed of volcanic mud; the Juwana, Rembang and Surabaya plains are marine sand and clay. Most interior plains are volcanic; those of the south coast are marsh and sandhills. In Mid and in West Java the northern plain is alluvial, with marsh and coral remains about the lowest levels. The rivers flowing into the shallow northern sea have built up a changing flat belt of sand and mud. The northeast coast is often wooded and of varied contour; westward past Cheribon the coastline is low and rich in mangrove and nipa palm. There has been reclamation for villages. The currents of the deep ocean on the south sweep away river mud but heap up shifting sand ridges which, during the southeast monsoons, may block river mouths. The limestone ranges thrust out headlands with cliffs rising 1,600 ft. from the sea.

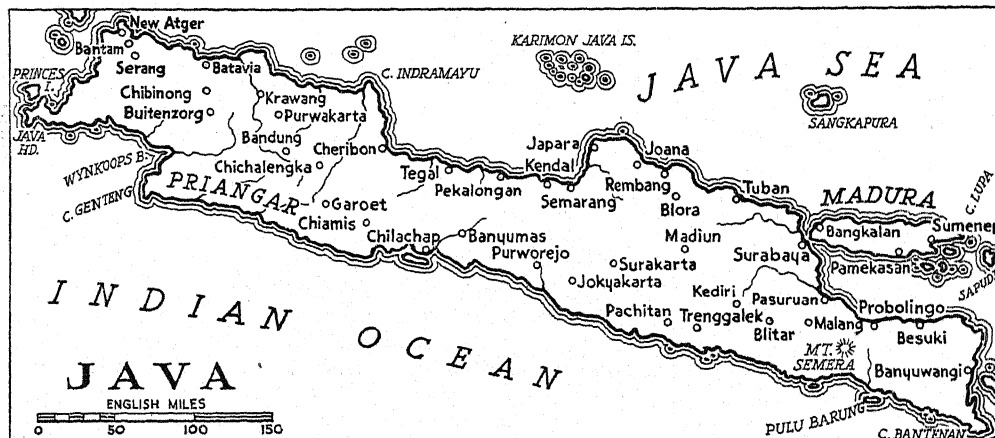

Geology.—In Java the Cretaceous occurs in one small inlier, strongly upfolded near the centre of the island; the Eocene appears as coal seams, sandstones and limestones, and the later Tertiary strata yield marls, breccias, and limestones and cover 38% of the island. The Miocene strata are very thick; fresh water Pliocene strata in the east, or the Pleistocene immediately above it yielded the famous "ape-man" or "dawn man" fossil called Pithecanthropus, and there is much marine Pleistocene material, some of it 350 ft. above sea level. The oldest rocks are serpentine and mica-schists, in part perhaps Cretaceous. Faults separate the central volcanic highlands from the northern low-

lands and from the broken country to the south, so that the island is formed of strips. The central volcanic mountains rest on highly folded Tertiary rocks with indications of underlying Cretaceous sandstones and Palaeozoic schists; they are interrupted by an extension of sediments southward across the island from Semarang. Volcanicity developed in the mid-Tertiary and attained its maximum in Pleistocene times; volcanic rocks, especially andesites and basalts, cover 28% of the island.

Islands.—Madura is described in a separate article.

Bavian or Bawean (73 sq. m.), 100 m. north of Surabaya, is the site of a broken volcano; it has 50,000 people (Boyans) of Madurese stock, Mohammedans and keen traders. The so-called Thousand Islands (actually about 80) lie northwest of Batavia Bay, and there are many other islands off Java.

Climate.—In spite of a sub-equatorial situation, Java rarely has extreme heat, though the temperature averages 78° to 80°; sea and mountains are cooling influences; sea breezes and thunder showers relieve the heat, and there is much cloud. Above 5,000 feet are temperate conditions, and a temperature of 27° has been recorded on the heights. The mean daily range at Batavia is

is united to the mainland by low marsh. Middle Java, between Semarang and Cheribon, has a chain formation of mountains (Slamat 11,400 ft.); the watershed is central, rather than near the south coast as it is in the east. Middle Java is separated from Eastern Java by the Kedu valley, cut off from the coast by a limestone ridge. West Java has the Preanger mountains in the southeast (Chikuraj 8,596 ft.) near the coast, with three extensive plateaus—Garut, Leles, and Bandung; westwards the heights are less but in northwest Bantam another group rises to 5,730 ft. The north coastal strip from Cheribon to Bantam is 3 to 25 m. broad, the southern strip is very narrow. Java is highly volcanic, yet

11°-8; in the mountains 38°. Absolute maxima and minima are 96°-1 and 66° at Batavia, 99° and 62°-4 at Assembagus (south coast), and 71°-2 and 49°-5 at Tosari (5,840 ft.). The coastal districts are coolest at 6 a.m. and warmest at 1 p.m. The mean monthly range is 4° at Tosari and 2° at Batavia. High humidity is general (78-87%).

Java has a northwest monsoon from December to March, bringing much rain and cloud especially in the north, while from April

COURT DANCING GIRLS IN A MOVEMENT OF THE S'RIMPI DANCE. DECOROUS FIGURE DANCE THAT THEY ALONE ARE PERMITTED TO PERFORM

to October it has a southeast monsoon bringing some rain to the south coast but making August the sunniest month at Batavia (51.6% of possible sunlight). Strong cyclones and typhoons are unknown but afternoon thunderstorms are common in the mountains and at night during the wet northwest monsoon. Batavia averages 122 thunderstorms a year. The northwest monsoon extends only to about 6,000 ft.; above this the southeast wind always blows and gives a serene climate.

Rainfall varies and reaches 327 in. at Kranggan in Banyumas, while Sirah Kuchong (3,413 ft.), in Kediri, once had 398.11 in. in one year. January is usually the most rainy month. Batavia averages 71.31, Cheribon 90.38, Banyuwangi 56.58, Buitenzorg 168.63, Bandung (2,346 ft.) 74.70, Chilachap (south coast) 152.25, Kalisat (3,609 ft.) 62.40 and Assembagus, the driest station, 35 inches. The region of maximum rainfall stretches from Mt. Cherimaj in Cheribon to Banyuwangi, southwest Bantam and Batavia. Periods of drought last from 12 to 53 days in the west, and 14 to 116 in the east, but a drought at Situbondo lasted 227 days.

Fauna.—The Javan one-horned rhinoceros is closely allied to a form in south-eastern Asia. The tiger occurs in Java and also the banteng or wild ox (*Bos sundaicus*), akin to the gaur, the great wild ox of India. There are two species of wild pig, both very destructive to crops, a leopard, a wild cat, deer, notably the little muntjac (*Cervulus muntjac*) and the graceful musk-deer, (*Tragulus javanicus*), several species of ape, Galeopithecus (a flying lemuroid), many bats which produce guano deposits, squirrels, flying squirrels, porcupines, rats, mice, shrews, ichneumons, civet cats, hares, badgers and the scaly anteater (*Manis javanica*). The dugong, a large aquatic mammal, visits the coasts of Java.

The green peacock (*Pavo muticus*) is found in Java. A rare and beautiful jungle fowl (*Gallus varius*) is found here and also *Gallus gallus*, the red jungle fowl. The bird population includes 400 species; snipe and other water fowl abound and weaver-birds and rice-birds prey upon the crops. Only two parrots occur. The swift (*Collocalia*) which produces the edible bird's nest is found along the coast. Two trogons, two blue-ground thrushes, a pink-headed dove, a black and crimson oriole, and three broad-tailed ground pigeons belong to Java. Large crocodiles (*C. porosus*) are common and lizards swarm; the monitors *Varanus salvator* (minyawak) and *V. bivittatus* (beawak) are large enough to attack poultry. Snakes, numbering more than 100 species, in-

clude the great python (*Python reticulatus*) revered because it destroys field mice, the cobra and an adder.

Seas, rivers and ponds swarm with gorgeously coloured fish which form a large element in the food supply. Crabs, lobsters and crayfish, are common. Over 500 species of butterflies occur here and moths, beetles, mosquitoes, ants, termites, hornets, are common. Scorpions and centipedes are troublesome and spiders abound; one spider snares small birds.

Flora.—Over 5,000 species of plants are known and the Botanic Gardens of Buitenzorg are world-famed. The flora is south Asian, with Australian affinities in the southeast and east. Dense rain-forest abounds in Java west of 112° E. but occurs only on damp slopes sheltered from the southeast wind. The rasamala (*Altingia excelsa*), a tall timber tree, common in the west, is absent from the east where mountain casuarina flourishes. Thick bamboo woods occur in the west; teak is found in the drier east.

There are four plant zones. From sea level to 1,750 feet is found the hot wet forest zone, the most extensive of the four; some trees such as *Barringtonia speciosa* and *Terminilia catappa* grow only near the sea, epiphytic plants are uncommon, and fleshy-leaved plants abound on salty soil. A short distance inland palms begin and the low hills are covered with alang-alang, glaga, bamboo and acacia. Where limestone is found in the hills, figs, acacias, sterculias, rattans, pepper vines and jasmine are common. Acacia forms fine woods between 400 and 1,300 feet, teak prefers less calciferous soil and thrives between 700 and 2,000 ft., forming one-third of the government forests. In this zone rubber, rice, cotton, sugar-cane, coconut palms, and tobacco are grown and there are cattle pastures.

Higher up, in the second zone, are great forests with brilliantly flowering epiphytes, notably orchids, as well as ferns and fungi, growing on the tree trunks. Figs, magnolias, and anonaceous trees are general while rasamala grows 130 ft. high in Mid Java; casuarina and bamboo are found in the east. The temperature

of the second zone is 64°-74°. It has a much narrower range of species and its cultivated plants include tea, cinchona, coffee, maize and sugar palm. Above the 3,000 foot level strawberries, violets and herbaceous composites occur.

In the third zone (temperature 54°-64°) are swamps and lakes with rich grassy shores, and azaleas and rhododendrons abound, also oaks, chestnuts, maples and laurels; a species of elm (anggrang) is found on Mounts Merapi and Kelut. Many trees are covered with mosses and lichens. Crowfoots, horse-tails, meadow rue, whortleberries, (*Vaccinium*), raspberries and blackberries abound. In the Tengger country there is some planting of maize, rye and tobacco, and of European vegetables.

On about 20 peaks, forming the fourth zone, conditions are Alpine and frosts occur. Ironwood, myrtle, elder, rhododendron, barberry, guelder rose, honeysuckle, heather and the so-called Javanese edelweiss (*Anaphalis javanica*) are common. The royal cowslip (*Prima imperialis*) is said to grow only on the summit of Pangerango, which also possesses wood-sorrel, sow-thistle, chickweed, lily of the valley, foxglove, lobelia, yew and annual grasses.

Teak is the chief tree economically exploited and since 1914 has been a state monopoly. During 1926 about 202,000 cubic metres of commercial teak was felled, mainly for local use. Rat-

A SULTAN IN CEREMONIAL ROBES MADE OF NATIVE BATIK

tan creepers are becoming important, notably for binding wicker chairs. There is a forestry school and experimental station and the service now controls all forests.

Towns.—Batavia (*q.v.*) is the capital, pop. 290,408. On the line to Buitenzorg (*q.v.*) is Depok, a missionary settlement, and in the adjacent residency of Bantam (*q.v.*) are Tangerang (11,061) on the river Sadan, and Serang (21,656) the capital of Bantam on the coast of the Sunda strait. Merak is a small port for steamer service to Sumatra; Anjer was once an important port of call and capital of Bantam. Pandeglang (south of Serang) has an Assistant Resident and a government rest house. Labuan is a fishing port and bathing resort with Pasauran (with a government rest house) to the north and Chichurup (also with a rest house) and other resorts to north and south. Southwest Bantam is without towns of interest but Rangkas Betung (4,425), with an Assistant Resident, is a rubber centre and has medicinal hot springs. On the main line from Batavia to Bandung are the following: Krawang (12,012) with residency, a rice centre; Chikampek, junction for Cheribon, Purwakarta (10,892) with an Assistant Resident; Bandung (*q.v.*) among the mountains is the capital of the Preanger Regencies and has a population of 170,498.

Another line into the Preanger Regencies (*q.v.*) reaches Sukabumi (42,039, incl. 1,200 Europeans and Eurasians), the seat of an Assistant Resident, 2,300 feet above sea and near Wijnkoop's Bay, a coastal resort, with the fine falls of Chi Burum (descent 429 feet), the hot springs or geysers of Chisolok, and the craters of Salak and Pangerango. Chandjur was formerly the capital of the Regencies but now has an Assistant Resident; near it the hill resort of Sindanglaya has above it the pass of Punchak (4,583 feet), the boundary between the Preangers and Batavia Residency and a famous view point. Near by are Chipanas, with the Governor General's summer house, and Chibodas (4,700 feet) with experimental gardens and primeval forest.

East of Bandung a line goes to Garut (*q.v.*) which has a population of 28,895. Sumedang (8,509) on the road to Cheribon has lost importance since the railway came. Tasikmalaya (20,132) with an Assistant Resident is in southeast Preanger, and makes wicker work, mats, etc. It is a road station with hotels near lovely scenery. Farther east is Banjar, an important rubber centre. Northeast of the Preangers is Cheribon (31,820; *q.v.*) with a Resident, while 23 m. inland from Cheribon is the hill resort of Kuningan (2,200 feet), and on the coast the bathing station of Linga Jati. Thirty miles northwest of Cheribon is the river port of Indramayu (17,285) the capital of a Residency (pop. 799,340) with many Chinese, and with trade in rice. A steam tramway runs from Cheribon along the coast to Samarang (150,952; *q.v.*); passing through Brebes (20,619), Tegal (33,143) the seat of an Assistant Resident, with sugar trade, and Pekalongan (60,680, incl. 605 Europeans and Eurasians) capital of a residency and a sugar port. Pekalongan and Batang have batik industry. Kendal (12,324), 18 m. west of Samarang, has an old fort and a Protestant church.

A line from Batavia runs south from the Pekalongan and Samarang Residencies through those of Kedu (*q.v.*) and Banyumas to Jokjakarta (110,120; *q.v.*). Banyumas (7,336) is the seat of a Resident and Chilachap (31,522) a fine port (*q.v.*). A steam tramway runs from Maos junction to Wonosobo (7,190; *q.v.*), capital of the Dieng plateau. Magelang (34,214 incl. 2,803 Europeans and Eurasians) stands at 1,246 ft. above sea level and is the capital of Kedu. It has a steam tramway to the military centre of Parakan, from which (or from Jokjakarta) Barabudur can be visited. Muntilan, between Magelang and Jokjakarta, has many Chinese, is an important market and is near Barabudur and Mendut (see *Archaeology*). Between Maos and Jokjakarta is Krakal with hot springs for rheumatic ailments and skin troubles. On a branch line is Purwareja (18,057, incl. 698 Europeans and Eurasians) with an Assistant Resident. In the Jokjakarta residency lie Prambanan (see *Archaeology*) and Kreteg, with the bathing station of Parang Tritis, whence the line runs to Surakarta (15,273; *q.v.*). Madiun (*q.v.*), (31,817 incl. 1,509 Europeans and Eurasians) is the seat of a Resident, a railway

and irrigation centre, and 30 m. south on a tramway is Ponorogo (15,932) with an important native market. The railway crosses from Madiun into the Kediri residency where Kertosono has an Assistant Resident and sugar factories, and Kediri (32,406, incl. 823 Europeans and Eurasians) is a sugar centre on the navigable Brantas. From Kertosono a line runs to Surabaya (248,961; *q.v.*), the chief commercial port of Java and a naval station, passing by sugar centres, and ruins that are said to be those of Majapahit (see *Archaeology*). A branch of the line Surabaya-Samarang passes Ambarawa (14,684, incl. 622 Europeans and Eurasians), 1,700 feet above sea level, originally a military settlement and still possessing a fortress. To the southeast is Salatiga (20,432, incl. 1,342 Europeans and Eurasians) at 1,900 feet, a favourite health resort, for Samarang people and now a test station for tea seeds. Merbabu, 11 m. farther on, is at the 4,000 feet level and is a health resort. Demak, northeast of Samarang, grows fruit (blimbing); it is one of the first irrigation centres, and was the seat of Raden Pateh (15th cent.) who built a temple with a pillar supposedly raised by superhuman skill, making the place very sacred. Kudus, (44,593, incl. over 4,000 Chinese) trades in cloths, batiks, kapok, copra and cattle. To the north lies Japara, chief port of Mataram in the 17th century and an early Dutch station. Pati (14,265), Rembang (13,618) a port and capital of a Residency, Blora (15,460), Chepu, centre of the mineral oil industry, Lamongan (12,692), Grissu (24,382), where the Dutch had their first factory (1602) destroyed by Javanese trade rivals in 1613, are on the way to Surabaya. East of this lies Pasuruan (33,133; *q.v.*), capital of a residency and a sugar port; branches off this line run up to small mountain resorts. Lawang (11,163) has an Assistant Resident and Malang (56,273, incl. 5,344 Europeans and Eurasians) is a military settlement and a health resort at an altitude of 1,460 feet, near fine scenery and ruins. Pasuruan is a starting point for the ascent to the mountain resort Tosari (*q.v.*), the capital of the Tengger; another starting point is Probolinggo (26,040, incl. 625 Europeans and Eurasians), which is a sugar port. From Probolinggo the railway goes across inland to Kalisat in the south of Java via Jember (17,373), a tobacco centre. Bondowoso (14,023) capital of Besuki Residency is well laid out. Banyuwangi (15,459) to the east, opposite Bali, has an important cable station and is a port of call for Australian ships. The Dutch came to Banyuwangi in 1774 to prevent Great Britain and her Balinese allies from controlling Bali strait, but in 1811, when Raffles controlled Java, the Balinese attacked and this necessitated a British expedition against Bali.

In spite of the size of Batavia, Surabaya, Samarang, Surakarta, Bandung, Jokjakarta, etc., Java's population is mainly rural. The native Javanese, the largest element, show old established Hindu influences in their culture, and are usually darker than the more clearly Malayan Sundanese of the west; the Madurese occupy Madura and Eastern Java. All show their Mongolian affinities in a lack of body-hair and a poverty of beard. The eye is not often oblique save among Sundanese. The traditional village is concentrated within a bamboo fence, each house having its own enclosure. The Sundanese often have their dwellings raised on piles. They live on rice with some fish but little meat. In religion Mohammedanism has replaced folk-beliefs. Of Buddhism and Brahmanism only the memory remains. The Javanese language is rich, its ancient form being called Kawi, which lasted until the rise of Majapahit and which had many loan words from Sanskrit. Modern Javanese includes a language of the nobility and one of the common people, while a middle form has also developed. The Javanese have notable skill in metal work, though the metal is imported and they cannot equal the Sumatra filigree workers. The Hindu tradition of architecture has long been quite dead. Boat building is highly developed. Music is much cultivated, also dancing, and the drama—shadow-shows, etc.

Agriculture.—Over 40% of the land is cultivated, the rest is mainly mountain or forest. Irrigation has been applied to about 2,000,000 acres and may still redeem some further areas. The soil includes volcanic elements, alluvium and remains of Tertiary Calcareous rocks. On the volcanic soils of Batavia, Cheribon, Tegal, Surabaya and Pasuruan residencies and the

Japara plain the cultivated area is 80% or more, while in Rembang and Krawang on calcareous soil it may be only 10 or 20%. On the plains are grown rice, sugar-cane, coconuts, millets, cassava, sweet potatoes, soya, kapok, plants producing essential oils, agaves (for fibre), tobacco, indigo, rubber, legumes, and fruits such as bananas, pineapples, mango, durian, mangosteen, melon, papaya, custard apple, etc. On the foothills, chiefly below 4,500 feet, rice, maize, cassava, ground-nuts, tobacco, tea, coffee, rubber, cocoa, coca, cinchona and European vegetables are grown.

Land is held (a) as leasehold (Crown lands) for a maximum of 75 years; (b) as private or particular lands, sometimes subject to manorial rights, which date back to the times of the East Indian Co. and of the British occupation; (c) as hired lands in the Vorstenlanden (Principalities); and (d) as properties rented from natives for a maximum of 21 years followed by a break when the native owner occupies. Private lands are being bought by government to be let on lease. The hiring of land in the Principalities is not being extended. Of 2½ million acres of rented agricultural land in Government possession half a million acres are let to private cultivators. There are some 2 million acres of particular lands, half a million acres are leased in the Vorstenlanden and 300,000 acres are let by Javanese to Europeans and Chinese etc. 1¼ million acres are held from the government on leases, sometimes heritable, mainly in the hands of companies. Purchase of land by aliens is not allowed.

Native agriculture in the strict sense is primarily for home supply of food, but it also yields material for export. Estate cultivation is mainly for export. In 1926, 7,272,072 acres of irrigated rice land yielded 6,960,786 short tons (2,000 lbs.); 1,100,333 acres of non-irrigated rice land gave 580,866 tons; maize with 4,837,128 acres yielding 2,219,733 tons; cassava 1,676,447 acres, 5,879,270 tons (of fresh tubers); sweet potatoes 419,333 acres, 1,155,470 tons (of fresh tubers); ground-nuts 483,200 acres, 154,700 tons (of shelled nuts); soya beans 421,861 acres, 107,870 tons; other legumes 522,869 acres, tobacco (native) 346,640 acres. Indigo, sugar-cane, red pepper, millet, sesame, onions and other vegetables together occupied 721,723 acres.

The coconut palm likes loose, porous, fertile soil free from stagnant water. There were 63 million coconut palms in Java in 1917 and, besides much produce used at home, 30,000 tons of copra and 10,388 tons of oil were exported in 1925. Cereals and pulses are grown as supplements to rice to guard against poor harvests, but much rice is imported from Siam, Indo-China and Burma. The common native implement is a plough of teakwood with a point tipped with iron and a yoke of bamboo; it is drawn by two buffaloes. The harrow, hoe, weeding knife, reaping knife and dibble are also used. In native irrigation hollowed coconut trunks are used as aqueducts with posts made of bamboo, and with primitively constructed dams. European advice is now influencing methods of agriculture and the purchasing power of the natives is growing. Small strong horses are bred for riding. The buffalo is the chief draught animal and gives milk and meat. Javan humped cattle are crossed with wild cattle from the Pasuruan forests and hides are exported. Sheep, goats and poultry are important adjuncts. Sea fishing is largely organised by Chinese and Japanese, the latter with motor boats. Both sea fish (chiefly bandeng) and fresh water fish are reared, the former by Chinese, the latter in Preanger on the rice fields between the seasons.

Highly scientific estate cultivation, partly Chinese, but mainly European, depending on cheap native labour, occupies about 2,100,000 acres, producing mainly sugar-cane, on rich volcanic plateau soil, and also rubber, tea and coffee. In 1894 there were only 185,250 acres of sugar-cane; in 1926, 456,836 supplying 178 sugar mills crushing from May to October which gave 1,982,795 tons, mostly from central and eastern Java, north of the volcanic range which runs from west Cheribon to Rembang, or from the Serayu valley, Merapi (in Jokjakarta and Surakarta), the volcanic lands of Madiun or the Kediri and Pasuruan residencies, with very important plantations on the plateau of the Vorstenlanden and in the valley of the Brantas. Cane, taking more than 12 months to mature, is planted once every three years, ground-nuts,

rice, cassava, tobacco, indigo etc. being planted on the same ground in rotation. About 55% of the export is white sugar with a saccharose-content of 99%. Most estates are within the United Sugar Producers' Association with offices in Surabaya, and with Dutch, British, Chinese and Japanese capital. Experimental stations give great assistance to sugar, rubber, coffee and tea planting.

Rubber, *Hevea brasiliensis*, was introduced in 1876-7 in the gardens at Buitenzorg and planting was stimulated by the coffee failure of 1900 and the rise of coffee planting in Brazil. After

A JAVANESE WOMAN IN A SARONG MADE OF BATIK

1908 a spurt occurred and after 1922 another, raising the area from 260,180 acres in 1922 to 480,958 in 1926, production rising from 28,902 to 51,794 tons. Rubber now occupies most of the suitable land. It grows on 226,993 acres in West Java up to 1,000 feet above sea, on 55,164 acres in Mid Java and on 197,221 acres in the east. The capital behind the industry is international with large Dutch and English contributions. At Chipetir in West Java one government estate of 3,120 acres produces guttapercha (246,642 lbs. in 1926). The tree is a *Palaquium* which was supposed to be dying out and the high grade product may have nearly 9% resin and nearly 91% guttapercha; impurities not being 2%. Tobacco was badly cultivated by forced labour until 1864, after which it spread, covering in 1926, 67,628 acres which gave 37,905,490 lbs. mostly from Vorstenlanden (Jokjakarta and Surakarta). Javan natives also grow tobacco under European guidance in Besuki, Kedu and Pasuruan, and the Europeans concerned buy the whole crop at prices fixed beforehand, for export chiefly to Holland. The tobacco exports in 1923 were worth 20,700,000 guilders (£1,725,000; \$8,383,000). In 1926 216,322 acres were under tea, a crop first tried in 1829 by the government but grown privately after 1870 and more successful after introduction of the Assam variety in 1873. Quality improves but quantity of yield diminishes at the higher levels. Some plants with Ceylon aroma are grown as well as fine Chinese varieties. Total production in 1926 was 85,950,900 lbs., Holland and Britain buying most. A Tea Expert Bureau in Batavia guards the quality and a Tea Buyers' Association protects interests of buyers. The production for 1927, including native grown tea, was 143,496,990 lbs.

Coffee, introduced from Arabia, was first shipped to Holland in 1711, 1724 seeing a shipment of 1,000,000 lbs. In 1830 the production was 40,000,000 lbs.; in 1832 the Culture System was introduced by Van den Bosch, and by 1840 the yield had reached 54,000,000 lbs., rising to an average of 100,000,000 lbs. per annum between 1850 and 1870. In 1885 the element of forced labour was dropped from the Culture System and in 1915 Government left the field entirely to private industry which had begun about 1870. Up to 1875, Arabica coffee only was grown but leaf disease brought disaster in 1880 and the Liberia variety was introduced. It became diseased and in 1900 the Robusta plant was brought in. The Quilua, Uganda and Excelsa varieties are also used, as well as hybrids. Robusta has a smallish bean but gives a yield in 3 years, as against 5 for the Arabica and Liberia types; it covers 93% of the estates and gives 86% of the yield, thriving from 1,000 to 2,500 feet in a loose soil. Surakarta, Samarang, Kediri, Pasuruan and Besuki are important coffee centres. The speculative nature of the crop has led to decrease of production, 870,000 acres in 1926 yielding 34,000 tons. The crop is sold through brokers, chiefly at Surabaya. Robusta coffee goes to Singapore, the United States, Holland and France; Holland, the United States and Scandinavia take the other varieties. Java gives the world 90% of its cinchona. The Dutch Dr. Hasskarl collected seeds of the *Calisaya* and *Succirubra* varieties in 1854 in South America and they were sent to Chinchiruan in the Preanger. In 1865 the government bought seeds of another, unknown, variety from an Englishman named Ledger and a hybrid was made be-

tween *Succirubra* and *Ledgeriana* for production of quinine sulphate while *Succirubra* is used for other pharmaceutical purposes. Private enterprise began in 1877 and, in 1926, 33,000 acres gave 9,317 tons of bark. The Pengalengan plateau in Preanger, about 5,000 ft. above sea, is the chief centre. Until 1896 cinchona was sold as bark in Holland, but a combination in Germany roused Java producers to open a factory at Bandung to extract the quinine. European factories still guarantee the purchase of a certain quantity of bark.

Kapok, the fibre of *Ceiba pentandra*, also called silk-cotton or in Java pandu, is almost a monopoly of the island, 18,000 acres in 1926 producing 35,500,000 lbs. About 134 lbs. of kapok is obtained from 15,000 seed pods.

Java Sisal (from *Agave sisalana*) and Java Cantala (from *Agave Cantala*) yielded 16,000 tons for export in 1926 mainly to the United States. The oil palm has recently been introduced and various spices, oils and drugs are produced.

Industries and Commerce.—Cassava is made into various forms of tapioca, 151,156 tons being exported in 1926. Split bamboo and pandan hats are made and many exported. Batik is made for use in Java and surrounding lands. Water power is being developed and probably 1,000,000 h.p. can be used. Retail trade is in Chinese hands and there are large banking facilities including village credit banks. Java's imports in 1925 were worth 527,632,000 guilders, exports 845,967,000 guilders, the guilder being equal to 1s. 8d., or 40 cents.

Minerals.—Petroleum occurs in Samarang, Remang and Surabaya, and in 1925 kerosene, etc. amounted to 1,685,000 gallons, paraffin 5,885,000 lbs. and lubricators 763,000 lbs. Wonokromo in East Java has large refineries and wax is made. Coal occurs in Bantam and Jokjakarta and lignite is found. The coal and oil resources are to be exploited in future by the state. Various other minerals are produced, including iodine from springs.

Communications.—There are excellent motor roads on the fine scenic plateaux (Preanger, Dieng, Malang, Tengger) as well as on the plains, but at many places a coastal road is impossible. Railways run mainly west to east on the two sides of the main range with linkages through the central valleys. They amount to 1,763 m. in State lands and nearly all are of 1-067 metre gauge. Private railways amount to 1,550 m. mostly of the same gauge. One section is electrified. Steam tramways are numerous and motor buses are used. The state railway headquarters are at Bandung. Coasting steamers as well as liners play an important part and a Dutch East Indian Air Service has been discussed. The telegraph and telephone services are very highly developed, the latter having 106,000 miles of wires. Bandung has one of the most powerful wireless installations in the world.

Administration.—West Java forms a government containing 9 residencies, the rest is divided into 13 residencies. The Resident has under him Assistant Residents with Controleurs as subordinates; the above are Dutch or Eurasian and the Controleurs look after the village (*desa*) headmen, with district officers as intermediaries. The Controleurs have very limited jurisdiction and the Governor of West Java and the Residents of the Barcas rule under the Governor General of the East Indies. There are also Regencies under native nobles called Regents who give and receive political advice and have had their powers somewhat increased of recent years. The Sultans of Solo (Surakarta) and Jokjakarta hold their realms as fiefs and govern with the advice of Residents; they are allowed much ceremony and large revenues. The Dutch government has Arab and Chinese advisers appointed by the Governor General to deal with these elements of the population. (See also EAST INDIES, and MALAY ARCHIPELAGO.)

HISTORY

The first definite reference to Java in European literature is probably that of Marco Polo in the 13th century. Early Arab chroniclers included the greater part, if not the whole, of the archipelago under the general definition of Jawi. The history of the island before the appearance of the Portuguese (c. 1511) divides itself into two parts: the long period of Hindu ascendancy and the first part of the succeeding Mohammedan régime. It is said that Hindus visited Java during the first century A.D. Four Hindu kingdoms, existing in the 12th century, became the empire of Majapahit in 1376 or 1378. This lasted for one hundred years, when it was overthrown by the Mohammedans, whose missions had long been at work. A considerable civilization was built up by the Hindus, and de Barros says that the Portuguese found in Java "the most civilized people of these parts"; while all the other peoples of the archipelago were addicted to piracy, there is no account of Javanese piratical expeditions. After the overthrow of Majapahit Java again split up into many kingdoms or provinces. In 1578 the governor of the province of Mataram secured sovereign power and founded the empire of that name. The Dutch arrived in 1595; in 1602 the Dutch East India Company was formed; and in 1610, when the first Dutch governor was appointed, they were given permission to build a fort in the neighbourhood of the present Batavia. In 1677, after several unsuccessful attempts to dislodge the Dutch, the principality of Jakarta was ceded to them. During the next century and a quarter they were repeatedly in conflict with native princes, each challenge ending in an extension of their power. Possession of the Preanger was obtained in 1705 by treaty with Mataram; in 1745 Dutch authority was recognized over the whole of the north-east coast, and ten years later Mataram was divided into the states of Surakarta and Jokjakarta whose princes acknowledged the sovereignty of Holland. The kingdom of Bantam was subjugated in 1808. During the later Napoleonic period France laid claim to Dutch possessions in the East, and the hoisting of the French flag at Batavia brought in the British, who defeated the French at Weltevreden. Stamford Raffles was appointed lieutenant-governor, subject to the control of Lord Minto, governor-general of India. The ablest and most notorious of Dutch governors was Marshal Daendels, who immediately preceded Raffles. His policy of extracting the last ounce of tribute had reduced Java to terror and exhaustion. Raffles promptly revolutionized the whole system of administration, abolished the *corvée* and reformed the land and legal systems. He was in charge of Java from 1811 to 1816, when it was returned to the Dutch, who had to face a five years' rebellion started in 1825 by Dipa Negara, and suffered heavily in men and money at the very time when they were engaged with the revolt of Belgium at home. In 1830 Holland had no resources with which to relieve the financial difficulties of the colony. Baron van den Bosen offered to provide the necessary funds. He was governor general and colonial minister from 1830 to 1839—black years in Java's history. He resumed the Daendels' policy of extortion and savage tyranny. From a population of some 5,000,000, it is estimated that Holland by forced cultures secured £166,000,000 sterling in 12 years. Belief that Dipa Negara would ultimately return to rescue his unhappy compatriots was responsible for more than one rising from 1848 to 1888. In the meanwhile Dutch opinion at home was roused and in 1854 laws were passed intended to put the whole political and economic administration on a humane and progressive basis, though the reform did not become completely effective till 1872. Dr. Sloet van de Beele as governor general in 1866 abolished passports for natives travelling in Java, reduced the *corvée* to a minimum and abandoned the monopoly of the fisheries. Primary education

and a liberal penal code were introduced in 1872. Java has since been governed along lines that have frequently commanded the admiration of British students. In 1903 the natives were admitted to a part in local affairs, and a first step in representative government and decentralization was followed by others, till in 1916 a *volksraad* or people's council was created. The effect of education, the example of Japan, the Chinese Revolution, the Indian Swaraj movement and the national and racial unrest throughout the world, especially since the World War of 1914-18, have had their reactions and repercussions on the Javanese. While the demand for home rule has grown among the moderates, the right to independence is insisted on by extremists. In 1918 it was decreed that the budget, hitherto provided for by the Netherlands East India Council, should be transferred to the governor general acting in consultation with the *volksraad*, and in 1922 the constitution was further revised with a view to the extension of popular control without prejudice to the authority of the Crown. Restrictions on native representation were consequently imposed. Recent governors general have favoured giving the natives an actual majority in the *volksraad*. (C. H.; E. S.)

ARCHAEOLOGY

The building of stone temples began at the end of the seventh century, with its centre in middle Java. An earlier West Java period which probably used only light material, has left no traces. The classical, or middle Javanese style, which closely follows Indian traditions, flourished in the eighth and ninth centuries, and while apparently in full flower comes to a sudden and unexplained end about 928. The centre of culture is then transferred to East Java. Of the first centuries of the East Javanese period there are only very sporadic remains; the great mass of monuments dates from the 13th and 14th centuries. Art declined in the 15th century and in the beginning of the 16th century was destroyed by Islam.

Middle Javanese art yields small temples, in groups and singly, square with vestibule in front, projections for niches on the three other sides, a roof in stories with corner towers, while the decoration is very restrained and combines harmoniously with the architecture; the panels of the faces are often smooth, the only ornamentation introduced being in borders around the entrance and niches, consisting of the head of a monster (*kāla*-motive, derived from a lion's head) at the top and a *makara* at each side (*kāla-makara* ornament). The sculpture is simple and severe. On the Dieng plateau, near Wanasaba, a place of pilgrimage was dedicated to Śiva; of the original 200 buildings, eight small temples still survive.

About A.D. 750 this art becomes greatly enriched and refined, with closer political relations with the kingdom of the Śailendra's in Sumatra who ruled over Java as well; we then find larger edifices, better technique, bolder designs, and more extensive, systematically planned groups of temples; the panels of the façades are filled with ornamentation or reliefs. In Sumatra only a few buildings have survived, e.g., the stupa of Muara Takus, on the Upper Kampar. In Java are numerous monuments, almost all dedicated to Mahāyāna Buddhism.

The most important monument is the stupa of Barabudur with its fore-temple Mendut. The latter contains a very large but delicately finished image of the Buddha between two Bodhisattva's. Barabudur itself is a terraced mound, dressed with stone, surrounded by four square galleries, crowned with niches, and covered by three circular terraces, with transparent bell stupas. In these bells and in the niches are found images of the Dhyāni-Buddhas. Along the galleries Sanskrit texts are illustrated. At the top arises the main stupa, where an unfinished Buddha image has been discovered, thought to be Ādi-Buddha. The foot of the monument was covered from sight even as early as the Middle Javanese period, by a pile of stones.

These edifices were erected in the Śailendra era, A.D. 750-860. Their successors, the princes of Mataram, built even richer monuments especially in Prambanan, where, besides the Buddhistic Chandi Plaosan, consisting of two Vihāras with Bodhisattvas, terraces and side temples, the Chandi Lara Djonggrang (c. 900), was constructed as the national temple (dedicated to Śiva), and

the royal mausoleum. Within four rows of minor temples, on the middle terrace, lie eight large buildings. The central and most important one is for Śiva and contains the images of the god and his pantheon and a series of Rāmāyana reliefs. On the sides are shrines of Brahma and Vishnu; opposite to Śiva stands a temple for his riding bull Nandin.

As to the relation between Middle and East Javanese art, East Javanese art is regarded by some as the direct descendant of the Middle Javanese style; it being assumed that only the disappearance of the connecting links prevents us from following its footsteps. Others hold that East Javanese art had an individual and indigenous character, and was contemporary with Middle Javanese art. The distinction between the two is clear. The harmonious connection between ornament and architecture is lost; the part is often made conspicuous at the cost of the whole; the systematic groups are replaced by apparently capricious combinations in different styles; the evenly flowing relief conceptions become episodic and the figures represented assume the appearance of the *wayang* puppets (Javanese shadow show). In the frame work ornamentation the *makaras* disappear and the monster heads stand alone; in the roof formation the towers are squeezed inwards, so that pyramidal forms with horizontal layers are formed. The same texts find a place in the shrines of both sects and at last Śiva-Buddha temples are built.

A few very ancient remains are pure Middle Javanese such as Chandi Badut, others, from the transition period, show a combination of Middle and East Javan characteristics, as at Chandi Sanggariti, built round a medicinal spring and at Chandi Gunung-Gangsir near Bangil, an example of ancient brick building. East Java uses brick, combined with stone, while Mid-Java prefers stone. The mausoleum-bathing place (bathing place where burial has also taken place) Djalatunda on the Penanggungan, dating from 977, is distinctly East Javanese; the reliefs which surround the middle terrace form a contrast to Middle Javanese especially in their lively composition. A later bathing place Belahan, yielded a fine image of the king Airlangga (1042) represented as Vishnu on Garuda.

The continuous series of East Javan works of art beginning half way through the 13th century with Chandi Kidal, near Malang, shows that in spite of the great delicacy of execution the feeling of proportion in the ornamentation was weakening. Medallions have become an important motive in decoration, but are replaced later by an inserted plate. At Chandi Djago, somewhat later, are high receding terraces, on top of which the temple stands. The reliefs, rendering ancient Javanese texts, are entirely in *wayang* style. The divine figures of the Bodhisattva Amogha-pāśa and his followers are more in accordance with the older style. Both edifices are royal mausolea. The unfinished tower temple of Singasari, with the side chapels built out from it, contained Śivaite deities. In this neighbourhood was found an image of the Buddhist Prajñāpāramitā, one of the best products of East Javanese art. An image of Harihara, with the features of King Krtarājasa (1294-1309), the founder of Majapahit, from the ruined shrine of Simping is the work of a nearly related school.

At its height, in the 14th century, the Majapahit empire dominated the whole archipelago, and its prosperity is reflected in its monuments. To this period belong Chandi Djabung near Kraksaän, the only example of a circular tower with a circular crown, and probably Chandi Sawentar near Blitar, striking from the severity of its lines. Of Chandi Surawana and Tigawangi only the basements remain, with rich reliefs, in which the available space is filled with reproductions of nature. At Djedong a few gateways remain, as on the ground of the ancient capital Majapahit itself, where also a bathing place and ruins of temples are found.

The chief shrine of East Java was Palah, now Chandi Panatran. This Śiva temple rose on the summit of three terraces, in the reliefs of which the episodes represented were cut up into small pieces, thus sacrificing the clearness of the story to the exigencies of decoration, and the artists gave human forms to the surrounding natural objects (clouds, mountains, trees, etc.). The

group contains further a small temple, around which serpents coil, several terraces, bathing places and many other remains quite unsystematically arranged.

A great Buddhistic group, Chandi Sanggrahan, is almost entirely destroyed; Chandi Ngetos is of much clumsier form and the grottos of Selamangleng are the only examples of relief decorations found within caves hollowed out of the living rock.

In the 15th century art in the plain was declining, as at Chandi Gambar and Tuban; whereas in the mountains there flourished sanctuaries both of a Hindu and a more Indonesian appearance; to the first belong Indrakila, Penanggungan and Penampikan; to the latter Argapura. In the extreme west of East Java, on the Lawu, Chandi Sukuh and Tjeta show how the Hindu Javanese and Indonesian culture, in the course of this century, combine to form a peculiar but not unpleasing mixture. The centre of worship here is not a temple but a pyramidal terrace.

At the beginning of the 15th century Majapahit fell and Islam became dominant, but the Hindu-Javan forms of building had become so national that the new religion used them in the minaret of Kudus and the mosque of Sendang-duwur; this style proved to have no permanent hold on life. Hinduism survived for some time in the eastern corner of the island and there raised the temples of Matjanputih. It finally succumbed and took refuge on the island of Bali, where it exists to the present day.

JAVELIN, a spear, particularly one light enough to be thrown, a dart. The javelin was often provided with a thong to help in casting. (See **SPEAR**.) Formerly the sheriff of a county or borough had a body of men armed with javelins, and known as javelin-men, who acted as a bodyguard for the judges when they went on assize. Their duties are now performed by the ordinary police. (See **JAVELIN THROWING**.)

JAVELIN THROWING, the art of throwing a spear to the greatest possible distance in a straight line at right angles to a given scratch line.

Javelin throwing is a natural, war-like sport, which was practised at the ancient Olympic Games and has been revived in the modern Olympiads instituted at Athens in 1896 (see **OLYMPIC GAMES**). The modern javelin consists of a wooden shaft attached to a sharp steel point and having about the centre of gravity a grip 16 centimetres broad formed of a binding of whipcord. The total length of the javelin must not exceed 8.5 ft. nor the total weight be less than 1.6 lb.

The throw is made from behind a scratch line marked upon the ground and the javelin must be held by the grip. The thrower may take as long a run-up as he wishes, but may neither touch, nor overstep, the scratch line until the point of the javelin has met the ground at the end of the flight. The throw is measured from the point at which the head of the javelin strikes the ground to the scratch line, or the scratch line produced. Each competitor is allowed three trial throws and the best three (at the Olympic Games the best six) are allowed three more throws. Each com-

petitor is credited with the best of all his throws.

As an athletic event this sport has been popular in Scandinavia longer than anywhere else among modern civilized peoples, and the finest throwers still come from Finland and Sweden. It is in Finland, too, that the best javelins are made, the shafts being chosen only from the outer, sunside layer of the finest Finnish birch trees. A javelin so shafted will fly anything up to 30 ft. further than one which is shafted with English ash, which is not so stiff.

The first country to hold a javelin throwing championship in modern times was Sweden (1896). In that year Harold Andersson reached 203 ft., the aggregate of his right and left hand throws being added together. The improvement that has taken place is clearly indicated by the fact that in 1924 H. Lindstrom, Sweden, with his right hand alone threw 218 ft. 6½ in., while S. A. Lay, New Zealand, established 222 ft. 9 in. at the A.A.A. Championship, Stamford Bridge, London. The world's record is held by E. Penttilä, Finland, for his 229 ft. 3¾ in. at Viborg, Denmark, in 1927.

The sport is a comparatively simple one to practise, but the whole secret of obtaining distance lies in the athlete's ability to make the throw with the run and without any break in the rhythm of speed or action, and of getting the javelin smoothly away from the hand without setting up tremors in the wooden shaft. The material point is to transmit the power in the longitudinal direction of the javelin so that it may fly through the air in a straight line.

Method of Throwing.—The thrower grasps the javelin by the centre grip with the hand above the shoulder, point of the javelin directed downwards. He takes up his position some 25 yd. behind the scratch line and facing the direction in which the throw is to be made. He runs lightly forward at increasing speed, and 16½ ft. from the scratch line he draws back the throwing arm to its fullest extent. The upper part of the body is gradually turned in the direction of the drawn-back arm. Eight and a half feet from the throwing line the right leg is bent and the left foot firmly planted as a point of resistance, and the throw is made by the pressing up of the right hip, the straightening out of the rear leg and the action of drawing the right hand, which holds the javelin, strongly forward above the right shoulder on a level with the thrower's ear. During the throw both feet should be upon the ground; after the javelin has left the hand the feet are quickly reversed.

See F. A. M. Webster, *Athletics* (1925); Silfverstrand and Rasmussen, *Illustrated Text Book of Athletics* (1926); T. E. Jones, *Track and Field* (1926). (F. A. M. W.)

JAW, in anatomy, the term for the upper maxillary bone, and the mandible or lower maxillary bone of the skull; it is sometimes loosely applied to all the lower front parts of the skull (*q.v.*).

JĀWALĪQĪ, ABU MANŠŪR MAUHŪB UL-JĀWALĪQĪ (1073-1145), Arabian grammarian, was born at Baghdad, where he studied philology under Tibrizi. Later he acted as imam to the caliph Moqtafi. His chief work is the *Kitāb ul-Mu'arrab*, or "Explanation of Foreign Words used in Arabic." The text was edited from an incomplete manuscript by E. Sachau (Leipzig, 1867). Many of the lacunae have been supplied from another manuscript by W. Spitta in the *Journal of the German Oriental Society*, xxxiii. Another work, supplementing the *Durrat ul-Ghawwās* of Hariri (*q.v.*), has been published as "Le Livre des locutions vicieuses," by H. Derenbourg in *Morgenländische Forschungen* (1875).

JAWHAR, a native state of India (Thana Agency), in the Konkan division of Bombay, situated among the lower ranges of the western Ghats. Area 310 sq.m. Pop. (1921) 49,662; there is no tribute. The chief, who is a Koli by caste, traces back his descent to 1343. The chief crops are rice and millet. The principal village is that of Jawhar (pop. 2,997).

JAWORÓW, a town of Poland, 30 m. W. of Lemberg (Lwow) on the river Skto. Pop. (1921) 8,910. It has pottery works and some trade in agricultural produce. The town was once the residence of John Sobieski. It passed to Poland from Austria after the World War.

JAY, JOHN (1745-1829), American statesman and jurist, son of Peter Jay, a wealthy New York merchant of Huguenot descent, was born in New York city on Dec. 12, 1745. He graduated from King's college (now Columbia University) in 1764, was admitted to the bar in 1768 and soon developed a successful practice. In 1774 he married Sarah Livingston, thus connecting himself with one of New York's most prominent families. In the controversy which led to the independence of the United States, Jay was active in resisting British coercive measures and though extremely reluctant to accept the policy of separation from the British Empire, became one of the most ardent supporters of the patriot cause.

A member of the First Continental Congress (1774), he was entrusted with drawing up an address to the people of Great Britain. In the second Congress he prepared addresses to the people of Canada and of Jamaica and Ireland (1775). While still a member of this body he was absent from its sessions in the summer of 1776 attending the provincial congress of New York and thus lost the opportunity of signing the Declaration of Independence. However, he drafted the resolutions which authorized the New York delegation to sign. In 1777 he was chairman of the committee which drafted the New York State Constitution, and shortly after became the first chief justice of the State. The following year he returned to the Continental Congress and on Dec. 10, 1778 became its president.

In the autumn of 1779 Jay was sent to Spain to seek an alliance somewhat similar to the one already existing with France. He was to guarantee the Floridas to Spain in case of Britain's defeat, and in return was to reserve to the United States the free navigation of the Mississippi; he was also to solicit a subsidy and a loan of \$5,000,000. Spain had already entered the war as an ally of France, but she feared to imperil her own colonial interests by directly aiding the revolt of Britain's former colonies. Hence her Government withheld recognition of the United States and received Jay only informally. In May 1780, however, the Spanish minister, Count de Florida Blanca, intimated to him that an agreement might be reached if the free navigation of the Mississippi were waived. After months of fruitless discussion he was authorized by Congress (in Feb. 1781) to make concessions on this point. This he did against his own better judgment, but made the offer conditioned upon immediate acceptance. The Spanish Government had not acted when news came of the surrender of Yorktown, and considering the treaty no longer worth a sacrifice Jay withdrew it. He was little more successful in his efforts to obtain a loan. By pledging his personal responsibility he finally induced the Spanish minister to aid him (to the extent of about \$150,000) in meeting some of the bills which Congress recklessly drew upon him; others he was forced to protest and the credit of his Government was saved only by a timely subsidy from France.

Jay was commissioned in 1781 to act with Franklin, John Adams, Jefferson and Henry Laurens in negotiating a peace with Great Britain. Their instructions were to act only with the knowledge and concurrence of the French Government; but Jay, for reasons which proved to be well founded, suspected the good faith of that Government and persuaded his fellow negotiators to treat independently with Great Britain. The provisional articles, which were more favourable to the United States than Congress had dared expect and were a great surprise to the courts of France and Spain, were signed on Nov. 30, 1782 and were adopted without important change as the final treaty on Sept. 3, 1783.

On his return to New York in July 1784 Jay was received with much enthusiasm, was presented with the freedom of the city and elected a delegate to the Continental Congress. In the following December he resigned his seat to become Secretary for Foreign Affairs. His experience in diplomacy together with his forceful personality and judicial mind enabled him to raise the uncertain status of this position to one of dignity and prestige. He proposed to Congress a plan under which the outstanding matters of dispute with Great Britain might be adjusted by a mixed commission. Although Congress took no action in the matter, Jay's advocacy of the principle of arbitration is regarded as significant in the light of the later importance of the principle in American history.

Always a strong advocate of centralization, Jay took an active part in the movement for the ratification of the Federal Constitution. He wrote, over the name "Publius," Nos. 2, 3, 4, 5 and 64 of the famous papers known collectively as *The Federalist* (see HAMILTON, ALEXANDER). In further defence of the Constitution he published anonymously *An Address to the People of New York*, and ably seconded Hamilton in the convention at Poughkeepsie in obtaining ratification on the part of his State. When Washington became president under the new Government, Jay was appointed chief justice of the supreme court, which position he held from Sept. 1789 to June 1795. The most famous case that came before him was that of *Chisom v. Georgia* in which the question was whether a State can be sued by a citizen of another State. Jay decided against Georgia on the ground that in America sovereignty rested in the people and not in a State. This decision led to the adoption of the 11th amendment to the Constitution, which prohibits any suit being brought in the Federal courts against any State by a citizen of another State or by a foreign citizen or subject.

One of the most famous acts of Jay's career was the negotiation of a treaty between the United States and Great Britain in 1794, known as the Jay Treaty (*q.v.*), which adjusted several of the points of dispute outstanding between the two countries since the close of the Revolutionary War. Returning from England in 1795 Jay found that he had just been elected governor of New York. He served in this capacity until 1801 when he permanently retired from public life.

Aristocratic by temperament, conservative and strongly nationalist in political philosophy, Jay stood with Alexander Hamilton and John Adams as among the foremost leaders of the Federalist Party, in opposition to the more democratic and particularistic Democratic-Republican Party of Thomas Jefferson. Though possessed of a certain vanity which sometimes proved his undoing, he was brilliant, capable and of spotless integrity.

JAY (*Garrulus glandarius*), a member of the crow family and the type of the subfamily *Garrulinae*. It inhabits the whole of Europe south of 64° N. and is fairly common in the wooded districts of Great Britain, where, however, it is remorselessly persecuted by gamekeepers and is consequently very shy. The body is cinnamon-coloured, the tail-coverts white and the wings contain patches of vivid blue and black striped feathers, used by fishermen for artificial flies. The voice is a harsh scream. The jay, despite its shyness, is a lively bird with an insatiable curiosity. The nest is placed in a tree or bush and in it are laid four to seven eggs of a greenish-white colour closely freckled with light olive. The flight is weak, and on the ground the bird

EUROPEAN JAY

hops. During the breeding season it is almost wholly silent. Its food includes fruits, insects, carrion, and during the spring and summer, eggs and young birds. In east Russia its range overlaps that of the allied *G. brandti*, which is distributed thence across Siberia to Japan.

In the south of Europe, Caucasia and Asia Minor occurs *G. krynicki*. Other species occur in Asia and north Africa.

In America the commonest forms are the extremely tame Canada jay (*Perisoreus canadensis*), often called the "whisky-jack," which has a very sombre coloration, and the beautiful blue jay (*Cyanocitta cristata*) of eastern North America. Both have habits somewhat similar to the European species. The latter has a considerable talent for mimicry. Allied to the Canada jay is the Siberian jay (*Lamius infaustus*) of northern Europe and Asia. Like the Canada jay, it inhabits pine forests.

JAY TREATY, the name applied, in U.S. history, to a

treaty signed on Nov. 19, 1794 by John Jay and Lord Grenville on behalf of the United States and Great Britain, respectively. The American grievances which led to the negotiations consisted principally in Great Britain's refusal to withdraw her troops from the forts on the north-western frontier, as required by the peace treaty of 1783; her refusal to make compensation for slaves carried away by the British army at the close of the American Revolution; her restrictions on American commerce; her refusal to enter into any commercial treaty with the United States; and the anti-neutral policy according to which British naval vessels were authorized to search American merchantmen and impress American seamen.

After negotiations which lasted for several months, Jay obtained a treaty which, although departing widely from his instructions, he believed would adjust some of the differences between the two nations. It provided that the north-west posts should be evacuated by June 1, 1796, that commissioners should be appointed to settle the north-east and north-west boundaries, and that the claims of British merchants as well as the American claims for compensation for illegal seizures should be referred to commissioners. The remaining articles of the documents constituted a treaty of commerce. By them the United States was granted privileges of trade in the British East Indies; some provisions were made for reciprocal freedom of trade between the United States and the British dominions in Europe; and some articles were specified under the head of "contraband of war," but only limited concessions were granted in the West Indian trade. The latter clause, which was limited to two years from the close of the existing war (between France and Great Britain and her allies), provided that American vessels not exceeding 70 tons burden might trade with the West Indies, but should carry only American products there and take away to American ports only West Indian products; moreover, the United States was to export in American vessels no molasses, sugar, coffee, cocoa or cotton to any port of the world. Other clauses provided for the free navigation of the Mississippi, that no enemy of England should fit out privateers in American waters, and that Americans should not accept commissions from the French minister. The treaty was silent on such important subjects as compensation for stolen slaves, neutral rights and the impressment of American sailors.

The treaty was laid before a special session of the Senate on June 8, 1795, and, with the exception of the article relating to West Indies trade, was ratified on the 24th by a bare two-thirds majority. Its subsequent publication raised a storm of protest both in America and France. The opposition filled newspapers with articles denouncing it and Jay was burned in effigy. Once in operation the treaty grew in favour.

JAZZ is (1) a technique for the playing of any music, embracing tricks of accent and rhythm, interpolated melodic figures, and instrumental effects; and (2) written music calling for the use of that technique or exhibiting its influence. It may have originated in a revolt of the individual; in the insubordinate attempt of one member of an orchestra to seize attention by startling or amusing the listeners; but the revolt, as such, has been practically suppressed, and its mischievous and humorous tradition, in many quarters, forgotten.

The rhythmical foundation of jazz is *ragtime*, which displays a syncopated air, brought into sharp relief by a regular beat, in common time, in the bass. Ragtime has long been characteristic of the religious and secular folk music of the American negro. In the first decade of the 20th century ragtime became the American popular idiom, and was used with increasing fluency and variety. Jazz represents, in one respect, a continuation of this development of and preoccupation with rhythm. One of its principal novelties, consisting of abnormalities of accent, would probably have come independently of jazz bands.

The commonest of these abnormalities is accenting the off-beat; thus, in 4-4 time, stressing the 2nd and 4th beat in each measure instead of the 1st and 3rd. Almost as common is the device of superimposing a 1, 2, 3 rhythm upon the fundamental 1, 2 or 1, 2, 3, 4 of the dance; i.e., a brief melodic passage is conceived of as divided into consecutive groups of three notes of equal value

and is accented accordingly, giving a momentary effect of triple time; obviously, a jazz effect may also be obtained by so accenting beats or equal fractions thereof as to group them in fives, sevens, etc.; or the intervals between accents may be unequal (figs. 1-5).

The effect of jazz accents is complicated by skipping or tying notes (figs. 2, 3, 4), skipping or anticipating beats, etc. "Licks"

(unexpected accents interpolated by single instruments) are sprinkled here and there. Patterns are formed by silence through a given part of each of several successive bars ("stop time").

The rhythm instruments have various patterns of their own which may be independent of the jazz accents in the melody. The famous "Charleston" rhythm, common in old spirituals as in jazz, was based on a skipped beat, and arrived at by taking the tango rhythm (a dotted quarter, an eighth and two quarter-notes), and striking only the dotted quarter and the eighth-note (fig. 6). The fashion in jazz rhythms and accents constantly changes; with familiarity, each is successively discarded as "corn-fed".

BEFORE AND DURING THE RAGTIME PERIOD

Jazz in its aspect of instrumental effects and tone colours was incubating before and during the ragtime period. Negro musicians in the 19th century unquestionably played cornets into buckets, boxes and derby hats, filed down the mouthpieces to raise their range, scratched a washboard or a mule's jaw-bone to mark rhythms, played tunes by blowing into the mouths of jugs or lengths of gas-pipe, as to-day. But their experiments were in general sporadic, individual and above all, covert. In jazz they are open, and the visual effect of comic instruments, as of the bodily contortions of the musicians, is, though dispensable, a part of jazz itself. But before the official appearance of jazz, New Orleans, if not other places, had genuine negro jazz bands, obscure and illiterate, but playing a violent form of this music, chiefly marked by a polyphony of strange tone-colours and instrumental effects. Experimentation for novel colours and effects has always been characteristic of jazz orchestras. It has eliminated the strings or retired them to the background in favour of saxophones, clarinets, brasses and banjos; has extended the upper range of clarinet, trumpet and trombone; perfected a legato technique for trombone and tuba; developed the banjo into a resounding rhythm instrument, the tenor banjo; discovered various effects possible to wind instruments without mechanical aid, such as the guttural flutter-tonguing, the explosive stop-tonguing; and perfected many unfamiliar and effective mutes for the brasses, all with the object at first of surprise and amusement simply, but later, of beauty or volume as well.

If the coming into existence of jazz bands was due to any single stimulus rather than simple evolution, the most plausible stimulus was the rise of the negro *blues* (*q.v.*) and their exploitation by W. C. Handy. The blues are a highly distinctive form of Afro-American secular folk song, which became popular among lower-class Southern negroes before 1910; they are at once melancholy and humorous, and deal exclusively with the singer's own emotions and philosophy. Their chief peculiarities are a three-line stanza, a melody of only 12 measures, in common time, and the fact that between the last syllable of a line, as sung, and the first syllable of the next, there generally occurs a space through which the voice is silent and which is filled in with improvised figures (a "break") on the accompanying instrument. Handy, a negro orchestra-leader in Memphis, Tenn., in 1910 composed a dance in the blues pattern and in 1912, when it had attracted wide attention, published it as "The Memphis Blues." In playing this, the first published blues, one musician after another of the Handy "band" (strings, clarinet, trombone, saxophone, piano and drum) would take the "break" in the third section (fig. 1) solo, and strive to *outdo* the others; on repetitions, moreover, a soloist would improvise a whole chorus while the rest marked the time and the original harmonic changes; a procedure similar to that of the modern "hot chorus." "The Memphis Blues" contained, besides its breaks, another important peculiarity: the frequent flattening of the seventh and third notes in the scale, in a melody whose prevailing mode was major, by which Handy had intended to suggest characteristic slurs of the untrained negro voice. These harsh and mournful sounds are a principal melodic characteristic of jazz, and whether or not they are slurred, or sounded as part of the favourite discord of the minor second, they are known as "blue notes." They abound in the nervous, angular figures of the "breaks" and "hot choruses," in the blues-type of piano jazz (all crashes and chirps) which cannot be analysed here, while jazz tunes are frequently rounded off by a brief *coda* ending on the flat seventh or the chord of the ninth. While the blues pattern itself has not been adopted by white composers, the "breaks,"

"hot choruses" and "blue notes" are of the essence of jazz, while the spirit of competition aroused by the breaks may well have been the original incentive to determined experimentation in search of surprising and humorous effects. Finally, the humour of the best modern jazz inherits the rueful or bitter flavour of the blues.

POPULARIZATION AND DEVELOPMENT

By 1915 there were white bands in New Orleans, with jazz instruments, and playing what was first known as jazz: polyphony in the sense that while the rhythm and harmonic scheme of some given song were referred to, each man otherwise played, as piercingly as he could (in *competition* with his fellows), whatever he pleased. Late that year one Joseph K. Gorham discovered and brought to Chicago one of these bands (clarinet, cornet, trombone, drum and piano), which there achieved fame as "Brown's Band from Dixieland." Bert Kelly, another manager, in the same winter bestowed the name "jazz bands" upon his numerous Chicago orchestras; and in the spring of 1916 imported a second white New Orleans organization (clarinet, banjo, saxophone, drum and piano). (Kelly was doubtless familiar with one or both of the previous uses of the word "jazz": as a disreputable verb, and, in New Orleans, as a verb applied to music and meaning "to speed up." No more fanciful derivations are worth considering.) In 1916 Brown's Band invaded New York; in 1917 the Dixieland Jazz Band (white, and from New Orleans) spread jazz to the winds with its phonograph record of D. J. La Rocca's "Livery Stable Blues," and Jim Europe (coloured) as an A.E.F. band-master introduced it to Europe.

The inevitable movement to modify the hideous noisiness of early jazz was led by Art Hickman, a California orchestra leader, and later taken over by Paul Whiteman, whose celebrated arranger, Ferdie Grofé, introduced the practice of writing elaborate orchestrations of the jazz repertoire which the musicians were required to play as written; sacrificing spontaneity to discipline, but obtaining remarkable beauty and volume of tone. The present-day "sweet" jazz, sprung from the Hickman-Whiteman reaction against cacophony, is opposed to "hot" jazz. The latter, descendant of the Memphis ("take your turn") and New Orleans (polyphonic) schools, has modified the pandemonium of Brown's Band and renewed acquaintance with melody; but to a far greater degree than the "sweet" orchestras, keeps in mind its traditional objectives, surprise and humour. In both modern schools crystallization has set in, and devices which once had, but have long since lost the power to startle or amuse, are now standard; but the apparent social ambition of "sweet" leaders to achieve some sort of *rapprochement* with "respectable" music and symphony orchestras, impairs the prospect that the most interesting future developments of jazz will come from their quarter.

It is true that to Whiteman's suggestion (and the inspired practical collaboration of Grofé) is owed a remarkable experiment in the adaptability of jazz idioms to larger musical forms, George Gershwin's "Rhapsody in Blue" (1924), but the jazz of this composition is in small part "sweet." The "Rhapsody" and its composer's Piano Concerto in F (1926) demonstrated that the two primary objects of jazz can be attained by its own methods independently of the monotonous foxtrot dance-time—a condition to the possibility of long and yet interesting jazz compositions. To how many composers such will be possible is another question. Although writers of unquestioned musicianship and some talent have made the attempt, Gershwin's success remains unique. But one major service which jazz may certainly be said to have rendered to music generally is its revelation of the possibilities of old and new instruments and mutes, and of the volume and beauty of tone and variety of colour obtainable by small orchestras.

BIBLIOGRAPHY.—The literature of jazz is confused and controversial. These are illustrative: H. O. Osgood, *So This is Jazz!* (1926); G. Seldes, *The Seven Lively Arts* (1924); S. Spaeth, *Common Sense of Music* (1924); A. V. Frankenstein, *Syncopating Saxophones* (1925); Paul Whiteman and M. McBride, *Jazz* (1926); W. C. Handy and Abbe Niles, *Blues* (1926); D. Knowlton, "The Anatomy of Jazz," *Harper's Magazine* (April, 1926); A. Coeuroy and A. Schaeffner, *Le Jazz* (1926); Paul Bernhard, *Jazz* (Munich, 1927); and for negro rhythms see H. E. Krehbiel, *Afro-American Folksongs* (1914); N. G. J.

Ballanta, *St. Helena Island Spirituals* (1925); Practical handbooks are: Arthur Lange, *Arranging for the Modern Dance Orchestra* (1926); F. Skinner, *Simplified Method for Modern Arrangement* (1928). Phonograph records are listed in A. Niles, "Jazz, 1928," *Bookman* (N.Y., Jan. 1929).

JEALOUSY, originally a condition of zealous emulation, hence the modern sense of resentment at being supplanted in the affection of another. The word is another form of "zealous," and is derived from Gr. ζήλος, ardour, from ζέειν, to boil, ferment. A thick, ribbed and non-transparent glass was formerly called "jealous-glass"; cf. the borrowed French word *jalousie*, a blind or shutter, made of slats of wood, which slope in such a way as to admit air and a certain amount of light.

JEAN D'ARRAS, a 15th-century *trouvère*, was the collaborator with Antoine du Val and Fouquart de Cambrai in a collection of stories entitled *Évangiles de quenouille*, told by ladies at their spinning, who relate the current theories on a great variety of subjects. The work throws much light on mediaeval manners.

There were many editions of this book in the 15th and 16th centuries, one of which was printed by Wynkyn de Worde in English, as *The Gospelles of Dystaves*. A modern edition (Collection Jannet) has a preface by Anatole France.

Another *trouvère*, JEAN D'ARRAS who flourished in the second half of the 14th century, wrote, at the request of John, duke of Berry, a long prose romance entitled *Chronique de la princesse*. It relates with many digressions the antecedents and life of the fairy Mélusine (q.v.).

JEAN DE MEUN or DE MEUNG (1250?–1305?), whose original name was Jean Clopinel or Chopinel, was born at Meun-sur-Loire. Tradition asserts that he studied at the University of Paris. At any rate he was, like his contemporary, Rutebeuf, a defender of Guillaume de Saint-Amour and a bitter critic of the mendicant orders. Most of his life seems to have been spent in Paris, where he possessed, in the Rue Saint-Jacques, a house described in 1305 as the house of the late Jean de Meung. Jean de Meun says that in his youth he composed songs that were sung in every public place and school in France. In the enumeration of his own works he places first his continuation of the *Roman de la rose* of Guillaume de Lorris (q.v.). The date of this second part is generally fixed between 1268 and 1285 by a reference in the poem to the death of Manfred and Conradin, executed (1268) by order of Charles of Anjou (d. 1285), who is described as the present king of Sicily. M. F. Guillon (*Jean Clopinel*, 1903), however, considering the poem primarily as a political satire, places it in the last five years of the 13th century. Jean de Meun doubtless edited the work of his predecessor, Guillaume de Lorris, before using it as the starting-point of his own vast poem, running to 19,000 lines. The continuation of Jean de Meun is a satire on the monastic orders, on celibacy, on the nobility, the papal see, the excessive pretensions of royalty, and especially on women and marriage. Guillaume had been the servant of love, and the exponent of the laws of "courtoisie"; Jean de Meun added an "art of love," exposing with brutality the vices of women, their arts of deception, and the means by which men may outwit them.

Spirit and Style.—Jean de Meun embodied the mocking, sceptical spirit of the *fabliaux*. He did not share in current superstitions, he had no respect for established institutions, and he scorned the conventions of feudalism and romance. His poem shows in the highest degree, in spite of the looseness of its plan, the faculty of keen observation, of lucid reasoning and exposition, and it entitles him to be considered the greatest of French mediaeval poets. He handled the French language with an ease and precision unknown to his predecessors, and the length of his poem was no bar to its popularity in the 13th and 14th centuries. Part of its vogue was no doubt due to the fact that the author, who had mastered practically all the scientific and literary knowledge of his contemporaries in France, had found room in his poem for a great amount of useful information and for numerous citations from classical authors.

Jean de Meun translated in 1284 the treatise, *De re militari*, of Vegetius into French as *Le livre de Vegèce de l'art de chevalerie* (ed. Ulysse Robert, *Soc. des anciens textes fr.*, 1897). He also produced a simplified version, the first in French, of the letters of Abelard and Héloïse. A 14th-century ms. of this translation in the Bibliothèque

Nationale has annotations by Petrarch. His translation of the *De consolazione philosophiae* of Boëtius is preceded by a letter to Philip IV. in which he enumerates his earlier works, two of which are lost—*De spirituelle amitié* from the *De spirituali amicitia* of Aelred of Rievaulx (d. 1166), and the *Livre des merveilles d'Irlande* from the *Topographia Hibernica*, or *De Mirabilibus Hiberniae* of Giraldus Cambrensis (Giraud de Barry). His last poems are doubtless his *Testament* and *Codicille*. The *Testament* is written in quatrains in monorime, and contains advice to the different classes of the community.

See also Paulin Paris in *Hist. lit. de la France*, xxviii. and E. Langlois in *Hist. de la langue et de la lit. française*, ed. L. Petit de Julleville, ii. (1896), and the introd. to Langlois's 1914 ed. of the *Roman de la rose* (q.v.).

JEANNETTE, a borough of Westmoreland county, Pa., U.S.A., 23m. S.E. of Pittsburgh; served by the Pennsylvania Railroad. The population was 10,627 in 1920 (20% foreign-born white), and was estimated locally at over 18,000 in 1928. It is supplied with natural gas, and is primarily a manufacturing centre, with an aggregate factory output in 1925 valued at \$20,761,744. The principal product is glass, of many kinds and for many purposes: window-glass, marine and submarine equipment, table and cooking-ware, lamps, jars, toys, bottles, sidewalks, prism tile, lenses and many other articles. For the first decade glass was the only manufacture, but since 1899 other industries have been established, notably the manufacture of rubber goods, power-plant equipment, heating systems and iron pipe-fittings. Jeannette was founded in 1888, and was incorporated as a borough in 1889.

JEANNIN, PIERRE (1540–1622), French statesman, was born at Autun. A pupil of the great jurist Jacques Cujas at Bourges, he was an advocate at Dijon in 1569 and became councillor and then president of the *parlement* of Burgundy. He opposed in vain the massacre of St. Bartholomew in his province. As councillor to the duke of Mayenne he sought to reconcile him with Henry IV. After the victory of Fontaine-Française (1595), Henry took Jeannin into his council and in 1602 named him intendant of finances. He took part in the principal events of the reign, negotiated the treaty of Lyons with the duke of Savoy (see HENRY IV.), and the defensive alliance between France and the United Netherlands in 1608.

See Berger de Xivrey, *Lettres missives de Henry IV.* (in the *Collection inédite pour l'histoire de France*), t. v. (1850); P(ierre) S(aumaise), *Eloge sur la vie de Pierre Janin* (Dijon, 1623); Sainte-Beuve, *Causeries du lundi*, t. x. (May 1854).

JEANS, SIR JAMES HOPWOOD (1877–), English mathematician, was born in London on Sept. 11, 1877. He was educated at Cambridge, where he was second wrangler in 1898 and Smith's Prizeman in 1900. He has held the posts of Stokes lecturer in applied mathematics at Cambridge and professor of applied mathematics at Princeton university and since 1919 he has been secretary of the Royal Society. Jeans has applied mathematics to many branches of physics and astronomy with marked success. In the kinetic theory of gases he has given proofs for the law of equipartition of energy and for Maxwell's law of distribution of the velocity of molecules. Jeans developed a formula for the distribution of energy emitted by a black body; he used classical methods and arrived at a formula similar to that of Rayleigh which only holds for long wave-lengths. He has also written on other aspects of radiation such as the interaction between radiation and free electrons. In astronomy Jeans has applied mathematics to such good effect that a number of original theories on cosmogony have resulted. As an example, his work on the stability of pear-shaped figures may be taken; he considered such bodies rotating in an incompressible fluid, later he considered the fluid to be compressible. The same mathematical analysis was then applied to problems of splitting due to tides produced by the approach of a second body and this in its turn was applied to the break-up of stars. Jeans also showed that Laplace's theory of the origin of the solar system was incorrect. Another problem of stellar dynamics which has claimed his attention is the effect of the gravitational attraction on the motion of stars. He has also written papers on the formation of binary stars; on the nature of spiral nebulae; on his theory of giant and dwarf stars; on the source of stellar energy; and on the evolution and radiation of gaseous stars.

Jean is the author of *Dynamical Theory of Gases* (1904), *Mathematical Theory of Electricity and Magnetism* (1908), *Problems of Cosmogony and Stellar Dynamics* (1919), *Radiation and the Quantum Theory* (1914 and 1924), *Atomicity and Quanta* (1926), *Astronomy and Cosmogony* (1928), *The Universe Around Us* (1929). He was knighted in 1928.

JEBAVÝ, VÁCLAV (1868–1929), Czech poet, universally known as Ottokar Březina, was born at Počátky, Bohemia, on Sept. 13, 1868. He taught in a secondary school at Jaromeř, Moravia, where he lived a life of contemplative seclusion, declining the honours and material advantages offered him by the Government. His published works consist of five books of poetry: *Secret Distances* (1895); *Dawn in the West* (1896); *Polar Winds* (1897); *Temple Builders* (1899) and *The Hands* (1901), and a volume of prose essays, *Music of the Springs* (1903); besides a number of poems scattered in various literary papers.

Březina is admittedly the greatest modern Czech poet, and is even judged by some foreign critics to be the greatest contemporary mystic poet of all nations. His development as a mystic philosopher and religious visionary passed from the subjective pessimism of his early poems, through a transcendental revelation of mystic realities, to an evolutionary optimism and a joyful belief in cosmic brotherhood. His diction is so concentrated and pregnant with thought that it presents considerable difficulty at first reading; but this is more than compensated for by the superlative beauty and entrancing music of his verse, the remarkable wealth of his imagery and the extraordinarily human and personal appeal of his philosophy which has its roots in the mystic tradition of the mediaeval Czech religious sects. He died in April, 1929.

See Paul Selver, *Anthology of Modern Slavonic Literature* (1919); *Modern Czech Poetry* (1920), and *A Study in Czech Literature* (1921).

JEBB, SIR RICHARD CLAVERHOUSE (1841–1905), English classical scholar, was born at Dundee on Aug. 27, 1841, and died at Cambridge, where he was professor of Greek, on Dec. 9, 1905. He was educated at Charterhouse and at Trinity college, Cambridge. In 1891 he was M.P. for Cambridge university, in 1900 he was knighted, and in 1905 he received the Order of Merit. Jebb was acknowledged to be one of the most brilliant classical scholars of his time, a humanist in the best sense, and his powers of translation from and into the classical languages were unrivalled. A collected volume, *Translations into Greek and Latin*, appeared in 1873 (ed. 1909). He married in 1874 the widow of General A. J. Slemmer, of the U.S. army, who survived him.

The following are his chief works: *The Characters* of Theophrastus (1870), text, introduction, English translation and commentary (re-edited by J. E. Sandys, 1909); *The Attic Orators from Antiphon to Isaeus* (2nd ed., 1893), with companion volume, *Selections from the Attic Orators* (2nd ed., 1888); *Bentley* (1882); *Sophocles* (3rd ed., 1893), with translation and notes; *Bacchylides* (1905), text, translation and notes; *Homer* (3rd ed., 1888), an introduction to the *Iliad* and *Odyssey*; *Modern Greece* (1901); *The Growth and Influence of Classical Greek Poetry* (1901); *The Rhetoric of Aristotle* (ed. J. E. Sandys, 1909).

A selection from his *Essays and Addresses*, and a subsequent volume, *Life and Letters of Sir Richard Claverhouse Jebb* (with critical introduction by A. W. Verrall) were published by his widow in 1907; see also J. E. Sandys, *Hist. of Classical Scholarship*, iii. (1908).

JEBEL, a village of Syria, about 20 m. N. of Beirut. Pop. about 1,000. There are traces of ancient magnificence in the ruins of its wall, castle, temple and in its numerous granite columns. Written in ink on earthen vessels recently discovered at Luxor were lists of foreign peoples, and heading the Asiatic group came the name of Byblos, i.e., *Kpny*, a name which passed into *Kubn* and then *Gubl*. Thus in the 3rd millennium B.C.—for such is the date of the vessels—Byblos took pride of place before Tyre and Sidon, confirming a tradition of Philo of Byblos as to its antiquity and importance. Byblos owed its position in those days to its flourishing trade in wood and resinous materials of which Egypt took large quantities. In biblical times its sculptors and shipwrights were famous.

A fortunate landslide at the south-east corner of the citadel in 1922 led to the discovery of a hypogeum containing a sarcophagus

of great size. Since then a whole royal necropolis containing sarcophagi of the rulers of Byblos has been exposed. Nine such tombs have been examined, but all except three had been previously violated. The funerary furniture shows that Byblos of the 14th century B.C. was Egypt in miniature; although it had at its head indigenous rulers, they were in the pay of the Pharaohs. On a sarcophagus of Ahiiram, king of Byblos, found together with cartouches of Ramses II. (13th century B.C.) is an inscription in Phoenician characters. This is 400 years earlier than any Phoenician inscription hitherto known and the forms of the letters are found to differ little (*aleph* is an exception) from the well-known inscriptions of the 9th and 8th centuries B.C. Byblos in the course of time was eclipsed by Sidon and later by Tyre. It was taken by both Alexander the Great and Pompey. The citadel was built with ancient building materials on an old site. The crusaders captured the town in 1103 but lost it to Saladin in 1189.

The temple of Baalat (Aphrodite Byblia), the orgies in which Lucian has described (*Dea. Syr. vi.*), has been partially excavated. It appears to have been erected about 1900 B.C. and existed substantially in its original form until the middle ages when, following on the crusades, Muslim fanaticism destroyed its famous statues and wrecked the building. The modern epoch has exploited it as a quarry for building stones.

See C. Virolleaud, "Découverte à Byblos d'un Hypogée de la douzième Dynastie Egyptienne," *Syria*, iii. (1922), 273 seq.; R. Dussaud, "Byblos et la mention des Gibrilites dans l'Ancien Testament," *Syria*, iv. (1923) 300 seq.; "Les Inscriptions phéniciennes du Tombeau de Ahiiram, roi de Byblos," *Syria*, v. (1924), 135 seq.; "Le Sanctuaire phénicien de Byblos d'après Benjamin de Tudèle," *Syria*, vii. (1926), 247 seq.; G. Contenau, *La Civilisation Phénicienne* (1926); M. Pillet, "Le Temple de Byblos," *Syria*, viii. (1927), 105 seq.; R. Dussaud, "Nouveaux Renseignements sur la Palestine et la Syrie vers 2000 avant notre Ere," *Syria*, viii. (1927), 216 seq. (E. Ro.)

JEBEL, an Arabic word for a mountain chain or a mountain, frequently used in place names, e.g., Gibraltar, i.e., Tarik's mountain. *Jebili* signifies a mountaineer.

JEDBURGH (jĕd'bŭr-ŭ), royal burgh, parish and county-town, Roxburghshire, Scotland. Pop. (1921), 2,426; on Jed Water, a tributary of the Teviot, 56½ m. S.E. of Edinburgh by the L.N.E. railway, via Roxburgh and St. Boswells (49 m. by road). There have been many variants of the name, while locally the word is often pronounced Jethart. The town is situated on the left bank of the Jed, the main streets running at right angles from each side of the central market-place. Of the renowned group of Border abbeys—Jedburgh, Melrose, Dryburgh and Kelso—that of Jedburgh is the stateliest. David, prince of Cumbria, founded a priory here for Augustinian monks from the abbey of St. Quentin at Beauvais in France, and in 1147, after he had become king, erected it into an abbey dedicated to the Virgin. Repeatedly damaged in Border warfare, it was ruined in 1544–45 during the English invasion led by Sir Ralph Evers (or Eure). The establishment was suppressed in 1559, the revenues being temporarily annexed to the Crown. After changing owners more than once, the lands were purchased in 1637 by the 3rd earl of Lothian. Latterly five of the bays at the west end had been utilized as the parish church, but the 9th marquess of Lothian built a church, and presented it to the heritors in exchange for the ruined abbey. In 1913 it was taken over for the nation by the Ancient Monuments Commission.

The abbey was built of Old Red sandstone, and is a beautiful example of the Norman and Transition styles. The west front contains a great Norman porch and a fine wheel window. The tower, at the intersection of the nave and transepts, is of unusually massive proportions. With the exception of the north piers and a small portion of the wall above, which are Norman, the tower dates from the end of the 15th century. The whole of the south transept has perished. The north transept, with early Decorated windows, has been covered in and walled off, and is the burial-ground of the Kerrs of Fernihirst, ancestors of the marquess of Lothian. The earliest tombstone is dated 1524; one of the latest is the recumbent effigy, by G. F. Watts, R.A., of the 8th marquess of Lothian (1832–1870). All that is left of the choir, which contains some very early Norman work, is two bays, corresponding to the design of the nave. It is supposed that the aisle,

with Decorated window and groined roof, south of the chancel, formed the grammar school (removed from the abbey in 1751) in which Samuel Rutherford (1600-1661), principal of St. Mary's College, St. Andrews, and James Thomson, author of *The Seasons*, were educated. The door from the south aisle into a garden, formerly the cloister, is a copy of one which had decayed. It was designed by Sir Rowand Anderson, under whose superintendence restoration in the abbey was carried out.

The castle stood on high ground at the south end of the burgh, or "town-head." Erected by David I., it was one of the strongholds ceded to England in 1174, under the treaty of Falaise, for the ransom of William the Lion. It was, however, so often captured by the English that it became a menace rather than a protection, and the townsfolk demolished it in 1409. It was occasionally used as a royal residence. The site was occupied in 1823 by the county prison, now known as the castle, which gradually fell into disuse and was acquired by the corporation in 1890. A house exists in Backgate in which Mary Queen of Scots resided in 1566, one in Castlegate which Prince Charles Edward occupied in 1745, and one in Canongate where Sir David Brewster was born.

The grammar school (built in 1883 to replace the successor of the school in the abbey) was founded by William Turnbull, bishop of Glasgow (d. 1454). The old market cross still exists. The chief industry is the manufacture of woollens (blankets, tweeds, etc.), but corn-milling and tanning are carried on, and fruit (especially pears) and garden produce are in repute. Jedburgh was made a royal burgh in the reign of David I., and received a charter from Robert I. and another, in 1566, from Mary Queen of Scots. Sacked and burned time after time during the Border strife, the townsmen became keen fighters.

"Jethart" or "Jeddart justice," according to which a man was hanged first and tried afterwards, seems to have been a hasty generalization from a solitary fact—the summary execution in James VI.'s reign of a gang of rogues at the instance of Sir George Home, but has nevertheless passed into a proverb.

JEEJEEBHOY, SIR JAMSETJEE, Bart. (1783-1859), Indian merchant and philanthropist, born in Bombay, of Parsee parents, and was left an orphan in early life. He made his way in life by his own unaided ability. Before he was twenty he undertook a voyage to China; and he subsequently initiated a systematic trade with that country. His second return voyage from China was made in one of the East India Company's fleet, which, under the command of Sir Nathaniel Dance, defeated the French squadron under Admiral Linois (Feb. 15, 1804). On his fourth return voyage from China, the Indiaman in which he sailed was forced to surrender to the French, by whom he was carried as a prisoner to the Cape of Good Hope, then a neutral Dutch possession; eventually he made his way back to Calcutta in a Danish ship. A fifth voyage to China was more successful. He had fairly established his reputation as a merchant, and settled down in Bombay where he extended his commercial operations on a great scale. By 1836 he had amassed what at that period was regarded as fabulous wealth.

Jamsetjee Jeejeebhoy then began that career of private and public philanthropy which is his chief title to fame. Hospitals, schools, homes of charity, pension funds, were founded or endowed by him, while numerous public works in the shape of wells, reservoirs, bridges, causeways and the like, not only in Bombay, but in other parts of India, were the creation of his bounty. The total of his known benefactions amounted at the time of his death, which took place in 1859, to over £230,000. At that time the various communities of India were much more isolated in their habits and their sympathies than they are now. Jamsetjee Jeejeebhoy's unsectarian philanthropy awakened a common understanding and created a bond between them which had a national and political significance. His services were recognized first in 1842 by the bestowal of a knighthood, and in 1858 by that of a baronetcy. These were the first distinctions of their kind conferred by Queen Victoria upon a British subject in India.

JEFFERIES, RICHARD (1848-1887), English naturalist and novelist, was born on Nov. 6, 1848, at Coate near Swindon. He attended school at Sydenham and then at Swindon until the age

of fifteen, when he made an unsuccessful attempt to reach Russia and then America. Returning home, he obtained a post on the local paper. His early novels were failures, but in 1872, he published a remarkably original letter in *The Times*, on "The Wiltshire Labourer," which was the turning-point in his career. In 1873 he found his true field of work, the life of the country, and began to write for *Fraser's Magazine* on "Farming and Farmers." The rest of his history is that of continual advance, from close observation to that intimate communion with Nature which is manifested in his later pages. Jefferies died at Goring on Aug. 14, 1887. His best-known books are: *The Gamekeeper at Home* (1878); *Wild Life in a Southern County* (1879); *Wood Magic* (1881); *Life of the Fields* (1884), containing the best paper he ever wrote, "The Pageant of Summer"; *Amaryllis at the Fair* (1884), and the autobiographical works, *Bevis* (1882) and *The Story of My Heart* (1883).

See Sir Walter Besant, *Eulogy of Richard Jefferies* (1888); H. S. Salt, *Richard Jefferies: a Study* (1894); E. Thomas, *Richard Jefferies; his Life and Work* (1909).

JEFFERSON, JOSEPH (1829-1905), American actor, was born in Philadelphia, Pa., Feb. 20, 1829. He was the third actor of this name in a family of actors and managers, and one of the most famous of all American comedians. At the age of three he appeared as the boy in Kotzebue's *Pizarro*, and throughout his youth he underwent all the hardships connected with theatrical touring in those early days. After a miscellaneous experience, partly as actor, partly as manager, he won his first pronounced success in 1858 as Asa Trenchard in Tom Taylor's *Our American Cousin* at Laura Keane's theatre in New York. This play was the turning-point of his career, as it was of Sothorn's.

Other early parts were Newman Noggs in *Nicholas Nickleby*, Caleb Plummer in *The Cricket on the Hearth*, Dr. Pangloss in *The Heir at Law*, Salem Scudder in *The Octoroon*, and Bob Acres in *The Rivals*, the last being not so much an interpretation of the character as Sheridan sketched it as a creation of the actor's.

In 1859 Jefferson made a dramatic version of the story of *Rip Van Winkle* on the basis of older plays, and acted it with success at Washington. The play was given its permanent form by Dion Boucicault in London, where (1865) it ran 170 nights, with Jefferson in the leading part. Jefferson was one of the first to establish the travelling combinations which superseded the old system of local stock companies. With the exception of minor parts, such as the First Gravedigger in *Hamlet*, which he played in an "all star combination" headed by Edwin Booth, Jefferson created no new character after 1865; and the success of *Rip Van Winkle* was so pronounced that he has often been called a one-part actor. If this was a fault, it was the public's, who never wearied of his one masterpiece. Jefferson died on April 23, 1905.

No man in his profession was more honoured for his achievements or his character. He was the friend of many of the leading men in American politics, art and literature. He was an ardent fisherman and lover of nature, and devoted to painting. Jefferson was twice married: to an actress, Margaret Clements Lockyer (1832-61), in 1850, and in 1867 to Sarah Warren, niece of William Warren the actor.

Jefferson's *Autobiography* (1889) is written with admirable spirit and humour, and its judgments with regard to the art of the actor and of the playwright entitle it to a place beside Cibber's *Apology*. See William Winter, *The Jeffersons* (1881), and *Life of Joseph Jefferson* (1894); Mrs. E. Jefferson, *Recollections of Joseph Jefferson* (1909).

JEFFERSON, THOMAS (1743-1826), third president of the United States of America, the most conspicuous of American apostles of democracy, and one of the great liberals of modern times, was born on April 13, 1743, at Shadwell, Albemarle county, Va. His father, Peter Jefferson (1707-57), was a civil engineer who became a justice of the peace, colonel of the county militia and a burgess, served the Crown in inter-colonial boundary surveys, and married into one of the most prominent colonial families, the Randolphs. Albemarle county was then in the frontier wilderness of the Blue Ridge, and was very different, socially, from the lowland counties where a few broad-acred families dominated an open-handed, somewhat luxurious and assertive aristocracy. Unlike his Randolph connections, Peter Jefferson was a

Whig and a thorough democrat; from him, and from the frontier, his son came naturally by democracy.

Education and Personal Traits.—He left the college of William and Mary at Williamsburg, in his 20th year, with a good knowledge of Latin, Greek and French, to which he soon added Spanish, Italian and Anglo-Saxon; and a familiarity with the higher mathematics (throughout life he made practical use of the calculus) and natural sciences only possessed, at his age, by men who have a rare natural taste and ability for those studies. He remained an ardent student throughout life, able to give and take in association with the many scholars, American and foreign, whom he numbered among his friends and correspondents. With a liberal Scotsman, Dr. William Small, then of the faculty of William and Mary and later a friend of Erasmus Darwin, and George Wythe (1726–1806), a very accomplished scholar and leader of the Virginia bar, he was an habitual member, while still in college, of a *partie carrée* at the table of Francis Fauquier (c. 1720–68), the accomplished lieutenant-governor of Virginia. Jefferson was an expert violinist, a good singer and dancer, proficient in outdoor sports, and an excellent horseman. Thoroughbred horses always remained to him a necessary luxury. When it is added that Fauquier was a passionate gambler, and that the gentry who gathered every winter at Williamsburg, the seat of provincial Government, were ruinously addicted to the same weakness, and that Jefferson had a taste for racing, it does credit to his early strength of character that of his social environment he took only the good. He never used tobacco, never played cards, never gambled and was never party to a personal quarrel.

A Virginia Lawyer.—Soon after leaving college he entered Wythe's law office, and in 1767, after five years of close study, was admitted to the bar. His average income during seven years of practice, about £300, was large for that time. To his collecting zeal Virginia owes the preservation of a large part of her early statutes, and of such of her colonial reports as still survive. He left practice with a poor opinion of lawyers—"whose trade it is to question everything, yield nothing, and talk by the hour." Moreover, industry and scholarship, not advocacy, for which he had neither the requisite voice nor temperament, were the secret of his success, which was such as to show that the profession had no rewards that were not fairly within his reach. Doubtless he saw and wished to reform the law's abuses. He turned, therefore, the more willingly to politics when his activity in the colonial cause compelled him to abandon practice in 1774.

Marriage and Home Life.—The death of his father had left him an estate of 1,900 ac., the income from which gave him the position of an independent country gentleman; and he added to his farms after the ambitious Virginia fashion until, when he married in his 30th year, there were 5,000 ac., all paid for; and almost as much more (though subject to heavy debts) came to him in 1773 on the death of his father-in-law. On Jan. 1, 1772, he married Martha Wayles Skelton (1749–82), a childless widow of 23, very handsome and accomplished. Their married life was exceedingly happy, and he never remarried after her early death. Of six children born from their union two daughters alone survived infancy. Jefferson's affectionate, generous and devoted relations with his children and grandchildren are among the fine features of his character.

Early Public Services.—He began his public service as a justice of the peace. Later he was chosen a member of the Virginia house of burgesses in 1769, and of every succeeding assembly and convention of the colony until he entered the Continental Congress in 1775. He was prominent in all, and a foremost member of several, great deliberative bodies, yet he can fairly be said never to have made a speech. He hated the "morbid rage of debate," believing men were never convinced by argument, but only by reflection, through reading or unprovocative conversation; and this belief guided him through life. He was, however, as John Adams said of him in the Continental Congress, though a silent member, so "prompt, frank, explicit and decisive upon committees and in conversation (not even Samuel Adams was more so)" that he was soon acknowledged as one of the strongest members. A forceful, facile pen added greatly to his

influence. Elected in 1774 to the first Virginia convention, called to consider the state of the colony and advance inter-colonial union, but prevented by illness from attending, he sent to the convention elaborate resolutions, which he proposed as instructions to the Virginia delegates to the Continental Congress that was to meet at Philadelphia in September. In the direct language of reproach and advice, these resolutions attacked the supremacy of Parliament and the errors of the king (with no disingenuous loading of the Crown's policy upon its agents), maintaining that "the relation between Great Britain and these colonies was exactly the same as that of England and Scotland after the accession of James and until the Union; and that our emigration to this country gave England no more rights over us than the emigration of the Danes and Saxons gave to the present authorities of their mother country over England." This was cutting at the common root of allegiance, emigration and colonization; but such radicalism was too thorough-going for the immediate end. The resolutions were published, however, as a pamphlet, entitled *A Summary View of the Rights of America*, which was of immense influence. In England, after receiving such modifications—attributed to Burke—as adapted it to the purposes of the opposition, this pamphlet ran through many editions, and procured for its author, as he said, "the honour of having his name inserted in a long list of proscriptions enrolled in a bill of attainder commenced in one of the two houses of parliament, but suppressed in embryo by the hasty course of events." It placed Jefferson among the foremost leaders of revolution, and procured for him the honour of drafting, later, the Declaration of Independence, whose historical portions were, in large part, only a revised transcript of the *Summary View*. In June 1775 he took his seat in the Continental Congress, taking with him fresh credentials of radicalism in the shape of Virginia's answer, which he had drafted, to Lord North's conciliatory propositions. He soon drafted the reply of Congress to the same propositions. Reappointed to the next Congress, he signalized his service by the authorship of the Declaration of Independence (q.v.). Again reappointed, he surrendered his seat, and after refusing a proffered election to serve as a commissioner with Benjamin Franklin and Silas Deane in France, he re-entered in Oct. 1776 the Virginia legislature, where he considered his services most needed.

Revision of the Laws of Virginia.—The local work to which Jefferson attributed such importance was the formulation of Virginia's constitution and a revision of her laws. Various of his proposals for the former (limiting the acquisition of public lands, regulating suffrage and legislative apportionment) were too radical for adoption at that time, and some were never adopted. Of the proposed statutory reforms he says: "I considered four . . . as forming a system by which every trace would be eradicated of ancient or future aristocracy, and a foundation laid for a government truly republican"—the repeal of the laws of entail; the abolition of primogeniture and the unequal division of inheritances (Jefferson was himself an eldest son); the guarantee of freedom of conscience and relief of the people from supporting, by taxation, an established church; and a system of general education. The first object was embodied in law in 1776, the second in 1785, the third—the first law of its kind in Christendom, although not the earliest practice of such liberty in America—in 1786. The last two were parts of a body of codified laws prepared (1776–79) by a commission, but very largely by Jefferson. Not so fortunate were his ambitious schemes of education. District, grammar and classical schools, a free State library and a State college, were all included in his plan. He was the first American statesman to make education by the State a fundamental article of democratic faith. His bill for elementary education he regarded as the most important part of the code, but Virginia had no strong middle class and the planters would not assume the burden of educating the poor. In 1779 he founded at William and Mary the first professorship of law in America.

At this time Jefferson championed the natural right of expatriation and gradual emancipation of all slaves. His earliest legislative effort, in 1769, had been marked by an effort to secure to masters freedom to manumit their slaves without removing

them from the State. It was unsuccessful, and the more radical measure he now favoured was more impossible of attainment; but a bill he introduced to prohibit the importation of slaves was passed in 1778. Finally he endeavoured, though unsuccessfully, to secure the introduction of juries into the courts of chancery, and—a generation and more before the fruition of the labours of Romilly and his co-workers in England—aided in securing a humanitarian revision of the penal code, which, though lost by one vote in 1785, was sustained by public sentiment and adopted in 1796. Capital punishment was confined to treason and murder; the former was not to be attended by corruption of blood, drawing or quartering; all other felonies were made punishable by confinement and hard labour, save a few to which was applied, against Jefferson's desire, the principle of retaliation. Jefferson is of course not entitled to sole credit for all these services: Wythe, George Mason and James Madison, in particular, were his devoted lieutenants, and—after his departure for France—principals in the struggle; moreover, an approving public opinion must receive large credit. But Jefferson was throughout the chief inspirer and most ardent worker.

Governor of Virginia.—In 1779, at almost the gloomiest stage of the war in the Southern States, he succeeded Patrick Henry as the governor of Virginia. In his second term (1780–81) the State was overrun by British expeditions, and Jefferson was blamed for the ineffectual resistance. Though he cannot be said to have been eminently fitted for the task that devolved upon him in such a crisis, most of the criticism of his administration was undoubtedly grossly unjust. He declined the renomination for the governorship, but was unanimously returned to the State legislature; and on the day previously set for legislative inquiry he received, by unanimous vote of the house, a declaration of thanks and confidence. He wished, however, to retire permanently from public life, a wish strengthened by the illness and death of his wife. At this time he composed his *Notes on Virginia*, a semi-statistical work full of humanitarian liberalism.

Services in Congress.—Congress twice offered him an appointment as one of the plenipotentiaries to negotiate peace with England, and he accepted the second offer, but the business was so far advanced before he could sail that his appointment was recalled. The following winter (1783), again in Congress, he headed the committee appointed to consider the treaty of peace. In the succeeding session his service was marked by a report from which resulted the present U.S. monetary system (its decimal basis being due, however, to Gouverneur Morris); and by the honour of reporting the first definitely formulated plan for the government of the Western Territories, that embodied in the ordinance of 1784. For the cession by Virginia to the United States of the vast territory north-west of the Ohio, consummated in that year, Jefferson had long laboured. Its importance to national unity was immense. His ordinance was notable for a provision that slavery should not exist after 1800, defeated in 1784 but adopted in 1787 for the Northwest Territory—a step which is very often said to have saved the Union in the Civil War; the Southwest Territory (out of which were later formed Mississippi, Alabama, etc.) being given over to slavery. To this anti-slavery clause of 1784 (though preceded by unofficial proposals to the same end) belongs rightly some special honour as setting a precedent for Federal control of slavery in the Territories, which later proved of such enormous consequence. His anti-slavery opinions grew in strength with years. Not only justice but patriotism pleaded with him the cause of the negroes, for he realized the dire political dangers of slavery, and foresaw the certainty that the slaves must some day, in some way, be freed; and could any feasible plan of emancipation and re-migration have been suggested he would have regarded its cost as a mere bagatelle. It is true that of his slaves (at one time he owned above 150) he manumitted but a few at his death; and had he fully realized his insolvency doubtless he would have deprived his creditors of none. It is also true that he opposed the Missouri Compromise of 1820—whether rightly or wrongly may be disputed—but at any rate for reasons (reflecting old political struggles) that are unsatisfying.

Minister to France.—From 1784 to 1789 he was in France, first under an appointment to assist Benjamin Franklin and John Adams in negotiating treaties of commerce with European States, and then as Franklin's successor (1785–89) as minister to France. In these years he travelled widely in western Europe. Though the commercial principles of the United States were far too liberal for acceptance, as such, by powers holding colonies in America, Jefferson won some specific concessions to American trade. He was exceedingly popular as a minister.

Religious and Political Theories.—The criticism is even to-day current with the uninformed that Jefferson took his manners (Patrick Henry semi-humorously charged, because he favoured French cooking, that he had “abjured his native victuals”), his morals, “irreligion” and political philosophy from his French residence; and it cannot be wholly ignored. It may therefore be said that there is nothing except scandal to contradict the conclusion, which abundant evidence supports, that Jefferson's morals, mind and tongue were pure. He was not an atheist, but a sincere deist. His attitude toward religion was deeply reverent, but he regarded it as so purely a matter of individual conscience that he was reluctant to discuss it even with his family or friends. “I am a Christian,” he wrote in 1823, “in the only sense in which he (Jesus) wished any one to be; sincerely attached to his doctrines in preference to all others; ascribing to himself every human excellence and believing he never claimed any other.” Religion was only “evidenced, as concerns the world, by each one's daily life.” He compiled from the New Testament a volume of Jesus' teachings which still survives, and has been published as “Jefferson's bible.” He was necessarily an enemy of any State church, since he demanded absolute freedom of private judgment, and regarded creeds as “the bane and ruin of the Christian church.” To-day he would be a Unitarian, or a member of an ethical culture society.

His political theories had a deep and broad basis in English Whiggism; and though he may well have found at least confirmation of his own ideas in French writers—and notably in Condorcet—he did not read sympathetically the writers commonly named, Rousseau and Montesquieu; besides, although he was deeply interested in all the events leading up to the French Revolution, and all his ideas were coloured by his experience of the five seething years passed in Paris, his democracy was seasoned, and he was rather a teacher than a student of revolutionary politics, when he went there. The *Notes on Virginia*, which were widely read in France, undoubtedly had some influence in forwarding the dissolution of the doctrines of divine right and passive obedience among the cultivated classes. On June 3, 1789, he proposed to the leaders of the third estate a compromise between the king and the nation. In July he received the extraordinary honour of being invited to assist in the deliberations of the committee appointed by the National Assembly to draft a constitution. This honour his official position compelled him, of course, to decline, for he sedulously observed official proprieties.

Secretary of State.—When he returned to America President Washington tendered him the secretaryship of State in the new Federal Government, and he reluctantly accepted. His only essential objection to the Constitution—the absence of a bill of rights—was soon met, at least partially, by amendments. Alexander Hamilton (*q.v.*) was secretary of the Treasury. These two men, antipodal in temperament and political belief, clashed in irreconcilable hostility; and in the conflict of public sentiment, first on the financial measures of Hamilton, and then on questions with regard to France and Great Britain, Jefferson's sympathies being predominantly with the former, Hamilton's with the latter, they formed about themselves the two parties of Democrats and Federalists. The schools of thought for which they stood have since contended for mastery in American politics: Hamilton's gradually strengthened by the necessities of stronger administration, as time gave widening amplitude and increasing weight to the specific powers—and so to Hamilton's great doctrine of the “implied powers”—of the general government of a growing country; Jefferson's rooted in colonial life, and still firmly buttressed by the hopes and convictions of American democracy.

The most perplexing questions treated by Jefferson as secretary of State arose out of the policy of neutrality adopted by the United States toward France, to whom she was bound by treaties and by a heavy debt of gratitude. Separation from European politics—the doctrine of “America for Americans” that was embodied later in the Monroe declaration—was a tenet cherished by Jefferson as by other leaders (not, however, Hamilton) and by none cherished more firmly; for by nature he was peculiarly opposed to war, and peace was a fundamental part of his politics. However deep, therefore, his French sympathies, he drew the same safe line as did Washington between French politics and American politics, and handled the Genêt complications in a manner that should have satisfied even the most partisan Federalists. He expounded, as a very high authority has said, “with remarkable clearness and power the nature and scope of neutral duty,” and gave a “classic” statement of the doctrine of recognition (John Bassett Moore).

French Democracy.—But the French question had another side in its reaction on American parties. Jefferson did not read excesses in Paris as warnings against democracy, but as warnings against the abuses of monarchy; nor did he regard Bonaparte's *coup d'état* as revealing the weakness of republics, but rather as revealing the danger of standing armies; he did not look on the war of the coalitions against France as one of mere powers, but as one between forms of government; and though the immediate fruits of the Revolution belied his hopes, as they did those of ardent humanitarians the world over, he had faith that a successful reformation of government in France would insure “a general reformation through Europe, and the resurrection to a new life of their people.” Three of these statements could be reversed as regards Hamilton. It is the key to an understanding of the times to remember that the Revolutionary War had disjointed society; and democracy—which Jefferson had proclaimed in the Declaration of Independence and enthroned in Virginia—after strengthening its rights by the sword had run to excesses of speech (and of acts in the Shays rebellion) that produced a conservative reaction. To this reaction Hamilton explicitly appealed in the Constitutional Convention of 1787; and of this reaction various features of the Constitution, and Hamiltonian Federalism generally, were direct fruits. Moreover, independently of special incentives to the alarmist and the man of property, the opinions of many Americans turned again, after the war, into a current of sympathy for England, as naturally as American commerce returned to English ports.

Jefferson, however, far from America in these years and unexposed to reactionary influences, came back with undiminished fervour of democracy, and the talk he heard of praise for England, and fearful recoil before even the beginning of the revolution in France, disheartened him, and filled him with suspicion. It was at this period of his life that he gave expression to some of the opinions for which he has been most severely criticized. For the Shays rebellion he felt little abhorrence, and wrote: “A little rebellion now and then is a good thing . . . an observation of this truth should render honest republican governors so mild in their punishment of rebellions as not to discourage them too much. It is a medicine necessary for the sound health of government.” Again, “Can history produce an instance of rebellion so honorably conducted? . . . God forbid that we should ever be twenty years without such a rebellion. . . . What signify a few lives lost in a century or two? The tree of liberty must be refreshed from time to time with the blood of patriots and tyrants: It is its natural manure.” And again: “Societies exist under three forms—(1) without government, as among our Indians; (2) under governments wherein the will of everyone has a just influence. . . . (3) under governments of force. . . . It is a problem not clear in my mind that the first condition is not the best” (*Writings*, Ford, ed., iv. 362–63, 467).

Hating as he did feudal class institutions and Tudor-Stuart traditions of arbitrary rule (he turned law students from Blackstone's toryism to Coke's political localism) his attitude can be imagined toward Hamilton's oft-avowed partialities—and Jefferson assumed, his intrigues—for British class-government. In

short, Hamilton took from recent years the lesson of the evils of lax government; whereas Jefferson clung to the other lesson, which crumbling colonial governments had illustrated, that governments derived their strength (and the Declaration had proclaimed that they derived their just rights) from the will of the governed. Each built his system accordingly: the one on the basis of order, the other on individualism. The two men and the fate of the parties they led are understandable only by regarding one as the leader of reaction, the other as in line with American tendencies. The educated classes characteristically furnished Federalism with a remarkable body of alarmist leaders; whereas Jefferson, because he had a thorough trust and confidence in the people, became the idol of American democracy.

Retires from Washington's Cabinet.—Hamilton was somewhat officious and very combative, and Jefferson, although uncontentious, was very suspicious. As both men held inflexibly to their opinions, cabinet harmony became impossible when the two had formed about themselves parties whose differences were carried into the newspapers; and Washington abandoned perforce his idea “if parties did exist to reconcile them.” Partly from discontent with a position in which he did not feel that he enjoyed the absolute confidence of the president, and partly because of financial embarrassments, Jefferson repeatedly sought to resign, and finally on Dec. 31, 1793, with Washington's reluctant consent, retired to his home at Monticello, near Charlottesville.

There he remained (having refused a foreign mission) until elected vice-president in 1796. He was never truly happy except in the country. He loved gardening, experimented enthusiastically in varieties and rotations of crops, and kept meteorological tables with diligence. For eight years he tabulated with painful accuracy the earliest and latest appearance of 37 vegetables in the Washington market. When abroad he sought out varieties of grasses, trees, rice and olives for American experiment, and after his return from France received yearly for 23 years, from his old friend the superintendent of the *Jardin des plantes*, a box of seeds, which he distributed to public and private gardens throughout the United States. Jefferson seems to have been the first discoverer of an exact formula for the construction of mould-boards of least resistance for ploughs. He was remarkably apt in the practical application of mechanical principles.

Kentucky and Virginia Resolutions.—In 1796 John Adams, the Federalist candidate for the presidency, became president; and Jefferson, the Republican candidate, became vice-president. At first the French reign of terror and the X.Y.Z. disclosures strengthened the Federalists, until these, mistaking popular resentment against France for a reaction against democracy—an equivalence in their own minds—passed the Alien and Sedition laws. In answer to those odious measures Jefferson and Madison prepared and procured the passage of the Kentucky and Virginia resolutions. These resolutions later acquired pernicious prominence in the elaboration of the States' Rights doctrine. It is, however, unquestionably true that as a startling protest against measures “to silence,” in Jefferson's words, “by force and not by reason the complaints or criticisms, just or unjust, of our citizens against the conduct of our agents,” they served a useful purpose. As a counterblast against Hamiltonian principles of centralization they were probably very salutary; while even as pieces of constitutional interpretation it is to be remembered that they did not contemplate nullification by any single State (*all* “the co-States recurring to their natural rights in cases not made federal”). Moreover, they are not to be judged by constitutional principles established later by courts and war. Jefferson's particularism increased as he grew older; owing mainly, without doubt, to his increasing fear of Chief Justice John Marshall, as that great scion of Federalism developed its doctrines in the decisions of the Supreme Court.

Twice Elected President.—The Federalist party had ruined itself, and it lost the presidential election of 1800. The Republican candidates, Jefferson and Aaron Burr (*q.v.*), receiving equal votes, it devolved upon the House of Representatives, in accordance with the system which then obtained, to make one of the two president, the other vice-president. Party feeling in America

has probably never been more dangerously impassioned than in the three years preceding this election; discount as one will the contrary obsessions of Hamilton and Jefferson, the time was fateful. In the end Hamilton—who very rightly judged Burr wholly undependable, and Jefferson, in addition to being honourable, more radical in theory than in practice—used his influence in favour of the latter, and he became president, entering upon his duties on March 4, 1801. Republicans who had affiliated with the Federalists at the time of the X.Y.Z. disclosures returned; very many of the Federalists Jefferson placated and drew over. "Believing," he wrote, "that (excepting the ardent monarchists) all our citizens agreed in ancient Whig principles I thought it advisable to define and declare them, and let them see the ground on which we can rally." This he did in his inaugural, which, though somewhat rhetorical, is a splendid and famous statement of democracy.¹

His conciliatory policy produced a mild schism in his own party, but proved eminently wise, and the State elections of 1801 fulfilled his prophecy of 1791 that the policy of the Federalists would leave them "all head and no body." In 1804 he was re-elected by 162 out of 176 votes. Even John Adams voted for him, as a Republican elector in Massachusetts.

Republicanizing the Government.—Jefferson's administrations were distinguished by the simplicity that marked his conduct in private life. He eschewed the pomp and ceremonies, natural inheritances from English origins, that had been an innocent setting to the office of his two predecessors. His dress was of "plain cloth" on the day of his inauguration. Instead of driving to the Capitol in a coach and six, he walked without a guard or servant from his lodgings (or, as a rival tradition has it, he rode, and hitched his horse to a neighbouring fence), attended by a crowd of citizens. Instead of opening Congress with a speech to which a formal reply was expected, he sent in a written message by a private hand. He discontinued the practice of sending ministers abroad in public vessels. Between himself and the governors of States he recognized no difference in rank. He would not have his birthday celebrated by State balls. The weekly levée was practically abandoned. Even such titles as "Excellency," "Honourable," "Mr." were distasteful to him. It was formally agreed in cabinet meeting that "when brought together in society all are perfectly equal, whether foreign or domestic, titled or untitled, in or out of office." Thus diplomatic grades were ignored in social precedence, and foreign relations were seriously compromised by dinner-table complications. One minister who appeared in gold lace and dress sword for his first official call on the president, was received by Jefferson—as he insisted with studied purpose—in negligent undress and slippers down at the heel. In truth, all this was in part premeditated system, indicative of his purpose to republicanize government and public opinion, which was the distinguishing feature of his administration; but it was also the nature of the man. In the company he chose by preference, honesty and knowledge were his only tests. He knew absolutely no social distinctions. "If it be possible," he said, "to be certainly conscious of anything, I am conscious of feeling no difference between writing to the highest and lowest being on earth."

The Louisiana Purchase.—The supreme achievement of his first administration was the Louisiana purchase (*q.v.*), following which Lewis and Clark, sent by him, conducted their famous exploring expedition across the continent to the Pacific. The purchase, judged by his professed principles of constitutional construction (and also by earlier expressions of policy—made, however, long before Napoleon's acquisition of the territory confronted the United States with one of the gravest crises of its history) was the greatest "inconsistency" of his career; although also an illustration, in corresponding degree, of his essential practicality and statesmanship. "This advocate of strict economy had spent on his own executive authority an amount equal to almost three-fourths of the debt which Hamilton had assumed for the States with the sanction of Congress. This champion of the letter

of the Constitution had exercised the power of acquiring foreign territory and promising foreigners admission to the citizenship of the United States, for which no clause could be found among the 'enumerated powers.' This opponent of the extension of the 'general Government' had stretched its power far beyond any point the Federalists had reached, and laid the foundation, in the creation of an immense national territory in the West, for that definitive triumph of the nation over the States which his 'countrymen' [Southerners] of the second generation fought so desperately to avert" (Muzzey).

It was consistent, however, with his past attitude toward England and Spain, respectively strong and weak, as western neighbours. It was consistent with his attitude toward American expansion westward, revealed in his writings and acts since 1776 (for 20 years before he sent Lewis and Clark he had been trying to initiate exploration of the trans-Mississippi region). Realizing fully the significance of the purchase he wrote to his envoy, James Monroe (and this when he did not dream of acquiring all of Louisiana): "The future destinies of our country hang on the event of this negotiation." In truth no other act or event in American history has been of vaster consequence. Jefferson's greatness, in statesmanship, is due to the fact that he embodied the frontier experience of colonial times, the tendencies of mind which (as Frederick J. Turner long since convinced students of history) had created American democracy. The words of McLaughlin are profoundly true: "Jefferson was not first of all, through and through, a States' Rights man, a strict constructionist, a sympathizer with France, an ambitious leader of men; he was a frontiersman or half-frontiersman. . . . Jeffersonism treated not as a spirit, but as a mode of constitutional interpretation or as a system of administration, is not Jeffersonism at all" (*Amer. Hist. Rev.*, 20: 266).

Civil Service and Indian Affairs.—It is often said that Jefferson established the "spoils system" by his changes in the civil service. He was the innovator, because for the first time there was opportunity for innovation. But justice requires attention to the fact that incentive to that innovation, and excuse for it, were found in the one-party monopoly maintained by the Federalists. Moreover, Jefferson's ideals were high; his reasons for changes were in general excellent; he at least so far resisted the great pressure for office—producing by his resistance dissatisfaction within his party—as not to lower, apparently, the personnel of the service; and there were no such blots on his administration as President Adams's "midnight judges." Nevertheless, his record here showed regrettable inconsistencies¹.

Another charge frequently made against Jefferson is that he was inconsistent in his treatment of the Indians. It is true. On one hand he voiced, sincerely beyond doubt, the most noble—and alas, in view of the character of American frontiersmen, impracticable—humanism in their behalf. On the other hand his efforts to extinguish Indian titles justify the harsh judgment of Henry Adams that "his greed for land equalled that of any settler on the border"; and in gratifying it he displayed in a few instances an unmoral opportunism that is incapable of condonation. It is, however, to be said in his defence, that in his mind the acquisition of Louisiana was associated with the idea (soon adopted, and followed as a national policy until very recent years) of removing the Indians to reservations of secure hunting grounds—which he (rightly) believed would end frontier wars. To crowd them from their homes east of the Mississippi was therefore, in his system, far removed from the dominant frontier view that Indians were without rights to land or life. Here again—as usually is true—Jefferson's inconsistency of acts turns out to be a lesser inconsistency of principle; and here again, as usually, he made no contemporary explanations, but left the matter to later judgment of the records.

¹See C. R. Fish, *The Civil Service and the Patronage*, ch. ii. (New York, 1905), and G. Hunt, in *Amer. Hist. Rev.*, 3: 270–291. He would not, he said, retain in office extreme Federalists, because he believed them a danger to the country. Theoretically this left a safe zone for moderates; but the importunity of Republican office-seekers made it impossible to maintain the distinction between Jefferson's principle and mere partisanship.

¹See also Jefferson to E. Gerry, Jan. 26, 1799 (*Writings*, vii. 325), and to Du Pont de Nemours (x. 23). Cf. Hamilton to J. Dayton, 1799 (*Works*, x. 329).

Struggle for Rights of Neutrals.—His second term derives most of its historical interest from the unsuccessful efforts to convict Aaron Burr of treasonable acts in the South-West, and from the efforts made to maintain, without war, the rights of neutrals on the high seas. In his first term he carried out a policy he had urged upon the government when minister to France and when vice-president, by dispatching naval forces to coerce Tripoli into a decent respect for the trade of his country—the first in Christendom to gain honourable immunity from tribute or piracy in the Mediterranean. Against greater powers he showed no such intrepidity. In his diplomacy with Napoleon and Great Britain he betrayed a painful incorrigibility of optimism. One writer has very justly said that what chiefly affects one in the whole matter is the pathos of it—"a philosopher and a friend of peace struggling with a despot of superhuman genius, and a Tory cabinet of superhuman insolence and stolidity" (Trent). All the charges against him of timidity and vacillation, so far as they have any basis, rest upon his foreign policy. In 1807 he was willing to rely chiefly on little gunboats—kept under sheds ashore except when actually needed, and then manned by a sort of naval militia!—and wrote (soon after the British "Leopard" had wrecked and searched the "Chesapeake") of "the ruinous folly of a navy!" It is fair to note, however, that Commodores Barron and Preble approved the gunboat policy. And the embargo, if dispassionately considered, must be pronounced not only amply justified by the contempt for neutral rights displayed equally by France and Great Britain, but quite as logical as the continental blockade.

His Agrarian Outlook.—Jefferson's statesmanship had the limitations of an agrarian outlook. The extreme to which he carried his advocacy of diplomatic isolation, his opposition to the creation of an adequate navy, his estimate of cities as "sores upon the body politic," his prejudice against manufactures, trust in farmers, and political distrust of the artisan class, reflect them. Jefferson favoured the wide distribution of the public land as the basis of personal independence and democracy (Hamilton might well have favoured it, in the interest of taxation and ultimate conservatism, but in fact he opposed it). In 1776 he wished to exclude from purchasing public land any man already holding 50 acres. In 1785 he wrote: "It is too soon yet . . . to say that every man who cannot find employment, but who can find uncultivated land, shall be at liberty to cultivate it, paying a moderate rent. But it is not too soon to provide by every possible means that as few as possible shall be without a little portion of land. The small landowners are the most precious portion of the State." It is probably fair to say that cheap land was the chief basis of his political philosophy (see C. Beard, *Economic Origins of Jeffersonian Democracy*, ch. xiv.; also pp. 328, 342, 347, 358).

When, on March 4, 1809, he retired from the presidency he had been almost continuously in the public service for 40 years. He refused to be elected for a third time, though requested by the legislatures of five States to be a candidate; and thus, with Washington's prior example, helped to establish a precedent deemed by him to be of great importance under a democratic government. His influence was little lessened in his retirement. Madison and Monroe, his immediate successors—neighbours and devoted friends, whom he had advised in their early education and led in their maturer years—consulted him on all great questions (though there were few in the latter's peaceful terms); and thus there was no break of principles in the 24 years of the "Jeffersonian system."

Jefferson the Political Leader.—Jefferson was one of the greatest political managers his country has known. He had a quick eye for character, was genuinely amiable, uncontentious, tactful, masterful; and it may be assumed from his success that he was shrewd to a degree. Full explanations do not remove from some important transactions in his political life an impression of indirectness. This is mainly because he would not himself mix in debate, pamphleteering or other controversy, while urging his doctrines upon followers who did so. Nor would he, except in conversations and letters, explain his principles and apply them to his conduct although certainly, unless tested by principles, his acts were often strikingly inconsistent; and, even when so

tested, sometimes remain so. But reasonable judgment must find very unjust the stigma of duplicity put upon him by the Federalists. Again, there were philosophic elements in his political faith which have led some to class him as a visionary and fanatic. But although he certainly indulged at times in dreams at which one may still smile, he was not, properly speaking, a visionary—looking backward his political prescience seems remarkable; nor can he with justice be pronounced a fanatic. He did have the full courage of his convictions. Extreme as were some of his principles, his independence in expressing and pertinacity in adhering to them were equally extreme. He felt fervently, was not afraid to risk all on the conclusions to which his heart and his mind led him and declared himself with openness and energy; he spoke and even wrote his conclusions, however bold or abstract, without troubling to detail his reasoning or clip his offhand speculations. Certain it is that there is much in his utterances at which less robust democrats will always cavil—though some of the ideas at which they hesitate are at last receiving consideration: e.g., his doctrine that one generation should not and cannot bind another by paper documents. But be his doctrines and aims ever so radical, in their attainment he proceeded, as Hamilton recognized, conservatively. Indeed, when practicality so counselled he was always content to wait for time and education to do his work. Soar as he might, he was essentially not a doctrinaire but an empiricist; his mind was objective. Though he remained to the end firm in his belief that there had been an active monarchist party, this obsession did not carry him out of touch with the realities of human nature and of his time. He built with surety on the colonial past, and had a better reasoned view of the actual future than had any of his contemporaries.

Faith in the People.—Events soon appraised the Federalist judgment of American democracy, so tersely expressed by Fisher Ames as "like death . . . only the dismal passport to a more dismal hereafter"; and, with it, appraised Jefferson's word in his first inaugural for those who, "in the full tide of successful experiment," were ready to abandon a government that had so far kept them "free and firm, on the visionary fear that it might by possibility lack energy to preserve itself." Time too is still testing his principle that that Government must prove the strongest on earth—"where every man . . . would meet invasions of the public order as his own personal concern." He summed up as follows the difference between himself and the Hamiltonian group: "One feared most the ignorance of the people; the other the selfishness of rulers independent of them"; one sect "believing that the executive is the branch of our government which most need (ed) support; the other, that, like the analogous branch in the British government, it (was) already too strong for the republican parts of the Constitution." Jefferson, in short, had unlimited faith in the honesty of the people; a large faith in their common sense; believed that all is to be won by appealing to the reason of voters; that by education their ignorance can be eliminated; that human nature is indefinitely perfectible; that majorities rule, therefore, not only by virtue of force (which was Locke's ultimate justification of them), but of right. His importance as a maker of modern America can scarcely be overstated, for the ideas he advocated have become the very foundations of American republicanism. No other man's ideas have had anything like an equal influence upon the institutions of the country. So competent a scholar as Andrew D. White put him alone in each of the three groups of men who did most to found, to build, and to brace the republic (*Atlantic Monthly*, Jan. 1862). His administrations ended the possibility, probability or certainty—measure it as one will—of a calculated development of Federalism in the direction of class government. Thus by his own labours he vindicated his faith in the experiment of self-government.

Services to the University of Virginia.—His last years were devoted to the establishment of the University of Virginia at Charlottesville, near his home. He planned the buildings and oversaw to the minutest details their construction; and he is to-day—for this work and the construction of Monticello and other buildings—recognized as notable in the history of American architecture. He gathered the faculty—mainly from abroad—

and shaped the organization. "A system," he wrote, "of public instruction . . . as it was the earliest so it will be the latest, of all the public concerns in which I shall permit myself to take an interest." The university was doubtless the most liberal institution of learning in the world at that time: the curriculum was wholly elective; there were no religious tests or practices; the faculty were all equals, under a rotating and elective chairman; students were under the honour system in all tests and discipline; agriculture and political science were first provided for in American education. In short many of the ideas of administration and curriculum that dominate American universities in the 20th century were anticipated by him.

Financial Troubles.—His financial affairs in these last years gave him grave concern. He had left the presidency with debts of \$20,000, contracted in an over-generous maintenance of his representative position. After the destruction of the library of Congress by the British in 1814 he sold to the nation for \$23,950 some 13,000 volumes of his own collection. But this gave only temporary relief. Relatives, invited guests, and strangers filled Monticello (frequently beds were made for a score and more, sometimes for fifty); they stayed for days, weeks, even months, drank his choice French wines, kept their horses in his stables. For solitude he had to retire to a second home, constructed as a refuge. Threatened with bankruptcy, a national subscription in 1826 (of \$16,500) enabled him to die in peace, but a few months later his furniture, silver, pictures and Monticello, which is to-day a national memorial, were sold to pay his debts.

Features and Personality.—Jefferson was 6 ft. 2 in. in height, large-boned, slim, erect and sinewy. He had angular features, a very ruddy complexion, sandy hair, and hazel-flecked grey eyes. Age lessened the unattractiveness of his exterior. His carriage was somewhat loose and undignified. There was grace, nevertheless, in his manners; and his frank and earnest address, his quick sympathy (yet he seemed cold to strangers), his vivacious, varied, informing talk, gave him an engaging charm. Beneath a quiet surface he was aglow with intense convictions and an emotional temperament. Yet he seems to have acted habitually, in great and little things, on system. His mind, no less trenchant and subtle than Hamilton's, was the most impressible, the most receptive, mind of his time in America. The range of his interests—in geography, geology, botany, zoölogy, ethnology, agriculture, plantation, medicine and surgery, mathematics, aeronautics, invention, government, education, languages and literature, religion—is astounding. For many years he was president of the American Philosophical Society. Though it is a tradition that he lacked wit, Molière and *Don Quixote* seem to have been his favourites; and though the utilitarian wholly crowds romanticism out of his writings, he had enough of that quality in youth to prepare to learn Gaelic in order to translate Ossian, and sent to Macpherson for the originals! His interest in art was evidently intellectual. He was singularly sweet-tempered, and shrank from the impassioned political bitterness that raged about him; bore with relative equanimity a flood of coarse and malignant abuse of his motives, morals, religion, personal honesty and decency; cherished very few personal animosities; and better than any of his great antagonists cleared political opposition of ill-blooded personality. In short, his kindness of heart rose above all social, religious or political differences, and nothing destroyed his confidence in men and his sanguine views of life. Complex as was his life in interests and incidents, it can be summed up in a single word: Freedom—freedom in creed, government, thought and speech. "I have sworn," he wrote in 1800, "upon the altar of God eternal hostility against every form of tyranny over the mind of man."

He died on July 4, 1826, the 50th anniversary of the Declaration of Independence, on the same day as John Adams. For his tomb he chose the epitaph: "Here was buried Thomas Jefferson, author of the Declaration of American Independence, of the statute of Virginia for religious freedom, and father of the University of Virginia."

BIBLIOGRAPHY.—See the editions of Jefferson's *Writings* by H. A. Washington (9 vol., New York, 1853-54, and later reprints), by Paul Leicester Ford (the best collection, 10 vol. New York, 1892-99); also

Works, "Federal" ed., 12 vol., New York, 1904-05); and A. A. Lipscomb, several editions of different name in 20 vol. (Washington, 1903-04), "Definitive" ed., 20 in 10 vol. (1905); T. J. Randolph, *Memoir, Correspondence and Miscellanies* (Charlottesville, 1829); a small selection from the largest collection of his private letters (his public papers were sold to the Government in 1848) is given in Mass. Hist. Society, *Collections*, ser. 7, vol. i. All these overlap, none is exhaustive of printed sources; a great body of mss. remains unprinted; there are 135 vol. of papers in the Library of Congress, new letters come frequently to light, several small collections have been published. J. P. Foley, *The Jefferson Cyclopaedia* (New York, 1900), S. E. Forman, *The Life and Writings of Thomas Jefferson, including all his Important Utterances on Public Questions* (Indianapolis, 1900); and G. Chinard, *The commonplace Book of Thomas Jefferson, a Repertory of his Ideas on Government* (Baltimore, 1926), are useful. Sarah N. Randolph, *Domestic Relations of Thomas Jefferson* (New York, 1871), and H. W. Pierson, *Jefferson at Monticello: the Private Life of Thomas Jefferson* (New York, 1862), embody family traditions, and are indispensable for personal sidelights. Of extreme importance for an appreciation of his political opinions is C. Beard, *Economic Origins of Jeffersonian Democracy* (New York, 1915); and indispensable on foreign affairs are Henry Adams, *History of the United States* (New York, 1889-91); and the sketch by S. F. Bemis in *The American Secretaries of State and their Diplomacy*, vol. ii. (New York, 1927). Special studies include: G. Chinard, *Jefferson et les Idéologues, d'après sa correspondance avec Destutt de Tracy, Cabanis, J. B. Say, et Auguste Comte* (Baltimore, 1925), Volney et L'Amérique d'après . . . sa correspondance avec Jefferson (Baltimore, 1923), which tend to over-emphasize French connections; W. A. Robinson, *Jeffersonian Democracy in New England* (New Haven, 1916); L. M. Sears, *Jefferson and the Embargo* (Durham, 1927); C. Becker, *The Declaration of Independence* (New York, 1922); C. E. Merriam, *A History of American Political Theories*, ch. iv. (New York, 1903); H. B. Adams, *Thomas Jefferson and the University of Virginia* (Washington, 1888); W. A. Lambeth and W. H. Manning, *Thomas Jefferson as an Architect and a Designer of Landscape* (Boston, 1913); F. Kimball, *Thomas Jefferson, Architect: Original Designs* (privately printed, Boston, 1916). J. T. Morse, *Thomas Jefferson* (Boston, 1883), mainly political, is the only important biography hostile to its subject; but the writers on Alexander Hamilton (*q.v.*) supply any necessary corrective. Other biographies, all sympathetic, are: G. Tucker, *Life of Thomas Jefferson* (Philadelphia, 1837), based in part on local sources not utilized by other students; H. S. Randall, *Life of Thomas Jefferson* (New York, 1853), able, and exhaustive for its time, but sharing Jefferson's obsessions regarding "monocrats" and otherwise partisan, still the leading source of information; J. Parton, *Life of Thomas Jefferson* (Boston, 1874), brilliant, less ably reasoned; J. Schouler, *Thomas Jefferson* (Boston, 1883); J. S. Williams, *Thomas Jefferson: His Permanent Influence on American Institutions* (New York, 1913), hurried and unfinished, by a very able Southern senator; T. E. Watson, *The Life and Times of Thomas Jefferson* (New York, 1903), vivid, very partisan, by a Southern Populist; D. S. Muzzey, *Thomas Jefferson* (New York, 1918), balanced and excellent; C. G. Bowers, *Jefferson and Hamilton: the Struggle for Democracy in America* (1925), brilliant and important; A. J. Nock, *Jefferson* (1926), a study of character and opinions, particularly economic; F. W. Hirst, *Life and Letters of Thomas Jefferson* (1926), a friendly English view. There is an illuminating appreciation by W. P. Trent in his *Southern Statesman of the Old Régime* (1897); another by John Fiske, in *Essays, Historical and Literary*, vol. i. (1902), has lesser merits. See also P. Wiltach, *Jefferson and Monticello*; Gilbert Chinard, *Thomas Jefferson: the Apostle of Americanism* (1929). (F. S. P.)

JEFFERSON CITY (legally and officially the City of Jefferson), the capital of Missouri, U.S.A., and the county seat of Cole county, on the south bank of the Missouri river, near the centre of the State. It is on Federal highways 50, 54 and 63; is served by the Chicago and Alton, the Missouri-Kansas-Texas, and the Missouri Pacific railways, and by motor bus lines as far as Saint Louis, Springfield and Kansas City; it has an airport. The population was 14,490 in 1920 (13.6% negroes) and was estimated locally at 20,000 in 1928. The magnificent State capitol, erected between 1911 and 1918 at a cost of \$5,000,000, dominates the scene from a bluff above the river. At the south entrance is a bronze statue of Thomas Jefferson by J. E. Fraser, and in the park stands Karl Bitter's group representing the signing of the Louisiana purchase treaty. There are decorative paintings and sculpture by Frank Brangwyn, Gari Melchers, Charles Hoffbauer, Henry Reuter Dahl, A. Stirling Calder, Hermon A. MacNeil and many other artists. In the dome (238 ft. high) is the radio broadcasting station of the State bureau of markets. The supreme court building, facing the capitol, houses one of the best law libraries in the country. The State penitentiary and the women's prison farm are located here. Lincoln university for negroes, a State institu-

tion since 1879, was founded in 1866 by two regiments of negro infantry on their discharge from the Union army. The city has large railroad shops and various other manufacturing industries with an aggregate output in 1925 valued at \$10,896,175.

The original Constitution of Missouri prescribed that the capital should be on the Missouri river, within 40m. of the mouth of the Osage. The site was selected by a commission, and the bill was signed by the first governor of the State on New Year's eve, 1821. In 1822 the town was laid out. The first State-house, built in 1826, was burned in 1837. A larger building was begun the same year, completed in 1842, enlarged in 1887, and in its turn destroyed by fire in 1911. The present structure was erected under the direction of a bi-partisan commission. Jefferson City became the county seat in 1828, and was chartered as a city in 1839. In June, 1861, it was occupied by Union forces, and in Sept.-Oct. 1864, it was threatened by Confederate troops under Gen. Sterling Price.

JEFFERSONVILLE, a city of southern Indiana, U.S.A., on the Ohio river, opposite Louisville, Ky.; the county seat of Clark county. It is served by the Baltimore and Ohio, the Big Four, the Interstate Public Service company (electric), and the Pennsylvania railways, and by river packet lines. The population was 10,098 in 1920 (14% negroes) and was estimated locally at 15,800 in 1928. It is attractively situated on bluffs above the river, which here falls over 26ft., furnishing abundant water-power. There are railroad car works, employing over 1,000 men, a large soap and perfume plant, and sundry other manufacturing industries, with a total output in 1927 valued at over \$5,000,000. An army supply depot is located here. In the river opposite Jeffersonville was formerly Corn Island (now completely washed away), from which Gen. George Rogers Clark started (June 24, 1778) on his expedition against Kaskaskia and Vincennes. Ft. Finney (later called Ft. Steuben) was built on the site of the present city in 1786, but was abandoned in 1791. Permanent settlement began in 1802, when a town was laid out, which was incorporated in 1815 and chartered as a city in 1830.

JEFFREY, FRANCIS JEFFREY, LORD (1773-1850), Scottish judge and literary critic, son of a depute-clerk in the Court of Session, was born at Edinburgh on Oct. 23, 1773. He was educated at Edinburgh high school, the university of Glasgow and Queen's College, Oxford. He was admitted to the Scottish bar in Dec. 1794, but found that his Whig politics seriously prejudiced his legal prospects. He went to London in 1798 and worked as a journalist, but without success; his marriage with Catherine Wilson in 1801 made the question of a settled income even more pressing. A project for a new review was brought forward by Sydney Smith in Jeffrey's flat, and resulted (1802) in the *Edinburgh Review*. After the first three numbers the editorial work devolved chiefly on Jeffrey, who was eventually appointed editor.

Most of the collaborators were Whigs; but it numbered Sir Walter Scott among its contributors; and no emphasis was given to its political leanings until the publication in 1808 of an article by Jeffrey himself on the work of Don Pedro Cevallos on the *French Usurpation of Spain*. The tradition established in the early years of the undertaking ensured its success. It had a circulation, great for those days, of 12,000 copies. The period of Jeffrey's editorship extended to about 26 years, ceasing with the 98th number, published in June 1829. Jeffrey's own contributions numbered 200. His criticisms were pungent and effective. But the essential narrowness of his general outlook prevented him from detecting and estimating latent forces, either in politics or in matters intellectual and moral; and this lack of understanding and sympathy accounts for his distrust and dislike of the passion and fancy of Shelley and Keats, and for his praise of the half-hearted and elegant romanticism of Rogers and Campbell. A criticism in the 15th number on the morality of Moore's poems led in 1806 to a duel between the two authors at Chalk Farm. The proceedings were stopped by the police, and Jeffrey's pistol was found to contain no bullet. The affair led to a warm friendship, however, and Moore contributed to the *Review*, while Jeffrey made ample amends in a later article on *Lalla Rookh* (1817).

Jeffrey's wife had died in 1805, and in 1813 he married Charlotte, daughter of Charles Wilkes of New York, and great-niece

of John Wilkes. Before returning to England after their marriage in New York, they visited several American cities, and his experience strengthened Jeffrey in the conciliatory policy towards that country. Jeffrey's literary reputation helped his professional advancement. His practice extended rapidly in the civil and criminal courts, and he regularly appeared before the general assembly of the Church of Scotland. His sharpness and insight gave him a formidable advantage over an opponent, and he excelled in eloquent closing appeals. Jeffrey was twice, in 1820 and 1822, elected lord rector of the university of Glasgow. In 1829 he was chosen dean of the faculty of advocates. On the return of the Whigs to power in 1830 he became lord advocate, and entered parliament as member for the Perth burghs. He was unseated, and afterwards returned for Malton, a borough in the interest of Lord Fitzwilliam. After the passing of the Scottish Reform Bill, which he introduced, he was returned for Edinburgh in Dec. 1832. He was raised to the judicial bench as Lord Jeffrey in May 1834. He died at Edinburgh on Jan. 26, 1850.

Some of his contributions to the *Edinburgh Review* appeared in four volumes in 1844 and 1845. This selection includes the essay on "Beauty" contributed to the *Ency. Brit.* The *Life of Lord Jeffrey, with a Selection from his Correspondence*, by Lord Cockburn, appeared in 1852 in 2 vols. See also the *Selected Correspondence of Macvey Napier* (1877); the sketch of Jeffrey in Carlyle's *Reminiscences*, vol. ii. (1881); and an essay by Lewis E. Gates in *Three Studies in Literature* (New York, 1899).

JEFFREYS, GEORGE JEFFREYS, 1ST BARON (1648-1689), lord chancellor of England, son of John Jeffreys, a Welsh country gentleman, was born at Acton Park, in Denbighshire, in 1648. He was educated at Shrewsbury, St. Paul's and Westminster schools, and at Trinity college, Cambridge, and entered the Inner Temple in 1663. Within three years of his call to the bar in 1668, he was elected common serjeant of the City of London. Jeffreys had remarkable aptitude for the profession of an advocate—quick intelligence, caustic humour, copious eloquence. His powers of cross-examination were masterly; and if he was insufficiently grounded in legal principles to become a profound lawyer, nothing but greater application was needed in the opinion of so hostile a critic as Lord Campbell, to have made him the rival of Nottingham and Hale. While holding the office of common serjeant, he pursued his practice at the bar. With a view to further preferment he now sought to ingratiate himself with the court party, to which he obtained an introduction possibly through William Chiffinch, the notorious keeper of the king's closet. He at once attached himself to the king's mistress, the duchess of Portsmouth; and as early as 1672 he was employed in confidential business by the court. He was knighted in 1677, became solicitor-general to James Duke of York, and recorder of London in 1678.

In the previous month Titus Oates had made his first revelations of the alleged popish plot, and from this time forward Jeffreys was prominently identified, either as advocate or judge, with the memorable state trials by which the political conflict between the crown and the people was waged during the remainder of the 17th century. Jeffreys threw in his lot with the court, displaying his zeal by initiating the movement of the "abhorers" (*q.v.*) against the "petitioners" who were giving voice to the popular demand for the summoning of parliament. He was rewarded with the office of chief justice of Chester in 1680; but when parliament met in October a hostile resolution induced him to resign his recordership, a piece of pusillanimity that drew from the king the remark that Jeffreys was "not parliament-proof." In 1683 the first of the Rye House conspirators were brought to trial. Jeffreys was briefed for the crown in the prosecution of Lord William Howard; and, having been raised to the bench as lord chief justice of the king's bench, he presided at the trials of Algernon Sidney in 1683 and of Sir Thomas Armstrong in the following year. In 1685 he passed sentence on Titus Oates for perjury in the plot trials; and about the same time James II. rewarded his zeal with a peerage as Baron Jeffreys of Wem, an honour never before conferred on a chief justice during his tenure of office. Jeffreys had been suffering from stone, and the malady probably was in some degree the cause of the unmeasured fury he displayed at the trial of Richard Baxter (*q.v.*) for seditious

libel—if the unofficial *ex parte* report of the trial, which alone exists, is to be accepted as trustworthy.

In 1685 Jeffreys opened at Winchester the "bloody assizes," his conduct of which has branded his name with infamy. The number of persons sentenced to death at these assizes for complicity in the duke of Monmouth's insurrection is uncertain. The official return of those actually executed was 320; many hundreds more were transported and sold into slavery in the West Indies. In all probability the majority of those condemned were in fact concerned in the rising, but the trials were in many cases a mockery of justice. Numbers were cajoled into pleading guilty; the case for the prisoners seldom obtained a hearing. The merciless severity of the chief justice did not however exceed the wishes of James II.; for on his return to London Jeffreys received from the king the great seal with the title of lord chancellor. For the next two years he was a strenuous upholder of prerogative, though he was less abjectly pliant than has sometimes been represented. He even withstood James on occasion, when the latter pushed his Catholic zeal to extremes. But while he watched with misgiving the king's preference of Roman Catholics, he made himself the masterful instrument of unconstitutional prerogative in coercing the authorities of Cambridge university, who in 1687 refused to confer degrees on a Benedictine monk, and the fellows of Magdalen college, Oxford, who declined to elect as their president a disreputable nominee of the king.

Being thus conspicuously identified with the most tyrannical measures of James II., Jeffreys was in a desperate plight when the king fled from the country on the approach of William of Orange. The lord chancellor also attempted to escape; but in spite of his disguise as a common seaman he was recognized in a tavern at Wapping and was arrested and conveyed to the Tower. The malady from which he had long suffered had recently made fatal progress, and he died in the Tower on April 18, 1689.

It is impossible to determine precisely with what justice tradition has made the name of "Judge Jeffreys" a byword of infamy. The Revolution, which brought about his fall, handed over his reputation to the mercy of his bitterest enemies. They alone have recorded his actions and appraised his motives and character, and their lampoons, while they fanned the indiscriminating hatred of contemporaries who remembered the judge's severities, and perpetuated that hatred in tradition, have not been sufficiently discounted even by historians like Macaulay and Lord Campbell. The name of Jeffreys has therefore been handed down as that of a coarse, ignorant, dissolute bully, who prostituted the seat of justice. That there was ground for the execration is not to be gainsaid. But the portrait has nevertheless been blackened overmuch. An occasional significant admission in his favour may be gleaned even from the writings of his enemies. Roger North and Jekyll have both admitted that in matters where the interests of the court were not concerned, he was as good a judge as they had seen. His conduct to prisoners was a failing so common to the age that not even Hale was exempt from it.

Some of his actions that have incurred the sternest reprobation were otherwise estimated by the best of his contemporaries. His trial of Algernon Sidney, decried by Macaulay and Lord Campbell as one of the most heinous of his iniquities, was warmly commended by Dr. William Lloyd, one of the seven bishops (see letter from the bishop of St. Asaph in H. B. Irving's *Life of Judge Jeffreys*, p. 184). Nor was the habitual illegality of his procedure so unquestionable as frequently assumed. Sir James Stephen inclined to the opinion that no actual abuse of law tainted the trials of the Rye House conspirators, or that of Alice Lisle, the most prominent victim of the "bloody assizes." The conduct of the judges in Russell's trial was, he thinks, "moderate and fair in general"; and the trial of Sidney "much resembled that of Russell." If Jeffreys judged political offenders with cruel severity, he also crushed some glaring abuses; conspicuous examples of which were the frauds of attorneys who infested Westminster hall, and the systematic kidnapping practised by the municipal authorities of Bristol. Even though the popular notion requires to be modified, it remains incontestable that Jeffreys was probably on the whole the worst example of a period when

the administration of justice in England had sunk to the lowest degradation, and the judicial bench had become the too willing tool of an unconstitutional and unscrupulous executive.

BIBLIOGRAPHY.—The chief contemporary authorities for the life of Jeffreys are Bishop Burnet's *History of my own Time* (1724) and see especially the edition "with notes by the earls of Dartmouth and Hardwick, Speaker Onslow and Dean Swift" (1833); Roger North's *Life of the Right Hon. Francis North, Baron of Guildford* (1808) and *Autobiography* (1887); *Ellis Correspondence, Verney Papers* (Hist. mss. Comm.), *Hatton Correspondence* (Camden Soc. pub.); the earl of Ailesbury's *Memoirs*; Evelyn's *Diary*. The only trustworthy information as to the judicial conduct and capacity of Jeffreys is to be found in the reports of the *State Trials*, vols. vii–xii.; and cf. Sir J. F. Stephen's *History of the Criminal Law of England* (1883). For details of the "bloody assizes," see *Hart. MSS.* 4,689; George Roberts, *The Life, Progresses and Rebellion of James Duke of Monmouth*, vol. ii. (1844); also many pamphlets, lampoons, e. c., in the British Museum, as to which see the article on "Sources of History for Monmouth's Rebellion and the Bloody Assizes," by A. L. Humphreys, in *Proceedings of the Somersetshire Archaeological and Natural Hist. Soc.* (1892). Later accounts are by H. W. Woolrych, *Memoirs of the Life of Judge Jeffreys* (1827); Lord Campbell, *The Lives of the Lord Chancellors* (1845), 1st series, vol. iii.; E. Foss, *The Judges of England* (1864), vol. vii.; Henry Roscoe, *Lives of Eminent British Lawyers* (1830); Lord Macaulay, *History of England* (1848; and many subsequent editions). Most of these works, and especially those by Macaulay and Campbell, are uncritical in their hostility to Jeffreys, and are based for the most part on untrustworthy authorities. The best modern work on the subject, though unduly favourable to Jeffreys, is H. B. Irving's *Life of Judge Jeffreys* (1898), the appendix to which contains a full bibliography. (C.)

JEHOIACHIN, son of Jehoiakim and king of Judah (2 Kings xxiv. 8 *sqq.*; 2 Chron. xxxvi. 9 *seq.*; Jer. xxii. 20–30). He came to the throne at the age of 18 in the midst of the Chaldean invasion of Judah, and is said to have reigned three months. He was compelled to surrender to Nebuchadrezzar II. and was carried off to Babylon (597 B.C.). Eight thousand people of the better class (including artisans, etc.) were removed, and the Temple was partially despoiled. Nearly 40 years later, Nebuchadrezzar died (562 B.C.) and Evil-Merodach (Amil-Marduk), his successor, released Jehoiachin.

JEHOIAKIM, son of Josiah (*q.v.*) and king of Judah (2 Kings xxiii. 34–xxiv. 6; Jer. xxii. 13–19). On the death of Josiah at Megiddo his younger son Jehoahaz (or Shallum) was chosen by the Judeans, but the Egyptian conqueror Necho summoned him to his headquarters at Riblah and removed him to Egypt, appointing in his stead Jehoiakim. For a time Jehoiakim remained under the protection of Necho and paid heavy tribute; but with the rise of the new Chaldean empire under Nebuchadrezzar II., and the overthrow of Egypt at the battle of Carchemish (605 B.C.) a vital change occurred. After three years of allegiance the king revolted. Invasions followed by Chaldeans, Syrians, Moabites and Ammonites, perhaps the advance troops despatched by the Babylonian king; the power of Egypt was broken and the whole land came into the hands of Nebuchadrezzar. It was at the close of Jehoiakim's reign, apparently just before his death, that the enemy appeared at the gates of Jerusalem, and although Jehoiakim "slept with his fathers" his young son was destined to see the first captivity of the land of Judah (597 B.C.).

JEHOL or Ch'eng-T'ê-Fu is the capital of a special administrative area, to the north of the Great Wall, formerly attached to the Chinese province of Chih-li. The city is situated about 130 m. N. E. of Peking at the head of navigation of the Lwan-ho on a plain within the belt of scarps which separates the Mongolian plateau from the lowlands of North China. It is famous in Chinese history as the summer residence of the Manchu dynasty, used mainly in autumn when the emperor was journeying to the great hunting-grounds (Wei-Chang) beyond Jehol, which was connected with the capital by a carefully graded road with numerous rest-houses. It was in the palace of Jehol, built in 1703, that the emperor Ch'ien Lung received the historic trade mission from England, headed by Lord Macartney, in 1793. In recent times the country round Jehol, formerly an imperial reserve, has been opened up for agricultural use and is being occupied by an increasing number of Chinese immigrants. The northern portion of the administrative district is drained towards Manchuria and is becoming economically linked up with it.

JEHORAM, the name of two kings in the Bible (also JORAM).

1. The son of Ahab, and king of Israel in succession to his brother Ahaziah. He maintained close relations with Judah, whose king seems to have recognised his suzerainty, and came to his help against Moab, who had revolted (II Kings. i. 1, iii.). The result of the campaign seems to have been a defeat for Israel. Together with Ahaziah, king of Judah, he endeavoured to recover Ramoth-Gilead from Hazael, king of Syria. He was wounded in the fighting round that town, and during his absence a revolution was fomented by the prophetic party (always hostile to the house of Omri), and Jehu seized the throne, putting to death Jehoram, his mother Jezebel, his nephew Ahaziah, king of Judah, all the living members of Ahab's family, and large numbers of the Ba'al party. These events seem to have occurred in or about the year 841 B.C.

2. Son of Jehoshaphat and king of Judah. He married Athaliah, daughter of Ahab, and was thus brother-in-law of 1. above, and contemporary with him. In his days Edom and Libnah revolted (II Kings viii. 20-22), perhaps in concert with one another. The Chronicler (II Chron. xxi. 1-xxii. 1) adds many details: on ascending the throne he massacred his brethren, was condemned to death from disease by Elijah, and was utterly defeated by a great invasion of Philistines and Arabians. He died a year before his namesake of Israel, *i.e.* probably in or about 842 B.C.

JEHOSHAPHAT was the son of Asa and king of Judah in the early part of the ninth century B.C. He seems to have been a subordinate ally of the house of Omri; his son Jehoram married Ahab's daughter Athaliah, and he himself took part in Ahab's fatal expedition to Ramoth-Gilead and in the attack on Mesha, king of Moab by Jehoram, king of Israel. He engaged in distant trading enterprises, but his attempt to establish a fleet at Ezion-Geber (near the modern Akabah) ended in failure. The Chronicler adds an account of an attack on Jehoshaphat by a joint army of Moabites, Ammonites and Edomites, in which the king of Judah was completely victorious (II Chron. xx.; I Kings xxii. 41 sqq.).

JEHOVAH, the God of Israel. The pronunciation "Jēhōvāh" is an error resulting among Christians from combining the consonants *Yhwh* (*Jhwh*) with the vowels of 'ādhōnāy, "Lord," which the Jews in reading the Scriptures substituted for the sacred name, commonly called the *tetragrammaton* as containing four consonants. It is first found in manuscripts of Martini's *Pugio Fidei* (1278), belonging to the 14th century; and Galatinus (1518) is found arguing against abbreviating it to "Jova," on the analogy of the Latin *Jovis* (as proved by G. F. Moore).

This avoidance of the *tetragrammaton*, due primarily to an over-rigid interpretation of certain passages in the Old Testament (*e.g.*, Lev. xxiv. 15-23; *cf.* Exod. xx. 7), may have arisen from various motives: a feeling that a proper name for God implies the existence of other gods, the fear lest the sacred name should be mispronounced or otherwise profaned, and the desire to prevent its abuse in magical practices. If this hope was the reason, secrecy had the opposite effect; for the *tetragrammaton* became the greatest name in both Jewish and heathen spells and miraculous efficacy was attributed to mere utterance of it. Several centuries before the Christian era the *tetragrammaton* ceased to be commonly used. Some later writers in the Old Testament pre-vaillingly or exclusively employed 'ēlōhīm, "God," which editors in some parts uniformly substituted for *Yhwh*; various periphrases also took its place, such as "the Most High," "the God of Heaven" and "the King of Heaven" in Daniel, or simply "Heaven" in I. Maccabees. The oldest Greek versions and the books written in Greek, *e.g.*, Wisdom and II. and III. Maccabees, replaced *Yhwh* by *Kύριος*, "Lord." The name was still pronounced only in the priestly benediction (Num. vi. 27) after the daily sacrifice in the temple, although a substitute was used in the synagogues, and by the high priest in his prayers and benediction on the Day of Atonement. The Rabbinic tradition that after the death of Simon the Just (fl. 290 B.C.) it was no longer pronounced even on these occasions, is contradicted by the well-attested statement that in the last generations before the fall of Jerusalem (A.D. 70) it was uttered so low that the sounds were lost in the chant of the priest. After that event the liturgical use of the name ceased, but the

tradition was perpetuated in the Rabbinic schools; it continued also to be employed by healers, exorcists and magicians, and is found on many magical *papyri*. It is asserted by Philo that only priests might pronounce it and by Josephus that those who knew it were forbidden to divulge it. Finally the Samaritans shared the scruples of the Jews, except that they used it in judicial oaths.

The early Christian scholars therefore easily learnt the true pronunciation. Clement of Alexandria (d. 212) gives 'Iáove or 'Iáovai (or in one manuscript 'Iáov), Origen (d. 253-54) 'Ián, and Epiphanius (d. 404) 'Iaβe (or 'Iave in one manuscript); Theodoret (d. 457) says that the Samaritans pronounced it 'Iaβe (or 'Iaβa) and the Jews Aīa (if the text is rightly restored). This direct testimony is supplemented by 'Iaβe or 'Iaβa or even 'Iawōne in Greek magical texts and by Yāwē in an Ethiopic charm. Clearly a form like *Yahweh* underlies all these transliterations except Aīa, which represents 'ehyeh or, in the Babylonian punctuation, 'ahyah, "I am," a verbal form sometimes used as the Divine name (Exod. iii. 14). Diodorus Siculus (1st century B.C.) and Macrobius (5th century A.D.), in giving 'Iáω, which agrees with *Iao* in Jerome (d. 420), reflect Yāhū; and Porphyry (fl. 275) with 'Iēw goes back to Yēhō—as found in proper names.

MODERN THEORIES

In spite of this testimony, modern scholars have differed widely as to the true pronunciation of the name. Thus Scaliger (1598) inclined to *Yahweh* or *Yehweh* and Genebrardus (1600) proposed *Ihus* (*cf.* Heb. *yihyeh*, "he becomes") or *Iahue*. Mercerus (d. 1570) suggested *Yehēweh* (*cf.* Heb. 'ehyeh, "I am"), Arias Montanus (1527-98) *Jeveh*, and Brinton (1899) *Jahva*. Other scholars were led astray by supposing that 'Iáω or *Iao* represented the *tetragrammaton*; thus Drusius (c. 1604) argued for *Jahvōh*, Beller-mann (1818) for *Yāhōh*, and Sayce (1894) for *Yāhāvah*. The arguments, however, of a succession of learned scholars from the end of the 15th to the beginning of the 19th century gradually prevailed; the support of Eichorn (1793) and the conversion of Gesenius (1786-1842) and Ewald (1803-75), who at first favoured *Yahwōh* and *Yēhōvāh* respectively, to *Yahweh* ensured the general acceptance of that form, although *Yahwōh* still finds occasional adherents.

The form *Yahweh*, in which the first *h* is voiced and the accent falls on the second syllable, is of the type of such a place-name as *Yabneh* (Eng. "Jabneh"), which is properly the imperfect tense of a verb and means "he causeth to build"; the alternative *Yabhnē'el* (Eng. "Jabneel"), meaning "God causes to build," shows that the implied subject in the abbreviated form is God. While, however, it is universally admitted that *Yahweh* is a verbal form, its precise sense is uncertain.

Firstly, it is disputed whether it is the intransitive or the causative theme; the former would be expected to take *i* in the first syllable, although this *i* was probably *a* originally, while the latter takes *a* invariably. Secondly, the root from which it is derived is open to doubt. The writer of the priestly narrative, who regards it as intransitive, identifies it with *yihyeh*, "he is" or "becomes," "he will be" or "become," when (having changed the third into the first person to suit the context) he explains it by the phrase 'EHYEH 'āsher 'EHYEH (Exod. iii. 14); this can be translated "I am that I am" or more exactly "I am wont to be that which I am wont to be" or "I will be that which I will be." The first implies that *Yahweh*'s nature can be defined only by itself or that, while he is, as opposed to non-existent heathen deities, he exists not simply in an abstract sense but actively, ever manifesting himself under fresh aspects (Oehler); the second means that he will be with Israel in future afflictions as in the present oppression (Rashi) or that he will show himself to Israel under the manifold attributes of goodness and so on (Davidson), or that he will be it, *viz.*, the performer of his promises (Ewald). The interpretation ὁ ὢν, "he who is," of the Alexandrian version, in implying metaphysically the assertion of this absolute being, is incorrect; for *hāyāh*, "became" or "was," denotes being phenomenally, not essentially or ontologically.

Although the general idea connected with the *tetragrammaton* by the priestly writer, and after him by the Israelites, was obvi-

ously that of a being who both is and manifests his being, the possibility cannot be excluded that he intended to attach to it a theological sense totally different from its original meaning. It was already recognized in the middle ages that formally it might have a causative meaning (Aaron ben Elijah). Consequently it has been translated "he causes to be," and this has been variously interpreted as signifying that he creates or gives life (Gesenius) in the sense that he is the giver either of existence (Schrader) or of life and deliverance (Kuenen), that he calls into existence the events of history (Lagarde), or that he brings to pass, viz., performs his promises (Le Clerc).

The intransitive interpretation agrees with Hebrew tradition but is open to certain objections: that (1) *i* would be expected in place of *a* in the first syllable, and (2) the correct form is *hāyāh*, not *hāwāh*, "was" in biblical Hebrew. Both can be easily explained: (1) the *a* may be an archaism, of which there are traces in the Old Testament; (2) the form *hāwāh* is found sporadically in biblical Hebrew and, being customary in the neighbouring dialects, especially Aramaic, may once have been normal in Hebrew. The causative interpretation, apart from the doubt about *w* for *y*, is liable to far more serious objections: that (1) *hāyāh*, though used of a fulfilment of a definite promise or prediction, can hardly be abstractly so employed with no indication of the promise, and (2) the causative theme of *hāyāh* is found in no Semitic language, except late Syriac, but is replaced by that of some other root. Those, therefore, who still regard it as causative refer it to *hāwāh*, found once in Hebrew in the form *hāwā*, "fell"; they interpret this as "he causes to fall," *sc.* the rain (Robertson Smith; *cf.* Arab. *haway*, "fell"), or "he overthrows," *sc.* with lightning (Green; *cf.* Arab. *ahway*, "overthrew" and Heb. *hōwāh* or *hawwāh* "destruction"). But, even though Yahweh was often depicted as a storm-god, the fact that the Heb. *hāwā*, "fell," is late and rare renders this explanation highly improbable. Even less likely are the attempts to explain it either as "he falls" like a meteoric stone or "he blows" (Wellhausen; *cf.* Arab. *haway*, "fell" and "blēw"), on the grounds that his worship originated among the Kenites or Midianites or other tribes to the south of Palestine and that several places sacred to him, *e.g.*, Horeb, Sinai and Kadesh, lay in northern Arabia, or as "he loves" (Gardner; *cf.* Arab. *haway*, "loved"). Such Arabizing interpretations are *a priori* doubtful, and the traditional Hebrew explanation is in itself as reasonable as anything else hitherto proposed.

Outside the Old Testament *Yhwh* occurs only on the Moabite Stone (*c.* 850 B.C.); the usual form is *Yh* or *Yhw*, occurring in unvocalized texts of the 5th and 4th centuries B.C. These forms appear in the Old Testament sporadically as the independent *Yāh* and regularly as *Yāh*- or *Yāhū*- at the end and *-Yēhō* or *-Yō* at the beginning of proper names. Elsewhere the initial and final forms in composition respectively are *Yw*- and *-Yw* in the 9th, *Yh*- and *-Yhw* in the 7th, *Yhw*- and *-Yhh* in the 6th, *Yh*- and *-Yhw* or *-Y* in the 5th century B.C.; thereafter most of these forms seem to have been used indiscriminately. In Assyrian and Babylonian texts, which alone give the contemporary vocalization, the tetragrammaton appears in transcribed Hebrew names as *Ya*- in the 9th, *Yau*- and *-Yau* or *-Ya* in the 8th, and *Yāhū*- and *-Yāma* (for *-Yāwa*) in the 5th century B.C. These point to *Yā* as the original pronunciation, in which case the final consonant was merely an orthographic device to avoid a final vowel; similarly, the medial *h* in *Yā(h)w* and *Yā(h)h* must have served merely to mark the *a* long. Afterwards, this *h* came incorrectly to be pronounced, as the hard *h* in *Yāhū*- and the Biblical *Yēhō*- and *-Yāhū* show. The forms *Yēhō*- and *Yō*-, which arise out of *Yēhau*- and *Yau*- respectively owing to a similar mispronunciation of the orthographic *w* and the change of *aw* or *au* into *ō* according to Hebrew practice, were fully established by the 3rd century B.C., since *ō* has replaced *a* almost always in the Septuagint.

It was formerly held that *Yāh* and similar forms were abbreviations of *Yahweh*. The arguments, however, against this view are overwhelming: (1) the short forms show that *ya* was the essential syllable, although on this theory it would be merely a prefix; (2) the inscriptions and papyri, as well as proper names,

show that *Yh* or *Yhw*, not *Yahweh*, was the extra-biblical form; (3) it is *a priori* improbable that a name held so sacred as *Yahweh* would be commonly abbreviated; (4) no other Semitic race ever shortened the names of its gods; (5) the endeavour to assign an abstract meaning to a divine name bears the impress of a later period of theological reflection. It has, therefore, been suggested, as Greek speculation shows, that *Yahweh* comes from an original *Yahw*, afterwards vocalized *Yāhū*, either by adding a questionable ending *-ay* become *-eh* (Grimme) or an *-h* like the Arabic vocative *-āh* (Lukyn Williams and Burkitt) or else by assimilation to *yihyeh*, "he is" (van Hoonacker). This last suggestion is probably correct; but, even so, it fails to account for *Yāh* as well as *Yāhū*. It is, however, not impossible that the primitive form was simply *Yā*, which Hebrew orthography required to be written *Yāw* or *Yāh*; later, when *w* was not thought sufficient to indicate the long vowel, *h* was inserted, giving rise to *Yā(h)w*, which came to be mispronounced *Yāhū* (on the false analogy of *sāhw* developed into *sāhū*, "swimming"). This development explains the presence of *a* and *w*, where *i* and *y* would be expected if *Yahweh* were connected with the substantive verb; for primarily they belonged to the primitive *Ya(hw)*, but secondarily the recollection of the archaic *a* in the imperfect tense and of the North-Palestinian and Aramaic *hāwāh* = *hāyāh*, "became," aided their retention.

This *Yā* was probably ejaculatory in origin (*cf.* Gr. *Βάκχος* and *Τακχος*); for *yā* or *yāh* is a common Semitic exclamation. At the Exodus the national unity of the Hebrews was enforced by the worship of one national God, and the adoption of the pre-eminent God of the patriarchs together with the alteration of his name from the meaningless *Yā* to the significant *Yahweh* reinforced the new idea. The transition, which was effected by a prolongation of the ejaculation natural in moments of emotion or excitement, may have been a gradual process; but its assimilation to and explanation by a simple verb was an act of inspiration. This new name, though at first widely known, as the Moabite Stone shows, was soon considered too sacred for daily use and confined to the Scriptures, while the older form persisted in profane use. On this theory there is no essential discrepancy between the statement that in the days of Enosh men began "to call upon the name of *Yahweh*" (Gen. iv. 26) and God's assertion that in the time of the patriarchs "by my name *Yahweh* I was not known" (Exod. vi. 3); for the writer or compiler of the first passage substituted the later *Yahweh* where strict history required *Yāh*, while in the second he was right to the extent that God was known not as *Yahweh* but as *Yāh* before the Exodus.

It has been argued on several grounds that *Yahweh* was originally a non-Hebrew deity. That he was a Kenite (Tiele) or Canaanite (Land) god is little more than conjecture. Thus it has been claimed that the name *Ahiyami*, found on a cuneiform tablet at Taanach (*c.* 1300 B.C.?) is the Hebrew *Ahiyāh*, "Ahijah," meaning "brother of *Yami* (*Yawi*) = *Yah(weh)*"; but this final element may just as well be *Yamu*, a deity apparently found in the Hebrew *Yēmū'el*, "Jemuel," which means "*Yēmū* = *Yamu* is god," or corresponds with *-ām* as seen in the Hebrew *Ahi'ām*, "Ahijah," in which case it is a mere termination. A Babylonian connection for *Yāhū*, afterwards Hebraized as *Yahweh*, has been urged on the ground that a god called *Yāu(m)* occurs in such names as the Bab. *Yāum-ilum* which is compared with the Heb. *Yō'el*, "Yahweh is God"; but the absence of the determinative sign indicating a god before *yāum* and the discovery of the possessive pronoun *yāum*, "my," makes the rendering "Mine is God" far more plausible. Similarly, in such names as *Yāwe-ilum* it is probable that *yāwe* is not a divine name but a verbal element, although its meaning is still unknown. Again, names like the Bab. *Bēliya* and *Bēliu* are not identifiable with the Heb. *Ba'alyāh*, "Yah is lord," not only because there is no mark of divinity before the final element but also because *-ya*, *yau* and so on are well known hypocoristic endings in Assyro-Babylonian, as in the neighbouring languages. The argument for the existence of a Babylonian god called *Yau* rests entirely on proper names; and, since these can be otherwise satisfactorily explained, it must be given up. Further, the occurrence of *Yāh* in proper names outside Hebrew

territory proves nothing; for *Azriyāu* ("Azariah"), lord of Ya'udi, *Yau-bi'di*, king of Hamath, and *Yôrām* ("Jehoram"), prince of Hamath, may have been Hebrews or descendants of Hebrews who had settled abroad and founded their own petty kingdoms; so *Yô'el* ("Joel," if the name is rightly interpreted) on a Maltese inscription may be the name of a Jewish settler. Names like "Uriah" the Hittite and "Tobiah" the Ammonite prove even less, since the ending may be not the divine element but a Hebraized form of the hypocoristic *-ya*; the Assyrian *Tābiya* and *Uriyā*, as well as the Cassite *Uriya*, are the foreign counterparts of these names. Yet the common recognition of heathen gods outside their own countries as attested on monuments and in proper names makes it necessary to admit the possibility of a sporadic worship of a god called *Yahweh* outside Hebrew territory. But the evidence hitherto adduced is equivocal and indirect, and no direct evidence exists; for the identification of the Heb. *Yāh* with the Bab. *Ea*, the god of wisdom, is a discovery periodically made by amateurs, which needs no refutation.

JEHU, a king of Israel. Son of Jehoshaphat and grandson of Nimshi, he was at first general of Ahab and Jehoram of Israel, and was noted for his furious driving of the chariot. During the joint expedition of Jehoram of Israel and Ahaziah of Judah, the former was wounded, and retired to Jezreel, where he was visited by the king of Judah. Instigated by the prophetic party and supported by the Rechabites, Jehu organised a revolution, hastened to Jezreel, where he put to death both Jehoram and Ahaziah, whilst he had the whole of the family of Ahab assassinated. The movement was the result of patriotic hostility to the foreign political theories and the religious innovations introduced by Jezebel from Sidon, which offended both the democratic feeling and the enthusiasm for Yahweh which were characteristic of Israel. Thus not only Jezebel herself but also large numbers of Baal worshippers were put to death.

In the course of an expedition against Damascus, undertaken in 841 B.C., Shalmaneser III. received tribute from Jehu. This was probably paid in order to secure Assyrian protection for the new régime, but it did not prevent the loss of much Israelite territory to the east of Jordan, or continuous war between Jehu and Hazael, king of Damascus, after the withdrawal from the country of the Assyrian armies.

Jehu is also the name of a prophet of the time of Baasha and Jehoshaphat (I Kings xvi.; II Chron. xix. seq.).

JELGAVA (German, *Mitau*), a town of Latvia, 29 m. by rail S.W. of Riga, on the river Aa, in a fertile plain only 12 ft. above sea level. Pop. (1925) 28,321. Jelgava is supposed to have been founded in 1266 by Conrad Mandern, grand-master of the order of the Brethren of the Sword. In 1345, when plundered by the Lithuanians, it was already an important town. In 1561 it became the residence of the dukes of Courland. During the 17th century it was thrice taken by the Swedes. Russia annexed it with Courland in 1795. At high water the plain and sometimes also the town are inundated. Jelgava is surrounded by a canal occupying the place of former fortifications. The old castle (1266) of the dukes of Courland was destroyed by Duke Biren, who erected in its place (1738-1772) a palace. Wax-cloth, linen, soap, ink and beer are the chief manufactures.

JELLAČIĆ, JOSEF, COUNT (1801-1859), Croatian soldier and statesman, was born at Pétervárdein, in the Croatian Military Frontier, on Oct. 16, 1801. Entering the Austrian army (1819), he saw service in Bosnia (1845), but it was not his military capacities, but his strong legitimist sympathies that led the emperor Ferdinand, on the advice of Baron Josika, to appoint him ban of Croatia and promote him to lieutenant-general on March

19, 1848, in order to counteract the national movement in Hungary. Jellačić took office on April 14, and immediately began the process of dissociating Croatia from Hungary, to place it directly under Austrian rule. The Hungarian Government, which was still in name loyal and constitutional, ordered Jellačić's measures to be annulled and himself to appear in Buda on a charge of high treason. Jellačić disregarded these orders; whereupon the Hungarian Count Batthyáni visited the Austrian court at Innsbruck and secured (it is said, by a trick) signature of a manifesto condemning the separatist movement in Croatia and depriving Jellačić of all his deputies.

Jellačić, who only a week after (June 19) himself appeared in Innsbruck and was hailed by the court as one of its chief pillars, disregarded the proclamation, and encouraged the separatist movement in the Croatian diet to run its course. On July 9, however, he prorogued it in view of the military situation, and as the movement in Hungary grew rapidly more extreme, the court grew more and more convinced that its salvation lay in the counter-movement led by Jellačić and his Croats. On Sept. 4 he was officially reinstated in his dignities, with a warm testimonial to his loyalty; and on Sept. 11 he crossed the Drave at the head of his troops, to attack Hungary. As a general, Jellačić was anything but talented, and was frequently defeated by the Magyar troops; but his regiments were largely instrumental in crushing the Magyars. Although the reorganization of Croatia carried through by the reaction was far from meeting his own wishes, he personally was loaded with honours. He was left in the post of civil and military governor of Croatia and the military frontier, created count (1855) and given command of the military expedition against Montenegro. He died on May 20, 1859. He published a volume of *Gedichte* in 1851.

JELlicoe, JOHN RUSHWORTH JELlicoe, 1ST EARL (1859-), British admiral, was born Dec. 5, 1859, the son of J. H. Jellicoe, a captain in the mercantile marine. His great-grandfather was Sir James Whalley Smyth Gardiner, the third and last baronet of that name. Educated at Rottingdean, he entered the navy as a naval cadet at the age of thirteen. He obtained his commission as sub-lieutenant in 1880, and his marked ability won him first class certificates in this three examinations for the rank of lieutenant. He soon developed an interest in gunnery and joined the Royal Naval College in 1883 for the theoretical part of the course for gunnery lieutenant, where he won a special £80 prize. The following year he spent in H.M.S. "Excellent," and became a fully qualified gunnery officer. From now onwards gunnery was his speciality, though his interests were by no means confined to this branch.

His first sea-going ship as a gunnery lieutenant was H.M.S. "Monarch," in which he served from 1886 to 1888. During his first year on board he went to the rescue of the crew of a stranded steamer, taking charge of a gig manned by volunteers. The boat upset in a heavy sea and he and the crew saved themselves with difficulty. He received the Board of Trade silver medal for his plucky effort. After two years on the senior staff of the Gunnery School, he was appointed to the admiralty as an assistant to the director of naval ordnance. In 1893 he was promoted to commander, and shortly afterwards was appointed to H.M.S. "Victoria," flagship of Admiral Sir George Tryon, commander-in-chief of the Mediterranean Fleet. When the "Victoria" was rammed and sunk by the "Camperdown," Commander Jellicoe had to take to the water. As he was seriously ill at the time he would have fared badly but for the support he received from a young naval cadet, P. D. Roberts-West, until rescued.

Commander Jellicoe soon recovered and two months later was appointed to the battleship "Ramillies" which flew the flag of the new commander-in-chief, Admiral Sir Michael Culme-Seymour. After a three years commission in that ship he was promoted captain on Jan. 1, 1897, and served on the Ordnance Committee. In 1898 he was appointed to the command of H.M.S. "Centurion," where he became flag captain to Admiral Sir Edward Seymour, commander-in-chief of the China Station. As the latter's chief of staff he took part in the expedition to relieve the legations in Peking during the Boxer rising in 1900. During

these operations Captain Jellicoe was badly wounded. He was subsequently awarded the C.B.

Service at the Admiralty.—He returned to the Admiralty in 1902 to be the naval assistant to the controller (third sea lord). Here he acquired a valuable insight of the work of that department. In August 1903 he went to sea again to take command of the armoured cruiser "Drake." The year 1905 saw him director of naval ordnance at the Admiralty. During his period of office he did much to further the advance of long range firing and to assist the development of naval gunnery on lines which more closely approximated to the real conditions of war. Towards the end of his time he reached the top of the captains' list and was promoted to flag rank in February 1907. In August of that year he hoisted his flag afloat in H.M.S. "Albemarle" as rear-admiral in the Atlantic Fleet. The appointment was for a year's duration only, when once more he returned to the admiralty, this time to become a member of the Board as third sea lord and controller of the navy. In December 1910 he was appointed acting vice-admiral in command of the Atlantic Fleet, being confirmed in that rank in the following November. At the end of the year he transferred his flag to H.M.S. "Hercules," on appointment to the command of the 2nd division of the Home Fleet.

In 1912 important gunnery experiments were carried out by two battleships of this division, the "Thunderer" and "Orion," the former being fitted with this system of director firing which Sir Percy Scott had been perfecting. The trials culminated in competitive firings under Admiral Jellicoe's personal supervision. As a result of these practices and largely owing to Admiral Jellicoe's insistent pressure, this most valuable system was adopted as the primary one for laying and firing the guns of practically all classes of H.M. ships. The event may be regarded as yet another milestone on the path of that gunnery progress for which he was greatly responsible. After a year in this command he returned to the Admiralty to rejoin the Board as second sea lord.

The War Period.—He left Whitehall temporarily in 1913 to become commander-in-chief of the "Red" fleet during manoeuvres, flying his flag in H.M.S. "Thunderer," but had returned to the Admiralty, when, on the eve of war, he was sent to join the Home Fleet at Scapa as second in command. The period of command of Admiral Sir George Callaghan was due to expire in a few months and Vice-Admiral Jellicoe had already been designated as his successor. When war could no longer be averted, it was considered desirable that the change in this most responsible naval command should not be delayed and Sir John Jellicoe was appointed commander-in-chief with acting rank of admiral. He had to perform a peculiarly difficult and trying duty in relieving his former chief, who was trusted and respected in an unusual degree throughout the fleet. That he achieved it so successfully was due to the chivalrous attitude of these two flag officers towards each other and to the very high reputation and strong personal regard which Sir John himself enjoyed.

Admiral Jellicoe was confirmed in his rank in March 1915, and for two years bore the exceptionally heavy burden of organising and training the Grand Fleet and keeping it ready for battle. His command was put to the test at the battle of Jutland (*q.v.*). Now that the full details of that action are better understood, the skillful handling of the British forces against an elusive enemy in conditions of low visibility and approaching darkness, is being increasingly appreciated. The German fleet escaped at night and took refuge in harbour with many ships severely damaged, and such was the impression left by Jutland that Germany never again risked a meeting with the Grand Fleet. The fruits of Admiral Jellicoe's leadership on that day and of his incomparable services throughout his period of command were seen in the historic surrender of German ships at the end of the War.

In the latter part of 1916 Admiral Jellicoe was invited to become first sea lord and regretfully left his last and greatest command afloat to take up that appointment. It was largely due to his tireless labours and wide experience that the danger of the German submarine menace was eventually overcome. He left the Admiralty at the end of 1917. After the Armistice he was sent on a special mission to visit the Dominions and advise on the

post-war organisation of their navies. On this tour he flew his flag in H.M.S. "New Zealand." He was promoted to Admiral of the Fleet in 1919 and the following year was made governor of New Zealand. During his four years in this high office he greatly endeared himself to the people of that Dominion.

For his services in the War Admiral Jellicoe received the thanks of parliament and a grant of £50,000, and at the end of 1918 he was raised to the peerage as Viscount Jellicoe of Scapa, subsequently taking the additional title of Viscount Brocas of Southampton. On his return from New Zealand and in recognition of his services as governor he was, in 1925, created an Earl. He received the K.C.V.O. in 1907, G.C.B. in 1915 and G.C.V.O. in 1916; he also holds a number of foreign orders. He married, in 1902, the daughter of Sir Charles Cayzer, Bart., and has four daughters and a son and heir, Viscount Brocas, who was born in 1918. Earl Jellicoe possesses in remarkable degree the power of inspiring others with his own loyalty and singleness of purpose. Few naval commanders since Nelson's time have enjoyed such devotion and confidence as he did as commander-in-chief of the greatest fleet that ever set forth to do battle. (E. A.; X.)

He published *The Grand Fleet 1914-16, its Creation, Development and Work* (1920); *The Crisis of the Naval War* (1920).

JELLINEK, ADOLF (1821-1893), Jewish preacher and scholar, was born in Moravia. After filling clerical posts in Leipzig, he became *Prediger* (preacher) in Vienna in 1856. He was associated with the promoters of the New Learning within Judaism, and wrote on the history of the Kabbala. His bibliographies (each bearing the Hebrew title *Qontres*) were useful compilations. But his most important work lay in three other directions. (1) *Midrashic*. Jellinek published in the six parts of his *Beth ha-Midrash* (1853-1878) a large number of smaller *Midrashi*, ancient and mediaeval homilies and folk-lore records, which have been of much service in the recent revival of interest in Jewish apocalyptic literature. A translation of these collections of Jellinek into German was undertaken by A. Wuensche, under the general title *Aus Israels Lehrhalle*. (2) *Psychological*. Before the study of ethnic psychology had become a science, Jellinek devoted attention to the subject. There is much keen analysis and original investigation in his two essays *Der jüdische Stamm* (1869) and *Der jüdische Stamm in nicht-jüdischen Spruch-wörtern* (1881-1882). It is to Jellinek that we owe the oft-repeated comparison of the Jewish temperament to that of women in its quickness of perception, versatility and sensibility. (3) *Homiletic*. Jellinek was probably the greatest synagogue orator of the 19th century. He published some 200 sermons, in most of which are displayed unobtrusive learning, fresh application of old sayings, and a high conception of Judaism and its claims. Jellinek was a powerful apologist and an accomplished homilist, at once profound and ingenious.

See *Jewish Encyclopedia*, vii. 92-94. For a character sketch of Adolf Jellinek see S. Singer, *Lectures and Addresses* (1908), pp. 88-93; Kohut, *Berühmte israelitische Männer und Frauen*. (I. A.)

JEMAPPES, town, province of Hainaut, Belgium, near Mons, the scene of the battle at which Dumouriez, with the French Revolutionary army, defeated the Austrian army under the duke of Saxe-Teschen and Clerfayt on Nov. 6, 1792 (see FRENCH REVOLUTIONARY WARS).

The Battle of Jemappes (1792).—The wars of Louis XIV. and Louis XV. had shown the advantage of an offensive in Belgium, since Belgium was the weak point in the Hapsburg front. The Austrians had failed in their efforts against Lille, and Dumouriez in command of the Army of the North at Valenciennes at once issued a stirring appeal to the Belgians. Then, in order to mask his intentions, he threatened the Austrians at several points, compelling them to extend their front while with speed he advanced to crush their main forces at Mons.

The Austrians under Duke Albert of Saxe-Teschen had been strongly reinforced by Clerfayt, though Dumouriez was not aware of this. Their combined forces numbered about 25,000 men and 50 guns, whilst the French army was probably 55,000 strong and

was accompanied by 100 guns. The Austrian position was a strong one. Clerfaut's right was entrenched at Jemappes (province of Hainaut, Belgium), his centre on a ridge south of the village, the eastern slopes of which extended to Cuesmes where his left was posted. As Dumouriez points out the only fault in the position was its difficult line of retreat.

Dumouriez' plan was to engage Clerfaut's right and centre, and turn his left; for this turning movement he ordered General Har-

PLAN OF THE BATTLE OF JEMAPPES, NOV. 6, 1792

ville and some 10,000 troops to move up from Maubeuge, out-flank the Austrian left and cut Clerfaut off from Mons. Harville's forward movement was, however, too slow to effect this, and the plan had to be modified.

Early on Nov. 6 Dumouriez dislodged Clerfaut's advanced troops at Quaregnon, and then checked his advance to enable Harville to come up. As he did not appear, and as his young troops were eager to attack, he opened the battle by a bombardment on the Jemappes entrenchments and batteries that crowned the slopes towards Cuesmes. Then, forming his columns of attack, he assaulted the Austrian right and centre. On the right General Beurnonville moved against Cuesmes. This attack failed all along the line except on the south of Jemappes, where a lodgment compelled Clerfaut to retreat across the Trouville stream. As the centre recoiled before the enemy's cannon, Dumouriez and his staff rode forward, amongst whom was the young Duke de Chartres (Philippe Égalité), and forming a solid column he called it *le bataillon de Mons*. Leading it forward he drove in the Austrian centre which was already feeling the pressure of the French at Jemappes, as these troops were beginning to threaten their rear. The batteries at Cuesmes were then taken in a hand to hand struggle, and the Austrians seeing Harville's corps advancing in the distance withdrew to Mons, and on the 7th retired to Brussels.

Each side lost some 7,000 men killed and wounded. The moral gain to the French was immense; without manoeuvre they had succeeded in imposing their will, and as one historian writes: "At Valmy they had merely stood their ground; at Jemappes they learnt to conquer."

JENA, a university town of Germany, in the republic of Thuringia, on the left bank of the Saale, 56 m. S.W. from Leipzig by the Grossberigen-Saalfeld and 12 m. S.E. of Weimar by the Weimar-Gera lines of railway. Pop. (1925) 53,623. Jena appears to have possessed municipal rights in the 13th century. It passed in 1423 from the margraves of Meissen to the elector of Saxony. In 1690 Jena was united with Eisenach, and in 1741 reverted to Weimar.

To the north lies the limestone plateau, descending steeply to the valley, famous as the scene of the battle of Jena (1806) in

which Napoleon defeated the Prussians. It contains in addition to the mediaeval market square, many old-fashioned houses and narrow streets. Besides the old university buildings, the most interesting edifices are the 15th-century church of St. Michael, the university library and the bridge across the Saale. Hard by is the Fuchs-Turm (Fox tower) celebrated for student orgies, while in the centre of the town is the house of an astronomer, Weigel, with a deep shaft through which the stars can be seen in the day time. There must also be mentioned the university church, the new university buildings, which occupy the site of the ducal palace (Schloss) where Goethe wrote his *Hermann und Dorothea*, the Schwarzer Bär hotel, where Luther spent the night after his flight from the Wartburg, and four towers and a gateway which now alone mark the position of the ancient walls. In 1547 the elector John Frederick the Magnanimous of Saxony, while a captive of the emperor, conceived the plan, carried out by his three sons of a university at Jena. A charter having been obtained from the emperor Ferdinand I., it was inaugurated in 1558. The most brilliant professoriate was under the duke Charles Augustus, Goethe's patron (1787–1806), when Fichte, Hegel, Schelling, Schlegel and Schiller were on its teaching staff. Founded as a home for the new religious opinions of the 16th century, it has even been in the forefront of German universities in liberal acceptance of new ideas. At the end of the 18th and the beginning of the 19th century, the opening of new universities, co-operating with the suspicions of the various German Governments as to the democratic opinions which obtained at Jena, militated for a while against the university. It had 180 teachers and 1,972 students in 1926. Amongst its numerous auxiliaries may be mentioned the library, the observatory, the meteorological institute and the botanical garden. There are also veterinary and agricultural colleges in connection with the university. The book trade has of late years revived, and there are several printing establishments.

The famous Zeiss firm of optical instrument makers has its seat at Jena and the town has profited in many ways therefrom. Scientific instruments, chemicals, machinery, etc., are also made.

Battle of Jena.—This famous victory on Oct. 14, 1806, by Napoleon over the Prussian army under the prince of Hohenlohe is described under NAPOLEONIC CAMPAIGNS.

JENATSCH, GEORG (1596–1639), Swiss political leader, one of the most striking figures in the troubled history of the Grisons in the 17th century, was born at Samaden, the Upper Engadine. He studied at Zürich and Basel, and in 1617 became the Protestant pastor of Scharans (near Thusis). He took the side of the Venetian and Protestant party of the Salis family, as against the Spanish and Romanist policy supported by the rival family, that of Planta. He headed the "preachers" who in 1618 tortured to death the arch-priest Rusca, of Sondrio, and outlawed the Plantas. As reprisals, a number of Protestants were massacred at Tirano (1620), which then fell into the hands of the Spanish. Jenatsch took part in the murder (1621) of Pompey Planta, the head of the rival party, but later with his friends was compelled to fly the country, giving up his position as a pastor, and henceforth acting solely as a soldier. He helped in the revolt against the Austrians in the Prättigau (1622), and in the invasion of the Valtellina by a French army (1624), but the peace made (1626) between France and Spain left the Valtellina in the hands of the pope, and so destroyed Jenatsch's hopes.

Having killed his colonel, Ruinelli, in a duel, Jenatsch had once more to leave his native land, and took service with the Venetians (1629–1630). In 1631 he went to Paris, and supported Richelieu's schemes for driving the Spaniards out of the Valtellina, which led to the successful campaign of Rohan (1635), one of whose firmest supporters was Jenatsch. But he soon saw that the French were as unwilling as the Spaniards to restore the Valtellina to the Grisons (which had seized it in 1512). So he became a Romanist (1635), and negotiated secretly with the Spaniards and Austrians. He was the leader of the conspiracy which broke out in 1637, and resulted in the expulsion of Rohan and the French from the Grisons. This treachery on Jenatsch's part did not, however, lead to the freeing of the Valtellina from the Spaniards, and once more he tried to get French support. But

on Jan. 24, 1639 he was assassinated at Coire by the Plantas; later in the same year the much coveted valley was restored by Spain to the Grisons, which held it till 1797.

Jenatsch's career is of general historical importance by reason of the long conflict between France and Spain for the possession of the Valtellina, which forms one of the most bloody episodes in the Thirty Years' War. (W. A. B. C.)

See biography by E. Haffter (Davos, 1894).

JENGHIZ KHAN (jěng'iz chahn) (1162-1227), Mongol emperor, born on the banks of the river Onon. His father Yesukai was absent at the time of his birth, in a campaign against a Tatar chieftain named Temuchin. The war brought success to Yesukai, who having slain his enemy returned to his encampment in triumph. He was met by the tidings that his wife Yulun had given birth to a son. On examining the child he observed in its clenched fist a clot of coagulated blood like a red stone. In the eyes of the superstitious Mongol this circumstance referred to his victory over the Tatar chieftain, and he therefore named the infant Temuchin. The death of Yesukai, which placed Temuchin at the age of 13 on the Mongol throne, was the signal also for the dispersal of several tribes whose allegiance the old chieftain had retained by his iron rule. When remonstrated with by Temuchin, the rebels replied: "The deepest wells are sometimes dry, and the hardest stone is sometimes broken; why should we cling to thee?" But Yulun was by no means willing to see her son's power melt away; she led those retainers who remained faithful against the deserters, and succeeded in bringing back fully one-half to their allegiance. With this doubtful material, Temuchin succeeded in holding his ground against the plots and open hostilities of the neighbouring tribes, more especially of the Naimans, Keraites and Merkits. With one or other of these he maintained an almost unceasing warfare until 1206, when he felt strong enough to proclaim himself the ruler of an empire. He therefore summoned the notables of his kingdom to an assembly on the banks of the Onon, and at their unanimous request adopted the name and title of Jenghiz Khan (Chinese, Chêng-sze, or "perfect warrior"; the correct Mongolian spelling is Chingiz, and scholars of oriental studies sometimes spell it in that manner). At this time there remained to him but one open enemy on the Mongolian steppes, Polo the Naiman khan. Against this chief he now led his troops, and in one battle so completely shattered his forces that Kushlek, the successor of Polo, who was left dead upon the field, fled with his ally Toto, the Merkit khan, to the river Irtysh.

CHINESE CONQUESTS

Jenghiz Khan now meditated an invasion of the empire of the Kin Tatars, who had wrested northern China from the Sung dynasty. As a first step he invaded western Hia, and, having captured several strongholds, retired in the summer of 1208 to Lungting to escape the great heat of the plains. While there news reached him that Toto and Kushlek were preparing for war. In a pitched battle on the river Irtysh he overthrew them completely. Toto was amongst the slain, and Kushlek fled for refuge to the Khitan Tatars. Satisfied with his victory, Jenghiz again directed his forces against Hia. After having defeated the Kin army under the leadership of a son of the sovereign, he captured the Wuliang-hai pass in the Great Wall, and penetrated as far as Ning-sia Fu in Kansuh. With unceasing vigour he pushed on his troops, and even established his sway over the province of Liao-tung. Several of the Kin commanders, seeing how persistently victory attended his banners, deserted to him, and garrisons surrendered at his bidding. Having thus secured a firm footing within the Great Wall, he despatched three armies in the autumn of 1213 to overrun the empire. The right wing, under his three sons, Juji, Jagatai and Ogotai, marched towards the south; the left wing, under his brothers Hochar, Kwang-tsin Noyen and Chow-tse-tepo-shi, advanced eastward towards the sea; while Jenghiz and his son Tulé with the centre directed their course in a south-easterly direction. Complete success attended all three expeditions. The right wing advanced as far as Honan, and after having captured upwards of 28 cities rejoined headquarters by the great western road. Hochar made himself master of the country as far as Liao-

si; and Jenghiz ceased his triumphal career only when he reached the cliffs of the Shantung promontory. But either because he was weary of the strife, or because it was necessary to revisit his Mongolian empire, he sent an envoy to the Kin emperor in the spring of the following year (1214), saying, "All your possessions in Shantung and the whole country north of the Yellow river are now mine with the solitary exception of Yenking (the modern Peking). By the decree of heaven you are now as weak as I am strong, but I am willing to retire from my conquests; as a condition of my doing so, however, it will be necessary that you distribute largess to my officers and men to appease their fierce hostility." These terms of safety the Kin emperor eagerly accepted, and as a peace offering he presented Jenghiz with a daughter of the late emperor, another princess of the imperial house, 500 youths and maidens and 3,000 horses. No sooner, however, had Jenghiz passed beyond the Great Wall than the Kin emperor, fearing to remain any longer so near the Mongol frontier, moved his court to K'ai-fêng Fu in Honan. This transfer of capital appearing to Jenghiz to indicate a hostile attitude, he once more marched his troops into the doomed empire.

While Jenghiz was thus adding city to city and province to province in China, Kushlek, the fugitive Naiman chief, was not idle. With characteristic treachery he requested permission from his host, the Khitan khan, to collect the fragments of his army which had been scattered by Jenghiz at the battle on the Irtysh, and thus having collected a considerable force he leagued himself with Mohammed, the shah of Khwārizm, against the confiding khan. After a short but decisive campaign the allies remained masters of the position, and the khan was compelled to abdicate the throne in favour of the late guest.

With the power and prestige thus acquired, Kushlek prepared once again to measure swords with the Mongol chief. On receiving the news of his hostile preparations, Jenghiz at once took the field, and in the first battle routed the Naiman troops and made Kushlek a prisoner. His ill-gotten kingdom became an appanage of the Mongol empire. Jenghiz now held sway up to the Khwārizm frontier. Beyond this he had no immediate desire to go, and he therefore sent envoys to Mohammed, the shah, with presents, saying, "I send thee greeting; I know thy power and the vast extent of thine empire; I regard thee as my most cherished son. On my part thou must know that I have conquered China and all the Turkish nations north of it; thou knowest that my country is a magazine of warriors, a mine of silver, and that I have no need of other lands. I take it that we have an equal interest in encouraging trade between our subjects." This peaceful message was well received by the shah, and in all probability the Mongol armies would never have appeared in Europe but for an unfortunate occurrence. Shortly after the despatch of this first mission, Jenghiz sent a party of traders into Transoxiana who were seized and put to death as spies by Inaljuk, the governor of Otrar. As satisfaction for this outrage Jenghiz demanded the extradition of the offending governor. Far from yielding to this summons, however, Mohammed beheaded the chief of the Mongol envoys, and sent the others back without their beards. This insult made war inevitable, and in the spring of 1219 Jenghiz set out from Karakorum on a campaign which was destined to be as startling in its immediate results as its ulterior effects were far-reaching.

SACKING OF BUKHĀRĀ

The invading force was in the first instance divided into two armies: one commanded by Jenghiz's second son Jagatai was directed to march against the Kankalis, the northern defenders of the Khwārizm empire; and the other, led by Juji, his eldest son, advanced by way of Signak against Jand (Jend). Against this latter force Mohammed led an army of 400,000 men, who were completely routed, leaving, it is said, 160,000 dead upon the field. With the remnant of his host Mohammed fled to Samarcand. Meanwhile Jagatai marched down upon the Syr Daria (Jaxartes) by the pass of Taras and invested Otrar, the offending city. After a siege of five months the citadel was taken by assault, and Inaljuk and his followers were put to the sword.

The conquerors levelled the walls with the ground, after having given the city over to pillage. At the same time a third army besieged and took Khojent on the Jaxartes; and yet a fourth, led by Jenghiz and his youngest son Tulē, advanced in the direction of Bukhārā. Tashkent and Nur surrendered on their approach, and after a short siege Bukhārā fell into their hands. On entering the town Jenghiz ascended the steps of the principal mosque, and shouted to his followers, "The hay is cut; give your horses fodder." No second invitation to plunder was needed; the city was sacked, and the inhabitants either escaped beyond the walls or were compelled to submit to infamies which were worse than death. As a final act of vengeance the town was fired, and before the last of the Mongols left the district, the great mosque and certain palaces were the only buildings left to mark the spot where the "centre of science" once stood.

From the ruins of Bukhārā Jenghiz advanced along the valley of the Sogd to Samarcand, which, weakened by treachery, surrendered to him, as did also Balkh. But in neither case did submission save either the inhabitants from slaughter or the city from pillage. Beyond this point Jenghiz went no farther westward, but sent Tulē, at the head of 70,000 men, to ravage Khurāsān, and two flying columns under Chēpē and Sabutai Bahadar to pursue after Mohammed who had taken refuge in Nishapur. Defeated and almost alone, Mohammed fled before his pursuers to the village of Astara on the shore of the Caspian sea, where he died of an attack of pleurisy, leaving his empire to his son Jelaeddin (Jalāl ud-din). Meanwhile Tulē carried his arms into the fertile province of Khurāsān, and after having captured Nessa by assault appeared before Merv. By an act of atrocious treachery the Mongols gained possession of the city, and, after their manner, sacked and burnt the town. From Merv Tulē marched upon Nishapur, where he met with a most determined resistance. For four days the garrison fought desperately on the walls and in the streets, but at length they were overpowered, and, with the exception of 400 artisans who were sent into Mongolia, every man, woman and child was slain. Herat escaped the fate which had overtaken Merv and Nishapur by opening its gates to the Mongols. At this point of his victorious career Tulē received an order to join Jenghiz before Talikhan in Badakshan, where that chieftain was preparing to renew his pursuit of Jelaeddin, after a check he had sustained in an engagement fought before Ghazni. As soon as sufficient reinforcements arrived Jenghiz advanced against Jelaeddin, who had taken up a position on the banks of the Indus. Here the Turks, though far outnumbered, defended their ground with undaunted courage, until, beaten at all points, they fled in confusion. Jelaeddin, seeing that all was lost, mounted a fresh horse and jumped into the river, which flowed 20ft. below. With admiring gaze Jenghiz watched the desperate venture of his enemy, and even saw without regret the dripping horseman mount the opposite bank. From the Indus Jenghiz sent in pursuit of Jelaeddin, who fled to Delhi, but failing to capture the fugitive the Mongols returned to Ghazni after having ravaged the provinces of Lahore, Peshawar and Melikpur. At this moment news reached Jenghiz that the inhabitants of Herat had deposed the governor whom Tulē had appointed over the city, and had placed one of their own choice in his room. To punish this act of rebellion Jenghiz sent an army of 80,000 men against the offending city, which after a siege of six months was taken by assault. For a whole week the Mongols ceased not to kill, burn and destroy, and 1,600,000 persons are said to have been massacred within the walls. Having consummated this act of vengeance, Jenghiz returned to Mongolia by way of Balkh, Bukhārā and Samarcand.

APPEARANCE IN EUROPE

Meanwhile Chēpē and Sabutai marched through Azerbaijan, and in the spring of 1222 advanced into Georgia. Here they defeated a combined force of Lesghians, Circassians and Kipchaks, and after taking Astrakhan followed the retreating Kipchaks to the Don. The news of the approach of the mysterious enemy of whose name even they were ignorant was received by

the Russian princes at Kiev with dismay. At the instigation, however, of Mitislaf, prince of Galicia, they assembled an opposing force on the Dnieper. Here they received envoys from the Mongol camp, whom they barbarously put to death. "You have killed our envoys," was the answer made by the Mongols; "well, as you wish for war you shall have it. We have done you no harm. God is impartial; He will decide our quarrel." In the first battle, on the river Kaleza, the Russians were utterly routed, and fled before the invaders, who, after ravaging Great Bulgaria retired, gorged with booty, through the country of Saksin, along the river Aktuba, on their way to Mongolia.

In China the same success had attended the Mongol arms as in western Asia. The whole of the country north of the Yellow river, with the exception of one or two cities, was added to the Mongol rule, and, on the death of the Kin emperor Süan Tsung in 1223, the Kin empire virtually ceased to be, and Jenghiz's frontiers thus became conterminous with those of the Sung emperors who held sway over the whole of central and southern China. After his return from Central Asia, Jenghiz once more took the field in western China. While on this campaign the five planets appeared in a certain conjunction, which to the superstitiously minded Mongol chief foretold that evil was awaiting him. With this presentiment strongly impressed upon him he turned his face homewards, and had advanced no farther than the Si-Kiang river in Kansuh when he was seized with an illness of which he died a short time afterwards (1227) at his travelling palace at Ha-lao-tu, on the banks of the river Sale in Mongolia. By the terms of his will Ogotai was appointed his successor, but so essential was it considered to be that his death should remain a secret until Ogotai was proclaimed that, as the funeral procession moved northwards to the great ordu on the banks of the Kerulen, the escort killed every one they met. The body of Jenghiz was then carried successively to the ordus of his several wives, and was finally laid to rest in the valley of Kilien.

Thus ended the career of one of the greatest conquerors the world has ever seen. Born and nurtured as the chief of a petty Mongolian tribe, he lived to see his armies victorious from the China sea to the banks of the Dnieper; and, though the empire which he created ultimately dwindled away under the hands of his degenerate descendants, leaving not a wrack behind, we have in the presence of the Turks in Europe a consequence of his rule, since it was the advance of his armies which drove their Osmanli ancestors from their original home in northern Asia, and thus led to their invasion of Bithynia under Othman, and finally their advance into Europe under Amurath I.

JENKIN, HENRY CHARLES FLEEMING (1833-1885), British engineer, was born near Dungeness on March 25, 1833, his father being a naval commander and his mother a novelist of some repute. He studied at Genoa university, where he took a first-class degree in physical science. In 1851 he was apprenticed to an engineer in Manchester, and subsequently he entered Newall's submarine cable works at Birkenhead. In 1859 he and W. Thomson (afterwards Lord Kelvin) began to work on problems connected with cables, to which he applied his researches on the resistance of gutta-percha. In partnership with Thomson, he was also a consulting telegraph engineer. In 1865 he was elected F.R.S., and was appointed professor of engineering at University college, London, and in 1868 at Edinburgh university. In 1873 he published a textbook of *Magnetism and Electricity*, full of original work. R. L. Stevenson's *Memoir* is a sympathetic tribute to his ability and character. In Stevenson's essay on "Talk and Talkers," Fleeming Jenkin figures as Cockshot. In 1882 Jenkin invented an automatic method of electric transport for goods—"telpherage"—but the details were still incomplete when

he died on June 12, 1885. A telpher line on his system was subsequently erected at Glynde in Sussex.

JENKINS, SIR LAWRENCE (1858–1928), Indian judge and reformer, was born at Cilbronau, Cardigan, on Dec. 22, 1858, and educated at Cheltenham and at University college, Oxford. He was called to the bar in 1883, and became well known as an equity lawyer. He married in 1892 Catherine Kennedy, author of *Sport and Travel in Both Tibets* (1909). In 1896 he was appointed judge in the high court of Calcutta. After three years he was promoted chief justice of Bombay, and was created K.C.I.E. in 1903. Sir Lawrence took a great interest in political and social problems in India, and sometimes aroused adverse criticism in his attempts to minimize the racial gulf between Europeans and Indians.

In 1908 he was made a member of the council of India and played an important part in the Morley-Minto plans for reform. Lord Minto soon urged his appointment as chief justice of Calcutta, and Lord Morley reluctantly agreed to let him go. The political unrest during the following period did not allow Sir Lawrence scope for the abilities which he had exercised in Bombay, and he did not escape criticism on political grounds for his handling of certain cases. After the outbreak of the World War, however, he conducted the Prize Court at Calcutta with a skill admitted both by his colleagues and by the public. He retired from the chief justiceship in 1916, and was made a member of the judicial committee of the Privy Council. Here full use was made of his intimate knowledge of Indian law and practice. In 1924 he received a special appointment on the board to consider the position of the Irish Boundary Commission. He died on Oct. 2, 1928.

JENKINS, SIR LEOLINE (1623–1685), English lawyer and diplomatist, was the son of a Welsh country gentleman. He was born in 1623 and was educated at Jesus college, Oxford. During the civil war and the commonwealth he was an ardent royalist; in 1661 he was made registrar of the consistory court of Westminster; in 1664 deputy judge of the court of arches; about a year later judge of the admiralty court; in 1689 judge of the prerogative court of Canterbury. In these offices Jenkins did enduring work in elucidating and establishing legal principles, especially in relation to international law and admiralty jurisdiction. He was selected to draw up the claim of Charles II. to succeed to the property of his mother, Henrietta Maria, on her death in 1666, and while in Paris for this purpose he succeeded in defeating the rival claim of the duchess of Orleans, being rewarded by a knighthood on his return. He was one of the English representatives at the Congresses of Cologne in 1673, and of Nijmegen in 1676–79. He was made a privy councillor in 1680 and became secretary of state in April of the same year, in which office he was the official leader of the opposition to the Exclusion Bill. He resigned office in 1684, and died on Sept. 1, 1685. Jenkins left his impress on the law of England in the Statute of Frauds, and the Statute of Distributions, of which he was the principal author, and of which the former profoundly affected the mercantile law of the country, while the latter regulated the inheritance of the personal property of intestates. He was never married.

See William Wynne, *Life of Sir Leoline Jenkins* (2 vols., 1724), which contains a number of his diplomatic despatches, letters, speeches and other papers. See also Sir William Temple, *Works*, vol. ii. (4 vols., 1770); Anthony à Wood, *Athenae Oxonienses* (Fasti), ed. by P. Bliss (4 vols., 1813–20), and *History and Antiquities of the University of Oxford*, ed. by J. Gutch (Oxford, 1792–96).

JENKINS, ROBERT (fl. 1731–1745), English master mariner, is known as the protagonist of the "Jenkins's ear" incident, which, magnified in England by the press and the opposition, became a contributory cause of the war between England and Spain (1739) which ultimately merged into the War of the Austrian Succession. Bringing home the brig "Rebecca" from the West Indies in 1731, Jenkins was boarded by a Spanish guardacosta, whose commander rifled the holds and cut off one of his ears. On arriving in England Jenkins stated his grievance to the king. At first the case created no stir, but in 1738 the repetition of his story with dramatic detail before a committee of the House of Commons created much political excitement.

Jenkins was subsequently given command of a ship in the East India Company's service, and later became supervisor of the company's affairs at St. Helena.

See T. H. Brooke, *History of the Island of St. Helena* (2nd ed., 1824), and H. R. Janisch, *Extracts from the St. Helena Records* (1885).

JENKS, JEREMIAH WHIPPLE (1856–1929), American economist, was born in St. Clair, Mich., on Sept. 2, 1856. He graduated at the University of Michigan in 1878; was admitted to the Michigan bar; taught languages in Mt. Morris college (Ill.); studied in Germany at the University of Halle; taught political science and English literature at Knox college, Galesburg, Ill., (1886–89); was professor of political economy and social science at Indiana State university (1889–91); was professor of political economy and politics at Cornell university (1891–1912); was professor of government and director of the division of public affairs at New York university (1912–17) and thereafter director of the division of oriental commerce and politics. In 1899–1901 he served as an expert agent of the U.S. industrial commission on investigation of trusts and industrial combinations in the United States and Europe. In 1901–02 he was special commissioner of the U.S. war department on colonial administration, and wrote a *Report on Certain Economic Questions in the English and Dutch Colonies in the Orient*, published (1902) by the bureau of insular affairs; and he later served the United States and other Governments as adviser on currency. In 1907–10 he was a member of the U.S. immigration commission; he has also held many administrative positions. Among his principal works are *The Trust Problem* (1900; enlarged ed. with W. E. Clark, 1917); *Citizenship and the Schools* (1906); *Principles of Politics* (1909); *The Immigration Problem* (with W. J. Lauck, 1913; 6th ed. revised by R. D. Smith, 1925); *Business and the Government* (1917). He died in New York city on Aug. 24, 1929.

JENNÉ, a city of West Africa, formerly the capital of the Songhoi empire, now included in the French colony of French Sudan. Jenné is situated on a marigot or natural canal connecting the Niger and its affluent the Bani or Dienné, and is within a few miles of the latter stream. It lies 250 miles south-west of Timbuktu, in a straight line. Thought to have been founded by the Songhoi in the 8th century, Jenné has passed under the dominion of many peoples. It seems to have been at the height of its power from the 12th to the 16th century, when its merchandise was found at every port along the west coast of Africa. It is thought that Jenné (Guinea) gave its name to the whole coast. (See GUINEA.) Subsequently, under the control of Moorish, Tuareg and Fula invaders, the importance of the city greatly declined. With the advent of the French, commerce again began to flourish. The city is surrounded by channels connected with the Bani but in the dry season it ceases to be an island. On the north is the Moorish quarter; on the north-west, the oldest part of the city, stood the citadel, now a fort. An old mosque was built on the site of the ancient palace of the Songhoi kings. There is little trace of the influence of Moorish or Arabian art. The buildings are mostly constructed of clay made into flat long bricks. Massive clay walls surround the city.

JENNER, EDWARD (1749–1823), English physician and discoverer of vaccination, was born at Berkeley, Gloucestershire, on May 17, 1749, the son of a clergyman. After his early education at Wotton-under-Edge and Cirencester, he began the study of medicine under Daniel Ludlow, a surgeon of Sodbury, near Bristol; but in 1770, went to London as a pupil of John Hunter. During this period he was employed by Sir Joseph Banks to prepare and arrange the zoological specimens which he had collected on Captain Cook's first voyage in 1771. Jenner was offered the post of naturalist in the second expedition, but he preferred to practise his profession in his native place. In one of his papers contributed at this time to the local medical society, of which he had been the principal founder, he appears to have anticipated the discoveries of others concerning rheumatic inflammations of the heart. He also studied ornithology, the geology of the district, and constructed the first balloon seen in those parts. He was a favourite in society, a fair musician and poet. In 1788 he married Catharine Kingscote and in 1792 obtained the M.D. from St. Andrews.

Meanwhile, the discovery of vaccination matured slowly in his mind. When an apprentice, he had noted a popular belief in Gloucestershire as to the antagonism between cow-pox and small-pox. He first investigated this subject about 1775, and within five years, he had satisfied himself that cow-pox really included two different forms of disease, only one of which protected against small-pox and that many of the failures could thus be explained. He further ascertained that the true cow-pox only protected when communicated at a particular stage of the disease, and at the same time concluded that "the grease" of horses is the same disease as cow-pox and small-pox, each being modified by the organism in which it develops. Cow-pox being scarce in his county at that period, Jenner had no opportunity of testing his theory until May 14, 1769, when he was able to inoculate an eight-year old boy with matter from the cow-pox vesicles on the hands of a milkmaid. In the following July, the boy was inoculated for small-pox, but the disease did not follow. Owing to the continued absence of cow-pox, Jenner was unable to repeat his successful discovery before 1798, in which year he published his *Inquiry into the Cause and Effects of the Variolae Vaccinae*, announcing his discovery to the world.

Henry Cline, surgeon of St. Thomas's hospital, London, made a number of successful inoculations against small-pox, and thereby brought vaccination before the medical profession, which had been prejudiced by the formidable criticism of J. Ingenhousz, a celebrated surgeon. But its adoption was delayed by the rash advocacy of George Pearson, who without seeing a case of cow-pox, lectured on the subject and supplied the virus. The matter which he distributed was derived from infected cows near London, and frequently produced not the mild disease described by Jenner but somewhat severe eruptions resembling small-pox. Hence Jenner had first to show in 1799 that the vaccine supplied by Pearson was accidentally contaminated with variolous matter, and then to secure in 1800 the abandonment of Pearson's project for establishing in London an institution for gratuitous vaccination with this defective vaccine. Jenner was afterwards presented to the members of the Royal family, who materially aided the spread of vaccination in England. (For the general adoption of the discovery, see VACCINATION.)

In 1803, the Royal Jennerian Society for the proper spread of vaccination in London was established. In the first 18 months 12,000 persons were inoculated, and the annual average of deaths from small-pox fell from 2,018 to 622. Dissensions within the society, however, led to its extinction in 1808, when the national vaccine establishment was founded. Of this, Jenner was at first the director, but later merely its adviser.

In 1802, a parliamentary grant of £10,000 had been voted for him, but when it was paid in 1804, £1,000 for fees being deducted, it did little more than cover the expenses of his discovery. Meanwhile, Jenner continued to vaccinate gratuitously often as many as 300 poor a day. From abroad, honours were showered upon him, and he was elected a member of the chief scientific societies, the first being that of Göttingen. But perhaps the most flattering proof of his influence was derived from France. On one occasion, when a petition for the release of a number of Englishmen detained in France on the sudden termination of the Peace of Amiens was about to be rejected by Napoleon, Josephine uttered the name of Jenner. The emperor paused and exclaimed: "Ah, we can refuse nothing to that name."

In England his merits were more slowly recognized. In 1806, Lord Henry Petty (afterwards marquess of Lansdowne) became chancellor of the exchequer, and proposed an address to the Crown, praying that the College of Physicians should report on vaccination. The report being strongly favourable, the then chancellor of the exchequer (Spencer Perceval) proposed a further £10,000 for Jenner. Finally the sum was raised to £20,000, and about the same time India raised a subscription of £7,383.

In 1810, the death of his eldest son and incessant labour affected his health. In 1813, Oxford conferred on him an honorary M.D., but he was unsuccessful in being elected into the College of Physicians because of his refusal to undergo an examination in classics. He visited London for the last time in 1814, when he was

presented to the allied sovereigns. On his wife's death in the following year, he retired from public life and occupied himself with his work as a physician, naturalist and magistrate. In 1822 he published his last work, *On the Influence of Artificial Eruptions in Certain Diseases*, and in the following year presented to the Royal Society his final paper, *On the Migration of Birds*. He died on Jan. 24, 1823.

See J. Baron, *The Life of E. Jenner* (1827); C. Creighton, *Jenner and Vaccination* (1889). See also VACCINATION.

JENNER, SIR WILLIAM, BART. (1815-1898), English physician, was born at Chatham on Jan. 30, 1815, and educated at University college, London. In 1847, at the London Fever hospital, he began investigations into cases of "continued" fever, which enabled him finally to make the distinction between typhus and typhoid on which his reputation as a pathologist principally rests. In 1849 he was appointed professor of pathological anatomy at University college, and held many hospital appointments as a consultant. He was also successively Holme professor of clinical medicine and professor of the principles and practice of medicine at University college. He was president of the college of physicians (1881-88); he was elected F.R.S. in 1864, and received honours and court appointments. In 1868 he was created a baronet. He died at Bishop's Waltham, Hants, on Dec. 11, 1898.

JENNET, a small Spanish horse; the word is sometimes applied in English to a mule, the offspring of a she-ass and a stallion.

JENOLAN CAVES, a series of remarkable caverns in Roxburgh county, New South Wales, Australia; 113 m. W. by N. of Sydney, and 36 m. from Tarana, which is served by railway. They are the most celebrated of several similar groups in the limestone country. The stalactitic formations, sometimes pure white, are of great beauty.

JENSEN, JOHANNES VILHELM (1873-), Danish author, was born at Farsø, North Jutland, on Jan. 20, 1873, of a family of peasant extraction. Jensen belongs to the new school of Danish literature which came into being about 1900. He repudiated the Brandes school with its imitation of French literature, and wrote of nature and outdoor life. Among his novels may be mentioned: *Kongens Fald* (1899-1902), a historical novel of the 16th century; *Madame d'Or* (1904); and *Den lange Rejse* (1908-21) describing the evolution of the Northern race from the glacial epoch to the time of Columbus. In *Himmerlandshistorier* (1898-1910); *Skovene* (1904); *Eksotiske Noveller* (1907-15) and *Myter og Jagter* (1907-24) he described life and scenery in his native country and abroad with brilliant imaginative talent and mastery of language.

See Otto Gelsted, *Johannes V. Jensen* (1913).

JENSEN, WILHELM (1837-1911), German novelist, was born at Heiligenhafen, Holstein, on Feb. 15, 1837, and died at Munich on Nov. 24, 1911. He wrote some tragedies, but his best work lies in his novels, remarkable for their fine descriptions of scene and place. Among the best examples are: *Eddystone* (1872), *Nirwana* (1877), *Karin* (1878), *Diana Akhnoba* (1890), *Luv und Lee* (1897) and *Vor der Elbmündung* (1905).

JENYNS, SOAME (1704-87), English author, was born in London on Jan. 1, 1704, and was educated at St. John's college, Cambridge. In 1742 he was chosen M.P. for Cambridgeshire, in which his property lay, and he afterwards sat for the borough of Dunwich and the town of Cambridge. From 1755 to 1780 he was one of the commissioners of the board of trade. He died on Dec. 18, 1787. Jenyns wrote poems: *Art of Dancing* (1727) and *Miscellanies* (1770): and, in prose, *Free Inquiry into the Nature and Origin of Evil* (1756), and *View of the Internal Evidence of the Christian Religion* (1776). He is chiefly remembered by the slashing review by Samuel Johnson in the *Literary Magazine* on the *Free Inquiry*, and by references in Boswell's *Life of Johnson*.

JEOPARDY, risk of death, loss or other injury, from O.Fr. *ju* (later *jeu*) and *parti*, even game. It was originally used of a problem in chess or of a stage in any other game at which the chances of success or failure are evenly divided between the players.

JEPHSON, ROBERT (1736-1803), Irish dramatist, was born in Ireland. After serving for some years in the British army,

he retired with the rank of captain, and lived in England, where he was the friend of Garrick, Reynolds, Goldsmith, Johnson, Burke, Burney and Charles Townshend. His appointment as master of the horse to the lord-lieutenant of Ireland took him back to Dublin, and he held his appointment under 12 succeeding viceroys. His plays include a tragedy, *Braganza* (1775), *Conspiracy* (1796), *The Law of Lombardy* (1779), and *The Count of Narbonne* (1781). He died at Blackrock, near Dublin, on May 31, 1803.

Jephson's other works include: *The Bachelor, or Speculations of Jeffrey Wagstaffe*, a defence of the Irish administration; and *The Confessions of Jacques Baptiste Couteau*, a satire on the French revolutionaries.

JEPHTHAH, one of the judges of Israel, in the Bible, was a son of Gilead by a secondary wife, and, being expelled from his father's house by his brethren, took refuge in the Syrian land of Tob, where he gathered around him a powerful band of homeless men like himself. The Ammonites pressing hard on his countrymen, the elders of Gilead called for his help, which he consented to give on condition that in the event of victory he should be made their head (Judges xi. 1-xii. 7). His name is best known in history and literature in connection with his vow, which led to the sacrifice of his daughter on his successful return. The annual lamentation of the women for her death suggests a mythical origin (see ADONIS). Attached to the narrative is an account of a quarrel between Jephthah and the Ephraimites. The latter were defeated, and their retreat was cut off by the Gileadites, who had seized the fords of the Jordan. As the fugitives attempted to cross they were bidden to say "shibboleth," and those who said "sibboleth" (the Ephraimites apparently being unused to *sh*), were put to death.

JEPSON, WILLIS LINN (1867-), American botanist, was born at Vacaville, Calif., on Aug. 19, 1867. Following his graduation at the University of California in 1889 (Ph.D., 1899), he pursued botanical study at Cornell and Harvard universities and also at Kew and Berlin. After serving as assistant in botany in 1891-94, instructor in 1895-98, assistant professor in 1899-1911 and associate professor in 1911-18, he was made in 1919 professor of botany in the University of California. He made extensive investigations in the taxonomy, geographic distribution and life-history of Western American seed-plants, especially the flora of California.

His works include *Flora of Western Middle California* (1901, 2nd ed., 1911); *The Trees of California* (1909, 2nd ed., 1923); *A Flora of the Economic Plants of California* (1924); *An Illustrated Manual of the Flowering Plants of California* (1925); and numerous contributions to scientific journals.

JERAHMEEL, in the Bible, a clan which with Caleb, the Kenites and others occupied the southern steppes of Palestine (1 Sam. xxx. 29), and was subsequently incorporated into Judah (q.v.). The *Chronicles of Jerahmeel* (M. Gaster, *Oriental Translation Fund*, 1899) is a late production containing a number of apocryphal Jewish legends of no historical value.

JERBA, an island off the coast of North Africa in the Gulf of Gabes, forming part of Tunis. It is separated from the mainland by two narrow straits, and save for these channels blocks the entrance to a large bay identified with the Lake Triton of the Romans. The western strait, opening into the Gulf of Gabes, is a mile and a half broad; the eastern strait is wider, but at low water it is possible to cross to the mainland by the Tarik-el-Jemil (road of the camel). The island is irregular in outline, its greatest length and breadth being some 20 m., and its area 425 sq.m. It contains neither rivers nor springs, but is supplied with water by wells and cisterns. It is flat and well wooded with date palms and olive trees. Its population is estimated at about 90,000, mostly Berbers.

Jerba is the Lotophagitis or Lotus-eaters' Island of the Greek and Roman geographers, and is also identified with the Brachion of Scylax. The modern name appears as early as the 4th century in Sextus Aurelius Victor. In the middle ages the possession of Jerba was contested by the Normans of Sicily, the Spaniards and the Turks, the Turks proving victorious. In 1560 after the destruction of the Spanish fleet off the coast of the island by Piali

pasha and the corsair Dragut, the Spanish garrison at Haumt-es-Suk was exterminated.

Jerba has a considerable reputation for the manufacture of the woollen tissues interwoven with silk which are known as burnous stuffs; a market for the sale of sponges is held from November till March; and there is a considerable export trade in olives, dates, figs and other fruits. The capital, trading centre and usual landing-place are at Haumt-es-Suk (market quarter) on the north side of the island. Here are a mediaeval fort, built by the Spaniards in 1284, and a modern fort. Gallala, to the south, is noted for the manufacture of a kind of white pottery, much prized.

JERBOA, the name of an Arabian and North African jumping rodent mammal, *Jaculus aegyptius*, typifying the family *Jaculidae*, but in a wider sense applied to most of the representatives of that family, which are distributed over the desert and semi-desert tracts of the Old World, although unknown in Africa south of the Sahara. (For the characteristics of the family see RODENTIA.)

BY COURTESY OF THE NEW YORK ZOOLOGICAL SOCIETY

JERBOA (*JACULUS AEGYPTIUS*), A SMALL RODENT OF AFRICA

In the Egyptian jerboa the length of the body is 8 in., and that of the tail, which is long, cylindrical and covered with short hair terminated by a tuft, 10 in. The five-toed front limbs are extremely short, while the hind pair are six times as long. When about to spring, the jerboa raises its body by means of the hinder extremities, and supports itself at the same time upon its tail, while the fore-feet are so closely pressed to the breast as to be scarcely visible. It then leaps into the air and alights upon its four feet, but instantaneously erecting itself, it makes another spring, and so on in rapid succession. It is a gregarious animal, living in burrows, which it excavates with its nails and teeth in the sandy soil of Egypt and Arabia. In these it remains during the day, emerging at night in search of the herbs on which it feeds. It is exceedingly shy, and this, together with its agility, renders it difficult to capture. The Persian jerboa (*Allactaga indica*) is also a nocturnal burrowing animal, feeding on grain, which it stores up in underground repositories, closing these when full, and only drawing upon them when the supply of food above ground is exhausted. (See also JUMPING MOUSE.)

JEREMIAH, the son of Hilkiah, belonging to the priestly family of Anathoth, a few miles to the north-west of Jerusalem, was the last of the great pre-exilic prophets of Israel.

His Life and Times.—The life of Jeremiah falls in one of the most striking and critical periods in the history of the ancient world. His ministry began in 626, the year of the death of Assurbanipal, the last of the great kings of Assyria, at a time when all western Asia was being laid desolate by the inroads of hordes of northern barbarians known to the Greeks as Scythians or Cimmerians and to the Babylonians as Umman-manda. He witnessed the complete overthrow of Assyria culminating in the destruction of Nineveh in 612, followed by the decisive defeat of Egypt's last attempt at world empire in the battle of Carchemish (605). Startling events took place in his own land also. In his youth (639) a king was assassinated; in 621 occurred the great reform of Josiah, who met a tragic end at Megiddo in 608. Judah became a vassal in turn of Egypt and of Babylon, and, rebelling against the latter in 597, suffered invasion, siege, and the deportation of her young king, Jehoiachin, and the best of her people. Jehoiachin's uncle and successor, Zedekiah, after years of vacillation and weakness, yielded to the machinations of his corrupt nobility and to the intrigues of Egypt, and the Jewish kingdom perished in 585 with the capture of Jerusalem and the destruction of the Temple of Solomon.

Jeremiah's call came in 626, when Judah was suffering from Scythian raids and even Jerusalem was threatened. His attitude towards the reforms of Josiah is a matter of dispute, some scholars holding that he regarded the law-book on which it was based as a forgery (cf. Jer. viii. 8), and that his uncompromising hos-

tility to sacrifice of any kind (*cf.* Jer. vii. 21) made it impossible for him to approve of a movement which permitted its continuance. On the other hand these views may have been later developments, and Jer. xi. 1-14 suggests naturally that he approved Josiah's action, while it is easy to understand the hostility of his own family (Jer. xi. 18-20, xii. 6) if he was concerned in a movement which would deprive the priests of Anathoth of their ancestral rights. We hear little more of Jeremiah during the rest of the reign of Josiah, for whom the prophet had a deep respect, but the reaction under Jehoiakim called for his condemnation, and his boldness endangered his life (Jer. vii. 1 *sqq.*, xxvi.). He fully realized the significance of the battle of Carchemish, and took a step which, as far as we know, was unprecedented in Israelite prophecy. He secured the services of a professional writer, Baruch by name, to whom he dictated earlier prophecies which were read in public on a festal occasion. Jehoiakim's attempt to suppress this document led only to its being rewritten (Jer. xxxvi.). In Zedekiah's reign he continued his protests against the moral and religious degradation of Israel, and during the final siege of Jerusalem took the unpopular course of recommending surrender to the Chaldeans. Called to Anathoth on family business during an interval of the siege, he was arrested and thrown into prison, where he continued to deliver the same message. An attempt was made to starve him to death in an old well, but he was rescued by an Ethiopian, Ebedmelech by name, and survived the fall of the city. He was allowed by the Chaldeans to make his home at Mizpah with Gedaliah, but, on the assassination of that honourable and chivalrous governor, Jeremiah was taken down to Egypt by the panic-stricken survivors. The last we hear of him is a final denunciation of his fellow-countrymen for adopting the worship of the Queen of Heaven.

The Man and His Message.—Few characters in history have stronger claims on our affection and sympathy than Jeremiah. Nervous, tender, shy, with a deep-rooted love of nature and of man, his temperament demanded a life of quiet domestic obscurity. His calling and his devotion to his God demanded that he should live a life of lonely publicity, always on the unpopular side, always confronted with the disaster which in the end overwhelmed his country, always conscious of sharing in responsibility for evils which he was powerless to avert or postpone. His was a double passion, a love of his people and a love of his God: the longing of his heart was to see them validly wedded to one another; and the tragedy of his life lay in the steady drift of Israel away from Yahweh, till the last blow fell in Egypt, and he had to pronounce their association at an end—they were finally divorced (Jer. xlv. 26-29). At the outset of his career he had received a promise of support in the face of man, and, as far as we know, he never blenched before priest or king or people. But in facing his God he stood alone, often rebelling, sometimes even doubting the good faith of a divine Master, who, as popular theology held, might entrap His very servants to their utter ruin (*cf.* Jer. xii. 1-6, xv. 15-21, xx. 7-11).

Yet though these experiences brought Jeremiah an agony paralleled in Hebrew literature only by that of Job, it was thence that the great significance of his life and work sprang. Accepting the doctrines and attitude of his great predecessors, especially Hosea, he saw that the union between God and man must be spiritual, not material, and he expressed this eternal truth in his prediction of the New Covenant (Jer. xxxi. 31-34). And his relations with Yahweh were a new phenomenon in the history of religion. Living in the midst of a community which nominally worshipped the God who had inspired him, he yet stood apart from it in his spiritual life. To him his religion was essentially personal, not communal, and, as far as we know, he was the first to stand alone with God; he was the Father of all the Saints.

The Book of Jeremiah.—This book exhibits with exceptional clearness the three types of material which were at the disposal of

the compilers of our Biblical prophetic literature, for it contains (i.) poetry (mainly actual oracles delivered by the prophet), (ii.) prose written in the first person, giving an account of various utterances of the prophet, sometimes with reference to the occasions on which they were delivered, and (iii.) prose written in the third person, giving an account mainly of events in the life of the prophet. It is usual to attribute passages of the last type to Baruch, the scribe, who acted as secretary to Jeremiah. It is clear that material of type (i.) was already arranged in small collections when it came into the hands of the compiler, who selected suitable sections from material of type (ii.) (or, when necessary, type [iii.]) to form introductions to the poetic collections. Thus i. 1-14 (ii.) forms an introduction, not only to the whole book, but also to the collection ii. 15-iii. 5; iii. 6-18 (ii.) forms an introduction to the collection of oracular poetry contained in iii. 19-vi. 30. It is noticeable that the oracular collections grow shorter as the book proceeds, and that the compiler was forced to use passages of type (iii.) for his "introductions" from ch. 19 onwards. Some modern scholars, notably Duhm and Mowinkel, believe that many of the (ii.) passages are the work of imaginative later scribes, who wished to claim the authority of the prophet for their own theological views, but the originality or otherwise of the sections does not affect their position in the history and structure of the book.

The Greek version (LXX.), representing the text current among Egyptian Jews, frequently differs very widely from the traditional Hebrew text, which is of Palestinian (or Babylonian?) origin. The best illustration of the divergence is to be found in the position of a large collection of oracles against foreign nations. In the common Hebrew text, followed by modern vernacular translations, this collection is placed near the end of the book, occupying chapters xlv.-li.; in the LXX. it appears between vv. 13 and 15 of ch. xxv. in our familiar arrangement. (T. H. R.)

JEREMY, EPISTLE OF, an apocryphal book of the Old Testament. The letter purports to have been written by Jeremiah to the exiles who were already in Babylon or on the way thither. The author was a Hellenistic Jew, and not improbably a Jew of Alexandria. His work, which shows little literary skill, was written with a serious practical purpose. He veiled his fierce attack on the idol gods of Egypt by holding up to derision the idolatry of Babylon. He warned the exiles that they were to remain in captivity for seven generations; that they would there see the worship paid to idols, from all participation in which they were to hold aloof; for that idols were nothing save the work of men's hands, without the powers of speech, hearing, or self-preservation. They could not bless their worshippers even in the smallest concerns of life; they were indifferent to moral qualities, and were of less value than the commonest household objects, and finally, "with rare irony, the author compared an idol to a scarecrow (*v.* 70), impotent to protect, but deluding to the imagination" (MARSHALL).

The date of the epistle is uncertain; possibly it belongs to the 1st century B.C.
